TMAG6180-Q1 車載用高精度アナログ AMR 360° 角度センサ

1 特長

- 車載アプリケーション用に AEC-Q100 認定済み:
  - 温度グレード 0:-40℃～150℃
- 機能安全準拠
  - 機能安全アプリケーション向けに開発
  - ASIL B までの ISO 26262 システム設計を支援するドキュメントを提供
- 高精度、小さい角度誤差の AMR センサ:
  - 0.1° (標準値)
  - 0.4° (3.3V、全温度範囲での最大値)
  - 0.56° (5.5V、全温度範囲での最大値)
- 高速 AMR 角度センサ:
  - 非常に低いレイテンシ < 2μs で最大 100krpm に対応
- 角度ドリフトが小さいため、温度範囲全体にわたるキャリブレーションが不要です
- 正弦波と余弦波の差動レシオメトリック アナログ出力
- 差動エンドまたはシングルエンドのアプリケーションをサポート
- 広い動作磁界範囲:20mT～1T
- 高速起動: < 40μs
- ホール センサを使用した内蔵象限検出
  - AMR の角度範囲を 360° まで拡大
  - 速度と方向に使用可能
  - オープン ドレイン デジタル出力
- 電源電圧範囲:2.7V～5.5V

2 アプリケーション

- 電動パワー・ステアリング
- 操舵角センサ
- BLDC/PMSM モーター位置検出
- 電動アシスト自転車
- ワイパー・モジュール
- アクチュエータ
- サーボ・ドライブ位置センサ
- トラクション・モーター

3 概要

TMAG6180-Q1 は、Anisotropic Magneto Resistive (AMR) テクノロジーをベースとする高精度角度センサです。このデバイスには、信号コンディショニング アンプが内蔵されており、印加される面内磁界の方向に関連する、正弦波と余弦の差動アナログ出力を提供します。このデバイスは X 軸と Y 軸に 2 つの独立したホール センサ出力も備えており、センサの角度範囲を 360° まで拡大するために使用できます。

TMAG6180-Q1 は、柔軟な機械的配置が可能な広い動作磁界と、回転子位置検出などの高速アプリケーションに適した低レイテンシ (1.6μs) 出力を特長としています。このデバイスは、正弦波出力と余弦出力のレイテンシが非常に短いため、レイテンシに関連する角度誤差を最小限に抑えることができ、最大 100krpm の回転子位置検出などの高速アプリケーションのために設計されています。

TMAG6180-Q1 は、車載と産業用の厳格な機能安全要件に対応するための広範な診断機能を備えています。このデバイスは、-40℃～+150℃の広い周囲温度範囲で一貫した動作を行い、熱ドリフトと寿命誤差を最小限に抑えます。

パッケージ情報

部品番号	パッケージ (1)	パッケージ サイズ(2)
TMAG6180-Q1	DGK (VSSOP、8)	3mm × 4.9mm

(1) 詳細については、セクション 10 を参照してください。
(2) パッケージ サイズ (長さ×幅) は公称値であり、該当する場合はピンも含まれます。

表 4-1. Pin Functions

PIN		TYPE[(1)]	DESCRIPTION
NO.	NAME		
1	COS_P	O	Differential cosine output (positive)
2	GND	G	Ground reference
3	COS_N	O	Differential cosine output (negative)
4	Q0	O	Quadrature 0 digital output (open drain)
5	Q1	O	Quadrature 1 digital output (open drain)
6	SIN_N	O	Differential sine output (negative)
7	VCC	P	Power supply
8	SIN_P	O	Differential sine output (positive)

(1) I = input, O = output, I/O = input and output, G = ground, P = power

5 Specifications

5.1 Absolute Maximum Ratings

over operating free-air temperature range (unless otherwise noted)[(1)]

		MIN	MAX	UNIT
V_{CC}	Main supply voltage	–0.3	7	V
I_{OUT}	Output current (SIN_P, SIN_N, COS_P, COS_N, Q1, Q0)	–10	10	mA
V_{OUT}	Output voltage (SIN_P, SIN_N, COS_P, COS_N, Q1 ,Q0)	–0.3	7	V
T_J	Junction temperature	–40	170	°C
T_{stg}	Storage temperature	–65	150	°C

(1) Operation outside the Absolute Maximum Ratings may cause permanent device damage. Absolute maximum ratings do not imply functional operation of the device at these or any other conditions beyond those listed under Recommended Operating Conditions. If briefly operating outside the Recommended Operating Conditions but within the Absolute Maximum Ratings, the device may not sustain damage, but it may not be fully functional. Operating the device in this manner may affect device reliability, functionality, performance, and shorten the device lifetime.

5.2 ESD Ratings

				VALUE	UNIT
$V_{(ESD)}$	Electrostatic discharge	Human body model (HBM), per AEC Q100-002[(1)] HBM ESD classification level 2		±2000	V
		Charged device model (CDM), per AEC Q100-011 CDM ESD classification level C4B	All pins	±500	
			Corner pins (1, 4, 5, and 8)	±750	

(1) AEC Q100-002 indicates that HBM stressing shall be in accordance with the ANSI/ESDA/JEDEC JS-001 specification.

5.3 Recommended Operating Conditions

over operating free-air temperature range (unless otherwise noted)

		MIN	NOM	MAX	UNIT
V_{CC}	Main supply voltage	2.7		5.5	V
T_A	Operating free air temperature	–40		150	C
C_L	Capacitive load on SIN_P, SIN_N, COS_P, COS_N	0.1		10	nF
I_L	Current load on SIN_P, SIN_N, COS_P, COS_N	–1		1	mA
B	Magnetic flux density for AMR saturation	20			mT

5.4 Thermal Information

THERMAL METRIC[(1)]		TMAG6180-Q1 DGK (VSSOP) 8 PINS	UNIT
$R_{\theta JA}$	Junction-to-ambient thermal resistance	166.8	°C/W
$R_{\theta JC(top)}$	Junction-to-case (top) thermal resistance	57.8	°C/W
$R_{\theta JB}$	Junction-to-board thermal resistance	88.7	°C/W
Ψ_{JT}	Junction-to-top characterization parameter	7.0	°C/W
Ψ_{JB}	Junction-to-board characterization parameter	87.1	°C/W

(1) For more information about traditional and new thermal metrics, see the Semiconductor and IC Package Thermal Metrics application report.

5.5 Electrical Characteristics

over operating free-air temperature range (unless otherwise noted); typical specifications are at T_A = 25°C

PARAMETER		TEST CONDITIONS	MIN	TYP	MAX	UNIT
AMR Output Parameters						
V_{out}	Single-ended output voltage peak to peak	V_{CC} = 3.3V	57	62	67.5	%V_{CC}
V_{out}	Single-ended output voltage peak to peak	V_{CC} = 5.5V	55	60	65	%V_{CC}
k	Amplitude asynchronism ratio (Vpk Cos/ Vpk Vsin)	B = 30mT, V_{CC} = 3.3V	–2.3	0.3	2.3	%
		B = 30mT, V_{CC} = 5V	–2.4	0.3	2.4	%
V_{offset_room}	Differential offset of SIN/COS outputs at room	B = 30mT, T_A = 25°C, V_{CC} = 3.3V	–56		56	mV
		B = 30mT, T_A = 25°C, V_{CC} = 5V	–90		90	mV
V_{offset_tc}	Temperature coefficient of differential offset voltage	B = 30mT, V_{CC} = 3.3V		±0.1		mV/°C
		B = 30mT, V_{CC} = 5V		±0.1		mV/°C
V_{CM}	Common-mode output voltage	B = 30mT, V_{CC} = 3.3V	48	50	52	%VCC
		B = 30mT, V_{CC} = 5V	48	50	52	%VCC
V_{NOISE}	Output referred noise (differential)	B = 30mT, C_{load} = 100pF		0.5		mV_{rms}
R_{out}	Series output resistance			55		Ω
t_{agc_update}	Update rate of the automatic gain control	After V_{out} reaching 60% of V_{CC}		1		s
DC Power						
V_{CC_UV}	VCC undervoltage threshold			2.45	2.65	V
V_{CC_OV}	VCC overvoltage threshold			5.9	6.36	V
VCC_{RAMP}	Power supply ramp rate for proper device start-up	V_{CC} = 10% to 90% Specified by design			0.2	ms
I_{ACT}	Active mode current from VCC			6.5	10	mA
$t_{on\_startup}$	Power-on time during start-up	To achieve 90% of output voltages after VCC has reached final value (C_{LOAD} =100pF)		38	85	µs
Digital I/O						
V_{OL_Q}	Low level output voltage	I_O = 1mA on Q0, Q1 pins	0		0.4	V
Hall sensor outputs						
tpd	Propagation delay time per channel	Change in B_{OP} or B_{RP} to change in output		10		µs

5.6 Magnetic Characteristics

over operating free-air temperature range (unless otherwise noted); typical specifications are at T_A = 25°C

PARAMETER		TEST CONDITIONS	MIN	TYP	MAX	UNIT
Angular Performance						
$ANG_{ERR\_DYN\_SE}$	Angular error linearity across temperature on continuous calibration (gain / offset) (single ended)	B = 30mT, V_{CC} = 3.3V, Magnetic field Rotation Speed = 1000rpm		0.1	0.35	deg
		B = 30mT, V_{CC} = 5V, Magnetic field Rotation Speed = 1000rpm		0.1	0.56	deg

