

TLC6C5724-Q1 車載用24チャンネル、完全な診断機能付きの定電流RGB LEDドライバ

1 特長

- 車載用にAEC-Q100認定済み
 - デバイス温度グレード1: $-40^{\circ}\text{C} \sim 125^{\circ}\text{C}$ 、 T_A
- 24の定電流シンク出力チャンネル
 - 最大出力電流: 50mA
 - 最大出力電圧: 8V
 - 3つの出力グループ: OUTRn, OUTGn, OUTBn
- 出力電流の調整
 - チャンネルごとに7ビットのドット訂正
 - グループごとに8ビットの輝度制御
- PWMグレースケール・ジェネレータを内蔵
 - チャンネルごとに独立したPWM調光
 - グローバルに調整可能なグレースケール・モード: 12ビット、10ビット、8ビット
- 保護および診断機能
 - LED開放検出、LED短絡検出、出力からGNDへの短絡検出
 - 隣接ピン短絡検出
 - 事前サーマル警告、サーマル・シャットダウン
 - IREF抵抗開放および短絡検出と保護
 - GCLKエラー検出とLOD_LSTレジスタ・エラー・チェックの反転ビット・トグル
 - LOD_LSD回路の自己テスト
- 出力スルー・レートをプログラム可能
- 出力チャンネル・グループ遅延
- シリアル・データ・インターフェイス

2 アプリケーション

- 車載用クラスタ
- 車載用ローカル調光ディスプレイ
- 車載用フェイスプレート
- 車載用HVAC制御パネル
- 車載用センター・スタック・ディスプレイ
- 車載用車内およびRGB環境照明
- 車載用Shift-by-Wireおよび変速装置

3 概要

インジケータやLCDローカル調光バックライトといった車載用途では、マルチチャンネルで定電流のLEDドライバに対する需要が高まっています。求められているのは、LEDの輝度および色温度を均一にすることです。システムレベルの安全性を確保するため、LEDドライバはフォルト検出機能を備えている必要があります。

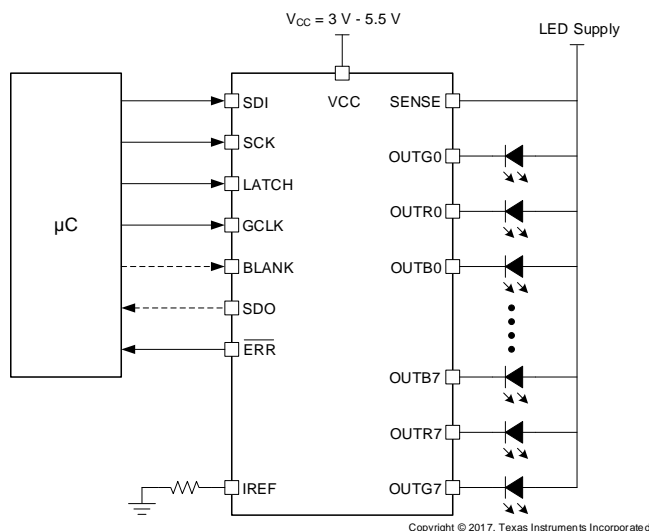

TLC6C5724-Q1は、車載用24チャンネルの定電流RGB LEDドライバであり、LED診断機能を備えています。外付け抵抗による設定で最大50mAの出力電流を供給できます。電流は7ビットのドット訂正により調整可能で、各出力に2つの範囲があり、各色グループの出力に対して8ビットの輝度制御が可能です。出力の輝度は12、10、8ビットのグレースケール制御により個別に変更可能です。フォルト検出回路を備えており、LEDフォルト、隣接ピン短絡フォルト、基準抵抗フォルトなどを検出できます。スルーレート制御は2通りに変更可能で、これによりシステム・ノイズを最大限に低減できます。LEDグループ間での出力レベルの変更には間隔を置くため、起動電流の低減につながります。またSDIおよびSDOピンにより、複数のデバイスを直列に接続して1つのシリアル・インターフェイスで制御できます。

製品情報⁽¹⁾

型番	パッケージ	本体サイズ(公称)
TLC6C5724-Q1	HTSSOP (38)	6.20mm×12.50mm

4 改訂履歴

	Page
2017年12月発行のものから更新	
• データシートのタイトルを変更	1
• 「特長」リストの項目を変更	1
• セクションを変更	1
• 「概要」セクションのテキストを変更	1
• Changed the descriptions for the GCLK, OUTBx, OUTGx, OUTRx, SENSE, and Thermal pad rows of the <i>Pin Functions</i> table	4
• Deleted a sentence and added a paragraph at the end of the <i>Grayscale Configuration</i> section	24
• Changed the section title from <i>Display Timing Reset</i> to <i>PWM Auto Repeat</i> and changed the text	25
• Changed the section title from <i>Auto Display Repeat</i> to <i>PWM Timing Reset</i> and changed the text	26
• Deleted "and PWM" from section title "LED and PWM Diagnostics"	26
• Changed 表 1	26
• Changed the text following 表 1	26
• Changed the 表 2 column headers	26
• Changed the 表 3 table headers and the text following the table	26
• Changed "two kinds" to "two sets" in the sentence immediately following 表 3	26
• Changed the text preceding 表 6	27
• Added a table note to 表 6	28
• Deleted the first sentence following 表 6	28
• Changed the text and deleted two tables in the <i>Adjacent-Pin-Short Check</i> section	28
• Added text and two tables following 表 8	29
• Changed the text of the <i>IREF Short and IREF Open Detection</i> section	29
• Changed the contents of the OUTUT column in 表 11	29
• Changed the text in the <i>Pre-Thermal Warning Flag</i> section	29
• Changed the text in the <i>Thermal Error Flag</i> section	30
• Changed the text and deleted a diagram in the <i>Negate Bit Toggle</i> section	30
• Changed the text and deleted a diagram in the <i>LOD_LSD Self-Test</i> section	30

改訂履歷 (continued)

• Changed the text in the <i>ERROR Clear</i> section	31
• Changed the text in the <i>Global Reset</i> section	31
• Changed the LED supply voltage from 7 V to 8 V in the <i>Power Up</i> section	32
• Added the TEF register, where the overtemperature fault is latched	32
• Added a sentence to paragraph 2 of the <i>Register Write and Read</i> section, changed "data" to "288-bit data", and changed "last SCK rising edge" to "288th SCK rising edge"	32
• Changed "data" to "288-bit data" in the <i>FC-BC-DC Write</i> section	33
• Changed "sink current" to "APS current" and added "APS detection time" to the definition for bits 200 and 199, respectively	33
• Deleted two equations preceding 表 16	35
• Changed the titles of 表 16, 表 17, and 表 18	35
• Added 式 5 to calculate duty cycle	36
• Changed "OUTB0" to "OUTG0" for bits 167–156 in 表 19	36
• Changed the last sentence of the <i>Special Command Function</i> section	37
• Changed the wording and deleted three figures in the <i>Register Maps</i> section	39
• Changed bit numbers 287 and 286 to 277 and 276 in Figure 28	39
• Changed "Output slew rate" to "Output slew-rate time" for bit 203	43
• Changed the text in the <i>Typical Application</i> section	49
• Added a sentence and a figure to the <i>Detailed Design Procedure</i> section	50
• Added the <i>Application Curves</i> section to the data sheet	50
• Changed the LED supply voltage from 7 V to 8 V and added a sentence to the <i>Power Supply Recommendations</i> section	51
• Added positioning information for the IREF resistor to the <i>Layout Guidelines</i> section	51

5 Pin Configuration and Functions

DAP PowerPAD™ Package
38-Pin HTSSOP With Exposed Thermal Pad
Top View

Pin Functions

PIN		I/O	DESCRIPTION
NAME	NO.		
BLANK	36	I	Blank all outputs. BLANK low forces all channels off. Grayscale counter resets, grayscale PWM timing controller is initialized. BLANK high starts grayscale PWM timing controller, channels are controlled by PWM timing controller.
$\overline{\text{ERR}}$	20	O	Open-drain error feedback
GCLK	4, 5, 6	I	Clock input for grayscale PWM counter. The three pins are internally connected together.
GND	33	—	Power ground
IREF	34	I	Reference-current pin for setting the full-scale output current
LATCH	3	I	Latch-enable input pin
NC	37	—	No internal connection
OUTB0–OUTB7	9, 12, 15, 18, 21, 24, 27, 30	O	Constant-current outputs for color group B
OUTG0–OUTG7	7, 10, 13, 16, 23, 26, 29, 32	O	Constant-current outputs for color group G

Pin Functions (continued)

PIN		I/O	DESCRIPTION
NAME	NO.		
OUTR0–OUTR7	8, 11, 14,17, 22, 25, 28, 31	O	Constant-current outputs for color group R
SCK	2	I	Data-shift clock-input pin
SDI	1	I	Serial data-in pin
SDO	19	O	Serial data-out pin
SENSE	38	I	Connect to LED supply for LED diagnostics
V _{CC}	35	I	Power supply pin
Thermal pad	—	—	Connect to ground to improve thermal performance

6 Specifications

6.1 Absolute Maximum Ratings

over operating junction temperature range (unless otherwise noted)⁽¹⁾

		MIN	MAX	UNIT
Input voltage	V _{CC}	-0.3	6	V
	SENSE	-0.3	8	
	BLANK, GCLK, LATCH, SCK, SDI	-0.3	V _{CC} + 0.3	
Output voltage	ERR, IREF, SDO	-0.3	V _{CC} + 0.3	V
	OUTR0–OUTR7, OUTG0–OUTG7, OUTB0–OUTB7	-0.3	8	
Output current	OUTR0–OUTR7, OUTG0–OUTG7, OUTB0–OUTB7	0	50	mA
Operating junction temperature, T _J		-40	150	°C
Storage temperature, T _{stg}		-55	150	°C

- (1) Stresses beyond those listed under *Absolute Maximum Ratings* may cause permanent damage to the device. These are stress ratings only, which do not imply functional operation of the device at these or any other conditions beyond those indicated under *Recommended Operating Conditions*. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.

6.2 ESD Ratings

			VALUE	UNIT	
V _(ESD)	Electrostatic discharge	Human-body model (HBM), per AEC Q100-002 ⁽¹⁾	±2000	V	
		Charged-device model (CDM), per AEC Q100-011	All pins		±500
			Corner pins (1, 19, 20, and 38)		±750

- (1) AEC Q100-002 indicates that HBM stressing shall be in accordance with the ANSI/ESDA/JEDEC JS-001 specification.

