

TPS3870-Q1 時間遅延および手動リセット搭載の過電圧リセット IC

1 特長

- 車載アプリケーション用に認定済み
- 下記内容で AEC-Q100 認定済み
 - デバイス温度グレード 1: 動作時周囲温度 -40°C ~ +125°C
 - デバイス HBM ESD 分類レベル 2
 - デバイス CDM ESD 分類レベル C7B
- 入力電圧範囲: 1.7V ~ 5.5V
- 低電圧誤動作防止 (UVLO): 1.7V
- 低い静止電流: 7μA (最大値)
- スレッシュホールドの高い精度
 - ± 0.25% (標準値)
 - ± 0.7% (-40°C ~ +125°C)
- 固定スレッシュホールド・レベル
 - 50mV 刻みで 500mV ~ 1.3V
 - 1.5V, 1.8V, 2.5V, 2.8V, 2.9V, 3.3V, 5V
- 電圧スレッシュホールド・レベルをユーザーが変更可能
- 内部的なグリッチ耐性およびヒステリシス
- 3% から 7% まで 1% 刻みの許容値が利用可能
- 固定時間遅延オプション: 50μs, 1ms, 5ms, 10ms, 20ms, 100ms, 200ms
- 単一の外付けコンデンサで時間遅延をプログラム可能なオプション
- オープン・ドレイン、アクティブ LOW の OV モ

過電圧検出機能を内蔵

ニタ

- $\overline{\text{RESET}}$ 電圧のラッチ出力モード

2 アプリケーション

- 先進運転支援システム (ADAS)
- カメラ
- センサ・フュージョン
- HEV/EV
- FPGA、ASIC、DSP ベースのシステム

3 概要

TPS3870-Q1 は統合された過電圧 (OV) モニタまたはリセット IC で、業界でも最も小さい 6 ピンの DSE パッケージに搭載されています。この高精度の電圧スーパーバイザは、低電圧電源レールで動作する、電源誤差の余地が小さいシステムに理想的です。低いスレッシュホールドのヒステリシスにより、監視対象の電源電圧が通常の動作範囲内であるときに誤ってリセット信号が発生するのを防止します。内部的なグリッチ耐性およびノイズ・フィルタにより、信号エラーによる誤ったリセットも回避されます。

5 概要（続き）

TPS3870-Q1 は、外付け抵抗なしで過電圧リセットのスレッショルドを設定できるため、総合的な精度、コスト、ソリューション・サイズをさらに最適化でき、安全性システムの信頼性も向上します。各デバイスの設計には2つのリセット遅延時間が設定されており、コンデンサ時間(CT)ピンを使用してどちらかを選択できるほか、コンデンサを接続してリセット遅延を調整することもできます。SENSE入力ピンとVDDピンが別になっていることで、高信頼性システムで求められる冗長性を実現できます。

このデバイスは、静止電流仕様がわずか $4.5\mu\text{A}$ です (標準値)。TPS3870-Q1 は車載用アプリケーションに適しており、AEC-Q100 グレード 1 に認定済みです。

6 Device Comparison Table

[Table 1](#) shows the released versions of the TPS3870-Q1, including the nominal overvoltage thresholds. For all possible voltages, threshold tolerance, time delays, and threshold options, see [表 6](#). Contact TI sales representatives or on TI's [E2E forum](#) for details and availability of other options; minimum order quantities apply.

Table 1. Device Comparison Table

PART NUMBER	V _{MON}	TIME DELAY (ms)			THRESHOLD TOLERANCE

TPS3870J4330DSERQ1	3.30 V	Programmable	10 ms	200 ms	4%

7 Pin Configuration and Functions

Pin Functions

PIN		I/O	DESCRIPTION
NO.	NAME		
1	SENSE	I	Input for the monitored supply voltage rail. When the SENSE voltage goes above the overvoltage threshold, the $\overline{\text{RESET}}$ pin is driven low. Connect to VDD pin if monitoring VDD supply voltage.
2	VDD	I	Supply voltage input pin. Good analog design practice is to place a 0.1- μF ceramic capacitor close to this pin.
3	CT	I	Capacitor time delay pin. The CT pin offers two fixed time delays by connecting CT pin to VDD or leaving it floating. Delay time can be programmed by connecting an external capacitor reference to ground.
4	$\overline{\text{RESET}}$	O	Active-low, open-drain output. This pin goes low when the SENSE voltage rises above the internally overvoltage threshold ($V_{\text{IT}+}$). See the timing diagram in Figure 19 for more details. Connect this pin to a pull-up resistor terminated to the desired pull-up voltage.
5	GND	—	Ground
6	$\overline{\text{MR}}$	I	Manual reset (MR), pull this pin to a logic low ($V_{\overline{\text{MR}}\text{L}}$) to assert a reset signal. After the $\overline{\text{MR}}$ pin is deasserted the output goes high after the reset delay time(t_D) expires. $\overline{\text{MR}}$ can be left floating when not in use.