6 Detailed Description

6.1 Overview

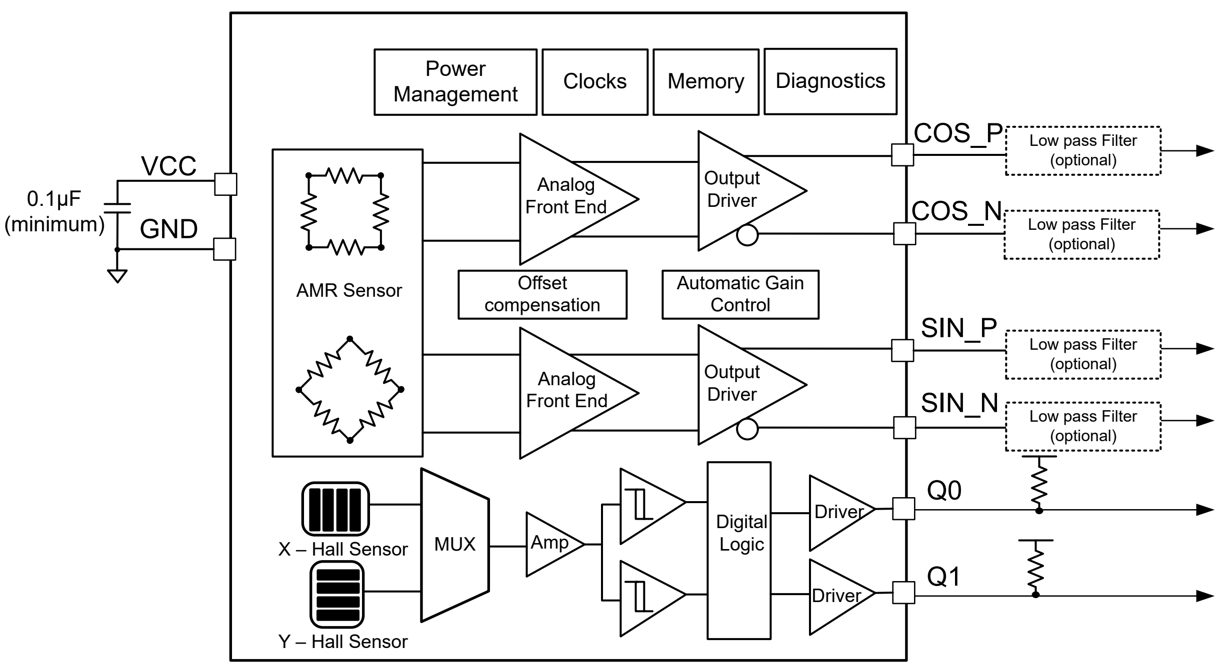
The TMAG6180-Q1 is a high-precision angle sensor based on the AMR sensor technology vertically integrated on top of the integrated amplifiers on silicon. The differential output sine and cosine signals from the AMR sensor are proportional to the angle of the applied magnetic field. The sine and cosine signals are internally signal conditioned, temperature compensated, and driven by differential output amplifiers with the ability to drive large capacitive loads. The output voltages of the AMR sensor are ratiometric to the supply voltage, therefore the external ADC can use the supply voltage as a reference.

TMAG6180-Q1 integrates X and Y Hall sensors to provide quadrature outputs on pins Q0 and Q1, respectively. The Hall effect sensors are chopper stabilized, signal conditioned, and multiplexed to provide two digital latched outputs. These outputs can be used to extend the angle sensing range of the AMR sensor from 180 degrees to 360 degrees.

The TMAG6180-Q1 contains the following functional and building blocks:

- The Power Management and Oscillators block contains internal regulators, biasing circuitry, a low-frequency, wake-up oscillator and a high-frequency, wake-up oscillator, overvoltage detection circuitry, and undervoltage detection circuitry
- The AMR sensor contains two Wheatstone bridges made of magnetic resistive sensors, each sensing one of the components of the applied magnetic field, the sine and the cosine components.
- The AMR sensing path contains the signal conditioning amplifiers, offset compensation, automatic gain control circuitry and the output drivers.
- The Quadrature Detection Path contains the X and Y Hall sensors, related biasing circuitry, signal conditioning, logic comparators and digital logic to drive the Q1 and Q0 outputs
- The Internal memory block supports the factory-programmed values
- The diagnostic blocks support background diagnostic checks of the internal circuitry

6.2 Functional Block Diagram



6.3 Feature Description

6.3.1 Magnetic Flux Direction

The TMAG6180-Q1 is sensitive to the magnetic field component in X and Y directions. The X and Y fields are in-plane with the package. The device generates sine and cosine outputs from the AMR based on the reference position (0°). See Direction of Sensitivity.

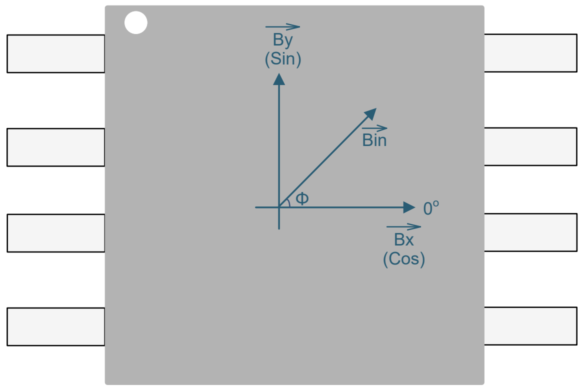


図 6-1. Direction of Sensitivity

6.3.2 Sensors Location and Placement Tolerances

Location of AMR Sensor and Hall Elements shows the location of the AMR sensor and X, Y Hall elements, along with the placement tolerances inside the TMAG6180-Q1.

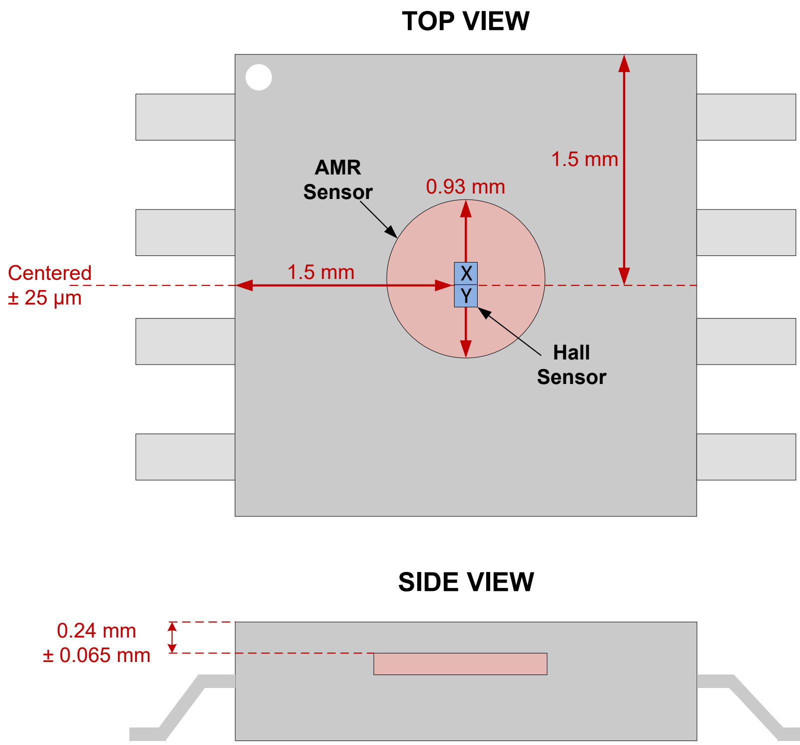

図 6-2. Location of AMR Sensor and Hall Elements

The center of the AMR and Hall sensors lie in the center of the package. Die Rotation Tolerances in the Package shows the tolerances of the die rotation within the package. This causes a reference angle error (Φ) of ± 3°.

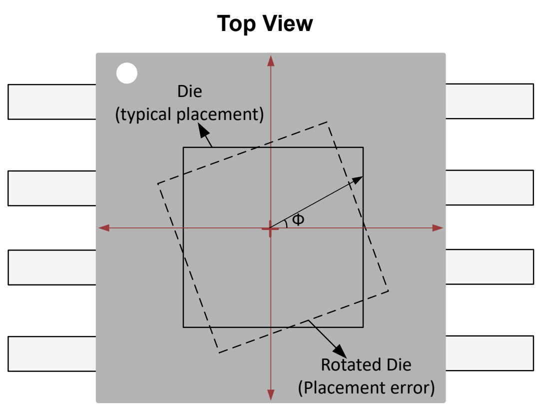

図 6-3. Die Rotation Tolerances in the Package

6.3.3 Magnetic Response

The AMR sensor has two components that are sensitive to the in-plane magnetic field X and Y axes parallel to the chip surface. セクション 6.3.3 shows the AMR sensor with the differential sine and cosine outputs SIN_P, SIN_N, COS_P and COS_N. The outputs have an electrical range of 180 degrees. If the mechanical angle between the sensor reference and the direction of the magnetic field is θ, then the AMR outputs correspond to cosine 2θ and sine 2θ respectively. For every 360° rotation of the external magnetic field, the AMR outputs provide two periods, at 180° sensing range for each period. Hence, for a dipole magnet rotating at speed of *f*, the electrical output from the AMR sensor outputs can be at twice the frequency at *2f*. Use 式 1 to calculate the angle of the magnetic field is calculated using an arctangent2 function.

$$\theta = \frac{\arctan2\left(\frac{Vsin}{Vcos}\right)}{2} \tag{1}$$

where

- Vsin is the differential sine output
- Vcos is the differential cosine output

The AMR sensor is sensitive only to the direction of the magnetic field and has a wide operating magnetic field range. The voltage levels of the AMR outputs are independent of the absolute flux density as long as the magnetic flux density is above the minimum recommended operating fields.

