

TPS62830x、2.25V～5.5V 入力、1、2、3、4A、出力精度 1% の降圧コンバータ、小型 WQFN パッケージおよび SOT583 パッケージで供給

1 特長

- 入力電圧範囲: 2.25V～5.5V
- 調整可能な出力電圧: 0.5V～4.5V
- 1% の FB 電圧精度 ($-40^{\circ}\text{C} \sim 125^{\circ}\text{C T}_J$)
- EMI 性能の最適化
- CISPR 11/32 準拠が容易
 - オンチップのノイズフィルタリングコンデンサを内蔵
 - CISPR に準拠した測定値を使用可能
- 優れた過度応答
- 動作時静止電流: 7 μ A
- 2.0MHz のスイッチング周波数
- 35m Ω /18m Ω のパワー MOSFET を内蔵
- DCS-Control トポロジ
- 導通モード選択用 MODE ピン
- 1.2V GPIO をサポート
- 100% デューティサイクル動作による最小のドロップアウト電圧
- アクティブ出力放電
- パワーグッド出力
- サーマルシャットダウン保護機能
- ヒックアップまたはラッチオフ OCP/OVP
- SIMPLIS モデルが使用可能
- WEBENCH® Power Designer により、TPS62830x を使用するカスタム設計を作成

2 アプリケーション

- ソリッドステートドライブ (SSD)
- ポータブルエレクトロニクス
- アナログセキュリティおよび IP ネットワークカメラ
- 産業用 PC
- ファクトリオートメーション / 制御
- ASIC、SoC、MCU の電源
- 一般的なポイントオブロード (POL)

3 概要

TPS62830x は、静止電流が小さい使いやすい同期整流降圧型 DC/DC コンバータファミリです。TPS62830x は DCS-Control トポロジをベースとしており、出力静電容量が小さく、高速過渡応答を実現します。内部基準電圧により、最低 0.5V まで出力電圧をレギュレートでき、接合部温度が $-40^{\circ}\text{C} \sim 125^{\circ}\text{C}$ の範囲で 1% の高い帰還電圧精度を維持します。このファミリは 2 つのパッケージで供給され、各パッケージのデバイスはピン互換です。

TPS62830x には、デバイスの動作モードを制御する MODE ピンがあります。パワーセーブモードは、非常に軽い負荷まで高効率を維持し、システムのバッテリー動作時間を延ばします。出力電圧のリプルを最小限に抑え、スイッチング周波数をほぼ一定に保つよう、強制 PWM モードは連続導通モードを維持します。このデバイスは、パワーグッド信号と、適切に制御された内部ソフトスタート回路を備えています。TPS62830x は 100% モードで動作可能です。障害保護の目的で、TPS62830x は HICCUP (ヒックアップ、間欠型) 短絡保護機能やサーマルシャットダウン機能を搭載しています。1 つのデバイスオプションには、短絡および過電圧インシデントに対するラッチオフ保護機能があります。このファミリは 2 つのパッケージで供給されます。8 ピンの 1.0mm × 2.0mm QFN パッケージは最高の電力密度設計を実現し、8 ピンの 1.6mm × 2.1mm SOT583 パッケージは組み立てやすい設計を実現します。

パッケージ情報

部品番号	パッケージ ⁽¹⁾	パッケージサイズ ⁽²⁾
TPS62830x	RZE (WQFN, 8)	1mm × 2mm
	DRL (SOT583, 8)	2.1mm × 1.6mm

- 詳細については、[セクション 11](#) を参照してください。
- パッケージサイズ (長さ×幅) は公称値であり、該当する場合はピンも含まれます

図 5-2. DRL Package 8-Pin SOT Top View

表 5-1. Pin Functions

PIN		TYPE ⁽¹⁾	DESCRIPTION
NAME	NO.		
VIN	1	PWR	Input voltage pin. Connect the input capacitor as close as possible between V_{IN} and GND.
GND	2		Ground pin.
MODE	3	I	The device runs in PSM/PWM mode when this pin is pulled low and in forced-PWM mode when pulled high. This event can also be done when the device is in-operation. Do not leave this pin floating.
FB	4	I	Feedback pin. Connect the resistive output voltage divider to this pin.
VOS	5	I	Output voltage sense pin. This pin must be connected directly after the inductor.
PG	6	O	Power good open-drain output pin. The pullup resistor can be connected to voltages up to 5.5 V. If unused, leave this pin floating.
SW	7	PWR	Switch pin of the power stage
EN	8	I	Device enable pin. To enable the device, this pin must be pulled high. Pulling this pin low disables the device. Do not leave this pin unconnected.