6.3 Recommended Operating Conditions

over operating junction temperature range (unless otherwise noted)

		MIN	NOM	MAX	UNIT
V _{CC}	Device supply voltage	3		5.5	V
V _{SENSE}	LED supply voltage			8	V
V _O	Output voltage			8	V
V _{IL}	Input logic-low voltage	BLANK, GCLK, LATCH, SCK, SDI	0	0.3 V _{CC}	V
V _{IH}	Input logic-high voltage	BLANK, GCLK, LATCH, SCK, SDI	0.7 V _{CC}	V _{CC}	V
I _{OH}	High-level output source current	SDO		1	mA
I _{OL}	Low-level input sink current	SDO		1	mA
		ERR		5	
I _O	Constant output sink current	OUTR0–OUTR7, OUTG0–OUTG7, OUTB0–OUTB7	2	50	mA
T _A	Operating ambient temperature		-40	125	°C
T _J	Operating junction temperature		-40	150	°C

6.4 Thermal Information

THERMAL METRIC ⁽¹⁾		TLC6C5724-Q1	UNIT
		DAP (HTSSOP)	
		38 PINS	
R _{θJA}	Junction-to-ambient thermal resistance	39.6	°C/W
R _{θJC(top)}	Junction-to-case (top) thermal resistance	31.2	°C/W
R _{θJB}	Junction-to-board thermal resistance	18	°C/W

- (1) For more information about traditional and new thermal metrics, see [Semiconductor and IC Package Thermal Metrics](#).

Thermal Information (continued)

THERMAL METRIC ⁽¹⁾		TLC6C5724-Q1	UNIT
		DAP (HTSSOP)	
		38 PINS	
ψ_{JT}	Junction-to-top characterization parameter	0.8	°C/W
ψ_{JB}	Junction-to-board characterization parameter	18.1	°C/W
$R_{\theta JC(bot)}$	Junction-to-case (bottom) thermal resistance	2	°C/W

6.5 Electrical Characteristics

$V_{CC} = 3\text{ V to }5.5\text{ V}$, $T_J = -40^\circ\text{C to }150^\circ\text{C}$, $V_{SENSE} = 5\text{ V}$, $GS = \text{FFFh}$, $BC = \text{FFh}$, $DC = 7\text{Fh}$ with upperDCrange (unless otherwise noted)

PARAMETER	TEST CONDITIONS	MIN	TYP	MAX	UNIT
POWER SUPPLIES					
I_{CC}	Supply current	SDI, SCK, LATCH = L, BLANK = L, GCLK = L, $V_{OUT} = 1\text{ V}$, $I_{OUT} = 2\text{ mA}$	4.2	5.5	mA
		SDI, SCK, LATCH = L, BLANK = L, GCLK = L, $V_{OUT} = 1\text{ V}$, $I_{OUT} = 20\text{ mA}$	7.7	9	
		SDI, SCK, LATCH = L, BLANK = H, GCLK = 8 MHz, $V_{OUT} = 1\text{ V}$, $I_{OUT} = 20\text{ mA}$, auto-repeat on	8.3	10	
		SDI, SCK, LATCH = L, BLANK = H, GCLK = 8 MHz, $V_{OUT} = 1\text{ V}$, $I_{OUT} = 50\text{ mA}$, auto-repeat on	13.5	16	
LOGIC INPUTS (SDI, SCK, LATCH, GCLK, BLANK)					
I_{lkg}	Input leakage current	At SDI, SCK, LATCH, with $V_I = V_{CC}$; or at SDI, SCK, LATCH, BLANK, GCLK, with $V_I = \text{GND}$		-1	1 μA
R_{pd}	Pull down resistance at BLANK, GCLK	250	500	750	k Ω
CONTROL OUTPUTS (IREF, $\overline{\text{ERR}}$, SDO)					
V_{IREF}	IREF voltage	$R_{IREF} = 0.96\text{ k}\Omega$	1.17	1.2	1.23 V
V_{OH}	High-level output voltage	At SDO, $I_{OH} = -1\text{ mA}$	$V_{CC} - 0.4$		V_{CC} V
V_{OL}	Low-level output voltage	At SDO, $I_{OL} = 1\text{ mA}$			0.4 V
V_{ERR}	$\overline{\text{ERR}}$ pin open-drain voltage drop	$I_{ERR} = 4\text{ mA}$			0.1 V_{CC} V
I_{LKG_ERR}	$\overline{\text{ERR}}$ pin leakage current	$V_{ERR} = 5\text{ V}$			1 μA
OUTPUT STAGE					
$V_{(OUT,min)}$	Minimum output voltage	$V_{CC} = 3.6\text{ V}$, $I_{OUT} = 50\text{ mA}$			0.67
		$V_{CC} = 3\text{ V}$, $I_{OUT} = 50\text{ mA}$			0.7
$K_{(OUT)}$	Ratio of output current to IREF current, $K = I_{(OUTX)} / I_{(IREF)}$			40	mA/mA
$I_{lkg(OUT)}$	Output leakage current	BLANK = L, $V_{OUT} = 7\text{ V}$, $V_{SENSE} = 7\text{ V}$		0.1	μA
CHANNEL ACCURACY					
$I_{(OUT)}$	Constant output current	$V_{OUT} = 1\text{ V}$, $R_{IREF} = 24\text{ k}\Omega$	1.86	2	2.14
		$V_{OUT} = 1\text{ V}$, $R_{IREF} = 0.96\text{ k}\Omega$	46.5	50	53.5
		$V_{OUT} = 1\text{ V}$, R_{IREF} open or short	7	10	13

Electrical Characteristics (continued)

$V_{CC} = 3\text{ V to }5.5\text{ V}$, $T_J = -40^\circ\text{C to }150^\circ\text{C}$, $V_{SENSE} = 5\text{ V}$, $GS = \text{FFFh}$, $BC = \text{FFh}$, $DC = 7\text{Fh}$ with upperDCrange (unless otherwise noted)

PARAMETER	TEST CONDITIONS	MIN	TYP	MAX	UNIT	
$\Delta I_{(\text{Ch-Ch})}$ (1)	Current accuracy (channel-to-channel in same color group)	$V_{OUT} = 1\text{ V}$, $I_{OUT} = 50\text{ mA}$	-4%	4%		
		$V_{OUT} = 1\text{ V}$, $I_{OUT} = 2\text{ mA}$	-4%	4%		
$\Delta I_{(\text{Dev-Dev})}$ (2)	Current accuracy (device-to-device)	$V_{OUT} = 1\text{ V}$, $I_{OUT} = 50\text{ mA}$	-4%	4%		
		$V_{OUT} = 1\text{ V}$, $I_{OUT} = 2\text{ mA}$	-4%	4%		
$\Delta I_{(\text{Ch-Ideal})}$ (3)	Current accuracy (channel-to-ideal output)	$V_{OUT} = 1\text{ V}$, $I_{OUT} = 50\text{ mA}$	-7%	7%		
		$V_{OUT} = 1\text{ V}$, $I_{OUT} = 2\text{ mA}$	-7%	7%		
$\Delta I_{(\text{OUT-VCC})}$ (4)	Line regulation	$V_{OUT} = 1\text{ V}$, $V_{CC} = 3\text{ V to }5.5\text{ V}$, $I_{OUT} = 50\text{ mA}$	-0.7	0.7	%V	
		$V_{OUT} = 1\text{ V}$, $V_{CC} = 3\text{ V to }5.5\text{ V}$, $I_{OUT} = 2\text{ mA}$	-0.7	0.7		
$\Delta I_{(\text{OUT-VOUT})}$ (5)	Load regulation	$V_{OUT} = 1\text{ V to }3\text{ V}$, $I_{OUT} = 50\text{ mA}$	-0.7	0.7	%V	
		$V_{OUT} = 1\text{ V to }3\text{ V}$, $I_{OUT} = 2\text{ mA}$	-0.7	0.7		
PROTECTION CIRCUITS						
V_{LOD1}	LED open-circuit detection low threshold	$LOD_VOLTAGE = 0b$	0.275	0.3	0.32	V
V_{LOD2}	LED open-circuit detection high threshold	$LOD_VOLTAGE = 1b$	0.48	0.5	0.52	V
V_{LSD1}	LED short-circuit detection high threshold	$LSD_VOLTAGE = 0b$	$V_{SENSE} - 0.4$	$V_{SENSE} - 0.3$	$V_{SENSE} - 0.2$	V
V_{LSD2}	LED short-circuit detection low threshold	$LSD_VOLTAGE = 1b$	$V_{SENSE} - 0.8$	$V_{SENSE} - 0.7$	$V_{SENSE} - 0.6$	V
I_{IREF_OC}	IREF resistor open-circuit detection threshold	$V_{CC} = 5\text{ V}$	8	10	12	μA
I_{IREF_OCHYS}	IREF resistor open-circuit detection threshold hysteresis	$V_{CC} = 5\text{ V}$		5		μA

(1) Channel to channel accuracy in the same color group is calculated by the formula below. (X = color group; i, j = 0 to 7)

$$\Delta I_{(\text{Ch-Ch})} = \left(\frac{8 \times I_{OUTXi} - 1}{\sum_{j=0}^7 I_{OUTXj}} \right) \times 100\%$$

(2) Device to device accuracy is calculated by the formula below.

$$\Delta I_{(\text{Dev-Dev})} = \left(\frac{\sum_{i=0}^7 (I_{OUTRi} + I_{OUTGi} + I_{OUTBi}) - I_{OUT,ideal}}{I_{OUT,ideal}} \right) \times 100\%$$

$$I_{OUT,ideal} = \frac{V_{IREF}}{R_{IREF}} \times K_{(OUT)}$$

(3) Channel to ideal accuracy is calculated by the formula below.

$$\Delta I_{(\text{Ch-Ideal})} = \left(\frac{I_{OUTXi} - 1}{I_{OUT,ideal}} \right) \times 100\%$$

(4) Line regulation accuracy is calculated by the formula below.