8 Specifications

8.1 Absolute Maximum Ratings

over operating free-air temperature range (unless otherwise noted)⁽¹⁾

		MIN	MAX	UNIT
Voltage	V_{DD}	-0.3	6	V
Voltage	V_{RESET}	-0.3	6	V
Voltage	V_{CT}	-0.3	6	V
Voltage	V_{SENSE}	-0.3	6	V
Voltage	V_{MR}	-0.3	6	V
Current	I_{RESET}		±40	mA
Temperature ⁽²⁾	Continuous total power dissipation	See the Thermal Information		
	Operating junction temperature, T_J	-40	150	°C
	Operating free-air temperature, T_A	-40	150	°C
	Storage temperature, T_{stg}	-65	150	°C

- (1) Stresses beyond values listed under Absolute Maximum Ratings may cause permanent damage to the device. These are stress ratings only, which do not imply functional operation of the device at these or any other conditions beyond those indicated under Recommended Operating Conditions. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.
- (2) As a result of the low dissipated power in this device, it is assumed that $T_J = T_A$.

8.2 ESD ratings

			VALUE	UNIT
$V_{(ESD)}$	Electrostatic discharge	Human-body model (HBM), per ANSI/ESDA/JEDEC JS-001 ⁽¹⁾	±2000	V
		Charged-device model (CDM), per AEC Q100-011	±500	
		Corner pins	±750	

- (1) AEC Q100-002 indicates that HBM stressing shall be in accordance with the ANSI/ESDA/JEDEC JS-001 specification

8.3 Recommended Operating Conditions

		MIN	NOM	MAX	UNIT
V_{DD}	Supply pin voltage	1.7		5.5	V
V_{SENSE}	Input pin voltage	0		5.5	V
V_{CT}	CT pin voltage ⁽¹⁾ ⁽²⁾			V_{DD}	V
V_{RESET}	Output pin voltage	0		5.5	V
V_{MR}	$\overline{MR}$ pin Voltage ⁽³⁾	0		5.5	V
I_{RESET}	Output pin current	0.3		10	mA
T_J	Junction temperature (free-air temperature)	-40		125	°C

- (1) CT pin connected to V_{DD} pin requires a pullup resistor; 10 kΩ is recommended.
- (2) The maximum rating is V_{DD} or 5.5 V, whichever is smaller.
- (3) If the logic signal driving $\overline{MR}$ is less than V_{DD} , then additional current flows into V_{DD} and out of $\overline{MR}$.

8.4 Thermal Information

THERMAL METRIC ⁽¹⁾		TPS3870-Q1	UNIT
		DSE (WSON)	
		PINS	
R _{θJA}	Junction-to-ambient thermal resistance	184.2	°C/W
R _{θJC(top)}	Junction-to-case (top) thermal resistance	30.6	°C/W
R _{θJB}	Junction-to-board thermal resistance	86.4	°C/W
Ψ _{JT}	Junction-to-top characterization parameter	13.4	°C/W
Ψ _{JB}	Junction-to-board characterization parameter	86.1	°C/W
R _{θJC(bot)}	Junction-to-case (bottom) thermal resistance	N/A	°C/W

(1) For more information about traditional and new thermal metrics, see the [Semiconductor and IC Package Thermal Metrics](#) application report.

8.5 Electrical Characteristics

At 1.7 V ≤ V_{DD} ≤ 5.5 V, CT = $\overline{\text{MR}}$ = Open, $\overline{\text{RESET}}$ Voltage (V_{RESET}) = 10 kΩ to V_{DD}, $\overline{\text{RESET}}$ load = 10 pF, and over the operating free-air temperature range of – 40°C to 125°C, unless otherwise noted. Typical values are at T_J = 25°C, typical conditions at V_{DD} = 3.3 V.

PARAMETER		TEST CONDITIONS	MIN	TYP	MAX	UNIT
V _{DD}	Supply Voltage		1.7		5.5	V
UVLO	Under Voltage Lockout ⁽¹⁾	V _{DD} falling below 1.7 V	1.2		1.7	V
V _{POR}	Power on reset voltage ⁽²⁾	V _{OL(max)} = 0.25 V, I _{OUT} = 15 μA			1	V
V _{IT+(OV)}	Positive- going threshold accuracy		-0.7	±0.25	0.7	%
V _{HYS}	Hysteresis Voltage ⁽³⁾		0.3	0.55	0.8	%
I _{DD}	Supply current	V _{DD} ≤ 5.5 V		4.5	7	μA
I _{SENSE}	Input current, SENSE pin	V _{SENSE} = 5 V		1	1.5	μA
V _{OL}	Low level output voltage	V _{DD} = 1.7 V, I _{OUT} = 0.4 mA			250	mV
		V _{DD} = 2 V, I _{OUT} = 3 mA			250	mV
		V _{DD} = 5 V, I _{OUT} = 5 mA			250	mV
I _{LKG}	Open drain output leakage current	V _{DD} = V _{RESET} = 5.5 V			300	nA
V _{MR_L}	$\overline{\text{MR}}$ logic low input				0.3	V
V _{MR_H}	$\overline{\text{MR}}$ logic high input		1.4			V
V _{CT_H}	High level CT pin voltage		1.4			V
R _{MR}	Manual reset Internal pullup resistance			100		KΩ
I _{CT}	CT pin charge current		337	375	413	nA
V _{CT}	CT pin comparator threshold voltage ⁽⁴⁾		1.133	1.15	1.167	V