(1) I = input, O = output, PWR = power

6 Specifications

6.1 Absolute Maximum Ratings

Over operating junction temperature range (unless otherwise noted) ⁽¹⁾

		MIN	MAX	UNIT
Voltage ⁽²⁾	V _{IN} , EN, MODE, FB, PG	−0.3	6	V
Voltage ⁽²⁾	SW (DC)	−0.3	V _{IN} + 0.3	V
Voltage ⁽²⁾	SW (AC, < 10 ns) ⁽³⁾	−2.5	10	V
T _J	Operating junction temperature	−40	150	°C
T _{stg}	Storage temperature	−65	150	°C

- (1) Operation outside the Absolute Maximum Ratings may cause permanent device damage. Absolute Maximum Ratings do not imply functional operation of the device at these or any other conditions beyond those listed under Recommended Operating Conditions. If used outside the Recommended Operating Conditions but within the Absolute Maximum Ratings, the device may not be fully functional, and this may affect device reliability, functionality, performance, and shorten the device lifetime.
- (2) All voltage values are with respect to the network ground terminal.
- (3) While switching

6.2 ESD Ratings

			VALUE	UNIT
V _(ESD)	Electrostatic discharge	Human-body model (HBM), per ANSI/ESDA/JEDEC JS-001 ⁽¹⁾	± 2000	V
		Charged-device model (CDM), per ANSI/ESDA/JEDEC JS-002 ⁽²⁾	± 500	

- (1) JEDEC document JEP155 states that 500-V HBM allows safe manufacturing with a standard ESD control process.
- (2) JEDEC document JEP157 states that 250-V CDM allows safe manufacturing with a standard ESD control process.

6.3 Recommended Operating Conditions

Over operating junction temperature range (unless otherwise noted)

		MIN	NOM	MAX	UNIT
V _{IN}	Input voltage range	2.25		5.5	V
V _{OUT}	Output voltage range	0.5		4.5	V
C _{IN}	Effective input capacitance ⁽¹⁾	3			μF
L	Nominal output inductor	0.24	0.47	1.0	μH
C _{OUT}	Effective output capacitance ⁽¹⁾	12		200	μF
I _{OUT}	Output current range; TPS628301			1	A
I _{OUT}	Output current range; TPS628302			2	A
I _{OUT}	Output current range; TPS628303			3	A
I _{OUT}	Output current range; TPS628304 ⁽²⁾			4	A
I _{PG}	Power-good input current capability			1	mA
T _J	Operating junction temperature	−40		125	°C

- (1) The values given for all the capacitors in the table are effective capacitance, which includes the DC bias effect. Due to the DC bias effect of ceramic capacitors, the effective capacitance is lower than the nominal value when a voltage is applied. Please check the manufacturer's DC bias curves for the effective capacitance vs DC voltage applied.
- (2) Lifetime is reduced when operating continuously at I_{OUT} = 4 A and the junction temperature > 105°C.

7 Detailed Description

7.1 Overview

The TPS62830x is a family of low-voltage step-down converters available in 1-, 2-, 3- and 4-A versions. These devices use a DCS-Control scheme which transitions seamlessly from pulse-width modulation (PWM) at medium and high output currents to pulsed-frequency modulation (PFM) at low output currents. During PWM operation, the devices switch at 2 MHz; during PFM operation, the switching frequency varies with the load current and reduces as the load current decreases. For applications that require the lowest possible output voltage ripple or a constant switching frequency, a high logic level on the MODE pin forces the devices to use PWM under all load conditions (at the expense of lower efficiency at low output currents). An external resistor-divider sets the output voltage anywhere from 0.5 V to 4.5 V and the nominal switching frequency is 2 MHz with a controlled variation over the input voltage range.

