TLC59025 低消費電力の 16 チャネル、定電流 LED シンク・ドライバ

1 特長

- 16 チャネルの定電流出力
- 出力電流と外付け抵抗の比が業界標準に適合
- 負荷電圧が変化しても出力電流は一定
- 出力電流精度:
  - チャネル間:±5% 未満 (最大値)
  - IC 間:±6% 未満 (最大値)
- 定出力電流範囲:
  3mA～45mA
- 出力電流は外付け抵抗により調整
- 出力電流の高速応答、$\overline{OE}$ (最小値):100ns
- クロック周波数:30MHz
- シュミット・トリガ入力
- 電源電圧:3.0V～5.5V
- 過熱保護のためのサーマル・シャットダウン
- ESD 性能:1kV HBM

2 アプリケーション

- ゲーム機 / エンターテインメント
- 汎用 LED アプリケーション
- LED ディスプレイ・システム
- 標識の LED ライティング
- 白物家電

3 概要

TLC59025 デバイスは、LED ディスプレイおよび LED ライティング・アプリケーション用に設計されています。TLC59025 には 16 ビットのシフト・レジスタとデータ・ラッチが搭載されており、シリアル入力データをパラレル出力形式に変換します。TLC59025 の出力段では、16 のレギュレーション電流ポートにより、幅広い VF 変動の範囲内で LED を駆動するための一定の電流を供給します。LED ディスプレイ・アプリケーション (LED パネルなど) のシステム設計に使用される TLC59025 は、優れた柔軟性とデバイス性能を実現します。外付け抵抗 (R_{EXT}) を使用して出力電流を 3mA～45mA の範囲で調整できるため、LED の光強度を柔軟に制御できます。TLC59025 は、出力ポートから最大 17V を供給するように設計されています。高いクロック周波数 (30MHz) により、大量データ送信のシステム要件も満たします。

シリアル・データは、SDI 経由で TLC59025 に転送され、シフト・レジスタにシフト・インされて、SDO 経由で TLC59025 から転送されます。LE は、シフト・レジスタ内のシリアル・データを出力ラッチにラッチできます。$\overline{OE}$ は、出力ドライバが電流をシンクできるようにします。

6 Specifications

6.1 Absolute Maximum Ratings

over operating free-air temperature range (unless otherwise noted) (1)

		MIN	MAX	UNIT
V_{DD}	Supply voltage	0	7	V
V_I	Input voltage	–0.4	V_{DD} + 0.4	V
V_O	Output voltage	–0.5	20	V
I_{OUT}	Output current		45	mA
I_{GND}	GND terminal current		750	mA
T_J	Operating virtual-junction temperature	–40	150	°C
T_{stg}	Storage temperature	–55	150	°C

(1) Stresses beyond those listed under *Absolute Maximum Ratings* may cause permanent damage to the device. These are stress ratings only, which do not imply functional operation of the device at these or any other conditions beyond those indicated under *Recommended Operating Conditions*. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.

6.2 ESD Ratings

			VALUE	UNIT
$V_{(ESD)}$	Electrostatic discharge	Human body model (HBM), per ANSI/ESDA/JEDEC JS-001 (1)	±1000	V
		Charged-device model (CDM), per JEDEC specification JESD22-C101 (2)	±500	

(1) JEDEC document JEP155 states that 500-V HBM allows safe manufacturing with a standard ESD control process. Pins listed as ±1000 V may actually have higher performance.
(2) JEDEC document JEP157 states that 250-V CDM allows safe manufacturing with a standard ESD control process. Pins listed as ±500 V may actually have higher performance.