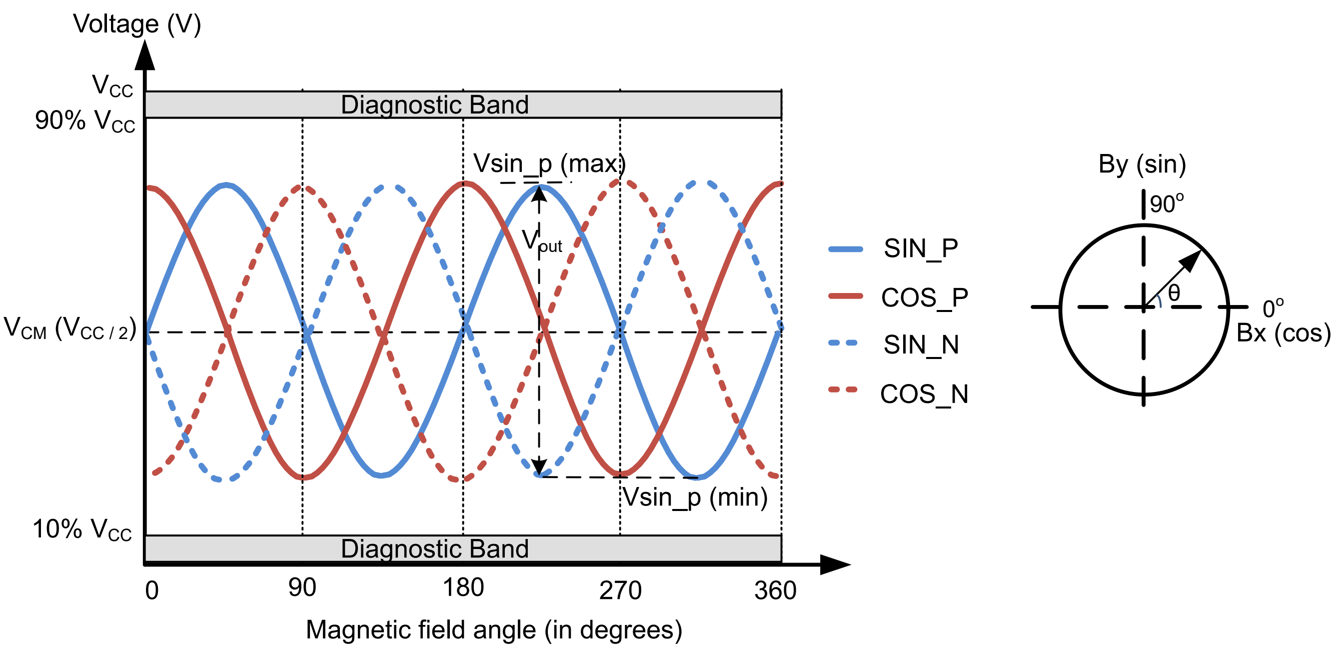

図 6-4. AMR Sensor Outputs Magnetic Response

The two integrated Hall sensors X and Y that are sensitive to the in-plane X and Y axes similar to the AMR sensor. 図 6-5 shows both the Hall outputs reacting to the input field by going low when the field is higher than operating point (B_{OP}) and going high when the field is lower than returning point (B_{RP}).

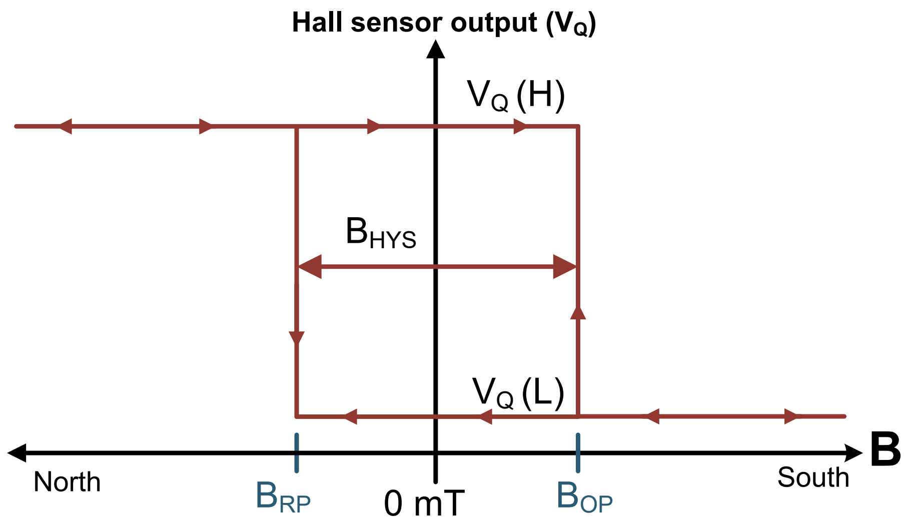

図 6-5. Hall Sensor Magnetic Response

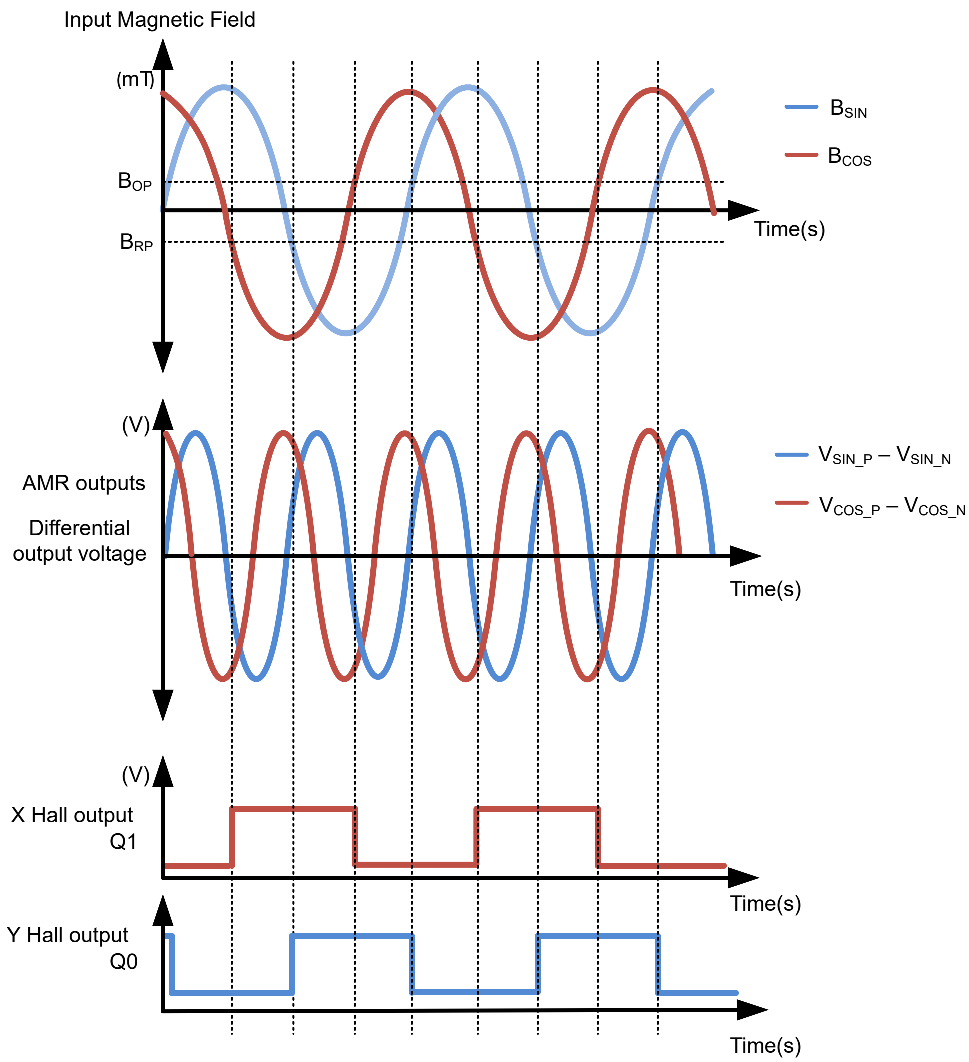
For a rotating input magnetic field, with the X and Y components of B_{SIN} and B_{COS} respectively, 図 6-6 shows the response of the AMR and Hall sensors. The integrated X and Y Hall sensors provide digital outputs (Q0 and Q1, respectively). See the *Functional Block Diagram*. The Hall sensors have a 360° compared to the 180° angle range of the AMR sensors. By utilizing the digital outputs of the Hall sensors, the angle range of the AMR sensor can be extended to 360°.