Device variants are available that support both hiccup and latch-off protection behavior.

The TPS62830x devices offer two significant advantages compared to previous devices in this series: Transient performance has improved significantly by usage of a fast comparator in both PFM and PWM modes, and EMI is reduced by an on-chip decoupling capacitor and an optimized gate driver.

7.2 Functional Block Diagram

7.3 Feature Description

7.3.1 Pulse Width Modulation (PWM) Operation

If the MODE pin is LOW and at load currents larger than half the inductor ripple current, the device operates in pulse width modulation in continuous conduction mode (CCM) as shown in [Figure 7-1](#). The PWM operation is based on an adaptive constant on-time control with stabilized switching frequency. To achieve a stable switching frequency in a steady state condition, the on-time is calculated as:

$$T_{ON} = \frac{V_{OUT}}{V_{IN}} \times 500ns \quad (1)$$

If the MODE pin is HIGH, the converter maintains a forced-PWM operation for all load currents.

図 7-1. Continuous Conduction Mode (PWM-CCM) Current Waveform

7.3.2 Power Save Mode (PSM) Operation

To maintain high efficiency at light loads, the device enters power save mode (PSM) at the boundary to discontinuous conduction mode (DCM). This event happens when the output current becomes smaller than half of the ripple current of the inductor. The device operates with a fixed on-time, and the switching frequency decreases proportional to the load current as shown in 図 7-2. Calculate as:

$$f_{PSM} = \frac{2 \times I_{OUT}}{T_{ON}^2 \times \frac{V_{IN}}{V_{OUT}} \left[\frac{V_{IN} - V_{OUT}}{L} \right]} \quad (2)$$

図 7-2. Discontinuous Conduction Mode (PSM-DCM) Current Waveform

In PSM, the output voltage rises slightly above the nominal target, which can be minimized using larger output capacitance. At duty cycles larger than 90%, the device does not enter PSM and maintains output regulation in PWM mode.

7.3.3 Start-Up and Soft Start

When the EN voltage goes High, the device starts loading the default values into the device registers. This action typically is done within 120 μs. After that, the internal soft-start circuitry controls the output voltage during start-up. This control avoids excessive inrush current and makes sure of a controlled output voltage ramp. This control also prevents unwanted voltage drops from high-impedance power sources or batteries. Finally, the PG signal has a delay up to 180 μs at start-up. 図 7-3 shows a start-up sequence, where the EN pin is pulled up to VIN.

図 7-3. Start-Up Timing When EN is Pulled Up to VIN

図 7-4 shows a start-up sequence, where an external signal is connected to the EN pin.

図 7-4. Start-Up Timing When an External Signal is Connected to the EN Pin

The TPS62830x can start into a prebiased output if enabled for the first time. For a new prebiased operation, a power cycle is needed to disable the active output discharge. 図 7-5 shows a start-up into a prebiased output voltage.

図 7-5. Start-Up into a Prebiased Output

7.3.4 Switch Cycle-by-Cycle Current Limit

All the devices in the family have a cycle-by-cycle current limit function. When the device detects that the current in the high-side FET exceeds the high-side current limit, either due to a heavy load or a short-circuit condition, the device immediately turns off the high-side FET and turns on the low-side FET. The high-side FET turns on again at the start of the next switching cycle. Note that because of the propagation delay in the current limit comparator (typically 60 ns), the current flowing in the high-side FET when the device detects a current limit condition can be slightly higher than the current limit specified in the device Electrical Characteristics.

Devices with an 'A' and 'K' suffix in their part number respond to repeated current limit events with hiccup behavior (see *Device Options*).

Devices with a 'B' suffix in their part number respond to repeated current limit events with latch-up behavior (see *Device Options*).

