

TPS255x 高精度、可変電流制限の電力分配スイッチ

1 特長

- USBの電流制限要件に適合
- 電流制限を500mA～5A (標準値)の間で変更可能
- 4.5Aにおいて±6.5%の電流制限精度
- 過電流への高速な応答: 3.5μs (標準値)
- 22mΩのハイサイドMOSFET
- 動作電圧: 2.5V～6.5V
- スタンバイ時の最大消費電流: 2μA
- ソフト・スタート内蔵
- システム・レベルの15kVおよび8kV ESD耐性
- UL認定済み: ファイルNo. E169910およびCB IEC60950-1-am2 ed2.0

2 アプリケーション

- USBポートおよびハブ
- デジタルTV
- セットトップ・ボックス
- VOIP電話

3 概要

TPS255xは、正確な電流制限が必要な、または大きな容量性負荷や短絡が発生する可能性があるアプリケーション向けの電力分配スイッチです。これらのデバイスは、外付け抵抗により電流制限スレッシュホールドを500mA～5A (標準値)の範囲でプログラム可能です。この電源スイッチの立ち上がりおよび立ち下がり時間は、オン/オフ時の電流サージを最小限に抑えるように制御されます。

TPS255xデバイスは、出力負荷が電流制限スレッシュホールドを超過したときに、定電流モードを使用して、出力電流を安全なレベルに制限します。過電流および過熱状態の間、**FAULT**ロジック出力はLOWにアサートされます。

6 Pin Configuration and Functions

TPS2556: $\overline{\text{EN}}$ pin is active low.
TPS2557: EN pin is active high.

Pin Functions

PIN			I/O	DESCRIPTION
NAME	TPS2556	TPS2557		
$\overline{\text{EN}}$	4	—	I	Enable input: Logic low turns on power switch. Applicable to the TPS2556.
EN	—	4	I	Enable input: Logic high turns on power switch. Applicable to the TPS2557.
$\overline{\text{FAULT}}$	8	8	O	Active-low open-drain output: Asserted during overcurrent or overtemperature conditions.
GND	1	1	—	Ground connection: Connect externally to PowerPAD.
ILIM	5	5	O	External resistor used to set current-limit threshold. TI recommends $20 \text{ k}\Omega \leq R_{\text{ILIM}} \leq 187 \text{ k}\Omega$.
IN	2, 3	2, 3	I	Input voltage: Connect a 0.1-μF or greater ceramic capacitor from IN to GND as close to the IC as possible.
OUT	6, 7	6, 7	O	Power-switch output.
PowerPAD™	PowerPAD	PowerPAD	—	Internally connected to GND. Used to heat-sink the part to the circuit board traces. Connect PowerPAD to GND pin externally.

7 Specifications

7.1 Absolute Maximum Ratings

over operating free-air temperature range (unless otherwise noted)⁽¹⁾⁽²⁾

		MIN	MAX	UNIT
Voltage	IN, OUT, EN or $\overline{\text{EN}}$, ILIM, and $\overline{\text{FAULT}}$ pins	−0.3	7	V
Voltage from IN to OUT		−7	7	V
Continuous output current		Internally limited		
Continuous $\overline{\text{FAULT}}$ sink current			25	mA
ILIM source current		Internally limited		
Continuous total power dissipation		See Thermal Information		
Maximum junction temperature		−40	OTSD2	°C
Storage temperature, T _{stg}		−65	150	°C

- (1) Stresses beyond those listed under *Absolute Maximum Ratings* may cause permanent damage to the device. These are stress ratings only, which do not imply functional operation of the device at these or any other conditions beyond those indicated under *Recommended Operating Conditions*. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.
- (2) Voltages are referenced to GND unless otherwise noted.

7.2 ESD Ratings

		VALUE	UNIT
V _(ESD) Electrostatic discharge	Human-body model (HBM), per ANSI/ESDA/JEDEC JS-001 ⁽¹⁾	±2000	V
	Charged-device model (CDM), per JEDEC specification JESD22-C101 ⁽²⁾	±500	
	IEC 61000-4-2 contact discharge ⁽³⁾	±8000	
	IEC 61000-4-2 air discharge ⁽³⁾	±15000	

- (1) JEDEC document JEP155 states that 500-V HBM allows safe manufacturing with a standard ESD control process.
- (2) JEDEC document JEP157 states that 250-V CDM allows safe manufacturing with a standard ESD control process.
- (3) Surges per EN61000-4-2, 1999 applied between USB and output ground of the TPS2556EVM (HPA423) evaluation module (see [Using the TPS2556EVM-423 and TPS2557EVM-423](#)). These were the test levels, not the failure threshold.

