

## THVD1500 ±8kV IEC ESD保護の500kbps RS-485トランシーバ

### 1 特長

- TIA/EIA-485A標準、およびSGCC (State Grid Corporation of China) Part 11シリアル通信プロトコルRS-485標準の要件を満たすか、それ以上を実現
- 電源電圧: 4.5V~5.5V
- 半二重RS-422/RS-485
- バスI/O保護
  - ±16kV HBM ESD
  - ±8kV IEC 61000-4-2接触放電
  - ±10kV IEC 61000-4-2エアギャップ放電
  - ±2kV IEC 61000-4-4高速過渡バースト
- 拡張工業用温度範囲: -40°C~125°C
- レシーバの大きなヒステリシスによるノイズ除去
- 低消費電力
  - 低いスタンバイ時消費電流: 1µA未満
  - 動作時の静止電流: 660µA未満
- グリッチなしの電源オン/オフによるホット・プラグイン能力
- オープン、短絡、アイドル・バスのフェイルセーフ
- 1/8単位負荷オプション(最大256のバス・ノード)
- 低EMIで500kbps

### 2 アプリケーション

- 電力メータ(E-Meter)
- インバータ
- HVACシステム
- ビデオ監視システム

### 3 概要

THVD1500は、産業用アプリケーション向けの堅牢な半二重RS-485トランシーバです。バスのピンは高レベルのIEC接触放電ESDイベントへの耐性があるため、システムレベルでの追加保護部品が不要です。

このデバイスは、単一の5V電源で動作します。同相電圧範囲が広く、バスのピンでの入力リークが小さいため、THVD1500は長いケーブルを使用するマルチポイントのアプリケーションに適しています。

THVD1500は、業界標準の8ピンSOICパッケージで供給され、ドロップイン互換性があります。-40°C~125°Cでの動作が規定されています。

## 2018年7月発行のものから更新

Page

•	タイトルを「300kbps RS-485」から「500kbps RS-485」に変更	1
•	「特長」の「低EMIで300kbps」を「低EMIで500kbps」に変更	1
•	Changed Signaling rate From: 300 kbps To: 500 kbps in the <i>Recommended Operating Condition</i>	5
•	Changed text From: "data transmission up to 300 kbps" To: "data transmission up to 500 kbps" in the <i>Overview</i> section	13

## 5 Pin Configuration and Functions

### Pin Functions

PIN		I/O	DESCRIPTION
NAME	NO.		
R	1	Digital output	Receive data output
$\overline{RE}$	2	Digital input	Receiver enable, active low (internal 2-M $\Omega$ pull-up)
DE	3	Digital input	Driver enable, active high (internal 2-M $\Omega$ pull-down)
D	4	Digital input	Driver data input
GND	5	Ground	Local device ground
A	6	Bus input/output	Bus I/O port, A (complementary to B)
B	7	Bus input/output	Bus I/O port, B (complementary to A)
V <sub>CC</sub>	8	Power	5-V supply

## 6 Specifications

### 6.1 Absolute Maximum Ratings

over operating free-air temperature range (unless otherwise noted)<sup>(1)</sup>

		MIN	MAX	UNIT
Supply voltage	$V_{CC}$	-0.5	7	V
Bus voltage	Range at any bus pin (A or B)	-18	18	V
Input voltage	Range at any logic pin (D, DE, or $\overline{RE}$ )	-0.3	5.7	V
	Transient pulse voltage range at any bus pin (A or B) through 100 $\Omega$	-100	100	
Receiver output current	$I_o$	-24	24	mA
Junction temperature			170	$^{\circ}\text{C}$
Absolute ambient temperature, $T_A$		-55	125	$^{\circ}\text{C}$
Storage temperature, $T_{stg}$		-65	150	$^{\circ}\text{C}$

(1) Stresses beyond those listed under *Absolute Maximum Ratings* may cause permanent damage to the device. These are stress ratings only, which do not imply functional operation of the device at these or any other conditions beyond those indicated under *Recommended Operating Conditions*. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.