7.3.5 Short-Circuit Protection

In devices with hiccup protection, when a current limit event occurs for 32 consecutive switching cycles (about 16 μ s), the device turns off the high-side FET for about 9.6 ms, during which time the inductor current decays through the low-side FET body diode. After 9.6 ms has expired, the device automatically starts switching again, beginning with a soft-start condition. The device alternates between bursts of switching cycles and 9.6-ms pauses for as long as the overload condition on the output exists.

In devices with latch-off protection, When a current limit event occurs for 32 consecutive switching cycles (about 16 μ s), the device stops switching and latches off the high-side and low-side FETs. To recover normal operation after a latched short-circuit event, you must cycle V_{IN} or EN.

In devices with latch-off protection, there is also an OVP protection circuit that uses the PG window comparator. An OVP event is detected when the FB voltage is approximately $110\% \times (0.5V)$ for a period longer than the deglitch time of 35 μ s. In this case, the converter de-asserts the PG signal and performs the overvoltage protection function. The converter latches off both high-side and low-side FET and remains in this state. To recover normal operation after a latched short-circuit event, you must cycle V_{IN} or EN.

7.3.6 Undervoltage Lockout

The undervoltage lockout (UVLO) function prevents misoperation of the device if the input voltage drops below the UVLO threshold.

7.3.7 Thermal Shutdown

The junction temperature (T_J) of the device is monitored by an internal temperature sensor. If T_J exceeds 150°C (typical), the device goes in thermal shutdown with a hysteresis of typically 20°C. After T_J has decreased enough, the device resumes normal operation.

7.3.8 Optimized EMI Performance

TPS62830x devices incorporate advanced techniques to minimize Electromagnetic Interference (EMI) and makes complying with stringent EMI standards simple. By integrating capacitors directly onto the silicon, parasitic elements are reduced and loop area is minimized, effectively reducing high-frequency noise emissions primarily above 450 MHz. The on-chip capacitors ensure low-inductance paths for high-frequency AC switching current and damping voltage ringing.

Additionally to the on-chip capacitors, the gate driver has been improved with advanced slew rate control mechanisms and by smoothing the supply voltage. The switch node voltage is controlled in a way to reduce sharp edges and minimize voltage overshoot, consequently diminishing EMI.

The above plot is measured on the EVM with the TPS628304ARZER and standard BOM. There is no notable difference on EMI performance between available packages.

$$I_{OUT} = 4 \text{ A}$$

$$V_{IN} = 5.5 \text{ V}$$

$$V_{OUT} = 1.8 \text{ V}$$

7-6. Radiated EMI Performance (CISPR11 Radiated Emission Test with Class A and Class B Limits)

7.4 Device Functional Modes

7.4.1 Enable, Disable, and Output Discharge

The device starts operation when Enable (EN) is set High. The input threshold levels are typically 0.8 V for rising and 0.35 V for falling signals. Do not leave EN floating. Shutdown is forced if EN is pulled Low with a shutdown current of typically 100 nA. During shutdown, the internal power MOSFETs as well as the entire control circuitry are turned off and the output voltage is actively discharged through the SW pin by a current sink. Therefore V_{IN} must remain present for the discharge to function.

7.4.2 Minimum Duty Cycle and 100% Mode Operation

There is no limitation for small duty cycles because, even at very low duty cycles, the switching frequency is reduced as needed to always make sure of a proper regulation.

If the output voltage (V_{OUT}) comes close to the input voltage (V_{IN}), the device enters 100% mode. While the high-side switch is constantly turned on, the low-side switch is switched off. This action is particularly useful in battery-powered applications to achieve longest operation time by taking full advantage of the whole battery voltage range. The difference between V_{IN} and V_{OUT} is determined by the voltage drop across the high-side FET and the DC resistance of the inductor. The minimum V_{IN} that is needed to maintain a specific V_{OUT} value is estimated as:

$$V_{IN,min} = V_{OUT} + I_{OUT,MAX} \times (R_{DS(on)} + R_L) \quad (3)$$

where

- $V_{IN,min}$ = Minimum input voltage to maintain an output voltage
- $I_{OUT,MAX}$ = Maximum output current
- $R_{DS(on)}$ = High-side FET ON-resistance
- R_L = Inductor ohmic resistance (DCR)