$$\Delta I_{(\text{OUT-VCC})} = \left(\frac{I_{(\text{OUTXi}, VCC=5.5V)} - I_{(\text{OUTXi}, VCC=3V)}}{I_{(\text{OUTXi}, VCC=3V)}} \right) \times \frac{100}{5.5 - 3} \% / V$$

(5) Load regulation accuracy is calculated by the formula below.

$$\Delta I_{(\text{OUT-VOUT})} = \left(\frac{I_{(\text{OUTXi}, VOUT=3V)} - I_{(\text{OUTXi}, VOUT=1V)}}{I_{(\text{OUTXi}, VOUT=1V)}} \right) \times \frac{100}{3 - 1} \% / V$$

Electrical Characteristics (continued)

$V_{CC} = 3\text{ V to }5.5\text{ V}$, $T_J = -40^\circ\text{C to }150^\circ\text{C}$, $V_{SENSE} = 5\text{ V}$, $GS = \text{FFFh}$, $BC = \text{FFh}$, $DC = \text{7Fh}$ with upperDCrange (unless otherwise noted)

PARAMETER	TEST CONDITIONS	MIN	TYP	MAX	UNIT	
I_{REF_SC}	IREF resistor short-circuit-detection threshold	$V_{CC} = 5\text{ V}$	2	2.7	3.2	mA
$I_{REF_SCHY_S}$	IREF resistor short-circuit-detection threshold hysteresis	$V_{CC} = 5\text{ V}$	0.3			mA
T_{PTW}	Pre-thermal warning flag threshold	Junction temperature	125	135	145	$^\circ\text{C}$
T_{HYS_PTW}	Pre-thermal warning flag hysteresis	Junction temperature		10		$^\circ\text{C}$
T_{SD}	Thermal error flag threshold	Junction temperature	150	160	170	$^\circ\text{C}$
T_{HYS_TEF}	Thermal error flag hysteresis	Junction temperature		10		$^\circ\text{C}$

6.6 Timing Requirements

$V_{CC} = 3\text{ V to }5.5\text{ V}$, $T_J = -40^\circ\text{C to }150^\circ\text{C}$.

PARAMETER	TEST CONDITIONS	MIN	NOM	MAX	UNIT

6.8 Typical Characteristics

7 Detailed Description

7.1 Overview

In automotive indicator and local dimming backlighting applications, the demand for multi-channel constant-current LED drivers is increasing to achieve uniformity of LED brightness and color temperature. System-level safety considerations require fault-detection capability and device self-check features.

The TLC6C5724-Q1 device is an automotive 24-channel constant-current RGB LED driver with LED diagnostics. The TLC6C5724-Q1 device provides up to 50-mA output current set by an external resistor. The current can be adjusted by 7-bit dot correction with two subranges for individual output and an 8-bit brightness control for the outputs of each color group. The brightness can be adjusted individually for each channel through a 12-, 10-, or 8-bit grayscale control. Fault-detection circuits are available to detect system faults including LED faults, adjacent-pin short faults, reference-resistor faults, and more. Negate bit toggle and LOD-LSD self-test provide a device self-check function to improve system reliability. Configurable slew-rate control optimizes the noise generation of the system and improves the system EMC performance. Output -channel group delay helps to reduce inrush current to optimize the system design. The SDI and SDO pins allow more than one device to be connected in a daisy chain for control through one serial interface.

7.2 Functional Block Diagram

7.3 Feature Description

7.3.1 Maximum Constant-Sink-Current Setting

LED full-scale current can be programmed using an external resistor connected between the IREF pin and GND. The R_{IREF} resistor value is calculated with the following formula.

$$R_{IREF} = K \times \frac{V_{IREF}}{I_{(OUT)max}}$$

where

- V_{IREF} is the reference voltage
 - K is the IREF-current to output-current ratio
 - $I_{(OUT)max}$ is full-scale current for each output
- (1)

Figure 15 shows the reference resistor calculation curve.

7.3.2 Brightness Control and Dot Correction

The TLC6C5724-Q1 device implements an 8-bit group brightness control (BC) and 7-bit individual dot correction (DC) to calibrate the output current. The 24 output channels are divided into three groups: OUTRn, OUTGn, and OUTBn. Each group contains 8 output channels. There are two configurable ranges for the DC value of each group. One is the low DC range with output current from 0 to 66.7% $I_{(OUT)max}$. The other is the high DC range with output current from 33.3% $I_{(OUT)max}$ to 100% $I_{(OUT)max}$. The IREF resistor, BC, DC, and DC range together determine the channel output current, as shown in Figure 21. Equation 2 and Equation 3 are the detailed output current calculation formulas.

Equation 2 determines the output sink current for each color group when DC is in the high adjustment range.

$$I_{OUT} = \left(\frac{1}{3} \times I_{(OUT)max} + \frac{2}{3} \times I_{(OUT)max} \times \frac{DC}{127} \right) \times \frac{BC}{255}$$
(2)

Equation 3 determines the output sink current for each color group when DC is in the low adjustment range.

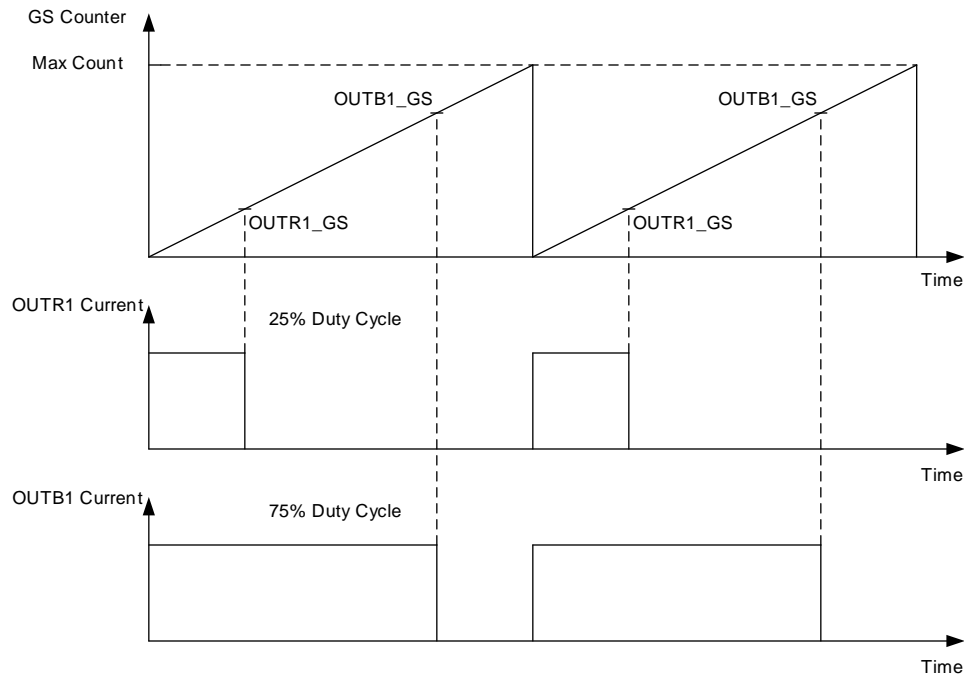

$$I_{OUT} = \frac{2}{3} \times I_{(OUT)max} \times \frac{DC}{127} \times \frac{BC}{255}$$
(3)

Feature Description (continued)

图 21. Brightness Control and Dot Correction Block Diagram
7.3.3 Grayscale Configuration

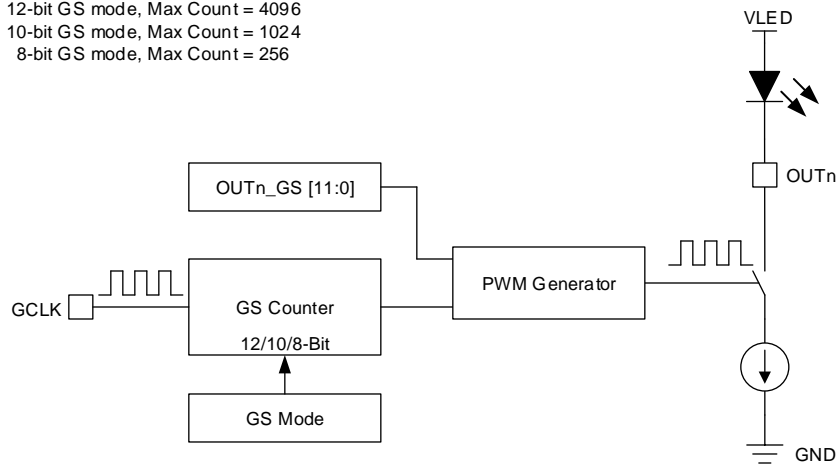

The TLC6C5724-Q1 device implements a grayscale configuration function to realize the individual PWM dimming function for the output channels. The grayscale has three global configuration modes, 12-bit, 10-bit and 8-bit. The GCLK input provides the clock source for the internal PWM generator. The GS counter counts the GCLK number and compares the number with the channel grayscale register value. The output channel turns off when the GS counter value reaches the grayscale register value. 图 22 shows the detailed block diagram of the PWM generator.

To restart a new PWM cycle, users can use two methods. One is to toggle the BLANK pin after the GS counter reaches the maximum count value, because BLANK low resets the GS counter and BLANK high restarts the GS counter. Another is to pull BLANK high and set the AUTO_REPEAT&TIMING_RESET register bit to 1. The PWM starts a new cycle automatically after the GS counter reaches the maximum count value.

Feature Description (continued)

12-bit GS mode, Max Count = 4096
 10-bit GS mode, Max Count = 1024
 8-bit GS mode, Max Count = 256

22. PWM Generator

7.3.3.1 PWM Auto Repeat

The PWM auto repeat function is configured by the AUTO_REPEAT bit. The AUTO_REPEAT bit is 0 by default, and the PWM auto repeat function is disabled under this condition. The PWM cycle only executes once, so users must toggle BLANK to restart a new PWM cycle. 11 and 12 show the PWM operation in this mode. When the AUTO_REPEAT bit is 1, the PWM auto repeat function is enabled. The PWM cycle automatically repeats as long as BLANK is high and GCLK is present, as shown in 13.