図 6-6. Magnetic Response of AMR and Hall sensors



6.3.4 Parameters Definition

6.3.4.1 AMR Output Parameters

The single-ended output signals SIN_P, SIN_N, COS_P and COS_N are shown in 図 6-4. These signals are ratiometric to the supply voltage (V_{CC}). The common-mode voltage (V_{CM}) of the individual signals is half of the supply voltage (V_{CC} /2). For single-ended signals, V_{OUT} is defined as the difference between the maximum and minimum output voltage for a rotating magnetic field. Use 式 2 to calculate $V_{OUT\_SIN\_P}$.

$$V_{OUT\_SIN\_P} = V_{SIN\_P(max)} - V_{SIN\_P(min)} \tag{2}$$

where

- $V_{SIN\_P\ (min)}$ is the minimum output voltage across the full magnetic angle range
- $V_{SIN\_P\ (max)}$ is the maximum output voltage across the full magnetic angle range

Typically, V_{OUT} is around 60% of the supply voltage (V_{CC}). The diagnostic band shown in AMR Sensor Outputs Magnetic Response indicates that the output signals are outside normal operating range and indicates a presence of fault.

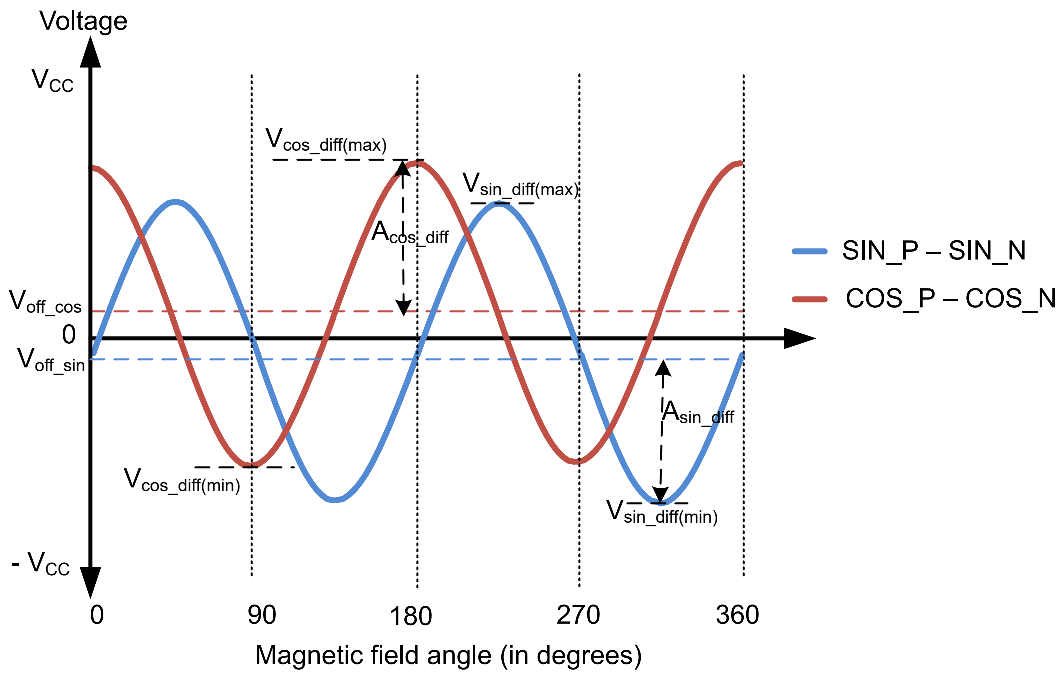


図 6-7. AMR Differential Ended Output Signals

The differential sine and cosine output signals shown in 図 6-7 are generated from the corresponding sine and cosine single-ended outputs. Use 式 3 and 式 4 to calculate the differential voltages.

$$V_{sin\_diff} = V_{SIN\_P} - V_{SIN\_N} \tag{3}$$

$$V_{cos\_diff} = V_{COS\_P} - V_{COS\_N} \tag{4}$$

The offset of the differential signals is the average of the maximum and minimum voltages of the sine or cosine signals. Use 式 5 and 式 6 to calculate the offsets for the sine and cosine signals.

$$V_{offset\_sin} = \frac{V_{sin\_diff(max)} + V_{sin\_diff(min)}}{2} \tag{5}$$

$$V_{offset\_cos} = \frac{V_{cos\_diff(max)} + V_{cos\_diff(min)}}{2} \quad (6)$$

For single-ended signals, the offset is the common-mode voltage (V_{CM}).

Use 式 7 to calculate the differential offset for sine and cosine channels at any given temperature, T_A.

$$V_{offset} = V_{offset,\ room} \times \left(1 + V_{offset\_TC} \times \left(T_A - 25^{o}C\right)\right) \quad (7)$$

where

- V_{Offset_TC} is the temperature drift coefficient of the offset
- V_{Offset_room} is the room temperature offset

Use 式 8 and 式 9 to calculate the amplitudes of the differential signals.

$$A_{sin\_diff} = \frac{V_{sin\_diff(max)} - V_{sin\_diff(min)}}{2} \quad (8)$$

$$A_{cos\_diff} = \frac{V_{cos\_diff(max)} - V_{cos\_diff(min)}}{2} \quad (9)$$

Use 式 10 to calculate the amplitude for single-ended signals.

$$A_{sin\_p} = \frac{V_{sin\_p(max)} - V_{sin\_p(min)}}{2} \quad (10)$$

Amplitude asynchronism refers to the amplitude mismatch error between sine and cosine channels. Use 式 11 to calculate the amplitude mismatch error.

$$k = 1 - \left(\frac{A_{cos\_diff}}{A_{sin\_diff}}\right) \quad (11)$$

The sine and cosine output signals are typically out-of-phase by 90 degrees. However, the sine and cosine outputs from the sensor can be different than the ideal 90 degrees if an internal phase error occurs owing to sensor and other on chip circuitry non-idealities. This error is referred to as the orthogonality error. This error is defined as the angle error between the zero crossing of the cosine output and maximum value of the sine outputs.

The hysteresis error (ANG_{hyst}) refers to the largest angle error difference between a clockwise rotation and a counter-clockwise rotation.

For the AMR sensor, the orthogonality error and the hysteresis errors are negligible.

6.3.4.2 Transient Parameters

Propagation delay (t_{del_amr}) is defined as the time taken for signal to propagate from magnetic input change to the sine and cosine AMR outputs. The bandwidth limitation of the internal signal conditioning amplifiers causes a phase shift on the applied magnetic field. The propagation delay increases based on the speed of the rotating field and is specified at the maximum speed of the recommended magnetic field. 図 6-8shows an input rotating magnetic field and the response of the AMR outputs. The propagation delay in the signal path leads to a phase error.

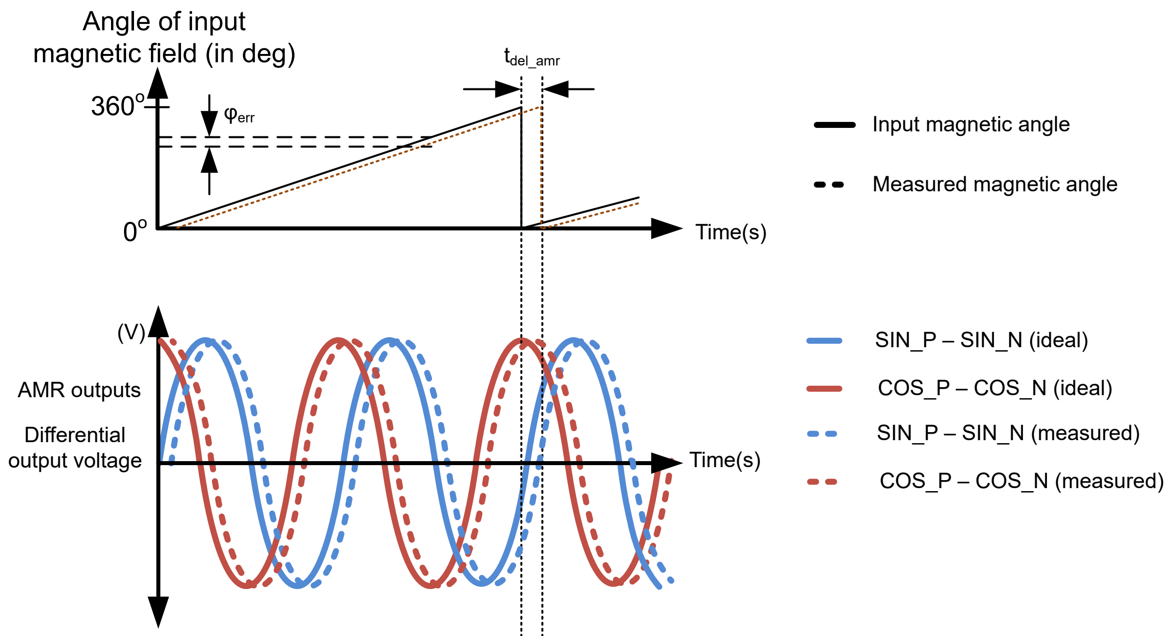

図 6-8. AMR Output Propagation Delay and Phase Error

The phase error (φ_{err}) refers to the angle error between the input magnetic field and output of the sensor. This error increases with the speed of the rotating magnetic field and the propagation delay of the AMR sensor. Typically, this error can be compensated to the first order if the speed of the rotating magnetic field is known.

