

TPS7A19

40V、450mA、広 V_{IN} 、低 I_Q 、低ドロップアウト電圧レギュレータ、パワー・グッド搭載

1 特長

- 広い入力電圧範囲: 4V~40V
- 出力電圧を1.5V~18Vの範囲で変更可能
- 出力電流: 450mA
- 低い静止電流(I_Q): 15 μ A
- 低いドロップアウト電圧: 400mAで450mV (最大値)
- 遅延時間をプログラム可能なパワー・グッド
- サーマル・シャットダウンおよび過電流保護機能
- セラミック出力コンデンサで安定動作
 - $V_{OUT} \geq 2.5V$ のとき10 μ F~500 μ F
 - $V_{OUT} < 2.5V$ のとき22 μ F~500 μ F
- 動作温度範囲: -40°C~+125°C
- パッケージ: 3mm×3mm SON-8

2 アプリケーション

- スマート電力網インフラストラクチャと計量
- 電動工具
- モータ・ドライブ
- アクセス制御システム
- 試験/測定機器

3 概要

TPS7A19は低ドロップアウトのリニア・レギュレータ(LDO)で、入力電圧範囲(V_{IN})が最高40Vと広く、最大450mAまでの大きな出力電流(I_{OUT})を供給できます。この電圧レギュレータは、広い入力電圧レールから低電圧の電源を生成するために理想的です。TPS7A19は、適切にレギュレートされた電圧レールを供給するだけでなく、単純なサージ保護回路として機能するため、過渡電圧に耐えられ、その間もレギュレーションを維持できます。

TPS7A19は軽負荷時にわずか15 μ Aの静止電流(I_Q)しか消費しないため、常時オンまたはバッテリー駆動のアプリケーションにおいて消費電力を削減できます。

TPS7A19には、サーマル・シャットダウンと過電流保護機能が搭載されています。また、TPS7A19には、出力電圧がレギュレーション範囲になったことを示すパワー・グッド出力(PG)があり、遅延時間をプログラム可能です。この機能は、電力レールのシーケンス機能に便利です。

このLDOは、熱特性が強化された3mm×3mmの小さな8ピンSONパッケージで供給されます。

5 Pin Configuration and Functions

**DRB Package
8-Pin SON With Thermal Pad
Top View**

Pin Functions

PIN		I/O	DESCRIPTION
NAME	NO.		
DELAY	1	—	Delay pin. Connect a capacitor to GND to adjust the PG delay time; leave open if the PG function is not needed.
EN	6	I	Enable pin. This pin turns the regulator on or off. If $V_{EN} \geq V_{EN_HI}$, the regulator is enabled. If $V_{EN} \leq V_{EN_LO}$, the regulator is disabled. If not used, the EN pin can be connected to IN.
FB	3	I	Feedback pin. The feedback pin is the input to the control-loop error amplifier.
GND	4,5	—	Ground pin.
IN	7	I	Regulator input supply pin.
OUT	2	O	Regulator output pin. When the output voltage is larger than 2.5 V, connect a 10- μ F to 500- μ F ceramic capacitor with an equivalent series resistance (ESR) from 0.001 to 20 Ω to assure stability. When the output voltage is from 1.5 V to 2.5 V, the minimum, stable capacitor value should be 22 μ F.
PG	8	O	Power good. This open-drain pin must be connected to V_{OUT} through an external resistor. PG is pulled low when the output voltage goes below threshold.
Thermal pad		—	Solder to printed-circuit-board (PCB) to enhance thermal performance. Although the thermal pad can be left floating, connect the thermal pad to the ground plane for optimal performance.