Feature Description (continued)

7.3.3.2 PWM Timing Reset

PWM timing reset function is configured by the TIMING_RESET bit. The PWM timing reset function can restart a PWM cycle with newly configured duty-cycle after a GS data write. The TIMING_RESET bit is 0 by default, The PWM timing reset function is disabled in this condition. The PWM duty cycle is not influenced by a GS data write. The newly configured PWM duty-cycle only is valid after the current PWM cycle finishes. When the TIMING_RESET bit is 1, the PWM timing reset function is enabled, and the PWM cycle restarts with the new PWM duty-cycle immediately after the GS data write.

7.3.4 Diagnostics

The TLC6C5724-Q1 device integrates a full LED diagnostics functionality, such as LED open detection (LOD), LED short detection (LSD), and output short-to-GND detection (OSD), which improves the system safety.

7.3.4.1 LED Diagnostics

An LOD-LSD detection circuit compares the output voltage with the LOD threshold and LSD threshold, and the output results show in [表 1](#).

表 1. LOD-LSD Detection

OUTPUT VOLTAGE CONDITION	DETECTOR OUTPUT BIT VALUE	
	LOD	LSD
$V_{OUTn} < LOD_VOLTAGE$	1	0
$LOD_VOLTAGE < V_{OUTn} < LSD_VOLTAGE$	0	0
$V_{OUTn} > LSD_VOLTAGE$	0	1

The LOD threshold can be configured by the LOD_VOLTAGE bit. The threshold is 0.3 V when LOD_VOLTAGE = 0, and the threshold is 0.5 V when LOD_VOLTAGE = 1.

表 2. LOD Threshold

LOD_VOLTAGE BIT	LOD THRESHOLD
0 (Default)	0.3 V
1	0.5 V

LSD threshold is configured by the LSD_VOLTAGE bit. The threshold is $V_{VSENSE} - 0.3$ V when LSD_VOLTAGE = 0, and the threshold is $V_{SENSE} - 0.7$ V when LSD_VOLTAGE = 1.

表 3. LSD Threshold

LSD_VOLTAGE BIT	LSD THRESHOLD
0 (Default)	$V_{SENSE} - 0.3$ V
1	$V_{SENSE} - 0.7$ V

There are two sets of LOD-LSD registers in the device. One is the LOD1-LSD1 registers, another is the LOD2-LSD2 registers. Each group of registers consists of 24 bits of LOD data and 24 bits of LSD data, corresponding to 24 channel outputs. The device updates the LOD1-LSD1 registers at the 9th GCLK rising edge. The device updates the LOD2-LSD2 registers the Nth GCLK rising edge. N is the maximum GCLK number in a PWM period minus 1, see [表 4](#).

To detect all kinds of LED faults, the output channel should turn ON at the 9th GCLK rising edge, and turn OFF at the Nth GCLK rising edge.

The device integrates an internal pullup circuit for LED diagnostics, shown in [图 23](#). The circuit turns off during the channel on-state, but turns on to charge the output pin during the channel off-state. For an LED-short fault, both LSD1 and LSD2 are 1. For an LED-open fault, both LOD1 and LSD2 are 1. For an output short-to-GND fault, both LOD1 and LOD2 are 1. [表 5](#) shows the details.

图 23. Internal Pullup Circuit

表 4. LOD-LSD Register Latch Timing

GS COUNTER MODE	LOD1-LSD1	LOD2-LSD2
12-bit	9th GCLK rising edge	4095th GCLK rising edge
10-bit	9th GCLK rising edge	1023rd GCLK rising edge
8-bit	9th GCLK rising edge	255th GCLK rising edge

表 5. LED Status Lookup Table

LED STATUS	LOD-LSD RESULT			
	LOD1-LSD1 UPDATED AT 9 th GCLK		LOD2-LSD2 UPDATED AT N th GCLK ⁽¹⁾	
LED Ok	LOD1	0	LOD2	0
	LSD1	0	LSD2	1
LED open	LOD1	1	LOD2	0
	LSD1	0	LSD2	1
LED short	LOD1	0	LOD2	0
	LSD1	1	LSD2	1
Output short-to-GND	LOD1	1	LOD2	1
	LSD1	0	LSD2	0

(1) N = 4095 for 12-bit GS mode, 1023 for 10-bit GS mode, 255 for 8-bit GS mode

In some cases, users may need to turn off output channels before the 9th GCLK to disable output channels, or turn on output channels at Nth GCLK to get more brightness. LOD_LSD faults are reported as shown in 表 6. Users can ignore the fault according to the GS register setting value.

表 6. PWM Status Lookup Table

PWM STATUS	LOD-LSD RESULT			
	LOD1-LSD1 UPDATED AT 9 th GCLK		LOD2-LSD2 UPDATED AT N th GCLK ⁽¹⁾	
PWM OK	LOD1	0	LOD2	0
	LSD1	0	LSD2	1
Channel off before 9th GCLK	LOD1	0	LOD2	0
	LSD1	1	LSD2	1
Channel on at Nth GCLK	LOD1	0	LOD2	0
	LSD1	0	LSD2	0

(1) N = 4095 for the 12-bit GS mode, 1023 for the 10-bit GS mode, 255 for the 8-bit GS mode

The LOD_LSD status is updated every PWM cycle. [图 14](#) is an example of the LOD-LSD register update timing for the 12-bit GS mode.

7.3.4.2 Adjacent-Pin-Short Check

The device implements the APS check function to detect the adjacent-pin short failures during system initialization. TI recommends to do an APS check when channels are all off. The APS check can be executed by writing the APS check command.

If there is no adjacent-pin short failure, the device passes the APS check and 011b is latched into APS FLAG in the error status register. The 24-bit APS register is 0. If there are two adjacent pins shorted, 110b is latched into APS_FLAG in the error status register. The corresponding bit in the APS register is set to 1. Users can read out the 24-bit data from the APS register to check which channel has the APS failure. [表 7](#) shows the details of the APS_FLAG and APS register. [表 8](#) shows the bit arrangement of the APS register. To read this APS information, see [表 22](#).

表 7. APS Flag and APS Register

REGISTER	VALUE	DESCRIPTION
APS_FLAG	011b	Pass, no adjacent pins short
	110b	Fail, adjacent pins short
Bit in APS register (24-bit total)	0b	This OUTn pin is not shorted with other pins
	1b	This OUTn pin is shorted with other pins

表 8. Bit Arrangement of the APS Register

BIT OF APS REGISTERS	CORRESPONDING OUTPUTS
Bit 23	OUTB7
Bit 22	OUTB6
Bit 21	OUTB5
Bit 20	OUTB4
Bit 19	OUTB3
Bit 18	OUTB2
Bit 17	OUTB1
Bit 16	OUTB0
Bit 15	OUTG7
Bit 14	OUTG6
Bit 13	OUTG5
Bit 12	OUTG4
Bit 11	OUTG3
Bit 10	OUTG2
Bit 9	OUTG1
Bit 8	OUTG0
Bit 7	OUTR7

表 8. Bit Arrangement of the APS Register (continued)

BIT OF APS REGISTERS	CORRESPONDING OUTPUTS
Bit 6	OCTR6
Bit 5	OCTR5
Bit 4	OCTR4
Bit 3	OCTR3
Bit 2	OCTR2
Bit 1	OCTR1
Bit 0	OCTR0

APS_FLAG and the APS registers are all 0 by default. After an APS check command, APS_FLAG should be 011b or 110b. Otherwise there is a failure in the APS check circuit. If the APS check result fails, the ERR pin is pulled low, the APS_FLAG value is 110b, and the ERR pin status stays unchanged until the fault is removed and the user executes an ERROR clear command. 表 5 and 表 9 show more detail.

As different LEDs have different parasitic capacitance, to make sure the APS Check function is suitable for all kinds of LEDs, the device provides two configuration bits for APS current and APS time. The APS current is selected by APS_CURRENT as shown in 表 9. The APS time is selected by APS_TIME as shown in 表 10.

表 9. APS Current Selection

APS_CURRENT BIT	APS CURRENT
0b	20 μ A
1b	40 μ A

表 10. APS Time Selection

APS_TIME BIT	ADJACENT-PIN-SHORT DETECTION TIME
0b	10 μ s
1b	20 μ s

7.3.4.3 IREF Short and IREF Open Detection

To protect the device from a reference-resistor short or open fault, the device integrates IREF short and open protection. In an IREF short or open fault condition, the device reports the fault and sets the output current to a default value to help improve the system safety.

By default, the ISF and IOF flags are 0. When the IREF current exceeds the fault-detection threshold, the ERR pin is pulled down, the ISF or IOF flag is set to 1. The error flag and ERR pin status stay unchanged until the fault is removed and there is an ERROR clear command.

Once there is an ISF or IOF failure, the output current is set to a default value, $I_{(OUT)max}$, of 10 mA, see 表 11. Once the ISF or IOF failure is removed, the output current returns back to the IREF setting value immediately.

表 11. Criteria of ISF/IOF Judgement and Corresponding Actions

I_{REF}	ISF	IOF	OUTPUT
$I_{REF} \leq 10 \mu$ A	0	1	$I_{(OUT)max} = 10$ mA
10μ A < $I_{REF} \leq 3$ mA	0	0	$I_{(OUT)max} = V_{IREF} \times 40 / R_{IREF}$
$I_{REF} > 3$ mA	1	0	$I_{(OUT)max} = 10$ mA

7.3.4.4 Pre-Thermal Warning Flag

The TLC6C5724-Q1 device implements a pre-thermal warning (PTW) function. Once the junction temperature exceeds the PTW threshold, the ERR pin is pulled low, the PTW flag in error status register is set to 1, the PTW_FLAG and ERR pin status stay unchanged until the junction temperature drops below $T_{PTW} - T_{HYS_PTW}$, and there is an ERROR clear command.

7.3.4.5 Thermal Error Flag

The TLC6C5724-Q1 device monitors junction temperature all the time. Once the junction temperature exceeds the thermal shutdown threshold, all of the constant-current outputs turn off, the ERR pin is pulled low, the thermal error flag and ERR pin status are set to 1 and stay unchanged until the fault is removed and there is an ERROR clear command. During this state, all the digital functions work normally, and users can read or write data through common shift registers. After the junction temperature drops below $T_{TEF} - T_{HYS_TEF}$, the device goes back to normal operation again. Users can reset the TEF flag by sending an ERROR clear command.

7.3.4.6 Negate Bit Toggle

The TLC6C5724-Q1 device implements a Negate Bit Toggle function to check the LOD-LSD registers, which is useful for safety-related applications.