(1) $\overline{\text{RESET}}$ pin is driven low when V_{DD} falls below UVLO.

(2) V_{POR} is the minimum V_{DD} voltage level for a controlled output state.

(3) Hysteresis is with respect of the trip point (V_{IT+(OV)})

(4) V_{CT} voltage refers to the comparator threshold voltage that measures the voltage level of the external capacitor at CT pin.

8.6 Timing Requirements

At 1.7 V ≤ V_{DD} ≤ 5.5 V, CT = $\overline{\text{MR}}$ = Open, $\overline{\text{RESET}}$ Voltage (V_{RESET}) = 10 kΩ to V_{DD}, $\overline{\text{RESET}}$ load = 10 pF, and over the operating free-air temperature range of – 40°C to 125°C, unless otherwise noted. Typical values are at T_J = 25°C, typical conditions at V_{DD} = 3.3 V.

			MIN	NOM	MAX	UNIT
t _D	Reset time delay, TPS3870J	CT = Open	7	10	13	ms
t _D	Reset time delay, TPS3870J	CT = 10 kΩ to V _{DD}	140	200	260	ms
t _D	Reset time delay, TPS3870K	CT = Open	0.7	1	1.3	ms
t _D	Reset time delay, TPS3870K	CT = 10 kΩ to V _{DD}	14	20	26	ms
t _D	Reset time delay, TPS3870L	CT = Open	3.5	5	6.5	ms
t _D	Reset time delay, TPS3870L	CT = 10 kΩ to V _{DD}	70	100	130	ms

Timing Requirements (continued)

At $1.7\text{ V} \leq V_{DD} \leq 5.5\text{ V}$, $CT = \overline{MR} = \text{Open}$, $\overline{RESET}$ Voltage (V_{RESET}) = $10\text{ k}\Omega$ to V_{DD} , $\overline{RESET}$ load = 10 pF , and over the operating free-air temperature range of -40°C to 125°C , unless otherwise noted. Typical values are at $T_J = 25^\circ\text{C}$, typical conditions at $V_{DD} = 3.3\text{ V}$.

			MIN	NOM	MAX	UNIT
t_D	Reset time delay, TPS3870M	$CT = 10\text{ k}\Omega$ to V_{DD} $CT = \text{Open}$		50		μs
t_{PD}	Propagation detect delay ⁽¹⁾⁽²⁾			15	30	μs
t_R	Output rise time ⁽¹⁾⁽³⁾			2.2		μs
t_F	Output fall time ⁽¹⁾⁽³⁾			0.2		μs
t_{SD}	Startup delay ⁽⁴⁾			300		μs
$t_{GI} (V_{IT+})$	Glitch Immunity overvoltage $V_{IT+(OV)}$, 5% Overdrive ⁽¹⁾			3.5		μs
$t_{GI} (\overline{MR})$	Glitch Immunity $\overline{MR}$ pin				25	ns
$t_{PD} (\overline{MR})$	Propagation delay from $\overline{MR}$ low to assert $\overline{RESET}$			500		ns
t_{MR_W}	$\overline{MR}$ pin pulse width duration to assert $\overline{RESET}$		1			μs
$t_D (\overline{MR})$	$\overline{MR}$ reset time delay			t_D		ms

- (1) 5% Overdrive from threshold. Overdrive % = $[V_{SENSE} - V_{IT+(OV)}] / V_{IT+(OV)}$
- (2) t_{PD} measured from threshold trip point $V_{IT+(OV)}$ to $\overline{RESET}$ V_{OL} voltage
- (3) Output transitions from V_{OL} to 90% for rise times and 90% to V_{OL} for fall times.
- (4) During the power-on sequence, V_{DD} must be at or above $V_{DD(MIN)}$ for at least $t_{SD} + t_D$ before the output is in the correct state.

1. Voltage Threshold and Hysteresis Accuracy

- (1) $V_{DD} = 2\text{ V}$, $R_{PU} = 10\text{ k}\Omega$ to V_{DD}
- (2) Variant M (time delay bypass) has a $\sim 40\text{ }\mu\text{s}$ pulse at $\overline{\text{RESET}}$ pin during power up window, this is present only when the power cycle off time is longer than 10 seconds, this behavior will not occur if SENSE pin is within window of operation during V_{DD} power up.