### 6.2 ESD Ratings

			VALUE	UNIT
$V_{(ESD)}$ Electrostatic discharge	Contact Discharge, per IEC 61000-4-2	Pins Bus terminals and GND	$\pm 8,000$	V
	Air Gap Discharge, per IEC 61000-4-2	Pins Bus terminals and GND	$\pm 10,000$	
	Human-body model (HBM), per ANSI/ESDA/JEDEC JS-001 <sup>(1)</sup>	Pins Bus terminals and GND	$\pm 16,000$	
		All pins except Bus terminals and GND	$\pm 4,000$	
	Charged-device model (CDM), per JEDEC specification JESD22-C101 <sup>(2)</sup>		$\pm 1,500$	
	Machine model (MM), per JEDEC JESD22-A115-A		$\pm 400$	
$V_{(EFT)}$ Electrical fast transient	Per IEC 61000-4-4	Pins Bus terminals	$\pm 2,000$	V

(1) JEDEC document JEP155 states that 500-V HBM allows safe manufacturing with a standard ESD control process.

(2) JEDEC document JEP157 states that 250-V CDM allows safe manufacturing with a standard ESD control process.

### 6.3 Recommended Operating Conditions

over operating free-air temperature range (unless otherwise noted)

		MIN	NOM	MAX	UNIT
V <sub>CC</sub>	Supply voltage	4.5		5.5	V
V <sub>I</sub>	Input voltage at any bus terminal <sup>(1)</sup>	-7		12	V
V <sub>IH</sub>	High-level input voltage (Driver, driver enable, and receiver enable inputs)	2		V <sub>CC</sub>	V
V <sub>IL</sub>	Low-level input voltage (Driver, driver enable, and receiver enable inputs)	0		0.8	V
V <sub>ID</sub>	Differential input voltage	-12		12	V
I <sub>O</sub>	Output current, Driver	-60		60	mA
I <sub>OR</sub>	Output current, Receiver	-8		8	mA
R <sub>L</sub>	Differential load resistance	54			Ω
1/t <sub>UI</sub>	Signaling rate			500	kbps
T <sub>A</sub>	Operating ambient temperature	-40		125	°C
T <sub>J</sub>	Junction temperature	-40		150	°C

(1) The algebraic convention, in which the least positive (most negative) limit is designated as minimum is used in this data sheet.

### 6.4 Thermal Information

## 8 Detailed Description

### 8.1 Overview

The THVD1500 is a low-power, half-duplex RS-485 transceiver suitable for data transmission up to 500 kbps.

### 8.2 Functional Block Diagrams

### 8.3 Feature Description

Internal ESD protection circuits protect the transceiver against Electrostatic Discharges (ESD) according to IEC 61000-4-2 of up to  $\pm 8$  kV (Contact Discharge),  $\pm 10$  kV (Air Gap Discharge) and against electrical fast transients (EFT) according to IEC 61000-4-4 of up to  $\pm 2$  kV.

The THVD1500 provides internal biasing of the receiver input thresholds in combination with large input-threshold hysteresis. With a positive input threshold of  $V_{IT+} = -50$  mV and an input hysteresis of  $V_{HYS} = 50$  mV, the receiver output remains logic high under a bus-idle or bus-short conditions without the need for external failsafe biasing resistors. Device operation is specified over a wide temperature range from  $-40^{\circ}\text{C}$  to  $125^{\circ}\text{C}$ .

### 8.4 Device Functional Modes

When the driver enable pin, DE, is logic high, the differential outputs A and B follow the logic states at data input D. A logic high at D causes A to turn high and B to turn low. In this case, the differential output voltage defined as  $V_{OD} = V_A - V_B$  is positive. When D is low, the output states reverse, B turns high, A becomes low, and  $V_{OD}$  is negative.

When DE is low, both outputs turn high-impedance. In this condition the logic state at D is irrelevant. The DE pin has an internal pull-down resistor to ground, thus when left open the driver is disabled (high-impedance) by default. The D pin has an internal pull-up resistor to  $V_{CC}$ , thus, when left open while the driver is enabled, output A turns high and B turns low.