There are NEG1 and NEG2 bits in the registers, and the values are both 0 by default. After executing the Negate Bit Toggle command, both NEG1 and NEG2 change to 1. The LOD-LSD results are reversed under this condition. If the LOD-LSD registers get stuck, the LOD-LSD results are not reversed, which means there is a fault in the LOD-LSD registers .

The LOD1-LSD1 registers only update on the 9th GCLK rising edge, and the LOD2-LSD2 registers only update on the Nth GCLK rising edge. So after the Negate Bit Toggle command, users must wait for at least one GS counter cycle (4096 GCLKs for the 12-bit GS counter mode, 1024 GCLKs for the 10-bit GS counter mode, or 256 GCLKs for the 8-bit GS counter mode) before reading the SID registers. So if the GCLK signal is lost, it can also be detected by the negate-bit toggle function.

7.3.4.7 LOD_LSD Self-Test

The TLC6C5724-Q1 device implements an LOD_LSD self-test function to check the LOD_LSD detection circuit to improve the system reliability. If the LOD_LSD detection circuit fails to detect the LED failure, the LOD_LSD self-test Function can identify and report the malfunction.

The LOD_LSD self-test function can be executed by sending the LOD_LSD self-test command. LOD_LSD_FLAG is 000b by default. After the LOD_LSD self-test command, if there is no fault on LOD_LSD detection circuit, and the LOD_LSD_FLAG value is 011b. If there are failures on the LOD_LSD detection circuits, the LOD_LSD_FLAG value is 110b, the ERR pin is pulled low, and the bit values stay unchanged until the fault is removed and an ERROR clear command is executed. If the LOD_LSD_FLAG is neither 011b nor 110b, there should be something wrong in the self-test procedure.

7.3.4.8 \overline{ERR} Pin

The TLC6C5724-Q1 device supports an active-low open-drain error output. [Figure 24](#) shows the error pulldown block diagram. 10-bit error status information controls the error pulldown circuit directly. But LED failure can be masked by the LED_ERR_MASK bit. The LED_ERR_MASK value is 1 by default, so an LED failure is masked from the error pulldown circuit. Even if there is an LED failure, the ERR pin is not pulled down by this LED failure. If LED_ERR_MASK is 0, the ERR pin is pulled down by an LED failure to indicate an error scenario. Users can use an MCU interrupt to read out the fault information.

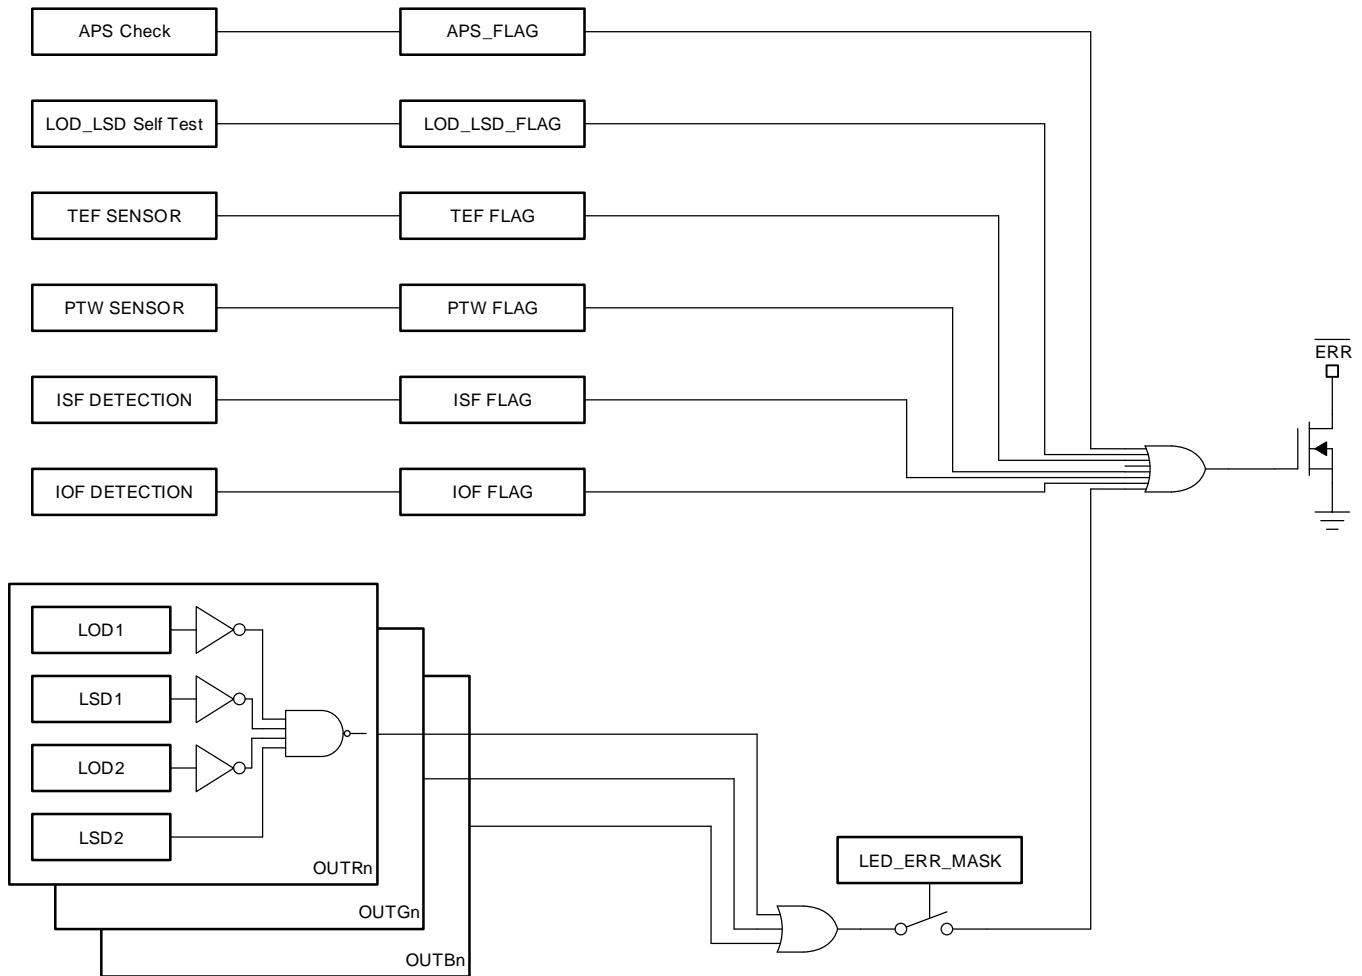

图 24. ERR Pin Pulldown Scheme

7.3.4.9 ERROR Clear

This command is used to clear the error flags in the error status register and APS register. The A53h 12-bit command code indicates an ERROR clear command. After executing the ERROR clear command, the 96-bit LOD_LSD registers, 1-bit NEG1, 1-bit NEG2, 10-bit error status and 24-bit adjacent-pin-short results are loaded into the common shift register. The error status registers and APS registers are reset to 0 if the error is removed. See 图 9 for more detail.

7.3.4.10 Global Reset

This command is used to implement a power-on reset with software input. The A5Ch 12-bit command code initiates a global reset command. After executing the global reset command, all internal registers are reset to their default values. See 图 10 for more detail.

7.3.4.11 Slew Rate Control

To improve system EMI performance, the TLC6C5724-Q1 device implements a programmable slew rate control for the output channels. This output slew rate is configured by the SLEW_RATE bit in the FC-BC-DC register. The SLEW_RATE bit is 0 by default, and the rising and falling time of the output is 200 ns. When the SLEW_RATE bit is 1, the rising and falling time of each output is 100 ns.

7.3.4.12 Channel Group Delay

Large surge currents may flow through the system if all 24 channels turn on simultaneously. These large current surge could induce detrimental noise and electromagnetic interference (EMI) into other circuits. The TLC6C5724-Q1 device implements channel turn-on delay for each group to reduce the surge current. The output current sinks are grouped into four groups.

Group 1: OTR0, -G0, -B0, OTR4, -G4, -B4.

Group 2: OTR1, -G1, -B1, OTR5, -G5, -B5.

Group 3: OTR2, -G2, -B2, OTR6, -G6, -B6.

Group 4: OTR3, -G3, -B3, OTR7, -G7, -B7.

All group 2 channels turn on and off 50 ns later than group 1 channels, all group 3 channels turn on and off later than group 2 channels, and all group 4 channels turn on and off 50 ns later than group 3 channels. [Figure 1](#) shows the details.

7.4 Device Functional Modes

7.4.1 Power Up

To make the device work normally, users must provide two power supplies to the TLC6C5724-Q1 device. One is V_{CC} , 3 V–5.5 V, for device internal logic power. The other is a supply up to 8 V, which is the power supply for the LED loads. To make sure the LED diagnostics feature works normally, the LED supply must connect to the SENSE pin directly.

7.4.2 Device Initialization

After device power on, users must send the error clear command and global reset command to initialize the device and make sure there are no existing faults on the circuit.

7.4.3 Fault Mode

The TLC6C5724-Q1 has full diagnostics features. The device can detect faults and latch the faults into registers. For device faults such as IREF resistor open or short, the device enters a self-protection scenario. The device reports the faults and sets the output current to a default value. For the overtemperature fault, the device turns off the output channels and latches the fault into the TEF register. Except for these two faults, for all other faults including LED faults, the device only detects and reports the faults, but does not take actions to handle the faults, and the channels keep their configured status. Users must read out the faults and decide how to handle the faults.

7.4.4 Normal Operation

Users must program the device through the serial interface for normal operation. Users write to the FC-BC-DC registers to set the operation mode and output current, write to the grayscale registers to set the PWM duty cycle for each channel, and read the SID registers to get device fault information.

7.5 Programming

7.5.1 Register Write and Read

The TLC6C5724-Q1 device is programmable via serial interface. It contains a 288-bit common shift register to shift data from SDI into the device. The register LSB connects to SDI and the MSB connects to SDO. On each SCK rising edge, the data on SDI shifts into the register LSB and all 288 data bits shift towards the MSB. The data appears on SDO when the 288-bit common shift register overflows.

The TLC6C5724-Q1 data write command contains 288-bit data. According to the following different criteria, there are three types of data write commands: FC-BC-DC write, GS data write, and special command.