9 Detailed Description

9.1 Overview

The TPS3870-Q1 family of devices uses a voltage comparator and a precision voltage reference for overvoltage detection. The TPS3870-Q1 features a highly accurate threshold voltage ($\pm 0.7\%$ over temperature) and a variety of voltage threshold variants.

The TPS3870-Q1 includes the resistors used to set the overvoltage threshold internal to the device. These internal resistors allow for lower component counts and greatly simplifies the design because no additional margins are needed to account for the accuracy of external resistors.

TPS3870-Q1 versions J, K and L have three time delay settings, two fixed by connecting CT pin to VDD through a resistor and leaving CT floating and a programmable time delay setting that only requires a single capacitor connected from CT pin to ground.

Manual Reset ($\overline{\text{MR}}$) allows for sequencing or hard reset by driving the $\overline{\text{MR}}$ pin below $V_{\text{MR_L}}$.

The TPS3870-Q1 is designed to assert active low output signals when the monitored voltage is outside the safe window. The relationship between the monitored voltage and the states of the outputs is shown in 表 2.

9.2 Functional Block Diagram

*For all possible voltages, threshold tolerance, time delays, and threshold options, see 表 6.

9.3 Feature Description

9.3.1 VDD

The TPS3870-Q1 is designed to operate from an input voltage supply range between 1.7 V to 5.5 V. An input supply capacitor is not required for this device; however, if the input supply is noisy good analog practice is to place a 1- μF capacitor between the VDD pin and the GND pin.

V_{DD} needs to be at or above $V_{\text{DD(MIN)}}$ for at least the start-up delay ($t_{\text{SD}} + t_{\text{D}}$) for the device to be fully functional.

9.3.2 SENSE

The TPS3870-Q1 uses a comparator with a precision reference voltage and a trimmed resistor divider. This configuration optimizes device accuracy because all resistor tolerances are accounted for in the accuracy and performance specifications. The comparator also includes built-in hysteresis that provides noise immunity and ensures stable operation.

Feature Description (continued)

Although not required in most cases, for noisy applications good analog design practice is to place a 1-nF to 10-nF bypass capacitor at the SENSE input in order to reduce sensitivity to transient voltages on the monitored signal.

When monitoring VDD supply voltage, the SENSE pin can be connected directly to VDD. The output ($\overline{\text{RESET}}$) is high impedance when voltage at the SENSE pin is lower than the upper boundary of the threshold.

9.3.3 $\overline{\text{RESET}}$

In a typical TPS3870-Q1 application, the $\overline{\text{RESET}}$ output is connected to a reset or enable input of a processor [such as a digital signal processor (DSP), application-specific integrated circuit (ASIC), or other processor type] or the enable input of a voltage regulator [such as a DC-DC converter or low-dropout regulator (LDO)].

The TPS3870-Q1 has an open drain active low output that requires a pull-up resistor to hold these lines high to the required voltage logic. Connect the pull-up resistor to the proper voltage rail to enable the output to be connected to other devices at the correct interface voltage levels. To ensure proper voltage levels, give some consideration when choosing the pull-up resistor values. The pull-up resistor value is determined by V_{OL} , output capacitive loading, and output leakage current. These values are specified in [Specifications](#). The open drain output can be connected as a wired-OR logic with other open drain signals such as another TPS3870-Q1 $\overline{\text{RESET}}$ pin.

表 2 describes the scenarios when the output ($\overline{\text{RESET}}$) is either asserted low or high impedance.

图 18. RESET output

9.3.4 Capacitor Time (CT)

The CT pin provides the user the functionality of both high-precision, factory-programmed, reset delay timing options and user-programmable, reset delay timing. The CT pin can be pulled up to V_{DD} through a resistor, have an external capacitor to ground, or can be left unconnected. The configuration of the CT pin is re-evaluated by the device every time the voltage on the SENSE line enters the valid window ($V_{SENSE} < V_{IT+(OV)}$). The pin evaluation is controlled by an internal state machine that determines which option is connected to the CT pin. The sequence of events takes 450 μs to determine if the CT pin is left unconnected, pulled up through a resistor, or connected to a capacitor. If the CT pin is being pulled up to V_{DD} , then a pull-up resistor is required, 10 k Ω is recommended.

9.3.5 Manual Reset ($\overline{\text{MR}}$)

The manual reset ($\overline{\text{MR}}$) input allows a processor or other logic circuits to initiate a reset. A logic low on $\overline{\text{MR}}$ causes $\overline{\text{RESET}}$ to assert. After $\overline{\text{MR}}$ returns to a logic high and the SENSE pin voltage is within a valid condition ($V_{SENSE} < V_{IT+(OV)}$), $\overline{\text{RESET}}$ is deasserted after the reset delay time (t_D). If $\overline{\text{MR}}$ is not controlled externally, then $\overline{\text{MR}}$ can either be connected to V_{DD} or left floating because the $\overline{\text{MR}}$ pin is internally pulled up to V_{DD} . Figure 19 shows the relation between $\overline{\text{MR}}$ and $\overline{\text{RESET}}$.