7.4.3 Power Good

The TPS62830x has a built-in power-good (PG) function. The PG pin goes high impedance when the output voltage has reached the nominal value. Otherwise, including when disabled, in UVLO or in thermal shutdown, PG is Low (see 表 7-1). The PG function is formed with a window comparator, which has an upper and lower voltage threshold. The PG pin is an open-drain output and is specified to sink up to 1 mA. The power-good output requires a pullup resistor connecting to any voltage rail less than 5.5 V.

表 7-1. PG Pin Logic

DEVICE CONDITIONS		LOGIC STATUS	
		HIGH Z	LOW
Enable	EN = High, $V_{FB} \geq 0.48$ V	√	
	EN = High, $V_{FB} \leq 0.56$ V		√
	EN = High, $V_{FB} \leq 0.525$ V	√	
	EN = High, $V_{FB} \geq 0.55$ V		√
Shutdown	EN = Low		√
Thermal shutdown	$T_J > T_{JSD}$		√
UVLO	$0.7 \text{ V} < V_{IN} < V_{UVLO}$		√
Power supply removal	$V_{IN} < 0.7$ V	√	

The PG signal can be used for sequencing multiple rails by connecting the PG signal to the EN pin of other converters. Leave the PG pin unconnected when not used. The PG rising edge and falling edge has a 40 μ s blanking time, as shown in 図 7-7. At start-up, the delay of PG signal is typically 125 μ s after soft start is finished.

図 7-7. Power-Good Behavior

8 Application and Implementation

注

Information in the following applications sections is not part of the TI component specification, and TI does not warrant its accuracy or completeness. TI's customers are responsible for determining suitability of components for their purposes, as well as validating and testing their design implementation to confirm system functionality.

8.1 Application Information

The following section discusses the design of the external components to complete the power supply design for several input and output voltage options by using typical applications as a reference.

8.2 Typical Application

図 8-1. Typical Application of TPS62830x (Optimized for Design Size)

図 8-2. Typical Application of TPS62830x (Optimized for Transient Response)

8.2.1 Design Requirements

For this design example, use the parameters listed in 表 8-1 as the input parameters.

表 8-1. Design Parameters

DESIGN PARAMETER	EXAMPLE VALUE
Input voltage	2.25 V to 5.5 V
Output voltage	1.8 V
Output ripple voltage	< 15 mV

表 8-2 lists the components used for the example.

表 8-2. List of Components

REFERENCE	DESCRIPTION	MANUFACTURER
C1	4.7 μ F, Ceramic capacitor, 6.3 V, X7R, size 0603, JMK107BB7475KA-T	Taiyo Yuden
C2	2 $\times$ 10 μ F, Ceramic capacitor, 10 V, X7R, size 0603, GRM188Z71A106KA73D	Murata
L1	0.47 μ H, Power inductor, XGL4015-471ME	Coilcraft
R1	Depending on the output voltage, 1%, size 0402	Std
R2	200 k Ω , Chip resistor, 1/16 W, 1%, size 0402	Std
R3	100 k Ω , Chip resistor, 1/16 W, 1%, size 0402	Std

8.2.2 Detailed Design Procedure

8.2.2.1 Custom Design With WEBENCH® Tools

[Click here](#) to create a custom design using the TPS62830x device with the WEBENCH® Power Designer.

1. Start by entering the input voltage (V_{IN}), output voltage (V_{OUT}), and output current (I_{OUT}) requirements.
2. Optimize the design for key parameters such as efficiency, footprint, and cost using the optimizer dial.
3. Compare the generated design with other possible solutions from Texas Instruments.

The WEBENCH Power Designer provides a customized schematic along with a list of materials with real-time pricing and component availability.

In most cases, these actions are available:

- Run electrical simulations to see important waveforms and circuit performance
- Run thermal simulations to understand board thermal performance
- Export customized schematic and layout into popular CAD formats
- Print PDF reports for the design, and share the design with colleagues

Get more information about WEBENCH tools at www.ti.com/WEBENCH.