7.3 Recommended Operating Conditions

		MIN	MAX	UNIT
V _{IN}	Input voltage, IN	2.5	6.5	V
V _{EN}	Enable voltage	TPS2556	0	V
V _{EN}		TPS2557	0	
V _{IH}	High-level input voltage on Enable pin	1.1		V
V _{IL}	Low-level input voltage on Enable pin		0.66	
I _{OUT}	Continuous output current (OUT pin)	0	5	A
	Continuous $\overline{\text{FAULT}}$ sink current	0	10	mA
R _{ILIM}	Recommended resistor limit	20	187	kΩ
T _J	Operating virtual junction temperature	−40	125	°C

7.4 Thermal Information

THERMAL METRIC ⁽¹⁾		TPS255x	UNIT
		DRB (VSON)	
		8 PINS	
R _{θJA}	Junction-to-ambient thermal resistance	41.5	°C/W

9 Detailed Description

9.1 Overview

The TPS2556 and TPS2557 are current-limited, power-distribution switches using N-channel MOSFETs for applications where short circuits or heavy capacitive loads are encountered. These devices allow the user to program the current-limit threshold from 500 mA to 5 A (typical) through an external resistor. These devices incorporate an internal charge pump and the gate drive circuitry necessary to drive the N-channel MOSFET. The charge pump supplies power to the driver circuit and provides the necessary voltage to pull the gate of the MOSFET above the source. The charge pump operates from input voltages as low as 2.5 V and requires little supply current. The driver controls the gate voltage of the power switch. The driver incorporates circuitry that controls the rise and fall times of the output voltage to limit large current and voltage surges and provides built-in soft-start functionality. The TPS255x family limits the output current to the programmed current-limit threshold (I_{OS}) during an overcurrent or short-circuit event by reducing the charge pump voltage driving the N-channel MOSFET and operating it in the linear range of operation. The result of limiting the output current to I_{OS} reduces the output voltage at OUT because N-channel MOSFET is no longer fully enhanced.

9.2 Functional Block Diagram

Copyright © 2016, Texas Instruments Incorporated

9.3 Feature Description

9.3.1 Overcurrent Conditions

The TPS255x responds to overcurrent conditions by limiting their output current to I_{OS} . When an overcurrent condition is detected, the device maintains a constant output current and the output voltage reduces accordingly. Two possible overload conditions can occur.

The first condition is when a short circuit or partial short circuit is present when the device is powered up or enabled. The output voltage is held near zero potential with respect to ground and the TPS255x ramps the output current to I_{OS} . The TPS255x limits the current to I_{OS} until the overload condition is removed or the device begins to thermal cycle.

The second condition is when a short circuit, partial short circuit, or transient overload occurs while the device is enabled and powered on. The device responds to the overcurrent condition within time t_{IOS} (see Figure 16). The current-sense amplifier is overdriven during this time and momentarily disables the internal N-channel MOSFET. The current-sense amplifier recovers and ramps the output current to I_{OS} . Similar to the previous case, the TPS255x limits the current to I_{OS} until the overload condition is removed or the device begins to thermal cycle.

The TPS255s thermal cycles if an overload condition is present long enough to activate thermal limiting in any of the above cases. The device turns off when the junction temperature exceeds 135°C (minimum) while in current limit. The device remains off until the junction temperature cools 20°C (typical) and then restarts. The TPS255x cycles on and off until the overload is removed (see Figure 5).

Feature Description (continued)

9.3.2 $\overline{\text{FAULT}}$ Response

The $\overline{\text{FAULT}}$ open-drain output is asserted (active low) during an overcurrent or overtemperature condition. The TPS255s asserts the $\overline{\text{FAULT}}$ signal until the fault condition is removed and the device resumes normal operation. The TPS255s is designed to eliminate false $\overline{\text{FAULT}}$ reporting by using an internal delay *deglitch* circuit for overcurrent (9-ms typical) conditions without the need for external circuitry. This ensures that $\overline{\text{FAULT}}$ is not accidentally asserted due to normal operation such as starting into a heavy capacitive load. The deglitch circuitry delays entering and leaving current-limit induced fault conditions. The $\overline{\text{FAULT}}$ signal is not deglitched when the MOSFET is disabled due to an overtemperature condition but is deglitched after the device has cooled and begins to turn on. This unidirectional deglitch prevents $\overline{\text{FAULT}}$ oscillation during an overtemperature event.