6.3.4.2.1 Power-On Time

The power-on time during start-up ($T_{on\_startup}$) is defined as the time it takes for the AMR outputs to reach to 90% of their final value (under a constant magnetic field) after the V_{CC} reaches $V_{CC(min)}$. 図 6-9 shows the power-on time of the device during a V_{CC} ramp.

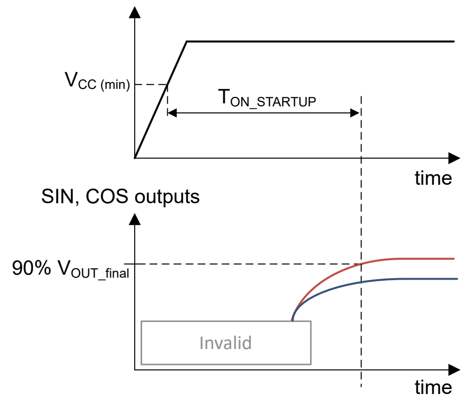

図 6-9. Power-On Time During Start-Up

6.3.4.3 Angle Accuracy Parameters

The overall angle error represents the relative angular error. セクション 6.3.4.3 shows the deviation from the reference line after zero angle definition..

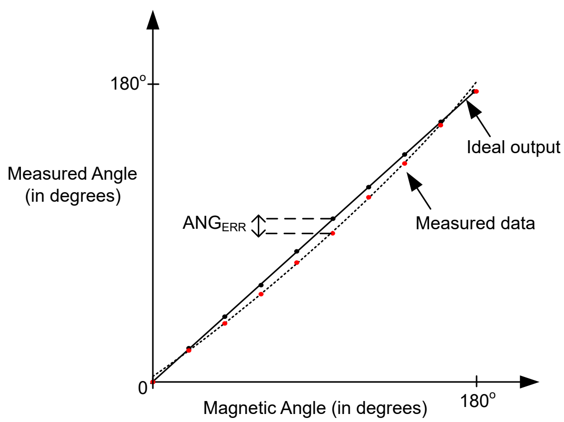

図 6-10. Angle Error

The uncalibrated angular error ($ANG_{ERR\_NOCAL\_DE}$) is defined as the maximum deviation from an ideal angle without any offset and amplitude mismatch calibration for the VSIN and VCOS differential signals. For single-ended signals, the uncalibrated angular error is denoted by $ANG_{ERR\_NOCAL\_SE}$.

The single point calibration angular error ($ANG_{ERR\_RTCAL\_DE}$) is defined as the maximum deviation from an ideal angle after the offset calibration is applied to the VSIN and VCOS differential signals at room temperature (25°C). For single-ended signals, the room-temperature calibrated angular error is denoted by $ANG_{ERR\_RTCAL\_SE}$.

The dynamic angular error (ANG_{ERR_DYN}) is defined as the maximum deviation from an ideal angle with the continuous offset and gain calibration applied to the VSIN and VCOS differential signals. The error is measured at 1krpm and includes the phase error owing to the propagation delay of the AMR outputs.

6.3.4.4 Hall Sensor Parameters

The Hall sensors X and Y have factory-calibrated operating (B_{OP}) and release points (B_{RP}). The operating and release points shown in 図 6-4 give the magnetic hysteresis for each Hall sensor.

Use 式 12 and 式 13 to calculate the symmetry point for each axis.

$$B_{SYM(X)} = B_{OP(X)} + B_{RP(X)} \tag{12}$$

where

- $B_{OP\ (X)}$ and $B_{RP\ (X)}$ represent the operating and release points for X Hall sensor

$$B_{SYM(Y)} = B_{OP(Y)} + B_{RP(Y)} \tag{13}$$

where

- $B_{OP\ (Y)}$ and $B_{RP\ (Y)}$ represent the operating and release points for Y Hall sensor

Use 式 14 to calculate the operating point symmetry.

$$B_{SYM\_OP} = B_{OP(X)} - B_{OP(Y)} \tag{14}$$

Use 式 15 to calculate the release point symmetry.

$$B_{SYM\_RP} = B_{RP(X)} - B_{RP(Y)} \tag{15}$$

6.3.5 Automatic Gain Control (AGC)

The TMAG6180-Q1 features an automatic gain control circuitry to reduce the drift of the AMR sensor outputs across temperature. The device changes the gain of the output drivers to keep the final output within an appropriate voltage range on SIN_P, SIN_N, COS_P and COS_N. The AGC block uses the square root of the sum of the squared amplitudes of the two channels to sense amplitude of output signals and set gain selection. The AGC block sets the gain for sine and cosine channels, meaning that the peak-to-peak amplitude of single-ended voltages, V_{OUT} is within the range listed in *Specifications*. The AGC block changes the gain of both the sine and cosine channels simultaneously.

If the outputs are out of the normal operating range, the AGC block changes the gain of the sine and cosine channels by a step size of ±1% V_{CC} at an interval of t_{agc_update}, typically around 1 second, as defined in *Specifications*. 図 6-11 shows the differential AMR outputs for a continuously rotating input field. The shaded area represents the *No AGC Control* band that represents ±5% of V_{CC} and is centered at 60% of V_{CC}. Notice that the AGC loop reduces the gain and updates the amplitude at a step size of 1% V_{CC} as the sine and cosine signals drift outside of the shaded region. If the outputs remain within the shaded region, then no action is taken by the AGC control loop.

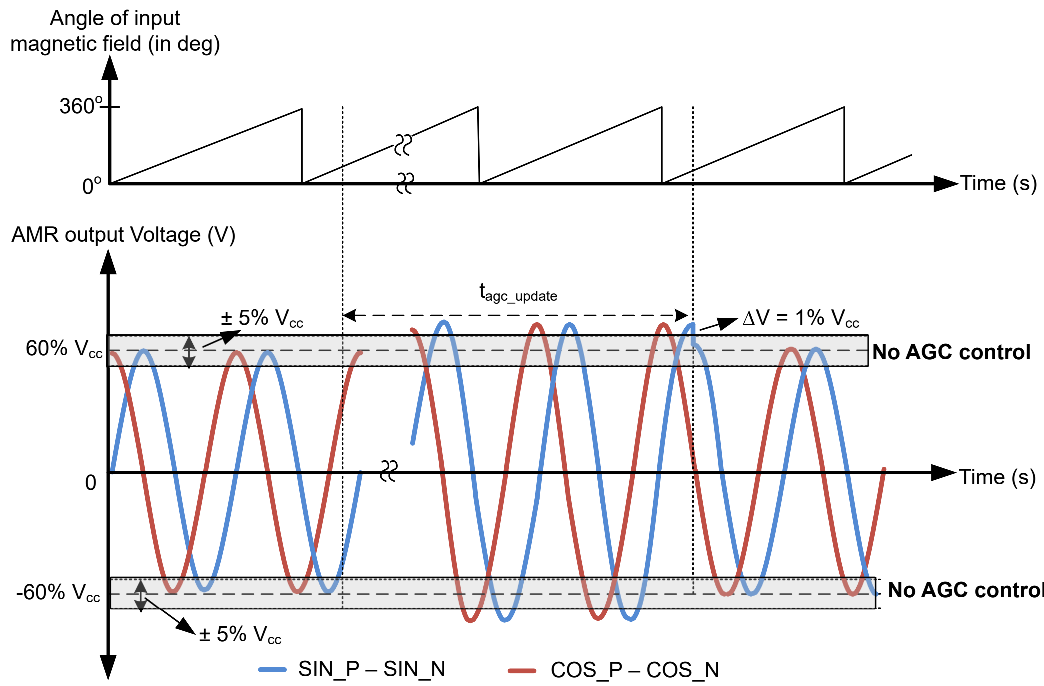

図 6-11. Timing Diagram Showing the Operation of Automatic Gain Control

6.3.6 Safety and Diagnostics

The TMAG6180-Q1 supports several device and system level diagnostics features to detect, monitor, and report failures during the device operation.

In the event of a failure, the TMAG6180-Q1 is placed in a FAULT state, where the outputs from the AMR sensors are placed in a high-impedance state. As shown in the *Application and Implementation* section, users can add pullup or pulldown resistors on SIN_P, SIN_N, COS_P, COS_N pins at the termination site (that is the microcontroller). The resistors are generally pulled up to supply voltage or pulled down to ground such that the ADC code on MCU is out of expected range. This state signal faults to the microcontroller.

In the fault state, the digital outputs Q0 and Q1 are not driven internally by the device.

The TMAG6180-Q1 performs the following device and system level checks:

6.3.6.1 Device Level Checks

- AMR signal path checks
  - AMR sensor bias check
  - AMR output signals common-mode check
  - Automatic gain control loop check
- Hall sensor signal path checks
  - Hall sensor bias and resistance check
  - Hall sensor comparator check
- Power management and supporting circuitry checks
  - Internal LDO undervoltage check
  - Internal clocks integrity check
- Internal memory integrity check (or a cyclic redundancy check–CRC)

6.3.6.2 System Level Checks

- V_{CC} undervoltage and overvoltage check
- Pin level opens and short checks

6.4 Device Functional Modes

6.4.1 Operating Modes

The TMAG6180-Q1 has primarily one mode of operation when all the conditions in the *Recommended Operating Conditions* are met. When the part detects an internal fault, the device switches into a fault mode (safe state). 図 6-12 shows the state transition for TMAG6180-Q1.