6.3 Recommended Operating Conditions

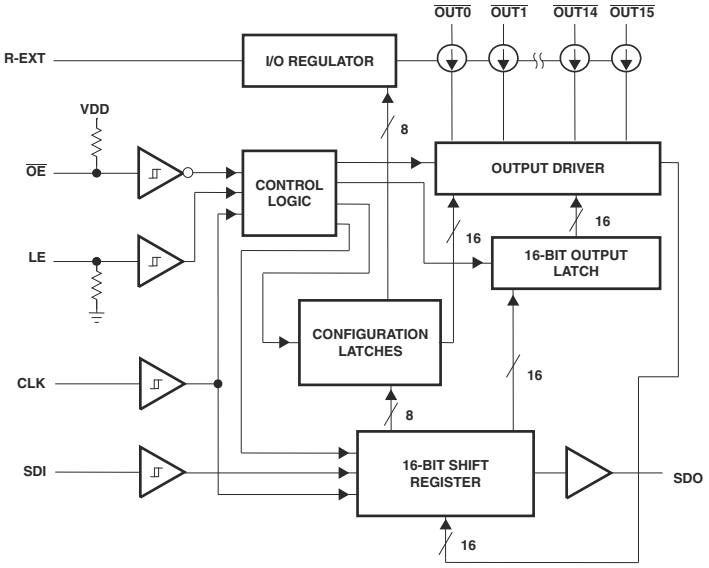
8 Detailed Description

8.1 Overview

The TLC59025 is a 16-channel LED driver designed for LED displays and LED lighting applications. The TLC59025 contains a 16-bit shift register and data latches, which convert serial input data into parallel output format. At the TLC59025 output stage, 16 regulated-current ports provide uniform and constant current for driving LEDs within a wide range of VF variations. Used in system design for LED display applications (for example, LED panels), the TLC59025 provides great flexibility and device performance. Users can adjust the output current from 3 mA to 45 mA through an external resistor, R_{EXT}, which gives flexibility in controlling the light intensity of LEDs. TLC59025 is designed for up to 17 V at the output port. The high clock frequency, 30 MHz, also satisfies the system requirements of high-volume data transmission.

8.2 Functional Block Diagram



8.3 Feature Description

8.3.1 Constant Current

In LED display applications, TLC59025 provides nearly no current variations from channel to channel and from IC to IC. While I_{OUT} ≤ 45 mA, the maximum current skew between channels is less than ±5% and between ICs is less than ±6%.

注

When the TLC59025 is used in very low current applications, reduced current accuracy can be expected. For example, current accuracy is estimated to degrade to as much as ±10% when Iout = 1.7 mA.

8.4 Device Functional Modes

表 8-1 lists the functional modes for the TLC59025.

9 Application and Implementation

注

以下のアプリケーション情報は、TI の製品仕様に含まれるものではなく、TI ではその正確性または完全性を保証いたしません。個々の目的に対する製品の適合性については、お客様の責任で判断していただくことになります。また、お客様は自身の設計実装を検証しテストすることで、システムの機能を確認する必要があります。

9.1 Application Information

9.1.1 Turning on the LEDs

To turn on an LED connected to one of the outputs of the device, the output must be pulled low. To do this, the SDI signal must let the device know which outputs should be activated. Using the rising edge of CLK, the logic level of the SDI signal latches the desired state of each output into the shift register. Once this is complete, the LE signal must be toggled from low to high then back to low. Once /OE is pulled down, the corresponding outputs will be pulled low and the LEDs will be turned on. The below diagram shows outputs 0, 3, 4, 5, 10, 13, and 15 being activated.

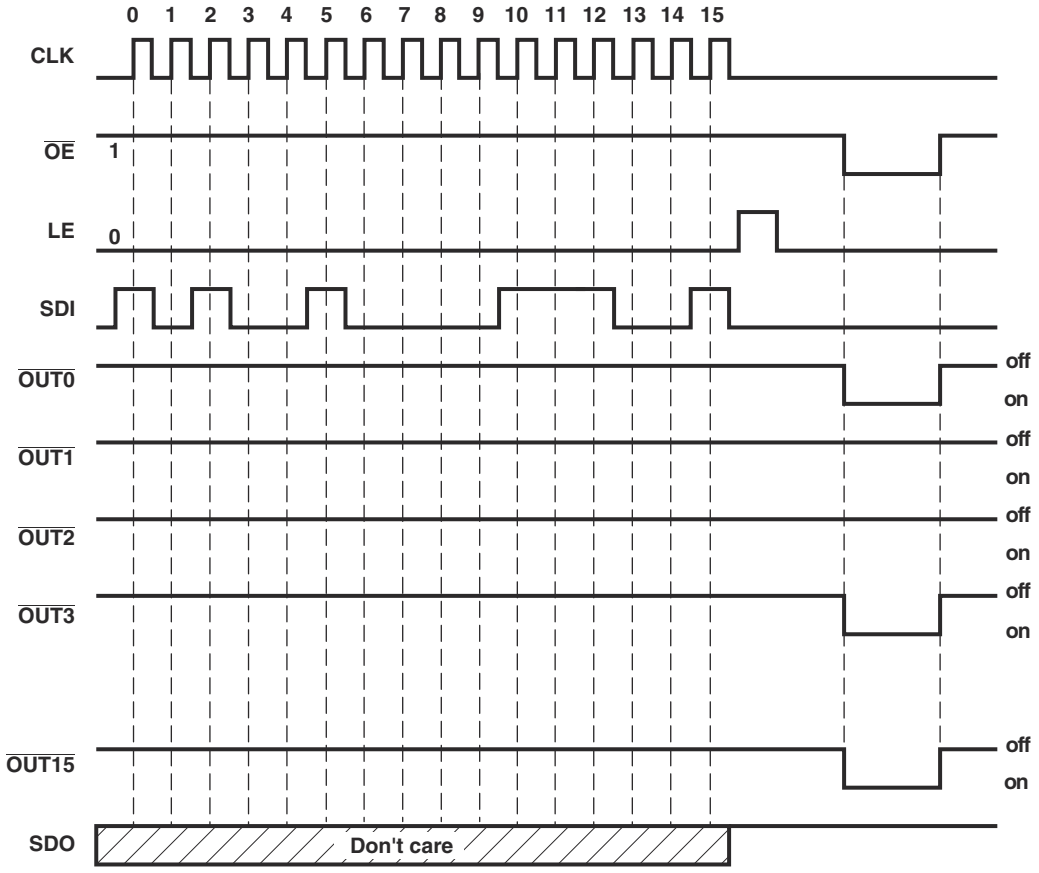

図 9-1. Timing Diagram

9.2 Typical Application

This application shows how to calculate the output current for $\overline{OUT0}$ through $\overline{OUT15}$.