6 Specifications

6.1 Absolute Maximum Ratings

over operating free-air temperature range -40°C to 125°C (unless otherwise noted)⁽¹⁾

			MIN	MAX	UNIT
Voltage ⁽²⁾	Input	IN, EN	−0.3	45	V
	Output	OUT ⁽³⁾	−0.3	V _{IN} + 0.3	
		DELAY ⁽⁴⁾	−0.3	45	
		FB, PG	−0.3	22	
Current	Peak output		Internally limited		
Temperature	Operating junction, T _J		−40	150	°C
	Storage, T _{stg}		−65	150	

- (1) Stresses beyond those listed under *absolute maximum ratings* may cause permanent damage to the device. These are stress ratings only and functional operation of the device at these or any other conditions beyond those indicated under *recommended operating conditions* is not implied. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.
- (2) All voltage values are with respect to GND.
- (3) The absolute maximum rating is $V_{\text{IN}} + 0.3\text{ V}$ or 22 V , whichever is lower.
- (4) The voltage at the DELAY pin must be lower than the V_{IN} voltage.

6.2 ESD Ratings

		VALUE	UNIT
$V_{\text{(ESD)}}$ Electrostatic discharge	Human-body model (HBM), per ANSI/ESDA/JEDEC JS-001 ⁽¹⁾	±2000	V
	Charged-device model (CDM), per JEDEC specification JESD22-C101 ⁽²⁾	±500	

- (1) JEDEC document JEP155 states that 500-V HBM allows safe manufacturing with a standard ESD control process.
- (2) JEDEC document JEP157 states that 250-V CDM allows safe manufacturing with a standard ESD control process.

6.3 Recommended Operating Conditions

over operating free-air temperature range (unless otherwise noted)

		MIN	MAX	UNIT
V_{IN}	Input supply voltage	4	40	V
V_{OUT}	Output voltage	1.5	18	V
V_{EN}	Enable voltage	0	40	V
T_{J}	Operating junction temperature	−40	125	$^{\circ}\text{C}$

6.4 Thermal Information

THERMAL METRIC ⁽¹⁾		TPS7A19	UNIT
		DRB (VSON)	
		8 PINS	
$R_{\theta\text{JA}}$	Junction-to-ambient thermal resistance	48	$^{\circ}\text{C/W}$
$R_{\theta\text{JC(top)}}$	Junction-to-case (top) thermal resistance	56.3	$^{\circ}\text{C/W}$
$R_{\theta\text{JB}}$	Junction-to-board thermal resistance	22.4	$^{\circ}\text{C/W}$
Ψ_{JT}	Junction-to-top characterization parameter	0.9	$^{\circ}\text{C/W}$
Ψ_{JB}	Junction-to-board characterization parameter	22.5	$^{\circ}\text{C/W}$
$R_{\theta\text{JC(bot)}}$	Junction-to-case (bottom) thermal resistance	4.6	$^{\circ}\text{C/W}$

- (1) For information about traditional and new thermal metrics, see the [Semiconductor and IC Package Thermal Metrics](#) application report.

6.5 Electrical Characteristics

at $T_J = -40^{\circ}\text{C}$ to $+125^{\circ}\text{C}$, $V_{IN} = 14\text{ V}$, $V_{EN} = V_{IN}$, $I_{OUT} = 200\text{ }\mu\text{A}$, $C_{IN} = 22\text{ }\mu\text{F}$, and $C_{OUT} = 47\text{ }\mu\text{F}$ (unless otherwise noted)

7 Detailed Description

7.1 Overview

The TPS7A19 is a low-dropout linear regulator (LDO) combined with enable and power good functions. The power good pin initializes when the output voltage, V_{OUT} , exceeds $V_{T(PG)}$. The power good delay is a function of the value set by an external capacitor on the DELAY pin before releasing the PG pin high.

7.2 Functional Block Diagram

Copyright © 2016, Texas Instruments Incorporated

7.3 Feature Description

7.3.1 Enable Pin (EN)

The enable pin is a high-voltage-tolerant pin. A logic-high input on EN activates the device and turns on the LDO. For self-bias applications, connect this input to the IN pin.

7.3.2 Regulated Output Pin (OUT)

The OUT pin is the regulated output based on the required voltage. The output is protected by internal current limiting. During initial power up, the LDO has a soft start feature incorporated to control the initial current through the pass element.

In the event that the LDO drops out of regulation, the output tracks the input minus a voltage drop based on the load current. When the input voltage drops below the UVLO threshold, the LDO shuts down until the input voltage exceeds the minimum start-up level.