9.3.3 Undervoltage Lockout (UVLO)

The undervoltage lockout (UVLO) circuit disables the power switch until the input voltage reaches the UVLO turnon threshold. Built-in hysteresis prevents unwanted on and off cycling due to input voltage droop during turnon.

9.3.4 Enable ($\overline{\text{EN}}$ OR EN)

The logic enable controls the power switch and device supply current. The supply current is reduced to less than 2- μA when a logic high is present on $\overline{\text{EN}}$ or when a logic low is present on EN. A logic low input on $\overline{\text{EN}}$ or a logic high input on EN enables the driver, control circuits, and power switch. The enable input is compatible with both TTL and CMOS logic levels.

9.3.5 Thermal Sense

The TPS255x self-protects by using two independent thermal sensing circuits that monitor the operating temperature of the power switch and disable operation if the temperature exceeds recommended operating conditions. The TPS255x operates in constant-current mode during an overcurrent conditions, which increases the voltage drop across power switch. The power dissipation in the package is proportional to the voltage drop across the power switch, which increases the junction temperature during an overcurrent condition. The first thermal sensor (OTSD) turns off the power switch when the die temperature exceeds 135°C (minimum) and the part is in current limit. Hysteresis is built into the thermal sensor, and the switch turns on after the device has cooled approximately 20°C.

The TPS255x also has a second ambient thermal sensor (OTSD2). The ambient thermal sensor turns off the power switch when the die temperature exceeds 155°C (minimum) regardless of whether the power switch is in current limit and turns on the power switch after the device has cooled approximately 20°C. The TPS255x continues to cycle off and on until the fault is removed.

9.4 Device Functional Modes

There are no other functional modes.

10 Application and Implementation

NOTE

Information in the following applications sections is not part of the TI component specification, and TI does not warrant its accuracy or completeness. TI's customers are responsible for determining suitability of components for their purposes. Customers should validate and test their design implementation to confirm system functionality.

10.1 Application Information

The TPS2556 and TPS2557 are precision power-distribution switches for applications where heavy capacitive loads and short circuits are expected to be encountered. The following design procedures can be used to choose the input and output capacitors as well as to calculate the current limit programming resistor value for a typical design. Additional application examples are provided including an auto-retry circuit and a two-level current limit circuit.

10.2 Typical Applications

10.2.1 Current-Limiting Power-Distribution Switch

Figure 18. Typical Current-Limiting Application

10.2.1.1 Design Requirements

For this example, use the parameters listed in [Table 1](#) as the input parameters.

Table 1. Design Parameters

PARAMETER	VALUE
Input voltage	5 V
Output voltage	5 V
Above a minimum current limit	3000 mA
Below a maximum current limit	5000 mA

10.2.1.2 Detailed Design Procedure

10.2.1.2.1 Input and Output Capacitance

Input and output capacitance improves the performance of the device; the actual capacitance must be optimized for the particular application. TI recommends a 0.1-μF or greater ceramic bypass capacitor between IN and GND as close to the device as possible for local noise decoupling for all applications. This precaution reduces ringing on the input due to power-supply transients. Additional input capacitance may be needed on the input to reduce voltage overshoot from exceeding the absolute-maximum voltage of the device during heavy transient conditions. This is especially important during bench testing when long, inductive cables are used to connect the evaluation board to the bench power supply.

Output capacitance is not required, but TI recommends placing a high-value electrolytic capacitor on the output pin when large transient currents are expected on the output.