- When LATCH is high at the 288th SCK rising edge, and the 12 MSBs of the 288-bit data are 0, the 205 LSBs of 288-bit data shift to the function control (FC), brightness control (BC) and dot correction (DC) registers on the LATCH rising edge, as shown in [Figure 2](#).
- When LATCH is low at the 288th SCK rising edge, all 288-bit data shifts into the grayscale (GS) configuration registers on the LATCH rising edge, as shown in [Figure 1](#).

Programming (continued)

- When LATCH is high at the 288th SCK rising edge, and the 12 MSBs of the 288-bit data match any of the eight 12-bit command codes, the device executes the corresponding command after the LATCH rising edge, as shown in [Special Command Function](#).

When the device powers on, the default value of the 288-bit common shift register is 0.

图 25. TLC6C5724-Q1 Common Register

7.5.1.1 FC-BC-DC Write

The device latches the 205 LSBs of data in the 288-bit common shift register into the FC-BC-DC registers at the rising edge of the latch signal when the 12 MSBs of the 288-bit data are 0.

When the device is powered on, the FC-BC-DC data latch is reset to all 0s. Therefore, data must be written to the 288-bit common shift register and latched into the FC-BC-DC registers before turning on the constant-current outputs. It is better to keep BLANK low to prevent the outputs from turning on.

图 26. FC-BC-DC Register

7.5.1.1.1 FC Data Write

The FC data is 13 bits in length, located from bit 204 to bit 192. See [表 12](#) for the detailed description. The default value for all FC data is 0, except for the LED_ERR_MASK bit which is 1.

表 12. Function-Control Data-Bit Assignment

BIT	NAME	DESCRIPTION
204	LED_ERR_MASK	LOD-LSD failure or PWM error information mask bit 0b = Any LOD-LSD failure or PWM error pulls down the ERR pin 1b = LOD-LSD failure or PWM error is masked from affecting the ERR pin
203	SLEW_RATE	Turnon and turnoff speed configuration bit 0b = 200 ns rising and falling time. 1b = 100 ns rising and falling time.
202	LOD_VOLTAGE	LED open-detection (LOD) threshold 0b = LOD threshold is 0.3 V 1b = LOD threshold is 0.5 V
201	LSD_VOLTAGE	LED short-detection (LSD) threshold 0b = LSD threshold is $V_{SENSE} - 0.3 V$ 1b = LSD threshold is $V_{SENSE} - 0.7 V$
200	APS_CURRENT	Adjacent-pin short-detection sink current 0b = 20- μA APS current 1b = 40- μA APS current
199	APS_TIME	Adjacent-pin short-detection time 0b = 10 μs APS detection time 1b = 20 μs APS detection time
198–197	GS_MODE	Grayscale-counter mode selection. 00/01b = 12-bit mode 10 = 10-bit mode 11 = 8-bit mode
196	TIMING_RESET	Display-timing reset mode 0b = Disabled 1b = Enabled

Programming (continued)
表 12. Function-Control Data-Bit Assignment (continued)

BIT	NAME	DESCRIPTION
195	AUTO_REPEAT	Auto-display repeat mode 0b = Disabled 1b = Enabled
194	DC_RANGE_B	Dot-correction adjustment range for the BLUE color output 0b = Lower range 0%–66.7% 1b = Higher range 33.3%–100%
193	DC_RANGE_G	Dot-correction adjustment range for the GREEN color output 0b = Lower range 0%–66.7% 1b = Higher range 33.3%–100%
192	DC_RANGE_R	Dot-correction adjustment range for the RED color output 0b = Lower range 0%–66.7% 1b = Higher range 33.3%–100%

The grayscale counter has 12-bit, 10-bit and 8-bit configurations. Bits 198–197 in the FC register configure the grayscale counter mode.

表 13. GS Counter Mode Table

GRAYSCALE COUNTER MODE (GS_MODE)		FUNCTION MODE
BIT 198	BIT 197	
0	Don't care	12-bit counter mode
1	0	10-bit counter mode, the lowest 10 bits of the 12-bit GS data are valid
1	1	8-bit counter mode, the lowest 8 bits of the 12-bit GS data are valid

7.5.1.1.2 BC Data Write

The BC data is 24 bits length which locates from bit 191 to bit 168. The data of the BC data latch are used to adjust the constant-current values for eight channel constant-current drivers of each color group. The current can be adjusted from 0% to 100% of each output current adjusted by brightness control with 8-bit resolution.

表 14. Brightness Control Data Bit Assignments

BITS	BRIGHTNESS CONTROL DATA
191–184	OUTB0-OUTB7 group
183–176	OUTG0-OUTG7 group
175–168	OUTR0-OUTR7 group

7.5.1.1.3 DC Data Write

The DC data is 168 bits in length, located from bit 167 to bit 0. The TLC6C5724-Q1 device can adjust the output current of each channel using the DC function. The DC function has two adjustment ranges with 7-bit resolution. [表 15](#) shows the DC data assignments in the DC registers. The high adjustment range DC can adjust output current from 33.3% to 100% of $I_{(OUT)max}$. The low adjustment range DC can adjust output current from 0% to 66.7% of $I_{(OUT)max}$. The range control is in bits 194–192 in the function control data latch select the high or low adjustment. Bit 194 controls the OUTB DC range. Bit 193 controls the OUTG DC range, Bit 192 controls the OUTR DC range. For details, see [表 12](#)

表 15. DC Data Assignments

BITS	DATA	BITS	DATA

7.5.1.2 Grayscale Data Write

The grayscale data, which is 288 bits long, contains a 12-bit grayscale value for each output. The grayscale value sets the channel turnon time. 图 27 shows the GS register configuration. 图 1 is the GS write timing diagram. Data is latched from the 288-Bit common shift register into the GS data latch at the rising edge of the LATCH pin. When data is latched into the GS registers, the new data is immediately available on the constant-current outputs. If data are latched with BLANK high, the outputs may turn on or off unexpectedly. So users should update the GS data when BLANK is low.

The 12-bit GS function has 4096 brightness steps, from 0% to 99.97% brightness. The GS function is controlled by a 12-bit GS counter. The GS counter increments on each rising edge of the grayscale reference clock, GCLK. The falling edge of BLANK resets the GS counter value to 0. The GS counter value stays 0 while BLANK is low, even if there is a GCLK input. Pulling BLANK high enables the 12-bit GS counter. The first rising edge of a GS clock after BLANK goes high increments the GS counter by 1 and turns on the outputs. Each additional rising edge increases the GS counter by 1. The GS counter monitors the number of clock pulses on the GCLK pin. The output stays on while the counter value is less than or equal to the GS setting value. The output turns off at the rising edge of the GS counter value when the counter is higher than the GS setting value. 表 20 is the on-time duty cycle of each GS data bit when 12-bit GS counter mode selected.

When the device is powered up, the 288-bit common shift register and GS data latch are reset to 0.

式 4 describes each output on time.

$$t_{ON} = t_{GCLK} \times GS$$

where

- t_{GCLK} is the GS clock period
- GS is the programmed grayscale value for each outputs

(4)

式 5 shows the duty cycle calculation equation.

$$\text{Duty cycle} = \frac{GS}{4096}$$

(5)

图 27. TLC6C5724-Q1 Grayscale Register

Once the GS data is latched into the GS registers at the rising edge of the LATCH signal, the FC-BC-DC data latch shifts into the lowest 205 bits of the common shift register. So, the FC-BC-DC data can be read out from SDO in GS write. This FC-BC-DC read function can also be realized by the read FC-BC-DC command, see [FC-BC-DC Read](#) for the timing diagram.

7.5.1.3 Special Command Function

There are eight special command codes defined in the TLC6C5724-Q1 device, shown in 表 21. To input the command, the level of LATCH at the last SCK before the LATCH rising edge must be high, and the highest 12 bits should be one of the listed 8 command codes. In this condition, the device ignores other bits and no data are latched into FC-BC-DC registers. Normally users can write other bits to 0 in the special command. The corresponding command function executes after the rising edge of the LATCH signal.

If no special command code is identified, the command is a NULL command and no special command is executed. The command is the same as the FC-BC-DC write function.

表 21. Special Command Codes

COMMAND	COMMAND CODE	FUNCTION
GS read	5AFh (0101 1010 1111b)	Load GS data into common register.
SID read	5A3h (0101 1010 0011b)	Load SID data into common register.
FC-BC-DC read	5ACh (0101 1010 1100b)	Load FC-BC-DC data into common register. This reading function can also be achieved by GS data write.
APS check	53Ah (0101 0011 1010b)	Adjacent pin short detection, APS test starts at the rising edge of Latch signal, then set APS register(24bits) and APS_Flag in SID register according to the test result. Keep all channels off during this test.
LOD_LSD self-test	535h (0101 0011 0101b)	LOD-LSD detector circuit self test and set LOD_LSD_FLAG in SID register according to the test result.
Negate bit toggle	55Ah (0101 0101 1010b)	Toggle Negate Bit. When Negate Bit = 0, the 48 bits LOD-LSD detector output data will be latched into LOD1-LSD1 and LOD2-LSD2 register without invert. When Negate Bit =1, the 48 bits LOD-LSD detector output data will invert, and latch into LOD1-LSD1 and LOD2-LSD2 register.
ERROR clear	A53h (1010 0101 0011b)	Load SID data into common register, and then reset the Error status register and APS register to 0.
GLOBAL reset	A5Ch (1010 0101 1100b)	All internal registers are reset. The command has the same function as power on reset.
NULL	Different from any of the above commands	The same function as FC-BC-DC write.

7.5.1.3.1 GS Read

The GS read command loads 288-bits of GS data into the common shift register. By applying 288 SCK clocks, the GS data shifts out from the SDO pin. For details, see [Figure 3](#).

7.5.1.3.2 FC-BC-DC Read

There are two ways to read the FC-BC-DC data latch.

One way is latching data into the GS data latch. After the GS write finishes, the FC-BC-DC data latches into the lowest 205 bits of the common shift register.

Another way is using the FC-BC-DC read command. After the FC-BC-DC read command finishes, the FC-BC-DC data latches into the lowest 205 bits of the common shift register.

By applying 288 SCK clocks, the FC-BC-DC data shifts out from the SDO pin. For details, see [Figure 8](#).