Feature Description (continued)

- (1) $\overline{RESET}$ pulls up to V_{DD} with 10 k Ω .
- (2) To initiate and continue time reset counter both conditions must be met $\overline{MR}$ pin above $\overline{V_{MR_H}}$ or floating and V_{SENSE} below $V_{IT+(OV)} - V_{HYS}$
- (3) $\overline{MR}$ is ignored during output $\overline{RESET}$ low event

19. Manual Reset Timing Diagram

9.4 Device Functional Modes

表 2. Functional Mode Truth Table

DESCRIPTION	CONDITION	$\overline{MR}$ PIN	V_{DD} PIN	OUTPUT ($\overline{RESET}$ PIN)
Normal Operation	$SENSE < V_{IT+(OV)}$	Open or above $\overline{V_{MR_H}}$	$V_{DD} > V_{DD(MIN)}$	High
Over Voltage detection	$SENSE > V_{IT+(OV)}$	Open or above $\overline{V_{MR_H}}$	$V_{DD} > V_{DD(MIN)}$	Low
Manual reset	$SENSE < V_{IT+(OV)}$	Below $\overline{V_{MR_L}}$	$V_{DD} > V_{DD(MIN)}$	Low
UVLO engaged	$SENSE < V_{IT+(OV)}$	Open or above $\overline{V_{MR_H}}$	$V_{POR} < V_{DD} < UVLO$	Low

9.4.1 Normal Operation ($V_{DD} > V_{DD(MIN)}$)

When the voltage on V_{DD} is greater than $V_{DD(MIN)}$ for approximately $(t_{SD} + t_D)$, the $\overline{RESET}$ output state will correspond to the $SENSE$ pin voltage with respect to the threshold limits, when $SENSE$ voltage is outside of threshold limits the $RESET$ voltage will be low (V_{OL}).

9.4.2 Undervoltage Lockout ($V_{POR} < V_{DD} < UVLO$)

When the voltage on V_{DD} is less than the device UVLO voltage but greater than the power-on reset voltage (V_{POR}), the $\overline{RESET}$ pin will be held low, regardless of the voltage on $SENSE$ pin.

9.4.3 Power-On Reset ($V_{DD} < V_{POR}$)

When the voltage on V_{DD} is lower than the required voltage (V_{POR}) to internally pull the asserted output to GND, $\overline{RESET}$ signal is undefined and is not to be relied upon for proper device function.

10 Application and Implementation

注

Information in the following applications sections is not part of the TI component specification, and TI does not warrant its accuracy or completeness. TI's customers are responsible for determining suitability of components for their purposes. Customers should validate and test their design implementation to confirm system functionality.

10.1 Application Information

10.1.1 Voltage Threshold Accuracy

Voltage monitoring requirements vary depending on the voltage supply tolerance of the device being powered. Due to the high precision of the TPS3870-Q1 ($\pm 0.7\%$ Max), the device allows for a wider supply voltage margins and threshold headroom for tight tolerance applications.

For example, take a DC/DC regulator providing power to a core voltage rail of an MCU. The MCU has a tolerance of $\pm 5\%$ of the nominal output voltage of the DC/DC. The user sets an ideal voltage threshold of 4% which allows for $\pm 1\%$ of threshold accuracy. Since the TPS3870-Q1 threshold accuracy is higher than $\pm 1\%$, the user has more supply voltage margin which can allow for a relaxed power supply design. This gives flexibility to the DC/DC to use a smaller output capacitor or inductor because of a larger voltage window for voltage ripple and transients. There is also headroom between the minimum system voltage and voltage tolerance of the MCU to ensure that the voltage supply will never be in the region of potential failure of malfunction without the TPS3870-Q1 asserting a reset signal.

Figure 20 illustrates the supply overvoltage margin and accuracy of the TPS3870-Q1 for the example explained above. Using a low accuracy supervisor will eat into the available budget for the power supply ripple and transient response. This gives less flexibility to the user and a more stringent DC/DC converter design.

图 20. TPS3870-Q1 Voltage Threshold Accuracy

Application Information (continued)

10.1.2 CT Reset Time Delay

The TPS3870-Q1 features three options for setting the reset delay (t_D): connecting a capacitor to the CT pin, connecting a pull-up resistor to VDD, and leaving the CT pin unconnected. Figure 21 shows a schematic drawing of all three options. To determine which option is connected to the CT pin, an internal state machine controls the internal pulldown device and measures the pin voltage. This sequence of events takes 450 μ s to determine which timing option is used. Every time the voltage on the SENSE line enters the valid window ($V_{SENSE} < V_{IT+(OV)} - V_{HYS}$, the state machine determines the CT option.