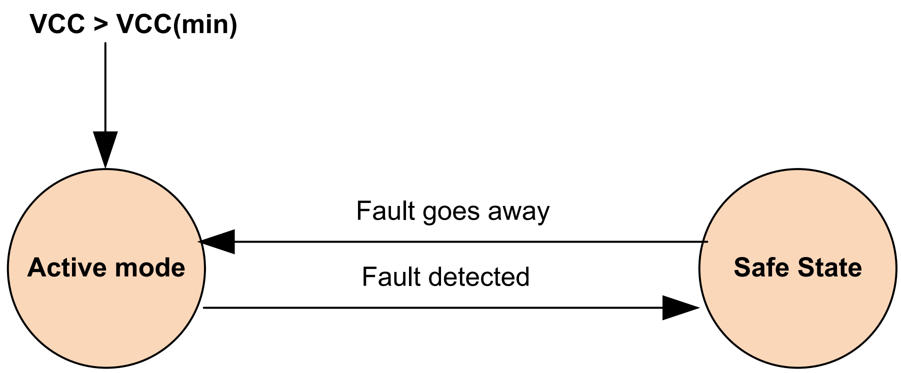

図 6-12. TMAG6180-Q1 State Transition Diagram

6.4.1.1 Active Mode

The device starts powering up after the V_{CC} supply crosses the minimum threshold as specified in the *Recommended Operating Conditions* table. The TMAG6180-Q1 enters the active mode, in which the SIN_P, SIN_N, COS_P and COS_N outputs actively provide the angle of the applied magnetic field. The average current consumption during the active conversion is I_{ACT}.

6.4.1.2 Fault Mode

The TMAG6180-Q1 supports extensive fault diagnostics as detailed in the *Diagnostics* section. When a fault is detected, the part enters the fault mode. In this mode, the AMR outputs and the Q0 and Q1 Hall outputs are placed in a high-impedance state.

7 Application and Implementation

注

Information in the following applications sections is not part of the TI component specification, and TI does not warrant its accuracy or completeness. TI's customers are responsible for determining suitability of components for their purposes, as well as validating and testing their design implementation to confirm system functionality.

7.1 Application Information

7.1.1 Power Supply as the Reference for External ADC

The AMR output signals of the TMAG6180-Q1 are ratiometric to the supply voltage, V_{CC}. This enables the external ADC to use the TMAG6180-Q1 supply voltage as a reference and eliminate the errors which can arise if a separate reference voltage is used. This also enables the optimization of the external ADC input range. TI therefore recommends to use the supply voltage (V_{CC}) as the reference for the external ADCs. TI also recommends using a 0.1µF bypass capacitor to minimize the noise on the power supply.

7.1.2 AMR Output Dependence on Airgap Distance

The AMR sensor is only sensitive to the direction of the applied magnetic field along the X-Y plane parallel to the chip surface. The applied magnetic field from a rotating magnet can vary based on the airgap distance between the TMAG6180-Q1 and the magnet.

As long the absolute magnetic field is above the minimum field listed in *Recommended Operating Conditions*, the angle accuracy from the AMR outputs are independent of the value of the applied magnetic field.

7.1.3 Calibration of Sensor Errors

The TMAG6180-Q1 is factory-calibrated for best angular accuracy. Some of the electrical errors from the sensor that impact the angle accuracy can be calibrated out for achieving the best performance. 図 7-1 shows the impact of the different sensor error parameters such as offset, amplitude mismatch and orthogonality error on the angle accuracy.

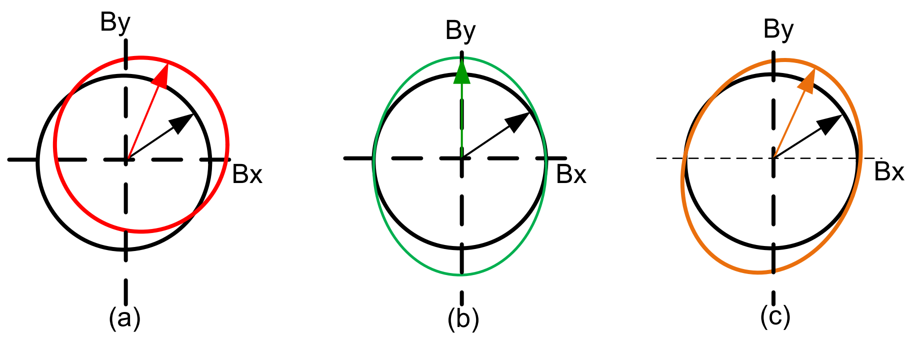

図 7-1. Angle Accuracy Impact Owing to Sensor Electrical Errors (a) Offset Error (b) Amplitude Mismatch Error (c) Orthogonality Error

Based on the parameters defined in *AMR Output Parameters*, use 式 16 to calculate the angle from the AMR sensors.

$$\theta = \frac{\text{arctan2}\left(\frac{A_{sin}\sin(2\theta) + V_{offset\_sin}}{A_{cos}\cos(2\theta) + V_{offset\_cos}}\right)}{2} \tag{16}$$

where

- V_{offset_sin} and V_{offset_cos} are the differential offsets of the sine and cosine outputs
- A_{sin} and A_{cos} are the differential amplitude of the sine and cosine outputs

The impact of the angle accuracy owing to the orthogonality error and the hysteresis errors is negligible for the TMAG6180-Q1 and can be ignored.

To calibrate the offset and amplitude mismatch errors, the magnetic field rotates over the entire range and the sine and cosine outputs are sampled continuously to obtain the minimum and maximum values of the outputs.

Users can calculate the average of the minimum and maximum values of the respective outputs across the full angle range to find the offset error of the sine and cosine outputs. Use 式 17 and 式 18 to calculate the offset correction parameters for sine and cosine.

$$V_{os\_sin\_cal} = \frac{V_{sin(max)} + V_{sin(min)}}{2} \tag{17}$$

$$V_{os\_cos\_cal} = \frac{V_{cos(max)} + V_{cos(min)}}{2} \tag{18}$$

Users can calculate the difference of the minimum and maximum values of the respective outputs across the full angle range to find the amplitude of the sine and cosine outputs. Use 式 19 to calculate the amplitude correction parameters for sine and cosine.

$$A_{corr} = 1 - \frac{V_{sin(max)} - V_{sin(min)}}{V_{cos(max)} - V_{cos(min)}} \tag{19}$$

7.2 Typical Application

The TMAG6180-Q1 AMR angle sensor can be used either in single-ended output mode or differential output mode. The TMAG6180-Q1 has the drive capability to either drive differential or single-ended SAR or Sigma Delta ADCs. Typically, an external microcontroller processes the AMR output signals to extract the angular position.

The differential-ended output mode is helpful to eliminate any common mode disturbances in the system. 図 7-2 shows a typical application circuit where the differential output signals SIN_P, SIN_N, COS_P and COS_N are all connected to the four single-ended ADC channels in the external microcontroller. If differential ADC channels are available, then they are recommended. The load capacitors and resistors must match each other to achieve high accuracy. When a fault is detected, the outputs are placed in high-impedance state. TI recommends using pulldown or pullup resistors so that the external microcontroller can detect this case.

The TMAG6180-Q1 can drive capacitive loads up to 10nF directly on the AMR output pins. The device can also drive up to 100m capacitive loads through a cable with capacitances of 100pF/m. The device can drive resistive loads with the ability to source and sink currents up to 1mA.