7.3.3 Power-Good Pin (PG)

The power good pin is an output with an external pullup resistor to the regulated supply. The output remains low until the regulated V_{OUT} exceeds approximately 91.6% of the set value, and the power good delay has expired. The regulated output falling below the 89.6% level asserts this output low after a short deglitch time of approximately 180 μ s (typical).

Feature Description (continued)

7.3.4 Delay Timer Pin (DELAY)

An external capacitor on the DELAY pin sets the timer delay before the PG pin is asserted high. The constant output current charges an external capacitor until the voltage exceeds a threshold that trips an internal comparator. If this pin is open, the default delay time is 325 μ s (typical).

The pulse delay time, t_{PG_DLY} , is defined with the charge time of an external capacitor DELAY, as shown in Equation 1.

$$t_{PG_DLY} = \left(\frac{C_{DELAY} \times 1\text{ V}}{9.5\text{ }\mu\text{A}} \right) + 325\text{ }\mu\text{s} \quad (1)$$

The PG pin initializes when V_{OUT} exceeds 91.6% of the programmed value. The delay is a function of the value set by an external capacitor on the DELAY pin before the PG pin is released high.

Figure 12. Conditions to Activate PG

7.3.5 Adjustable Output Voltage (ADJ for TPS7A1901)

An output voltage between 1.5 V and 18 V can be selected by using the external resistor dividers. Use Equation 2 to calculate the output voltage, where $V_{FB} = 1.233\text{ V}$. In order to avoid a large leakage current and to prevent a divider error, the value of $(R1 + R2)$ must be between 10 k Ω and 100 k Ω .

$$V_{OUT} = V_{FB} \times \left(1 + \frac{R1}{R2} \right) \quad (2)$$

7.3.6 Undervoltage Shutdown

The TPS7A19 family of devices has an internally-fixed, undervoltage-shutdown threshold. Undervoltage shutdown activates when the input voltage on V_{IN} drops below V_{IN_UVLO} . This activation makes sure that the regulator is not latched in an unknown state when there is a low-input supply voltage. If the input voltage has a negative transient that drops below the UVLO threshold and recovers, the regulator shuts down and powers up, similar to a typical power-up sequence when the input voltage exceeds the required levels.

Feature Description (continued)

7.3.7 Thermal Shutdown

The TPS7A19 incorporates a thermal shutdown (TSD) circuit as protection from overheating. For continuous standard operation, the junction temperature must not exceed the TSD trip point. If the junction temperature exceeds the TSD trip point, the output turns off. When the junction temperature falls below the TSD trip point minus the TSD hysteresis value, the output turns on again.

Thermal protection disables the output when the junction temperature rises to approximately 175°C, and allows the device to cool. When the junction temperature cools to approximately 150°C, the output circuitry enables. Based on power dissipation, thermal resistance, and ambient temperature, the thermal protection circuit may cycle on and off. This cycling limits the temperature of the regulator, and protects the device from damage as a result of overheating.

Although the internal protection circuitry of the TPS7A19 device is designed to protect against overload conditions, the circuitry is not intended to replace proper heat-sink methods. Continuously running the TPS7A19 device into thermal shutdown degrades device reliability.

7.4 Device Functional Modes

7.4.1 Operation With $V_{IN} < 4\text{ V}$

The devices operate with input voltages above 4 V. The devices do not operate at input voltages below the actual UVLO voltage.

7.4.2 Operation With EN Control

The enable rising edge threshold voltage is 1.7 V, maximum. When the EN pin is held above 1.7 V, and the input voltage is greater than the UVLO rising voltage, the device enables.

The enable falling edge is 0.4 V, minimum. When the EN pin is held below 0.4 V, the device is disabled. The quiescent current is reduced in this state.

8 Application and Implementation

NOTE

Information in the following applications sections is not part of the TI component specification, and TI does not warrant its accuracy or completeness. TI's customers are responsible for determining suitability of components for their purposes. Customers should validate and test their design implementation to confirm system functionality.