表 1. Driver Function Table

INPUT	ENABLE	OUTPUTS		FUNCTION
		A	B	
H	H	H	L	Actively drive bus high
L	H	L	H	Actively drive bus low
X	L	Z	Z	Driver disabled
X	OPEN	Z	Z	Driver disabled by default
OPEN	H	H	L	Actively drive bus high by default

When the receiver enable pin,  $\overline{\text{RE}}$ , is logic low, the receiver is enabled. When the differential input voltage defined as  $V_{ID} = V_A - V_B$  is positive and higher than the positive input threshold,  $V_{IT+}$ , the receiver output, R, turns high. When  $V_{ID}$  is negative and lower than the negative input threshold,  $V_{IT-}$ , the receiver output, R, turns low. If  $V_{ID}$  is between  $V_{IT+}$  and  $V_{IT-}$ , the output is indeterminate.

When  $\overline{\text{RE}}$  is logic high or left open, the receiver output is high-impedance and the magnitude and polarity of  $V_{ID}$  are irrelevant. Internal biasing of the receiver inputs causes the output to go failsafe-high when the transceiver is disconnected from the bus (open-circuit), the bus lines are shorted (short-circuit), or the bus is not actively driven (idle bus).

表 2. Receiver Function Table

DIFFERENTIAL INPUT	ENABLE	OUTPUT	FUNCTION
$V_{ID} = V_A - V_B$	$\overline{RE}$	R	
$V_{IT+} < V_{ID}$	L	H	Receive valid bus high
$V_{IT-} < V_{ID} < V_{IT+}$	L	?	Indeterminate bus state
$V_{ID} < V_{IT-}$	L	L	Receive valid bus low
X	H	Z	Receiver disabled
X	OPEN	Z	Receiver disabled by default
Open-circuit bus	L	H	Fail-safe high output
Short-circuit bus	L	H	Fail-safe high output
Idle (terminated) bus	L	H	Fail-safe high output

## 9 Application and Implementation

### 注

Information in the following applications sections is not part of the TI component specification, and TI does not warrant its accuracy or completeness. TI's customers are responsible for determining suitability of components for their purposes. Customers should validate and test their design implementation to confirm system functionality.

### 9.1 Application Information

The THVD1500 is a half-duplex RS-485 transceiver commonly used for asynchronous data transmissions. The driver and receiver enable pins allow for the configuration of different operating modes.

### 9.2 Typical Application

An RS-485 bus consists of multiple transceivers connecting in parallel to a bus cable. To eliminate line reflections, each cable end is terminated with a termination resistor,  $R_T$ , whose value matches the characteristic impedance,  $Z_0$ , of the cable. This method, known as parallel termination, allows for higher data rates over longer cable length.

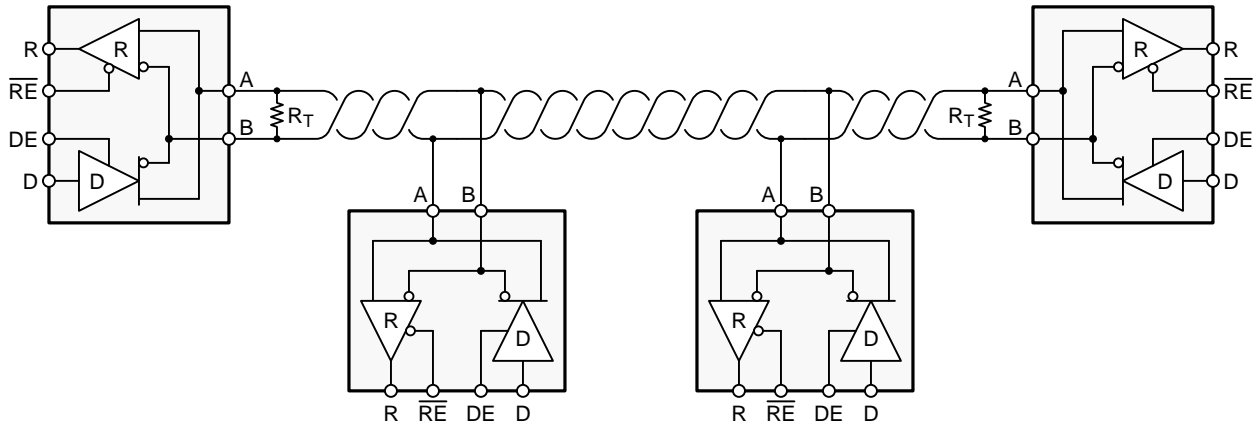

图 18. Typical RS-485 Network With Half-Duplex Transceivers

#### 9.2.1 Design Requirements

RS-485 is a robust electrical standard suitable for long-distance networking that may be used in a wide range of applications with varying requirements, such as distance, data rate, and number of nodes.