10.2.1.2.2 Programming the Current-Limit Threshold

The overcurrent threshold is user programmable through an external resistor. The TPS255x uses an internal regulation loop to provide a regulated voltage on the ILIM pin. The current-limit threshold is proportional to the current sourced out of ILIM. The recommended 1% resistor for R_{ILIM} is $20\text{ k}\Omega \leq R_{ILIM} \leq 187\text{ k}\Omega$ to ensure stability of the internal regulation loop. Many applications require that the minimum current limit is above a certain current level or that the maximum current limit is below a certain current level, so it is important to consider the tolerance of the overcurrent threshold when selecting a value for R_{ILIM} . Equation 1 approximates the resulting overcurrent threshold for a given external resistor value (R_{ILIM}). See [Electrical Characteristics](#) for specific current limit settings. The traces routing the R_{ILIM} resistor to the TPS255x must be as short as possible to reduce parasitic effects on the current-limit accuracy.

$$\begin{aligned} I_{OSmax}(\text{mA}) &= \frac{99038\text{V}}{R_{ILIM}^{0.947}\text{k}\Omega} \\ I_{OSnom}(\text{mA}) &= \frac{111704\text{V}}{R_{ILIM}^{1.0028}\text{k}\Omega} \\ I_{OSmin}(\text{mA}) &= \frac{127981\text{V}}{R_{ILIM}^{1.0708}\text{k}\Omega} \end{aligned} \quad (1)$$

Figure 19. Current-Limit Threshold vs R_{ILIM}

10.2.1.2.2.1 Designing Above a Minimum Current Limit

Some applications require that current limiting cannot occur below a certain threshold. For this example, assume that 3 A must be delivered to the load so that the minimum desired current-limit threshold is 3000 mA. Use the I_{OS} equations and [Figure 19](#) to select R_{ILIM} .

$$\begin{aligned}
 I_{OSmin}(\text{mA}) &= 3000\text{mA} \\
 I_{OSmin}(\text{mA}) &= \frac{127981\text{V}}{R_{ILIM}^{1.0708}\text{k}\Omega} \\
 R_{ILIM}(\text{k}\Omega) &= \left(\frac{127981\text{V}}{I_{OSmin}\text{mA}} \right)^{\frac{1}{1.0708}} \\
 R_{ILIM}(\text{k}\Omega) &= 33.3\text{k}\Omega
 \end{aligned} \tag{2}$$

Select the closest 1% resistor less than the calculated value: $R_{ILIM} = 33.2\text{ k}\Omega$. This sets the minimum current-limit threshold at 3000 mA. Use the I_{OS} equations, [Figure 19](#), and the previously calculated value for R_{ILIM} to calculate the maximum resulting current-limit threshold.

$$\begin{aligned}
 R_{ILIM}(\text{k}\Omega) &= 33.2\text{k}\Omega \\
 I_{OSmax}(\text{mA}) &= \frac{99038\text{V}}{R_{ILIM}^{0.947}\text{k}\Omega} \\
 I_{OSmax}(\text{mA}) &= \frac{99038\text{V}}{33.2^{0.947}\text{k}\Omega} \\
 I_{OSmax}(\text{mA}) &= 3592\text{mA}
 \end{aligned} \tag{3}$$

The resulting maximum current-limit threshold is 3592 mA with a 33.2-k Ω resistor.

10.2.1.2.2.2 Designing Below a Maximum Current Limit

Some applications require that current limiting must occur below a certain threshold. For this example, assume that the desired upper current-limit threshold must be below 5000 mA to protect an upstream power supply. Use the I_{OS} equations and [Figure 19](#) to select R_{ILIM} .

$$\begin{aligned}
 I_{OSmax}(\text{mA}) &= 5000\text{mA} \\
 I_{OSmax}(\text{mA}) &= \frac{99038\text{V}}{R_{ILIM}^{0.947}\text{k}\Omega} \\
 R_{ILIM}(\text{k}\Omega) &= \left(\frac{99038\text{V}}{I_{OSmax}\text{mA}} \right)^{\frac{1}{0.947}} \\
 R_{ILIM}(\text{k}\Omega) &= 23.4\text{k}\Omega
 \end{aligned} \tag{4}$$

Select the closest 1% resistor greater than the calculated value: $R_{ILIM} = 23.7\text{ k}\Omega$. This sets the maximum current-limit threshold at 5000 mA. Use the I_{OS} equations, [Figure 19](#), and the previously calculated value for R_{ILIM} to calculate the minimum resulting current-limit threshold.

$$\begin{aligned}
 R_{ILIM}(\text{k}\Omega) &= 23.7\text{k}\Omega \\
 I_{OSmin}(\text{mA}) &= \frac{127981\text{V}}{R_{ILIM}^{1.0708}\text{k}\Omega} \\
 I_{OSmin}(\text{mA}) &= \frac{127981\text{V}}{23.7^{1.0708}\text{k}\Omega} \\
 I_{OSmin}(\text{mA}) &= 4316\text{mA}
 \end{aligned} \tag{5}$$

The resulting minimum current-limit threshold is 4316 mA with a 23.7-k Ω resistor.