8.2.2.2 Setting The Output Voltage

The output voltage is set by an external resistor divider according to 式 4:

$$R1 = R2 \times \left(\frac{V_{OUT}}{V_{FB}} - 1 \right) = R2 \times \left(\frac{V_{OUT}}{0.5V} - 1 \right) \quad (4)$$

R2 can be any value between 200 kΩ and 600 kΩ to achieve high efficiency at light load while providing acceptable noise sensitivity.

8.2.2.3 Inductor Selection

The main parameter for the inductor selection is the inductor value and then the saturation current of the inductor. To calculate the maximum inductor current under static load conditions, 式 5 and 式 6 are given.

$$I_{L,MAX} = I_{OUT,MAX} + \frac{\Delta I_L}{2} \quad (5)$$

$$\Delta I_L = V_{OUT} \times \frac{1 - \frac{V_{OUT}}{V_{IN}}}{L \times f_{SW}} \quad (6)$$

where:

- $I_{OUT,MAX}$ = Maximum output current
- ΔI_L = Inductor current ripple
- f_{SW} = Switching frequency
- L = Inductor value

TI recommends to choose a saturation current for the inductor that is approximately 20% to 30% higher than $I_{L,MAX}$. In addition, DC resistance and size must also be taken into account when selecting an appropriate inductor. Finally, for better transient response performance, TI recommends a smaller inductance value. 表 8-3 lists recommended inductors.

表 8-3. List of Recommended Inductors

INDUCTANCE [μ H]	CURRENT RATING [A]	DIMENSIONS [mm]	MAX. DC RESISTANCE [m Ω]	MFR PART NUMBER ⁽¹⁾
0.47	4.4	4.0 × 4.0 × 1.6	7.5	XGL4015-471ME, Coilcraft
	4.8	2.0 × 1.6 × 1.0	22	HTEN20161T-R47MDR, Cyntec
	4.8	2.0 × 1.6 × 1.0	22	CIGT201610EHR47MNE, Samsung
	5.1	2.0 × 1.6 × 1.0	34	TFM201610ALM-R47MTAA, TDK
0.24	4.8	2.0 × 1.25 × 0.8	17	LSCNE2012HKTR24MD, Taiyo Yuden
	4.7	2.0 × 1.6 × 1.0	19	CIGT201610LHR24MNE, Samsung
	4.7	2.0 × 1.6 × 1.0	20	DFE201610E-R24M, MuRata
	3.6	2.0 × 1.6 × 0.8	23	CIGT201608LMR24MNE, Samsung

(1) See the [Third-party Products Disclaimer](#).

8.2.2.4 Output Capacitor Selection

The inductor and the output capacitor together provide a low-pass filter. To simplify this process, 表 8-5 outlines possible inductor and capacitor value combinations for most applications. Cells with the (✓) mark represent combinations that are proven for stability by simulation and lab test. additionally, cells with the (+) mark represent combinations that are proven for stability by simulation only. Check further combinations for each individual application.

The DCS-Control scheme of the TPS62830x allows the use of tiny ceramic capacitors. Ceramic capacitors with low ESR values have the lowest output voltage ripple and are recommended. To keep low resistance up to high frequencies and to get narrow capacitance variation with temperature, TI recommends using X7R or X5R dielectrics. At light load currents, the converter operates in Power Save Mode and the output voltage ripple is dependent on the output capacitor value. A larger output capacitors can be used reducing the output voltage ripple. Considering the DC-bias derating the capacitance, the recommended minimum effective output capacitance is 12 μ F when using a 0.47- μ H or larger inductor. When using a 0.24- μ H or lower inductor, the recommended minimum effective output capacitance is 22 μ F. 表 8-6 lists recommended capacitors.