Figure 21. CT Charging Circuit

10.1.2.1 Factory-Programmed Reset Delay Timing

To use the factory-programmed timing options, the CT pin must either be left unconnected or pulled up to VDD through a 10 k Ω pull-up resistor. Using these options enables a high-precision reset delay timing, as shown in Table 3.

Table 3. Reset Delay Time for Factory-Programmed Reset Delay Timing

VARIANT	RESET DELAY TIME (t_D)			VALUE
	CT = Capacitor to GND	CT = Floating	CT = 10 k Ω to VDD	
TPS3870J	Programmable t_D	10	200	ms
TPS3870K	Programmable t_D	1	20	ms
TPS3870L	Programmable t_D	5	100	ms
TPS3870M	N/A	50	50	μ s

10.1.2.2 Programmable Reset Delay-Timing

The TPS3870 reset time delay is based on internal current source (I_{CT}) to charge external capacitor (C_{CT}) and read capacitor voltage with the internal comparator. The minimum value capacitor is 250 pF. There is no limitation on maximum capacitor the only constrain is imposed by the initial voltage of the capacitor, if CT cap is zero or near to zero then ideally there is no other constraint on the max capacitor. The typical ideal capacitor value needed for a given delay time can be calculated using Equation 1, where C_{CT} is in nanofarads (nF) and t_D is in ms:

$$t_D = 3.066 \times C_{CT} + 0.5 \text{ ms} \quad (1)$$

To calculate the minimum and maximum-reset delay time use Equation 2 and Equation 3, respectively.

$$t_{D(\min)} = 2.7427 \times C_{CT} + 0.3 \text{ ms} \quad (2)$$

$$t_{D(\max)} = 3.4636 \times C_{CT} + 0.7 \text{ ms} \quad (3)$$

The slope of the equation is determined by the time the CT charging current (I_{CT}) takes to charge the external capacitor up to the CT comparator threshold voltage (V_{CT}). When $\overline{\text{RESET}}$ is asserted, the capacitor is discharged through the internal CT pulldown resistor. When the $\overline{\text{RESET}}$ conditions are cleared, the internal precision current source is enabled and begins to charge the external capacitor; when $V_{CT} = 1.15$ V, $\overline{\text{RESET}}$ is unasserted. Note that in order to minimize the difference between the calculated $\overline{\text{RESET}}$ delay time and the actual $\overline{\text{RESET}}$ delay time, use a high-quality ceramic dielectric COG, X5R, or X7R capacitor and minimize parasitic board capacitance around this pin. 表 4 lists the reset delay time ideal capacitor values for C_{CT} .

表 4. Reset Delay Time for Ideal Capacitor Values

C_{CT}	$\overline{\text{RESET}}$ DELAY TIME (t_D), TYPICAL
250 pF	1.27 ms
1 nF	3.57 ms
3.26 nF	10.5 ms
32.6 nF	100.45 ms
65.2 nF	200.40 ms
1 μ F	3066.50 ms

10.1.3 $\overline{\text{RESET}}$ Latch Mode

The TPS3870-Q1 features a voltage latch mode on the $\overline{\text{RESET}}$ pin when connecting the CT pin to common ground. A pull-down resistor is recommended to limit current consumption of the system. In latch mode, if the $\overline{\text{RESET}}$ pin is low or triggers low, the pin will stay low regardless if V_{SENSE} is within the acceptable voltage boundaries ($V_{\text{SENSE}} < V_{\text{IT}+(\text{OV})}$). To unlatch the device provide a voltage to the CT pin that is greater than the CT pin comparator threshold voltage, V_{CT} . The $\overline{\text{RESET}}$ pin will trigger high instantaneously without any reset delay. A voltage greater than 1.2 V is recommended to ensure a proper unlatch. Use a series resistance to limit current when an unlatch voltage is applied. For more information, [Design 1: \$\overline{\text{RESET}}\$ Latch Mode](#) gives an example of a typical latch application.

注

At power up, the TPS3870-Q1 will be latched when CT is connected to GND. To ensure correct power up when using $\overline{\text{RESET}}$ latch mode, send a pulse to the CT pin greater than 1.2 V after t_{SD} and SENSE is within the correct window of operation.

图 22. $\overline{\text{RESET}}$ Latch Circuit

10.1.4 Adjustable Voltage Thresholds

The TPS3870-Q1 0.7% maximum accuracy allows for adjustable voltage thresholds using external resistors without adding major inaccuracies to the device. In case that the desired monitored voltage is not available, external resistor dividers can be used to set the desired voltage thresholds. Figure 23 illustrates an example of how to adjust the voltage threshold with external resistor dividers. The resistors can be calculated depending on the desired voltage threshold and device part number. TI recommends using the 0.8V voltage threshold device such as the TPS3870J4080 because of the bypass mode of internal resistor ladder.