7.5.1.3.3 Status Information Data Read

Status information data (SID) is 132 bits long and contains device status information and LED fault information. [Table 22](#) describes the bit mapping when SID data loads into the common shift register.

Bits 287–240 are the LED-open information for the output channels, bits 203–144 are the LED-short information for the output channels, bits 239–216 are the adjacent-pin-short information for the output channels, bits 215–206 are the error status registers, bits 205–204 are the negate bits, and other bits are reserved registers.

After power on, all error status registers are set to 0. If any one of the error-status-register flags (bits 215–206) asserts, the registers latch the faults until a reset error command is executed to clear the faults. But the LOD_LSD data continues to update every PWM cycle.

表 22. SID Register

BITS OF COMMON SHIFT REGISTER	DESCRIPTION
287–280	LOD2 data for OUTB7–OUTB0
279–272	LOD2 data for OUTG7–OUTG0
271–264	LOD2 data for OUTF7–OUTF0
263–256	LOD1 data for OUTB7–OUTB0
255–248	LOD1 data for OUTG7–OUTG0
247–240	LOD1 data for OUTF7–OUTF0
239–232	APS data for OUTB7–OUTB0
231–224	APS data for OUTG7–OUTG0
223–216	APS data for OUTF7–OUTF0
215	Thermal error flag (TEF). 0b = Normal temperature condition, 1b = High temperature condition.
214	Pre-thermal warning (PTW). 0b = No pre-thermal warning, 1b = Pre-thermal threshold triggered.
213–211	Adjacent-pin-short check result (APS_FLAG). 011b: Pass, 110b: Fail
210	IREF resistor-short flag (ISF). 0b = IREF resistor is not shorted, 1b = IREF resistor short detected.
209	IREF resistor-open flag (IOF). 0b = IREF resistor is not open, 1b = IREF resistor open detected.
208–206	LOD-LSD detection circuit self-test result (LOD_LSD_FLAG). 011b: Pass, 110b: Fail
205	Negate bit for LOD1-LSD1 register (NEG1)
204	Negate bit for LOD2-LSD2 register (NEG2)
203–192	Reserved
191–184	LSD2 data for OUTB7–OUTB0
183–176	LSD2 data for OUTG7–OUTG0
175–168	LSD2 data for OUTF7–OUTF0
167–160	LSD1 data for OUTB7–OUTB0
159–152	LSD1 data for OUTG7–OUTG0
151–144	LSD1 data for OUTF7–OUTF0
143–0	Reserved

7.6 Register Maps

The TLC6C5724-Q1 register map includes three sections: GS registers, FC_BC_DC registers, and SID registers. Users can write to the GS registers and FC_BC_DC registers through the serial interface. Status Information can be read out through the serial interface.

7.6.1 GRAYSCALE Registers

Table 23 lists the memory-mapped registers for the GRAYSCALE. All register offset addresses not listed in Table 23 should be considered as reserved locations and the register contents should not be modified.

Grayscale Register

Table 23. GRAYSCALE Registers

Offset	Acronym	Register Name	Section
0h	OUTn_GS	Output Grayscale Register	Go

Complex bit access types are encoded to fit into small table cells. Table 24 shows the codes that are used for access types in this section.

8 Application and Implementation

注

Information in the following applications sections is not part of the TI component specification, and TI does not warrant its accuracy or completeness. TI's customers are responsible for determining suitability of components for their purposes. Customers should validate and test their design implementation to confirm system functionality.

8.1 Application Information

Below is a typical application for an automotive local dimming application.

8.2 Typical Application

In automotive LCD display applications such as a solid-state cluster or center information display, LED backlighting is one of the key parts for the display. Today most LED backlighting is the traditional edge-lit type, which means the backlighting is globally dimmed. This method consumes much power and causes light leakage from the liquid crystals in the black areas, as the backlighting is always turned on. Recently, local-dimming backlighting, a direct-lit type of backlighting, has been proposed to overcome this drawback. The lighting level of the backlighting follows the display contents. The lighting level is dynamically adjusted by the content of the image blocks for local-dimming control. When an image block is bright, the lighting level of the backlighting turns high also. Conversely, the backlighting level is adjusted to low in a black region. This arrangement reduces power dissipation and light leakage from the LCD and creates pure black, increasing the image contrast ratio.

Users can use the TLC6C5724-Q1 device to drive LED backlighting in local dimming applications. Depending how many zones are in the display, users can connect different numbers of TLC6C5724-Q1 devices in a daisy chain to drive the LEDs.

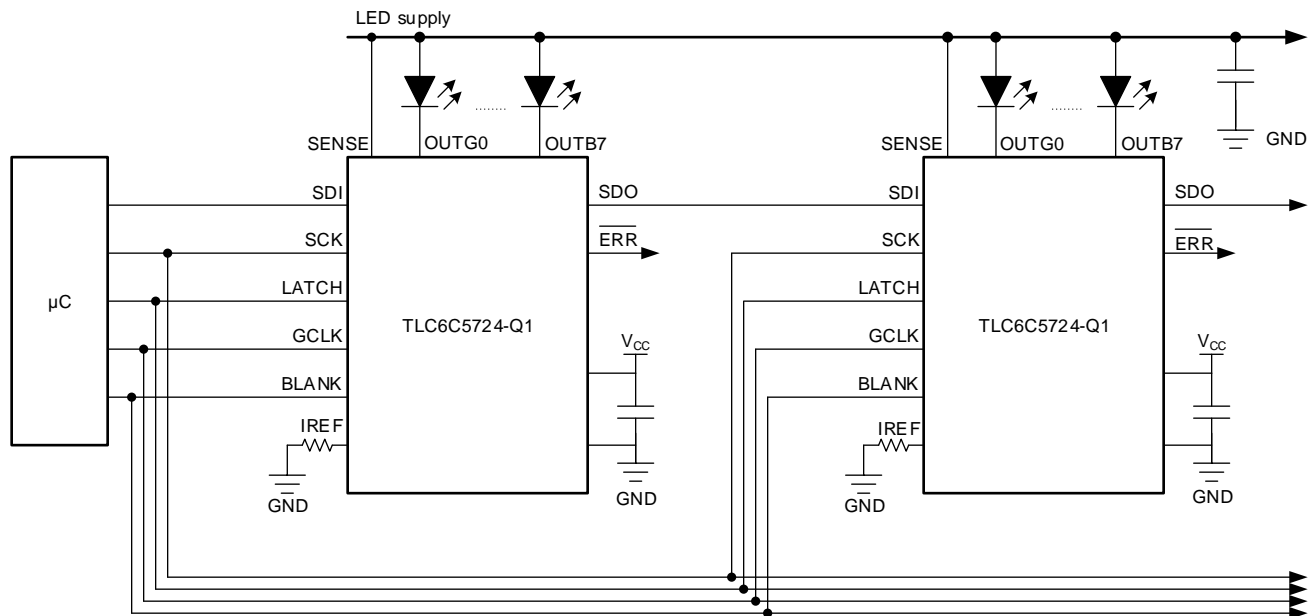

图 31. Typical Block Diagram for Local Dimming

Typical Application (continued)

8.2.1 Design Requirements

表 32 shows the design requirements for the local dimming application.

表 32. Design Requirements

PARAMETER	VALUE
LCD size	12.3 inches
Zones	128
Number of LEDs per string	1
LED current	50 mA

8.2.2 Detailed Design Procedure

As the backlighting includes 128 zones, each TLC6C5724-Q1 device can drive 24 zones, so a total of six TLC6C5724-Q1 units are needed.

According to [Maximum Constant-Sink-Current Setting](#), to realize a 50-mA output current, users can choose a 0.96-kΩ reference resistor.

Users can use a daisy chain connection to control all of the six TLC6C5724-Q1 devices through one serial interface, just as 图 31 shows. 图 32 shows how to send the data into cascaded devices, where M is the number of cascading devices.

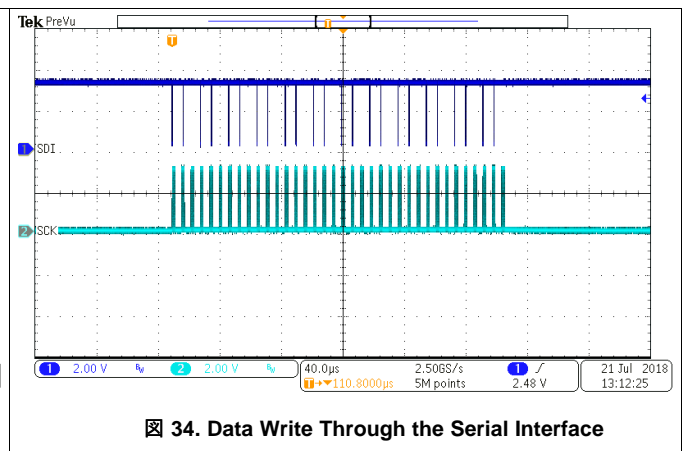

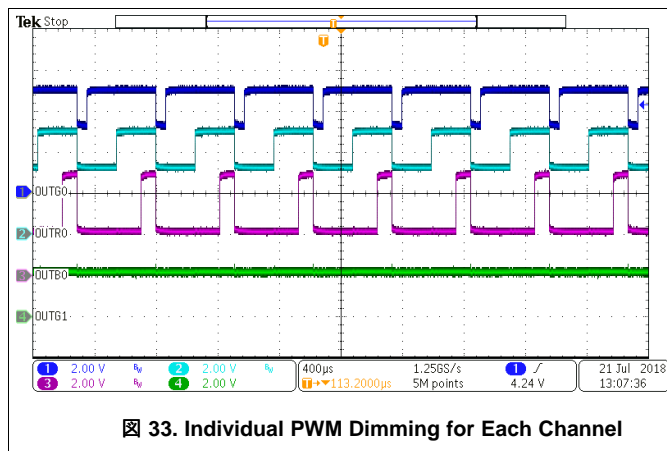

图 32. Cascading Data Write

8.2.3 Application Curves

Below are two test waveforms. 图 33 shows different PWM duty cycles for different output channels, which can realize a local dimming feature. 图 34 shows a data-write waveform typical for each write of $M \times 288$ bits of data into the serial interface.