表 8-4. Matrix of Output Capacitor and Inductor Combinations (TPS628301 and TPS628302)

V_{OUT} [V]	NOMINAL L [μ H] ⁽²⁾	NOMINAL C_{OUT} [μ F] ⁽³⁾		
		2 × 10 or 22	2 × 22 or 47	100
0.5 ≤ V_{OUT} ≤ 1.8	0.47	✓ ⁽¹⁾	✓	+
	1.0	+	+	
1.8 < V_{OUT}	0.47		✓ ⁽¹⁾	+
	1.0	+	+	

表 8-5. Matrix of Output Capacitor and Inductor Combinations (TPS628303 and TPS628304)

V_{OUT} [V]	NOMINAL L [μ H] ⁽²⁾	NOMINAL C_{OUT} [μ F] ⁽³⁾		
		2 × 10 or 22	2 × 22 or 47	100
0.5 ≤ V_{OUT} ≤ 1.8	0.47	✓ ⁽¹⁾	✓	+
	0.24	+	✓	+
1.8 < V_{OUT}	0.47		✓ ⁽¹⁾	+
	0.24		✓	+

(1) This LC combination is the standard value and recommended for most applications.

(2) Inductor tolerance and current derating is anticipated. The effective inductance can vary by 20% and –30%.

(3) Capacitance tolerance and bias voltage derating is anticipated. The effective capacitance can vary by 20% and –50%.

表 8-6. List of Recommended Capacitors

NOMINAL CAPACITANCE [μF]	VOLTAGE RATING [V]	DIMENSIONS [mm]	MFR PART NUMBER ⁽¹⁾
10	6.3	2.0 × 1.5 × 1.25	MSASJ21GAB7106MTNA01, Taiyo Yuden
10	10	2.0 × 1.25 × 1.25	C2012X7R1A106K125AC, TDK
10	10	1.6 × 0.8 × 0.8	GRM188Z71A106KA73#, MuRata
10	10	1.6 × 0.8 × 0.8	C1608X5R1A106K080AC, TDK
22	10	2.0 × 1.25 × 1.25	GRM21BZ71A226ME15#, MuRata
22	10	1.6 × 0.8 × 0.8	C1608X5R1A226M080AC, TDK

8.2.2.5 Input Capacitor Selection

The input capacitor is the low-impedance energy source for the converter, which helps provide stable operation. Because the buck converter has a pulsating input current, a low ESR ceramic input capacitor is required for best input voltage filtering to minimize input voltage spikes. Place the capacitor between VIN and GND pins and as close as possible to those pins.

For most applications, a minimum effective input capacitance of 3 μF is sufficient, though a larger value reduces input current ripple and is recommended. When operating from a high impedance source, TI recommends a larger input buffer capacitor ≥10 μF to avoid voltage drops during start-up and load transients. Additionally, small de-coupling capacitors can also be used in case of noise at the input if the device. The input capacitor can be increased without any limit for better input voltage filtering.

表 8-7 shows a list of recommended capacitors.

表 8-7. List of Recommended Capacitors

NOMINAL CAPACITANCE [μF]	VOLTAGE RATING [V]	DIMENSIONS [mm]	MFR PART NUMBER ⁽¹⁾
4.7	6.3	1.6 × 0.8 × 0.8	MSASJ168BB7475MTNA01, Taiyo Yuden
4.7	10	2.0 × 1.25 × 1.25	C2012X7R1A475K125AC, TDK
10	10	1.6 × 0.8 × 0.8	GRM188Z71A106KA73#, MuRata

8.3 Power Supply Recommendations

The TPS62830x family does not have special requirements for the input power supply and is designed to operate from an input voltage supply range from 2.25 V to 5.5 V. The output current of the input power supply must be rated according to the supply voltage, output voltage, and output current of the device.

8.4 Layout

8.4.1 Layout Guidelines

The printed-circuit-board (PCB) layout is an important step to maintain the high performance of the device. See [Layout Example](#) for the recommended low EMI PCB layout.

- Place the input and output capacitors and the inductor as close as possible to the IC. This action keeps the power traces short. Routing these power traces direct and wide results in low trace resistance and low parasitic inductance.
- Connect the low side of the input and output capacitors properly to the GND pin to avoid a ground potential shift.