##### 9.2.1.1 Data Rate and Bus Length

There is an inverse relationship between data rate and cable length, which means the higher the data rate, the shorter the cable length; and conversely, the lower the data rate, the longer the cable length. While most RS-485 systems use data rates between 10 kbps and 100 kbps, some applications require data rates up to 300 kbps at distances of 4000 feet and longer. Longer distances are possible by allowing for small signal jitter of up to 5 or 10%.

## Typical Application (continued)

### 9.2.1.2 Stub Length

When connecting a node to the bus, the distance between the transceiver inputs and the cable trunk, known as the stub, should be as short as possible. Stubs present a non-terminated piece of bus line which can introduce reflections as the length of the stub increases. As a general guideline, the electrical length, or round-trip delay, of a stub should be less than one-tenth of the rise time of the driver, thus giving a maximum physical stub length as shown in 式 1.

$$L_{(\text{STUB})} \leq 0.1 \times t_r \times v \times c$$

where

- $t_r$  is the 10/90 rise time of the driver
- $c$  is the speed of light ( $3 \times 10^8$  m/s)
- $v$  is the signal velocity of the cable or trace as a factor of  $c$

(1)

### 9.2.1.3 Bus Loading

The RS-485 standard specifies that a compliant driver must be able to driver 32 unit loads (UL), where 1 unit load represents a load impedance of approximately 12 k $\Omega$ . Because the THVD1500 consists of 1/8 UL transceivers, connecting up to 256 receivers to the bus is possible.

### 9.2.1.4 Receiver Failsafe

The differential receivers of the THVD1500 are *failsafe* to invalid bus states caused by the following:

- Open bus conditions, such as a disconnected connector
- Shorted bus conditions, such as cable damage shorting the twisted-pair together
- Idle bus conditions that occur when no driver on the bus is actively driving

In any of these cases, the differential receiver will output a failsafe logic high state so that the output of the receiver is not indeterminate.

Receiver failsafe is accomplished by offsetting the receiver thresholds such that the *input indeterminate* range does not include zero volts differential. In order to comply with the RS-422 and RS-485 standards, the receiver output must output a high when the differential input  $V_{ID}$  is more positive than 200 mV, and must output a low when  $V_{ID}$  is more negative than  $-200$  mV. The receiver parameters which determine the failsafe performance are  $V_{IT+}$ ,  $V_{IT-}$ , and  $V_{HYS}$  (the separation between  $V_{IT+}$  and  $V_{IT-}$ ). As shown in the [Electrical Characteristics](#) table, differential signals more negative than  $-200$  mV will always cause a low receiver output, and differential signals more positive than 200 mV will always cause a high receiver output.

When the differential input signal is close to zero, it is still above the  $V_{IT+}$  threshold, and the receiver output will be high. Only when the differential input is more than  $V_{HYS}$  below  $V_{IT+}$  will the receiver output transition to a low state. Therefore, the noise immunity of the receiver inputs during a bus fault conditions includes the receiver hysteresis value,  $V_{HYS}$ , as well as the value of  $V_{IT+}$ .

Typical Application (continued)

9.2.1.5 Transient Protection

The bus pins of the THVD1500 transceiver family include on-chip ESD protection against ±16-kV HBM and ±8-kV IEC 61000-4-2 contact discharge. The International Electrotechnical Commission (IEC) ESD test is far more severe than the HBM ESD test. The 50% higher charge capacitance,  $C_{(S)}$ , and 78% lower discharge resistance,  $R_{(D)}$ , of the IEC model produce significantly higher discharge currents than the HBM model.

19. HBM and IEC ESD Models and Currents in Comparison (HBM Values in Parenthesis)

The on-chip implementation of IEC ESD protection significantly increases the robustness of equipment. Common discharge events occur because of human contact with connectors and cables. Designers may choose to implement protection against longer duration transients, typically referred to as surge transients.