10.2.1.2.2.3 Accounting for Resistor Tolerance

The analysis of resistor selection focused only on the TPS255x performance and assumed an exact resistor value. However, resistors sold in quantity are not exact and are bounded by an upper and lower tolerance centered around a nominal resistance. The additional R_{ILIM} resistance tolerance directly affects the current-limit threshold accuracy at a system level. Table 2 shows a process that accounts for worst-case resistor tolerance assuming 1% resistor values. Using the selection process outlined, determine the upper and lower resistance bounds of the selected resistor. Then calculate the upper and lower resistor bounds to determine the threshold limits. It is important to use tighter tolerance resistors (0.5% or 0.1%) when precision current limiting is desired.

Table 2. Common R_{ILIM} Resistor Selections

DESIRED NOMINAL CURRENT LIMIT (mA)	IDEAL RESISTOR (k Ω)	CLOSEST 1% RESISTOR (k Ω)	RESISTOR BOUNDS (k Ω)		I_{OS} ACTUAL LIMITS (mA)

10.2.1.2.3 Auto-Retry Functionality

Some applications require that an overcurrent condition disables the part momentarily during a fault condition and re-enables after a pre-set time. This *auto-retry* functionality can be implemented with an external resistor and capacitor. During a fault condition, \overline{FAULT} pulls EN low. The part is disabled when EN is pulled below the turn-off threshold, and \overline{FAULT} goes high impedance allowing C_{RETRY} to begin charging. The part re-enables when the voltage on EN reaches the turn-on threshold. The auto-retry time is determined by the resistor and capacitor time constant. The part continues to cycle in this manner until the fault condition is removed. The time between retries is given in Equation 6.

$$T_{BR} = -R_{FAULT} \times C_{RETRY} \times \ln(1 - V_{EN} / (V_{IN} - V_{OL})) + T_{FAULT}$$

where

- V_{EN} is the EN pin typical threshold voltage
- V_{IN} is the input voltage
- V_{OL} is the \overline{FAULT} pin typical saturation voltage
- T_{FAULT} is the internal \overline{FAULT} typical deglitch time

(6)

The retry duty cycle is calculated with Equation 7, and the average current is $D \times I_{OS}$.

$$D = T_{FAULT} / (T_{FAULT} + T_{BR})$$

(7)

Figure 20. Auto-Retry Functionality

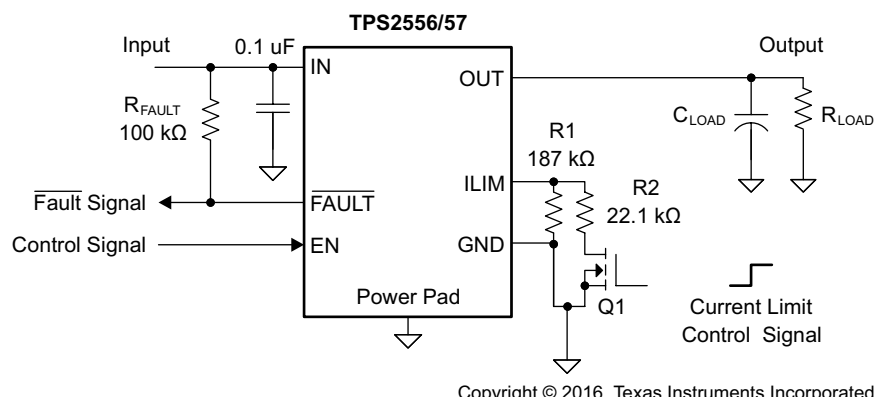

Some applications require auto-retry functionality and the ability to enable and disable with an external logic signal. The figure below shows how an external logic signal can drive EN through R_{FAULT} and maintain auto-retry functionality. The resistor and capacitor time constant determines the auto-retry time-out period.