8.1 Application Information

Figure 13 shows a typical application circuit for the TPS7A1901. Based on the end-application, different values of external components can be used. Some applications may require a larger output capacitor during fast load steps in order to prevent a PG low from occurring. Use a low-ESR ceramic capacitor with a dielectric of type X5R or X7R for better load transient response.

8.2 Typical Application

Figure 13. Adjustable Operation

8.2.1 Design Requirements

For this design example, use the parameters listed in Table 1.

Table 1. Design Parameters

DESIGN PARAMETER	EXAMPLE VALUE
Input voltage	12 V, $\pm 10\%$
Output voltage	3.3 V
Output current	50 mA (max)
PG delay time	1 ms

8.2.2 Detailed Design Procedure

To begin the design process:

1. First, make sure that the combination of maximum current, maximum ambient temperature, maximum input voltage, and minimum output voltage does not exceed the maximum operating condition of $T_J = 125^\circ\text{C}$. The [Power Dissipation and Thermal Considerations](#) section describes how to calculate the maximum ambient temperature and power dissipation.
2. Next, set the feedback resistors to give the desired output voltage. See [Equation 2](#) for the V_{OUT} relationship to R_1 and R_2 . A good nominal value for R_2 is 10 k Ω .
3. Then, calculate the required C_{DELAY} capacitor to achieve the desired PG delay time using [Equation 1](#). For 1 ms of delay, the nearest standard value capacitor is 10 nF.
4. Finally, select an output capacitor with a total effective capacitance between 22 μF and 500 μF , a sufficient voltage rating, and an ESR below 20 Ω . Higher capacitance gives improved transient response, but results in higher inrush current at startup.

8.2.2.1 Power Dissipation and Thermal Considerations

Device power dissipation is calculated with [Equation 3](#).

$$P_D = I_{OUT} \times (V_{IN} - V_{OUT}) + I_Q \times V_{IN}$$

where

- P_D = continuous power dissipation
- I_{OUT} = output current
- V_{IN} = input voltage
- V_{OUT} = output voltage

(3)

As $I_Q \ll I_{OUT}$, the term $I_Q \times V_{IN}$ in [Equation 3](#) can be ignored.

For a device under operation at a given ambient air temperature (T_A), calculate the junction temperature (T_J) with [Equation 4](#).

$$T_J = T_A + (\theta_{JA} \times P_D)$$

where

- θ_{JA} = junction-to-ambient air thermal impedance

(4)

A rise in junction temperature because of power dissipation can be calculated with [Equation 5](#).

$$\Delta T = T_J - T_A = (\theta_{JA} \times P_D)$$

(5)

For a given maximum junction temperature (T_{JM}), the maximum ambient air temperature (T_{AM}) at which the device can operate is calculated with [Equation 6](#).

$$T_{AM} = T_{JM} - (\theta_{JA} \times P_D)$$

(6)

8.2.3 Application Curves

$V_{IN} = 12\text{ V}$, V_{EN} step from 0 V to 12 V, $C_{IN} = 10\text{ }\mu\text{F}$,
 $C_{OUT} = 22\text{ }\mu\text{F}$, $R_{LOAD} = 66\text{ }\Omega$

Figure 14. Enable Startup

$V_{IN} = 12\text{ V}$, V_{EN} step from 12 V to 0 V, $C_{IN} = 10\text{ }\mu\text{F}$,
 $C_{OUT} = 22\text{ }\mu\text{F}$, $R_{LOAD} = 66\text{ }\Omega$

Figure 15. Enable Shutdown

9 Power Supply Recommendations

The device operates from an input voltage supply range between 4 V and 40 V. This input supply must be well regulated. If the input supply is located more than a few inches from the TPS7A19 device, add an electrolytic capacitor with a value of 47 μ F and a ceramic bypass capacitor at the input.