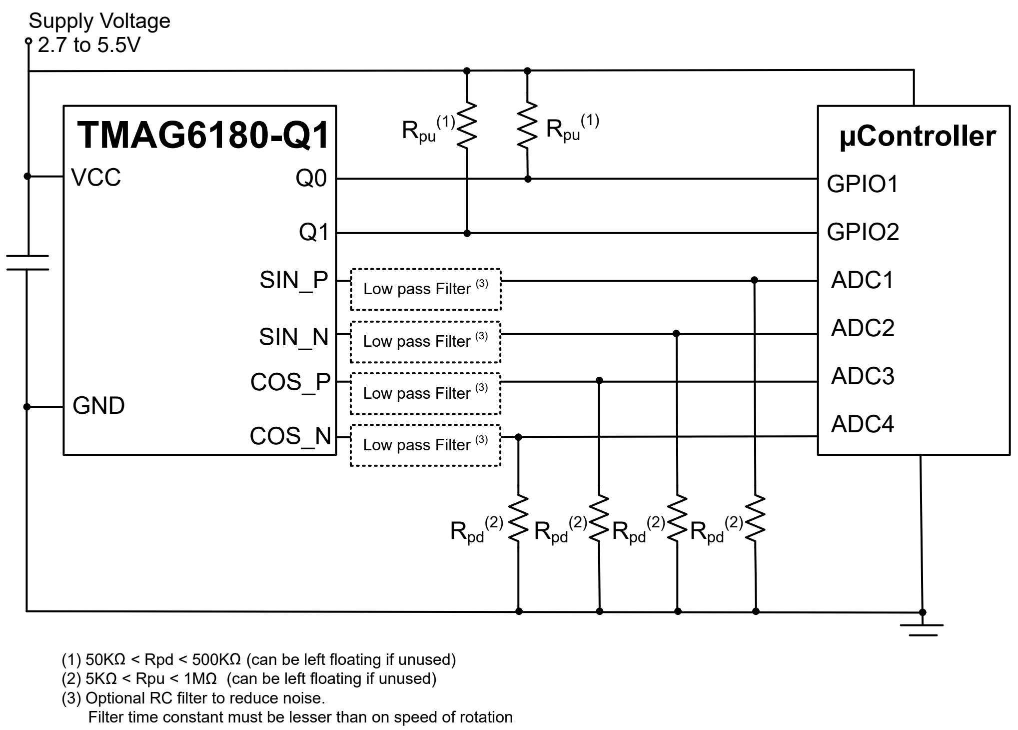

図 7-2. Application Diagram for TMAG6180-Q1 in Differential-Ended Output Mode

TI recommends using the single-ended output mode if the number of ADC ports in the microcontroller are limited, or if the number of wires from the sensor to the microcontroller must be kept to a minimum. 図 7-3 shows a typical application circuit where only the positive output channels (SIN_P and COS_P) are connected to single-ended ADCs. The unused output signals (SIN_N and COS_N) can be either left floating or connected to ground through a high resistance. In single-ended output mode, the dynamic range (SNR) and noise immunity is typically reduced compared to the differential output mode. To reduce noise on the outputs and for filtering EMC disturbances, an external low-pass filter such as a first order RC network can be used. The bandwidth of the external filter must be designed based on the rotation speed of the magnetic field to be detected. TI recommends adding pullup or pulldown resistors to ground on the single-ended outputs (SIN_P and COS_P) so the outputs are defined when the outputs are in high-impedance state. The supply voltage of the sensor is used as the reference for the ADCs in the microcontroller.

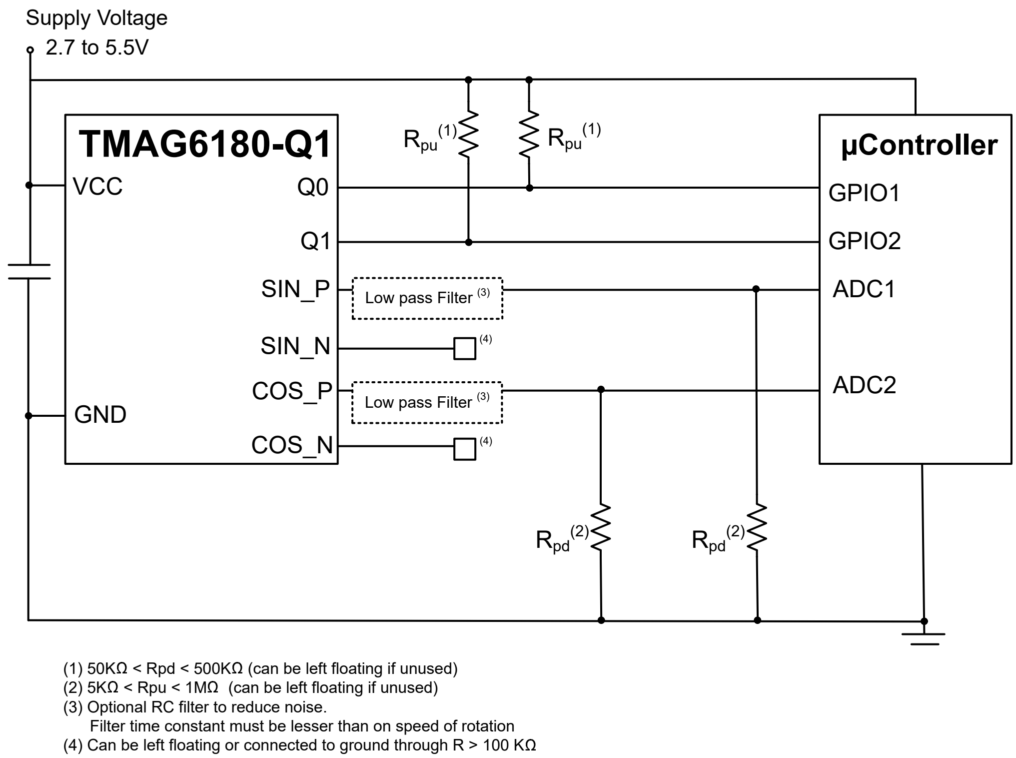

図 7-3. Application Diagram for TMAG6180-Q1 in Single-Ended Output Mode

7.2.1 Design Requirements

図 7-4 shows the center of the magnet aligned with the center of the sensor in a typical on-axis application.

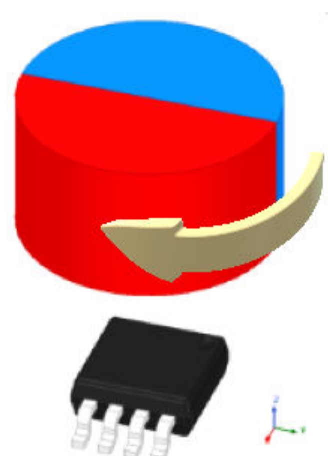

図 7-4. On axis measurement setup for TMAG6180-Q1

Use the parameters listed in 表 7-1 for this design example

表 7-1. Design Parameters

DESIGN PARAMETERS	ON-AXIS MEASUREMENT
V_{CC}	5V
Magnet	Cylinder: 4.7625mm diameter, 12.7mm thick, neodymium N52, Br = 1480
Output mode	Differential-ended
Maximum speed of the motor	8,000 RPM
Desired Angle error across temperature	< 1°
Magnet to sensor placement	End of shaft

7.2.2 Detailed Design Procedure

For accurate angle measurement, the center of the magnet is aligned to the center of the sensor with acceptable tolerances. Follow these steps to calibrate the sensor for best accuracy:

- Reference angle calibration - Set the reference angle based on the magnet alignment to the sensor. This error can be saved in the microcontroller for runtime absolute position calculation. This error is also known as Angle offset in a system.
- Electrical offset calibration - See *Calibration of Sensor Errors* for the offset calibration procedure. If the sensor cannot be rotated across the full range, then the electrical offsets cannot be calibrated.
- Amplitude mismatch calibration - See *Calibration of Sensor Errors* for the amplitude mismatch calibration procedure. If the sensor cannot be rotated across the full range, then the amplitude mismatch cannot be calibrated.
- To extend the angle range from the AMR sensor to 360 degrees, see *Extending the Angle Range to 360 Degrees*

7.2.2.1 Extending the Angle Range to 360 Degrees

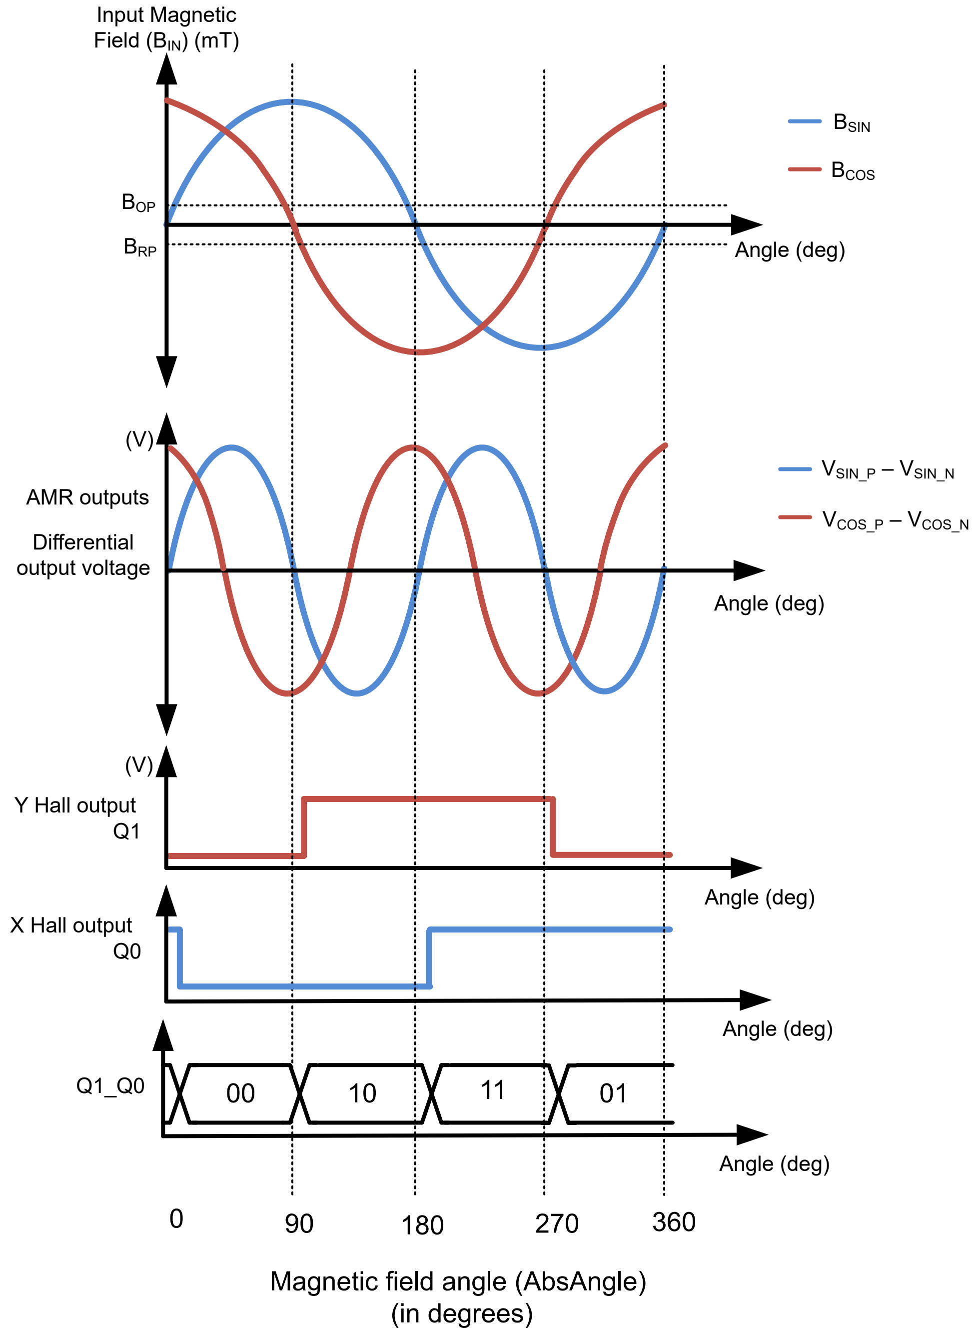

図 7-5. Magnetic Response for a 360° Input Field

図 7-5 shows the response of the differential-ended AMR output signals and the Hall outputs (Q_1, Q_0) for a 360° input magnetic field (B_{IN}).