Figure 21. Auto-Retry Functionality With External EN Signal

10.2.1.2.4 Two-Level Current-Limit Circuit

Copyright © 2016, Texas Instruments Incorporated

Figure 22. Two-Level Current-Limit Circuit

Some applications require different current-limit thresholds depending on external system conditions. [Figure 22](#) shows an implementation for an externally-controlled, two-level current-limit circuit. The current-limit threshold is set by the total resistance from ILIM to GND (see [Programming the Current-Limit Threshold](#)). A logic-level input enables and disables MOSFET Q1 and changes the current-limit threshold by modifying the total resistance from ILIM to GND. Additional MOSFET and resistor combinations can be used in parallel to Q1 and R2 to increase the number of additional current-limit levels.

NOTE

ILIM must never be driven directly with an external signal.

10.2.1.3 Application Curve

In [Figure 23](#), the load current setpoint is 5.05 A, as programmed by the 22.1-kΩ resistor. Load current is stepped mildly from approximately 4.9 A to 5.2 A. The internal FAULT timer runs and after 9 ms, FAULT goes low and current continues to be regulated at approximately 5 A. Due to the high power dissipation within the device, thermal cycling occurs.

In [Figure 24](#), the load current setpoint is 597 mA, as programmed by the 187-kΩ resistor. Load current is stepped mildly from approximately 560 mA to 620 mA. The internal FAULT timer runs and after 9 ms, FAULT goes low and current continues to be regulated at approximately 580 mA.

Figure 23. 5-A Current Limit With Thermal Cycling

Figure 24. 600-mA Current Limit Without Thermal Cycling

11 Power Supply Recommendations

The TPS255x operates from 2.5 V to 6.5 V. TI recommends operating from either a 3.3-V \pm 10% or 5-V \pm 10% power supply. The load capacity of the power supply must be greater than the maximum current limit (I_{OS}) setting of the TPS255x.

12 Layout

12.1 Layout Guidelines

- TI recommends placing the 100-nF bypass capacitor near the IN and GND pins, and make the connections using a low-inductance trace.
- TI recommends placing a high-value electrolytic capacitor and a 100-nF bypass capacitor on the output pin when large transient currents are expected on the output.
- The traces routing the R_{ILIM} resistor to the device must be as short as possible to reduce parasitic effects on the current limit accuracy.
- The PowerPAD must be directly connected to PCB ground plane using wide and short copper trace.