For example, consider a 2.0 V rail being monitored (V_{MON}) using the TPS3870J4080 variant. Using Equation 4, $R_1 = 15\text{ k}\Omega$ given that $R_2 = 10\text{ k}\Omega$, $V_{MON} = 2\text{ V}$, and $V_{SENSE} = 0.8\text{ V}$. This device is typically meant to monitor a 0.8 V rail with a +4% voltage threshold. This means that the device overvoltage threshold ($V_{IT+(OV)}$) is 0.832 V. Using Equation 4, the monitored overvoltage threshold (V_{MON+}) = 2.08 V when $V_{SENSE} = V_{IT+(OV)}$. If a wider tolerance threshold is desired, use a device variant shown on Table 6 to determine what device part number matches your application.

$$V_{SENSE} = V_{MON} \times (R_2 \div (R_1 + R_2)) \quad (4)$$

There are inaccuracies that must be taken into consideration while adjusting voltage thresholds. Aside from the tolerance of the resistor divider, there is an internal resistance of the SENSE pin that may affect the accuracy of the resistor divider. Although expected to be very high impedance, users are recommended to calculate the values for design specifications. The internal sense resistance (R_{SENSE}) can be calculated by the sense voltage (V_{SENSE}) divided by the sense current (I_{SENSE}) as shown in Equation 6. V_{SENSE} can be calculated using Equation 4 depending on the resistor divider and monitored voltage. I_{SENSE} can be calculated using Equation 5.

$$I_{SENSE} = (V_{MON} - V_{SENSE}) \div R_1 - (V_{SENSE} \div R_2) \quad (5)$$

$$R_{SENSE} = V_{SENSE} \div I_{SENSE} \quad (6)$$

Figure 23. Adjustable Voltage Threshold with External Resistor Dividers

Although Equation 4 solves for V_{SENSE} , inaccuracies for leakage need to be taken into consideration when understanding the overall threshold accuracy of the device. To calculate the threshold with this inaccuracy taken into account, use Equation 7

$$V_{IT_Actual} = V_{SENSE} + R_1 \times ((V_{SENSE} \div R_2) + I_{SENSE}) \quad (7)$$

To calculate the worst case values through the resistor divider, I_{SENSE} should be taken from the Electrical Characteristics table. While these equations provide a summary of what you need to correctly account for factors that go into determining your resistor divider with inaccuracy, you should use the Application Report [Optimizing Resistor Dividers at a Comparator Input](#) to further understand this and to design your implementation. This report explains how to optimize the resistor divider at the SENSE input for an adjustable voltage threshold version of the device. You should follow this Application Report using 0.8 V as the V_{REF} value for the TPS3870-Q1.

10.1.5 Immunity to SENSE Pin Voltage Transients

The TPS3870-Q1 is immune to short voltage transient spikes on the input pins. Sensitivity to transients depends on both transient duration and overdrive (amplitude) of the transient.

Overdrive is defined by how much the V_{SENSE} exceeds the specified threshold, and is important to know because the smaller the overdrive, the slower the response of the outputs ($\overline{RESET}$). Threshold overdrive is calculated as a percent of the threshold in question, as shown in 式 8:

$$\text{Overdrive \%} = | (V_{SENSE} - (V_{IT+(OV)})) / V_{IT} (\text{Nominal}) \times 100\% |$$

where:

- V_{SENSE} is the voltage at the SENSE pin
- $V_{IT} (\text{Nominal})$ is the nominal threshold voltage
- $V_{IT+(OV)}$ represents the actual overvoltage tripping voltage

(8)

10.1.5.1 Hysteresis

The overvoltage comparator includes built-in hysteresis that provides noise immunity and ensures stable operation. For example if the voltage on the SENSE pin goes above $V_{IT+(OV)}$ and $\overline{RESET}$ is asserted (driven low), then when the voltage on the SENSE pin is below the positive threshold voltage, $\overline{RESET}$ deasserts after the user-defined $\overline{RESET}$ delay time. Figure 24 shows the relation between $V_{IT+(OV)}$ and hysteresis voltage (V_{HYS}).

图 24. SENSE Pin Hysteresis

10.2 Typical Application

10.2.1 Design 1: $\overline{\text{RESET}}$ Latch Mode

Another typical application for the TPS3870-Q1 is shown in [Figure 25](#). The TPS3870-Q1 is used in a $\overline{\text{RESET}}$ latch output mode. In latch mode, once $\overline{\text{RESET}}$ driven logic low, it will stay low regardless of the sense voltage. If the $\overline{\text{RESET}}$ pin is low on start up, it will also stay low regardless of sense voltage.