9 Power Supply Recommendations

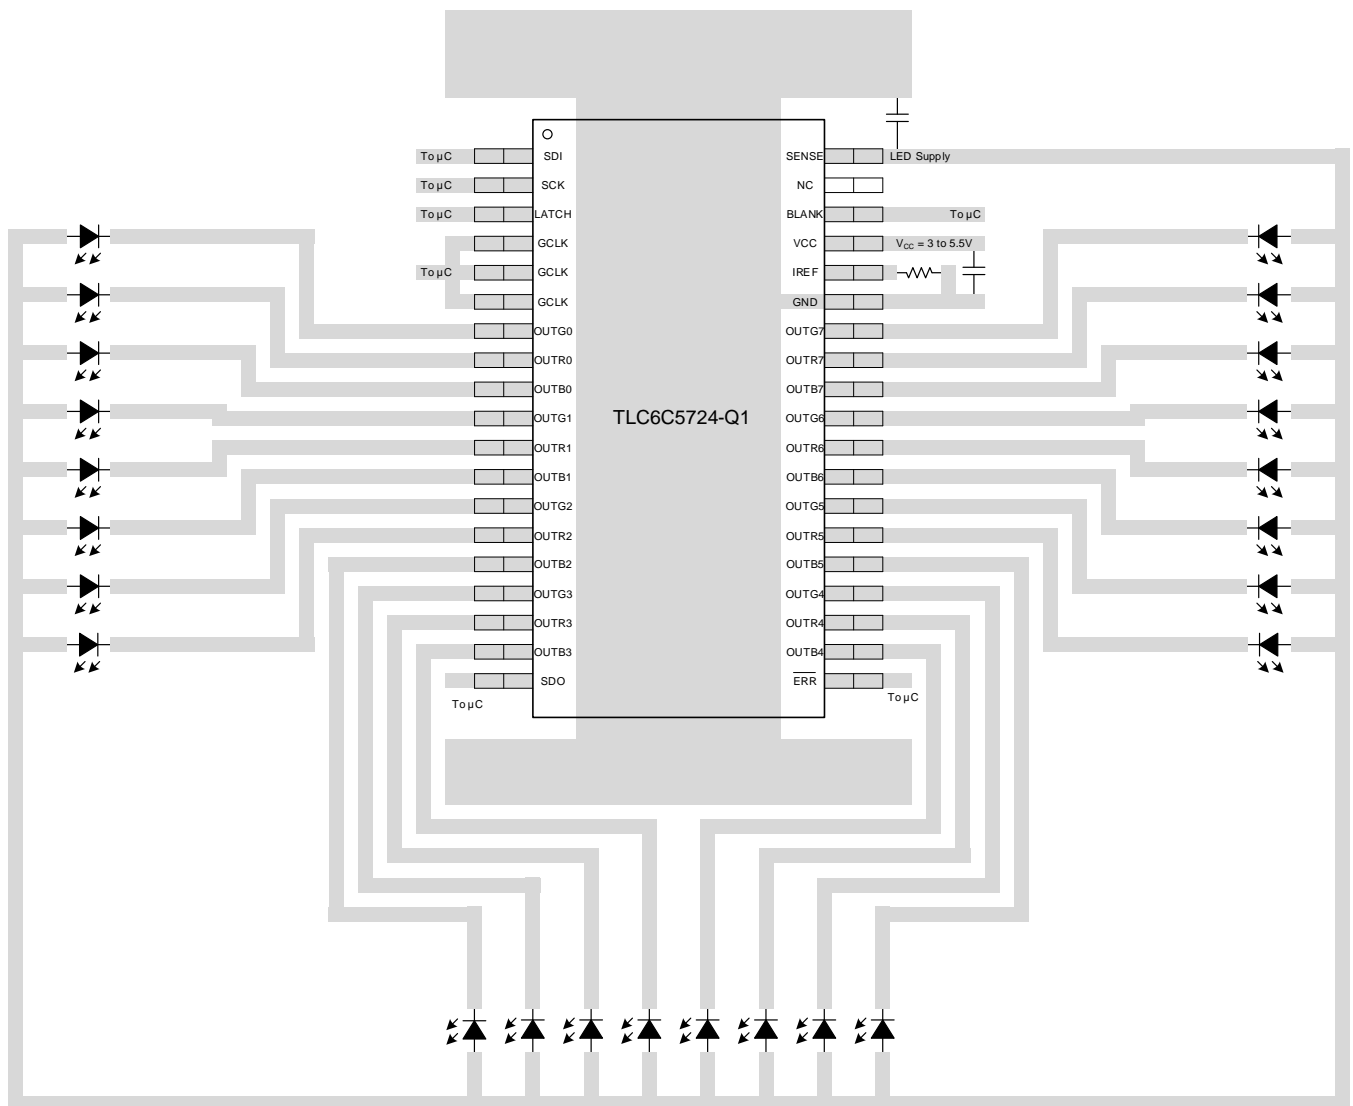

The TLC6C5724-Q1 device requires two power supplies. One is V_{CC} , which can range from 3 V to 5.5 V. The other is V_{LED} , which can go up to 8 V. Users must add a capacitor on the V_{CC} power supply to filter noise. Place the capacitor as close to the V_{CC} pin and SENSE pin as possible.

10 Layout

10.1 Layout Guidelines

Figure 35 shows a layout example for the TLC6C5724-Q1 device. To improve the thermal performance, TI recommends to use the GND plane to dissipate the heat. To filter the supply noise, users can put the capacitor as close to the V_{CC} and SENSE pins as possible. The IREF resistor also should be connected as close to IREF pin as possible.

SLYZ022 — *TI Glossary*.

This glossary lists and explains terms, acronyms, and definitions.

12 メカニカル、パッケージ、および注文情報

以降のページには、メカニカル、パッケージ、および注文に関する情報が記載されています。これらの情報は、指定のデバイスに対して提供されている最新のデータです。このデータは予告なく変更されることがあり、ドキュメントが改訂される場合もあります。本データシートのブラウザ版を使用されている場合は、画面左側の説明をご覧ください。

PACKAGING INFORMATION

Orderable part number	Status (1)	Material type (2)	Package Pins	Package qty Carrier	RoHS (3)	Lead finish/ Ball material (4)	MSL rating/ Peak reflow (5)	Op temp (°C)	Part marking (6)
TLC6C5724QDAPRQ1	Active	Production	HTSSOP (DAP) 38	2000 LARGE T&R	Yes	NIPDAU	Level-3-260C-168 HR	-40 to 125	TLC6C5724Q
TLC6C5724QDAPRQ1.A	Active	Production	HTSSOP (DAP) 38	2000 LARGE T&R	Yes	NIPDAU	Level-3-260C-168 HR	-40 to 125	TLC6C5724Q

(1) **Status:** For more details on status, see our [product life cycle](#).

(2) **Material type:** When designated, preproduction parts are prototypes/experimental devices, and are not yet approved or released for full production. Testing and final process, including without limitation quality assurance, reliability performance testing, and/or process qualification, may not yet be complete, and this item is subject to further changes or possible discontinuation. If available for ordering, purchases will be subject to an additional waiver at checkout, and are intended for early internal evaluation purposes only. These items are sold without warranties of any kind.

(3) **RoHS values:** Yes, No, RoHS Exempt. See the [TI RoHS Statement](#) for additional information and value definition.

(4) **Lead finish/Ball material:** Parts may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead finish/Ball material values may wrap to two lines if the finish value exceeds the maximum column width.

(5) **MSL rating/Peak reflow:** The moisture sensitivity level ratings and peak solder (reflow) temperatures. In the event that a part has multiple moisture sensitivity ratings, only the lowest level per JEDEC standards is shown. Refer to the shipping label for the actual reflow temperature that will be used to mount the part to the printed circuit board.

(6) **Part marking:** There may be an additional marking, which relates to the logo, the lot trace code information, or the environmental category of the part.

Multiple part markings will be inside parentheses. Only one part marking contained in parentheses and separated by a "~" will appear on a part. If a line is indented then it is a continuation of the previous line and the two combined represent the entire part marking for that device.

Important Information and Disclaimer: The information provided on this page represents TI's knowledge and belief as of the date that it is provided. 重要なお知らせと免責事項

テキサス・インスツルメンツは、技術データと信頼性データ(データシートを含みます)、設計リソース(リファレンス デザインを含みます)、アプリケーションや設計に関する各種アドバイス、Web ツール、安全性情報、その他のリソースを、欠陥が存在する可能性のある「現状のまま」提供しており、商品性および特定目的に対する適合性の黙示保証、第三者の知的財産権の非侵害保証を含むいかなる保証も、明示的または黙示的にかかわらず拒否します。

これらのリソースは、テキサス・インスツルメンツ製品を使用する設計の経験を積んだ開発者への提供を意図したものです。(1) お客様のアプリケーションに適したテキサス・インスツルメンツ製品の選定、(2) お客様のアプリケーションの設計、検証、試験、(3) お客様のアプリケーションに該当する各種規格や、その他のあらゆる安全性、セキュリティ、規制、または他の要件への確実な適合に関する責任を、お客様のみが単独で負うものとし、ます。

上記の各種リソースは、予告なく変更される可能性があります。これらのリソースは、リソースで説明されているテキサス・インスツルメンツ製品を使用するアプリケーションの開発の目的でのみ、テキサス・インスツルメンツはその使用をお客様に許諾します。これらのリソースに関して、他の目的で複製することや掲載することは禁止されています。テキサス・インスツルメンツや第三者の知的財産権のライセンスが付与されている訳ではありません。お客様は、これらのリソースを自身で使用した結果発生するあらゆる申し立て、損害、費用、損失、責任について、テキサス・インスツルメンツおよびその代理人を完全に補償するものとし、テキサス・インスツルメンツは一切の責任を拒否します。

テキサス・インスツルメンツの製品は、[テキサス・インスツルメンツの販売条件](#)、または [ti.com](https://www.ti.com) やかかるテキサス・インスツルメンツ製品の関連資料などのいずれかを通じて提供する適用可能な条項の下で提供されています。テキサス・インスツルメンツがこれらのリソースを提供することは、適用されるテキサス・インスツルメンツの保証または他の保証の放棄の拡大や変更を意味するものではありません。

お客様がいかなる追加条項または代替条項を提案した場合でも、テキサス・インスツルメンツはそれらに異議を唱え、拒否します。