12.2 Layout Example

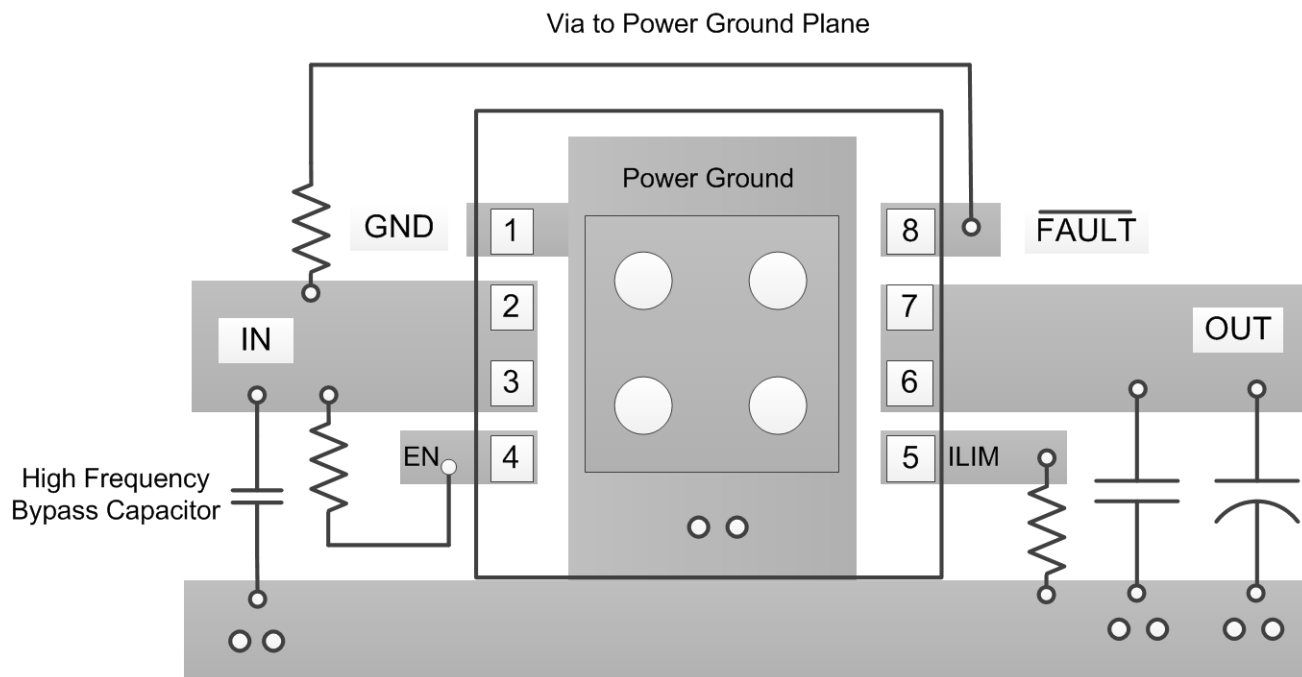

Figure 25. TPS255x Layout Example

12.3 Thermal Considerations

The low on-resistance of the N-channel MOSFET allows small surface-mount packages to pass large currents. It is good design practice to estimate power dissipation and junction temperature. This analysis gives an approximation for calculating junction temperature based on the power dissipation in the package. However, thermal analysis is strongly dependent on additional system level factors. Such factors include air flow, board layout, copper thickness and surface area, and proximity to other devices dissipating power. Good thermal design practice must include all system level factors in addition to individual component analysis.

Begin by determining the $r_{DS(ON)}$ of the N-channel MOSFET relative to the input voltage and operating temperature. As an initial estimate, use the highest operating ambient temperature of interest and read $r_{DS(ON)}$ from the typical characteristics graph. Using this value, the power dissipation can be calculated by [Equation 8](#).

$$P_D = r_{DS(ON)} \times I_{OUT}^2$$

where

- P_D = Total power dissipation (W)
 - $r_{DS(ON)}$ = Power switch on-resistance (Ω)
 - I_{OUT} = Maximum current-limit threshold (A)
- (8)

Finally, calculate the junction temperature with [Equation 9](#).

$$T_J = P_D \times R_{\theta JA} + T_A$$

where

- T_A = Ambient temperature ($^{\circ}\text{C}$)
 - $R_{\theta JA}$ = Thermal resistance ($^{\circ}\text{C}/\text{W}$)
 - P_D = Total power dissipation (W)
- (9)

Compare the calculated junction temperature with the initial estimate. If they are not within a few degrees, repeat the calculation using the *refined* $r_{DS(ON)}$ from the previous calculation as the new estimate. Two or three iterations are generally sufficient to achieve the desired result. The final junction temperature is highly dependent on thermal resistance, and thermal resistance is highly dependent on the individual package and board layout.

⁽¹⁾ **Status:** For more details on status, see our [product life cycle](#).

⁽²⁾ **Material type:** When designated, preproduction parts are prototypes/experimental devices, and are not yet approved or released for full production. Testing and final process, including without limitation quality assurance, reliability performance testing, and/or process qualification, may not yet be complete, and this item is subject to further changes or possible discontinuation. If available for ordering, purchases will be subject to an additional waiver at checkout, and are intended for early internal evaluation purposes only. These items are sold without warranties of any kind.

⁽³⁾ **RoHS values:** Yes, No, RoHS Exempt. See the [TI RoHS Statement](#) for additional information and value definition.

⁽⁴⁾ **Lead finish/Ball material:** Parts may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead finish/Ball material values may wrap to two lines if the finish value exceeds the maximum column width.

⁽⁵⁾ **MSL rating/Peak reflow:** The moisture sensitivity level ratings and peak solder (reflow) temperatures. In the event that a part has multiple moisture sensitivity ratings, only the lowest level per JEDEC standards is shown. Refer to the shipping label for the actual reflow temperature that will be used to mount the part to the printed circuit board.

⁽⁶⁾ **Part marking:** There may be an additional marking, which relates to the logo, the lot trace code information, or the environmental category of the part.

Multiple part markings will be inside parentheses. Only one part marking contained in parentheses and separated by a "~" will appear on a part. If a line is indented then it is a continuation of the previous line and the two combined represent the entire part marking for that device.