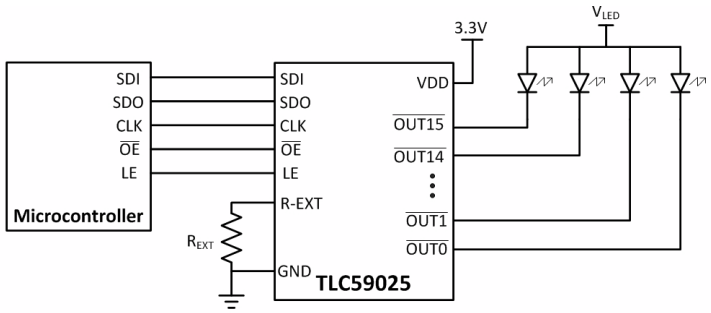

図 9-2. Typical Application Diagram

9.2.1 Design Requirements

For the following design procedure, the input voltage (V_{DD}) is between 3 V and 5.5 V.

9.2.2 Detailed Design Procedure

9.2.2.1 Adjusting Output Current

TLC59025 sets I_{OUT} based on the external resistor R_{EXT}. Users can follow the below formula to calculate the target output current $I_{OUT,target}$ in the saturation region:

$I_{OUT,target} = (1.21\ V / R_{EXT}) \times 15.5$

Where R_{EXT} is the external resistance connected between R-EXT and GND. Using this equation, the output current is calculated to be approximately 26 mA at 720 Ω and 13 mA at 1440 Ω.

9.2.3 Application Curve

The default relationship after power on between $I_{OUT,target}$ and R_{EXT} is shown in 図 9-3.

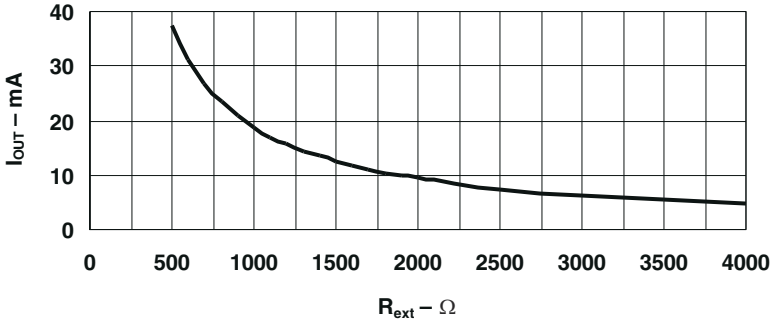

図 9-3. Default Relationship Curve Between $I_{OUT,target}$ and R_{ext} After Power Up

10 Power Supply Recommendations

The TLC59025 is designed to operate with a VDD range between 3 V and 5.5 V.

11 Layout

11.1 Layout Guidelines

The SDI, CLK, SDO, LE, and $\overline{OE}$ signals should all be kept from potential noise sources.

All traces carrying power through the LEDs should be wide enough to handle necessary currents.

All LED current passes through the device and into the ground node. There must be a strong connection between the device ground and the circuit board ground.

(1) **Status:** For more details on status, see our product life cycle.

(2) **Material type:** When designated, preproduction parts are prototypes/experimental devices, and are not yet approved or released for full production. Testing and final process, including without limitation quality assurance, reliability performance testing, and/or process qualification, may not yet be complete, and this item is subject to further changes or possible discontinuation. If available for ordering, purchases will be subject to an additional waiver at checkout, and are intended for early internal evaluation purposes only. These items are sold without warranties of any kind.

(3) **RoHS values:** Yes, No, RoHS Exempt. See the TI RoHS Statement for additional information and value definition.

(4) **Lead finish/Ball material:** Parts may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead finish/Ball material values may wrap to two lines if the finish value exceeds the maximum column width.

(5) **MSL rating/Peak reflow:** The moisture sensitivity level ratings and peak solder (reflow) temperatures. In the event that a part has multiple moisture sensitivity ratings, only the lowest level per JEDEC standards is shown. Refer to the shipping label for the actual reflow temperature that will be used to mount the part to the printed circuit board.

(6) **Part marking:** There may be an additional marking, which relates to the logo, the lot trace code information, or the environmental category of the part.

Multiple part markings will be inside parentheses. Only one part marking contained in parentheses and separated by a "~" will appear on a part. If a line is indented then it is a continuation of the previous line and the two combined represent the entire part marking for that device.