EFTs are generally caused by relay-contact bounce or the interruption of inductive loads. Surge transients often result from lightning strikes (direct strike or an indirect strike which induce voltages and currents), or the switching of power systems, including load changes and short circuit switching. These transients are often encountered in industrial environments, such as factory automation and power-grid systems.

20 compares the pulse-power of the EFT and surge transients with the power caused by an IEC ESD transient. The left hand diagram shows the relative pulse-power for a 0.5-kV surge transient and 4-kV EFT transient, both of which dwarf the 10-kV ESD transient visible in the lower-left corner. 500-V surge transients are representative of events that may occur in factory environments in industrial and process automations.

The right hand diagram shows the pulse-power of a 6-kV surge transient, relative to the same 0.5-kV surge transient. 6-kV surge transients are most likely to occur in power generation and power-grid systems.

20. Power Comparison of ESD, EFT, and Surge Transients

**Typical Application (continued)**

In the event of surge transients, high-energy content is characterized by long pulse duration and slow decaying pulse power. The electrical energy of a transient that is dumped into the internal protection cells of a transceiver is converted into thermal energy, which heats and destroys the protection cells, thus destroying the transceiver. 21 shows the large differences in transient energies for single ESD, EFT, surge transients, and an EFT pulse train that is commonly applied during compliance testing.

21. Comparison of Transient Energies

## Typical Application (continued)

### 9.2.2 Detailed Design Procedure

In order to protect bus nodes against high-energy transients, the implementation of external transient protection devices is necessary. [Figure 22](#) suggests a protection circuit against 1 kV surge (IEC 61000-4-5) transients. [Table 3](#) shows the associated Bill of Materials.

**Figure 22. Transient Protection Against ESD, EFT, and Surge Transients for Half-Duplex Devices**

**Table 3. Bill of Materials**

DEVICE	FUNCTION	ORDER NUMBER	MANUFACTURER
XCVR	RS-485 transceiver	THVD1500	TI
R1	10-Ω, pulse-proof thick-film resistor	CRCW0603010RJNEAHP	Vishay
R2			
TVS	Bidirectional 400-W transient suppressor	CDSOT23-SM712	Bourns

### 9.2.3 Application Curves

Data Rate = 300 Kbps

**Figure 23. TBD**

## 10 Power Supply Recommendations

To ensure reliable operation at all data rates and supply voltages, each supply should be decoupled with a 100 nF ceramic capacitor located as close to the supply pins as possible. This helps to reduce supply voltage ripple present on the outputs of switched-mode power supplies and also helps to compensate for the resistance and inductance of the PCB power planes.

## 11 Layout

### 11.1 Layout Guidelines

Robust and reliable bus node design often requires the use of external transient protection devices in order to protect against surge transients that may occur in industrial environments. Since these transients have a wide frequency bandwidth (from approximately 3 MHz to 300 MHz), high-frequency layout techniques should be applied during PCB design.

1. Place the protection circuitry close to the bus connector to prevent noise transients from propagating across the board.
2. Use  $V_{CC}$  and ground planes to provide low inductance. Note that high-frequency currents tend to follow the path of least impedance and not the path of least resistance.
3. Design the protection components into the direction of the signal path. Do not force the transient currents to divert from the signal path to reach the protection device.
4. Apply 100-nF to 220-nF bypass capacitors as close as possible to the  $V_{CC}$  pins of transceiver, UART and/or controller ICs on the board.
5. Use at least two vias for  $V_{CC}$  and ground connections of bypass capacitors and protection devices to minimize effective via inductance.
6. Use 1-k $\Omega$  to 10-k $\Omega$  pullup and pulldown resistors for enable lines to limit noise currents in these lines during transient events.
7. Insert pulse-proof resistors into the A and B bus lines if the TVS clamping voltage is higher than the specified maximum voltage of the transceiver bus pins. These resistors limit the residual clamping current into the transceiver and prevent it from latching up.
8. While pure TVS protection is sufficient for surge transients up to 1 kV, higher transients require metal-oxide varistors (MOVs) which reduce the transients to a few hundred volts of clamping voltage, and transient blocking units (TBUs) that limit transient current to less than 1 mA.