- Take special care to avoid noise being induced. The sense traces connected to FB is a signal trace. Keep these traces away from SW nodes. The connection of the output voltage trace for the FB resistors must be made at the output capacitor.
- Refer to [Layout Example](#) for an example of component placement, routing, and thermal design with good EMI performance.

8.4.2 Layout Example

図 8-49. PCB Layout Recommendation (RZE Package)

図 8-50. PCB Layout Recommendation (DRL Package)

8.4.2.1 Thermal Considerations

Implementation of integrated circuits in low-profile and fine-pitch surface-mount packages typically requires special attention to power dissipation. Many system-dependent issues such as thermal coupling, airflow, added heat sinks and convection surfaces, and the presence of other heat-generating components affect the power dissipation limits of a given component.

Two basic approaches for enhancing thermal performance are:

- Improving the power dissipation capability of the PCB design
- Introducing airflow in the system

The Thermal Data section in [Thermal Information](#) provides the thermal metric of the device on the EVM after considering the PCB design of real applications. The big copper planes connecting to the pads of the IC on the PCB improve the thermal performance of the device. For more details on how to use the thermal parameters, see the Thermal Characteristics application notes, [Thermal Characteristics of Linear and Logic Packages Using JEDEC PCB Designs](#) and [Semiconductor and IC Package Thermal Metrics](#).

TPS628304KRZER	Active	Production	WQFN-HR (RZE) 8	3000 LARGE T&R	Yes	SN	Level-2-260C-1 YEAR	-40 to 125	04K

⁽¹⁾ **Status:** For more details on status, see our [product life cycle](#).

⁽²⁾ **Material type:** When designated, preproduction parts are prototypes/experimental devices, and are not yet approved or released for full production. Testing and final process, including without limitation quality assurance, reliability performance testing, and/or process qualification, may not yet be complete, and this item is subject to further changes or possible discontinuation. If available for ordering, purchases will be subject to an additional waiver at checkout, and are intended for early internal evaluation purposes only. These items are sold without warranties of any kind.

⁽³⁾ **RoHS values:** Yes, No, RoHS Exempt. See the [TI RoHS Statement](#) for additional information and value definition.

⁽⁴⁾ **Lead finish/Ball material:** Parts may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead finish/Ball material values may wrap to two lines if the finish value exceeds the maximum column width.

⁽⁵⁾ **MSL rating/Peak reflow:** The moisture sensitivity level ratings and peak solder (reflow) temperatures. In the event that a part has multiple moisture sensitivity ratings, only the lowest level per JEDEC standards is shown. Refer to the shipping label for the actual reflow temperature that will be used to mount the part to the printed circuit board.

⁽⁶⁾ **Part marking:** There may be an additional marking, which relates to the logo, the lot trace code information, or the environmental category of the part.

Multiple part markings will be inside parentheses. Only one part marking contained in parentheses and separated by a "~" will appear on a part. If a line is indented then it is a continuation of the previous line and the two combined represent the entire part marking for that device.

Important Information and Disclaimer: The information provided on this page represents TI's knowledge and belief as of the date that it is provided. TI bases its knowledge and belief on information provided by third parties, and makes no representation or warranty as to the accuracy of such information. Efforts are underway to better integrate information from third parties. TI has taken and continues to take reasonable steps to provide representative and accurate information but may not have conducted destructive testing or chemical analysis on incoming materials and chemicals. TI and TI suppliers consider certain information to be proprietary, and thus CAS numbers and other limited information may not be available for release.

In no event shall TI's liability arising out of such information exceed the total purchase price of the TI part(s) at issue in this document sold by TI to Customer on an annual basis.

NOTES:

1. All linear dimensions are in millimeters. Any dimensions in parenthesis are for reference only. Dimensioning and tolerancing per ASME Y14.5M.
2. This drawing is subject to change without notice.
3. This dimension does not include mold flash, protrusions, or gate burrs. Mold flash, interlead flash, protrusions, or gate burrs shall not exceed 0.15 mm per side.
4. Reference JEDEC Registration MO-293, Variation UDAD