Figure 25. Window Voltage Monitoring with $\overline{\text{RESET}}$ Latch

10.2.1.1 Design Requirements

Table 5. Design Parameters

PARAMETER	DESIGN REQUIREMENT	DESIGN RESULT
Monitored Rail	1.2- V_{CORE} nominal, with alerts if outside of 5% of 1.2 V (including device accuracy), Latch when $\overline{\text{RESET}}$ is low, until voltage is applied on CT pin.	Worst case $V_{\text{IT+(OV)}} = 1.256 \text{ V}$ (4.7%),
Output logic voltage	5-V CMOS	5-V CMOS
Maximum device current consumption	15 μA	4.5 μA (Typ), 7 μA (Max)

10.2.1.2 Detailed Design Procedure

The $\overline{\text{RESET}}$ pin can be latched when the CT pin is connected to a common ground with a pull-down resistor. A 10 k Ω resistor is recommended to limit current consumption. To unlatch the device provide a voltage to the CT pin that is greater than the CT pin comparator threshold voltage, V_{CT} . A voltage greater than 1.15 V is recommended to ensure a proper unlatch. Use a series resistance to limit current when an unlatch voltage is applied. To go back into latch operation, disconnect the voltage on the CT pin. The $\overline{\text{RESET}}$ pin will trigger high instantaneously without any reset delay.

10.2.1.3 Application Curves

V_{SENSE} ramp from 0 V to 1.4V, $V_{DD} = 3.3$ V, $V_{CT} = 0$ V
 $V_{RESET} = V_{DD} = 3.3$ V

图 26. TPS3870-Q1 SENSE Ramp Latch Function

V_{CT} biased at least to 1.15 V, $V_{SENSE} = 1.2$ V
 $V_{RESET} = V_{DD} = 3.3$ V

图 27. TPS3870-Q1 CT Bias Unlatch Function

V_{DD} ramp up from 0 V to 3.3 V, $V_{SENSE} = 1.2$ V, $CT = 0$ V
 $V_{RESET} = V_{DD} = 3.3$ V

图 28. TPS3870-Q1 VDD Ramp Latch Function

11 Power Supply Recommendations

11.1 Power Supply Guidelines

This device is designed to operate from an input supply with a voltage range between 1.7 V to 5.5 V. It has a 6-V absolute maximum rating on the VDD pin. It is good analog practice to place a 0.1- μ F to 1- μ F capacitor between the VDD pin and the GND pin depending on the input voltage supply noise. If the voltage supply providing power to VDD is susceptible to any large voltage transient that exceed maximum specifications, additional precautions must be taken. See [SNVA849](#) for more information.

12 Layout

12.1 Layout Guidelines

- Place the external components as close to the device as possible. This configuration prevents parasitic errors from occurring.
- Avoid using long traces for the VDD supply node. The VDD capacitor, along with parasitic inductance from the supply to the capacitor, can form an LC circuit and create ringing with peak voltages above the maximum VDD voltage.
- Avoid using long traces of voltage to the sense pin. Long traces increase parasitic inductance and cause inaccurate monitoring and diagnostics.
- Do not run sensitive analog traces in parallel with digital traces. Avoid crossing digital and analog traces if possible, and only make perpendicular crossings when absolutely necessary.

TPS3870J4330DSERQ1	Active	Production	WSO (DSE) 6	3000 LARGE T&R	Yes	NIPDAUAG	Level-1-260C-UNLIM	-40 to 125	H4
TPS3870J4330DSERQ1.A	Active	Production	WSO (DSE) 6	3000 LARGE T&R	Yes	NIPDAUAG	Level-1-260C-UNLIM	-40 to 125	H4

⁽¹⁾ **Status:** For more details on status, see our [product life cycle](#).

⁽²⁾ **Material type:** When designated, preproduction parts are prototypes/experimental devices, and are not yet approved or released for full production. Testing and final process, including without limitation quality assurance, reliability performance testing, and/or process qualification, may not yet be complete, and this item is subject to further changes or possible discontinuation. If available for ordering, purchases will be subject to an additional waiver at checkout, and are intended for early internal evaluation purposes only. These items are sold without warranties of any kind.

⁽³⁾ **RoHS values:** Yes, No, RoHS Exempt. See the [TI RoHS Statement](#) for additional information and value definition.

⁽⁴⁾ **Lead finish/Ball material:** Parts may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead finish/Ball material values may wrap to two lines if the finish value exceeds the maximum column width.

⁽⁵⁾ **MSL rating/Peak reflow:** The moisture sensitivity level ratings and peak solder (reflow) temperatures. In the event that a part has multiple moisture sensitivity ratings, only the lowest level per JEDEC standards is shown. Refer to the shipping label for the actual reflow temperature that will be used to mount the part to the printed circuit board.

⁽⁶⁾ **Part marking:** There may be an additional marking, which relates to the logo, the lot trace code information, or the environmental category of the part.

Multiple part markings will be inside parentheses. Only one part marking contained in parentheses and separated by a "-" will appear on a part. If a line is indented then it is a continuation of the previous line and the two combined represent the entire part marking for that device.