### 12.6 静電気放電に関する注意事項

これらのデバイスは、限定的なESD (静電破壊) 保護機能を内蔵しています。保存時または取り扱い時は、MOSゲートに対する静電破壊を防止するために、リード線同士をショートさせておくか、デバイスを導電フォームに入れる必要があります。

### 12.7 Glossary

[SLYZ022](#) — TI Glossary.

This glossary lists and explains terms, acronyms, and definitions.

## 13 メカニカル、パッケージ、および注文情報

以降のページには、メカニカル、パッケージ、および注文に関する情報が記載されています。この情報は、そのデバイスについて利用可能な最新のデータです。このデータは予告なく変更されることがあり、ドキュメントが改訂される場合もあります。本データシートのブラウザ版を使用されている場合は、画面左側の説明をご覧ください。

**D0008B**

**PACKAGE OUTLINE**  
**SOIC - 1.75 mm max height**

SOIC

4221445/B 04/2014

**NOTES:**

1. Linear dimensions are in inches [millimeters]. Dimensions in parenthesis are for reference only. Controlling dimensions are in inches. Dimensioning and tolerancing per ASME Y14.5M.
2. This drawing is subject to change without notice.
3. This dimension does not include mold flash, protrusions, or gate burrs. Mold flash, protrusions, or gate burrs shall not exceed  $.006$  [0.15], per side.
4. This dimension does not include interlead flash.
5. Reference JEDEC registration MS-012, variation AA.

**EXAMPLE BOARD LAYOUT**

**D0008B**

**SOIC - 1.75 mm max height**

SOIC

4221445/B 04/2014

NOTES: (continued)

- 6. Publication IPC-7351 may have alternate designs.
- 7. Solder mask tolerances between and around signal pads can vary based on board fabrication site.

## EXAMPLE STENCIL DESIGN

**D0008B**

**SOIC - 1.75 mm max height**

SOIC

NOTES: (continued)

- 8. Laser cutting apertures with trapezoidal walls and rounded corners may offer better paste release. IPC-7525 may have alternate design recommendations.
- 9. Board assembly site may have different recommendations for stencil design.

(1) **Status:** For more details on status, see our [product life cycle](#).

(2) **Material type:** When designated, preproduction parts are prototypes/experimental devices, and are not yet approved or released for full production. Testing and final process, including without limitation quality assurance, reliability performance testing, and/or process qualification, may not yet be complete, and this item is subject to further changes or possible discontinuation. If available for ordering, purchases will be subject to an additional waiver at checkout, and are intended for early internal evaluation purposes only. These items are sold without warranties of any kind.

(3) **RoHS values:** Yes, No, RoHS Exempt. See the [TI RoHS Statement](#) for additional information and value definition.

(4) **Lead finish/Ball material:** Parts may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead finish/Ball material values may wrap to two lines if the finish value exceeds the maximum column width.

(5) **MSL rating/Peak reflow:** The moisture sensitivity level ratings and peak solder (reflow) temperatures. In the event that a part has multiple moisture sensitivity ratings, only the lowest level per JEDEC standards is shown. Refer to the shipping label for the actual reflow temperature that will be used to mount the part to the printed circuit board.

(6) **Part marking:** There may be an additional marking, which relates to the logo, the lot trace code information, or the environmental category of the part.

Multiple part markings will be inside parentheses. Only one part marking contained in parentheses and separated by a "-" will appear on a part. If a line is indented then it is a continuation of the previous line and the two combined represent the entire part marking for that device.

**Important Information and Disclaimer:**The information provided on this page represents TI's knowledge and belief as of the date that it is provided. TI bases its knowledge and belief on information provided by third parties, and makes no representation or warranty as to the accuracy of such information. Efforts are underway to better integrate information from third parties. TI has taken and continues to take reasonable steps to provide representative and accurate information but may not have conducted destructive testing or chemical analysis on incoming materials and chemicals. TI and TI suppliers consider certain information to be proprietary, and thus CAS numbers and other limited information may not be available for release.

In no event shall TI's liability arising out of such information exceed the total purchase price of the TI part(s) at issue in this document sold by TI to Customer on an annual basis.