An example code for extending the angle range from 180 degrees to 360 degrees using the Q0, Q1 outputs is given below ;

```
MeasuredAngle = arctan2(SIN, COS)/2 ; //0-180° angle range , Multiply by 180/Pi if the angle is returned in radians

MeasuredAngle = 90 - MeasuredAngle // If arctan2 function returns from -90deg to 90deg angle range, then use this to convert to 0-180° angle range

if (MeasuredAngle is between 45°–135°) then

(

if (Q1_Q0 is 00b or 10b) then //around 90°
```

```
    AbsAngle = MeasuredAngle ;
```

```
else //Q1_Q0 is 11b or 01b, around 270°
```

```
    AbsAngle = MeasuredAngle + 180°;
```

```
)

else //MeasuredAngle is 0°–45° or 135°-180°

(

if (Q1_Q0 is 00b or 01b) then //around 0°

(

if (MeasuredAngle ≥ 135°) then

AbsAngle = MeasuredAngle + 180°;
```

```
       else
         //MeasuredAngle is 0-45°
```

```
AbsAngle = MeasuredAngle;

)
```

```
    else
        //2Digital is 10b or 11b, around 180°
```

```
(

if (MeasuredAngle ≥ 135°) then

AbsAngle = MeasuredAngle;
```

```
       else
         //MeasuredAngle is 0-45°)
```

```
AbsAngle = MeasuredAngle + 180°;

)

)
```

7.2.3 Application Curves

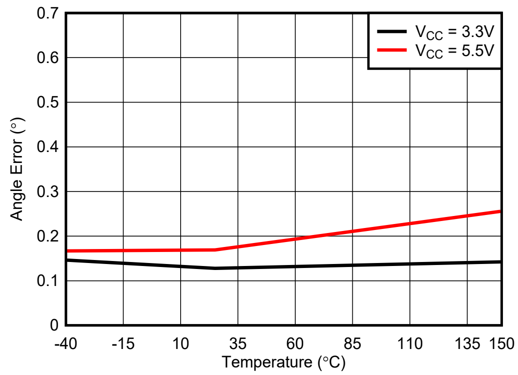

図 7-6. Angle Error with Dynamic Calibration

7.3 Power Supply Recommendations

A decoupling capacitor close to the device must be used to provide local energy with minimal inductance. TI recommends using a ceramic capacitor with a value of at least 0.1µF.

7.4 Layout

7.4.1 Layout Guidelines

Magnetic fields pass through most nonferromagnetic materials with no significant disturbance. Embedding magnetic sensors within plastic or aluminum enclosures and sensing magnets on the outside is common practice. Magnetic fields also easily pass through most printed circuit boards (PCBs), which makes placing the magnet on the opposite side of the PCB possible.

7.4.2 Layout Example

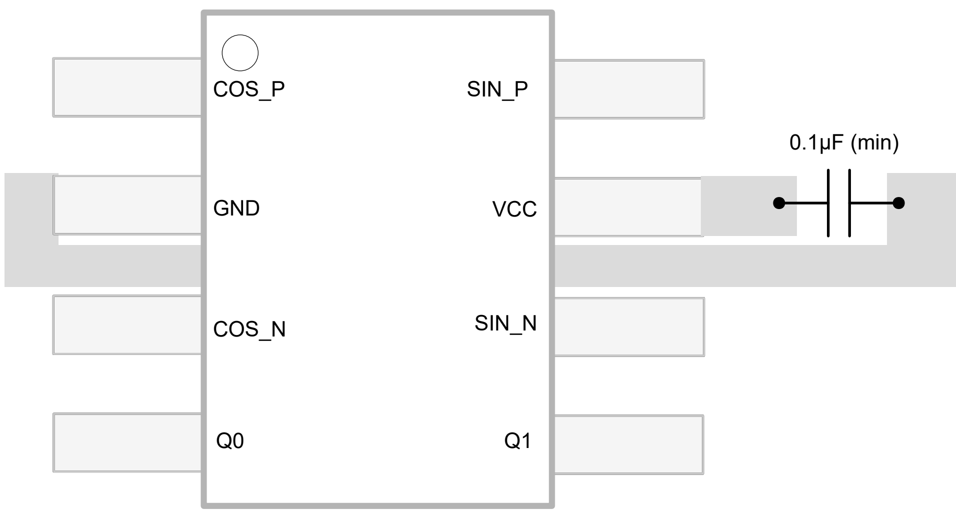

図 7-7. Layout Example With TMAG6180-Q1

8 Device and Documentation Support

8.1 ドキュメントの更新通知を受け取る方法

ドキュメントの更新についての通知を受け取るには、www.tij.co.jp のデバイス製品フォルダを開いてください。[通知] をクリックして登録すると、変更されたすべての製品情報に関するダイジェストを毎週受け取ることができます。 変更の詳細については、改訂されたドキュメントに含まれている改訂履歴をご覧ください。

8.2 サポート・リソース

テキサス・インスツルメンツ E2E™ サポート・フォーラムは、エンジニアが検証済みの回答と設計に関するヒントをエキスパートから迅速かつ直接得ることができる場所です。既存の回答を検索したり、独自の質問をしたりすることで、設計で必要な支援を迅速に得ることができます。

リンクされているコンテンツは、各寄稿者により「現状のまま」提供されるものです。これらはテキサス・インスツルメンツの仕様を構成するものではなく、必ずしもテキサス・インスツルメンツの見解を反映したものではありません。テキサス・インスツルメンツの使用条件を参照してください。

8.3 Trademarks

テキサス・インスツルメンツ E2E™ is a trademark of Texas Instruments.
すべての商標は、それぞれの所有者に帰属します。

8.4 静電気放電に関する注意事項

この IC は、ESD によって破損する可能性があります。テキサス・インスツルメンツは、IC を取り扱う際には常に適切な注意を払うことを推奨します。正しい取り扱いおよび設置手順に従わない場合、デバイスを破損するおそれがあります。

ESD による破損は、わずかな性能低下からデバイスの完全な故障まで多岐にわたります。精密な IC の場合、パラメータがわずかに変化するだけで公表されている仕様から外れる可能性があるため、破損が発生しやすくなっています。

PACKAGING INFORMATION

Orderable part number	Status (1)	Material type (2)	Package | Pins	Package qty | Carrier	RoHS (3)	Lead finish/ Ball material (4)	MSL rating/ Peak reflow (5)	Op temp (°C)	Part marking (6)
TMAG6180EDGKRQ1	Active	Production	VSSOP (DGK) | 8	2500 | LARGE T&R	Yes	SN	Level-1-260C-UNLIM	-40 to 150	6180
TMAG6180EDGKRQ1.B	Active	Production	VSSOP (DGK) | 8	2500 | LARGE T&R	Yes	SN	Level-1-260C-UNLIM	-40 to 150	6180

(1) **Status:** For more details on status, see our product life cycle.

(2) **Material type:** When designated, preproduction parts are prototypes/experimental devices, and are not yet approved or released for full production. Testing and final process, including without limitation quality assurance, reliability performance testing, and/or process qualification, may not yet be complete, and this item is subject to further changes or possible discontinuation. If available for ordering, purchases will be subject to an additional waiver at checkout, and are intended for early internal evaluation purposes only. These items are sold without warranties of any kind.

(3) **RoHS values:** Yes, No, RoHS Exempt. See the TI RoHS Statement for additional information and value definition.

(4) **Lead finish/Ball material:** Parts may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead finish/Ball material values may wrap to two lines if the finish value exceeds the maximum column width.

(5) **MSL rating/Peak reflow:** The moisture sensitivity level ratings and peak solder (reflow) temperatures. In the event that a part has multiple moisture sensitivity ratings, only the lowest level per JEDEC standards is shown. Refer to the shipping label for the actual reflow temperature that will be used to mount the part to the printed circuit board.

(6) **Part marking:** There may be an additional marking, which relates to the logo, the lot trace code information, or the environmental category of the part.

Multiple part markings will be inside parentheses. Only one part marking contained in parentheses and separated by a "~" will appear on a part. If a line is indented then it is a continuation of the previous line and the two combined represent the entire part marking for that device.