10 Layout

10.1 Layout Guidelines

- To improve ac performance such as PSRR, output noise, and transient response, design the board with separate ground planes for V_{IN} and V_{OUT} , with each ground plane connected only at the GND pin of the device. In addition, connect the ground connection for the output capacitor directly to the GND pin of the device.
- Minimize equivalent series inductance (ESL) and equivalent series resistance (ESR) in order to maximize performance and stability. Place every capacitor as close to the device as possible, and on the same side of the PCB as the regulator.
- Do not place any of the capacitors on the opposite side of the PCB from where the regulator is installed. The use of vias and long traces are strongly discouraged because of the negative impact on system performance. Vias and long traces can also cause instability.
- If possible, and to maximize the performance listed in this data sheet, use the same layout pattern used for the TPS7A19 evaluation module, [TPS7A1901EVM-760](#) (SBVU031).

This glossary lists and explains terms, acronyms, and definitions.

12 メカニカル、パッケージ、および注文情報

以降のページには、メカニカル、パッケージ、および注文に関する情報が記載されています。この情報は、そのデバイスについて利用可能な最新のデータです。このデータは予告なく変更されることがあり、ドキュメントが改訂される場合もあります。本データシートのブラウザ版を使用されている場合は、画面左側の説明をご覧ください。

PACKAGING INFORMATION

Orderable part number	Status (1)	Material type (2)	Package Pins	Package qty Carrier	RoHS (3)	Lead finish/ Ball material (4)	MSL rating/ Peak reflow (5)	Op temp (°C)	Part marking (6)
TPS7A1901DRBR	Active	Production	SON (DRB) 8	3000 LARGE T&R	Yes	NIPDAU	Level-1-260C-UNLIM	-40 to 125	A1901
TPS7A1901DRBR.A	Active	Production	SON (DRB) 8	3000 LARGE T&R	Yes	NIPDAU	Level-1-260C-UNLIM	-40 to 125	A1901
TPS7A1901DRBT	Active	Production	SON (DRB) 8	250 SMALL T&R	Yes	NIPDAU	Level-1-260C-UNLIM	-40 to 125	A1901
TPS7A1901DRBT.A	Active	Production	SON (DRB) 8	250 SMALL T&R	Yes	NIPDAU	Level-1-260C-UNLIM	-40 to 125	A1901
TPS7A1901DRBTG4.A	Active	Production	SON (DRB) 8	250 SMALL T&R	Yes	NIPDAU	Level-1-260C-UNLIM	-40 to 125	A1901

⁽¹⁾ **Status:** For more details on status, see our [product life cycle](#).

⁽²⁾ **Material type:** When designated, preproduction parts are prototypes/experimental devices, and are not yet approved or released for full production. Testing and final process, including without limitation quality assurance, reliability performance testing, and/or process qualification, may not yet be complete, and this item is subject to further changes or possible discontinuation. If available for ordering, purchases will be subject to an additional waiver at checkout, and are intended for early internal evaluation purposes only. These items are sold without warranties of any kind.

⁽³⁾ **RoHS values:** Yes, No, RoHS Exempt. See the [TI RoHS Statement](#) for additional information and value definition.

⁽⁴⁾ **Lead finish/Ball material:** Parts may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead finish/Ball material values may wrap to two lines if the finish value exceeds the maximum column width.

⁽⁵⁾ **MSL rating/Peak reflow:** The moisture sensitivity level ratings and peak solder (reflow) temperatures. In the event that a part has multiple moisture sensitivity ratings, only the lowest level per JEDEC standards is shown. Refer to the shipping label for the actual reflow temperature that will be used to mount the part to the printed circuit board.

⁽⁶⁾ **Part marking:** There may be an additional marking, which relates to the logo, the lot trace code information, or the environmental category of the part.

Multiple part markings will be inside parentheses. Only one part marking contained in parentheses and separated by a "~" will appear on a part. If a line is indented then it is a continuation of the previous line and the two combined represent the entire part marking for that device.

Important Information and Disclaimer:The information provided on this page represents TI's knowledge and belief as of the date that it is provided. TI bases its knowledge and belief on information provided by third parties, and makes no representation or warranty as to the accuracy of such information. Efforts are underway to better integrate information from third parties. TI has taken and continues to take reasonable steps to provide representative and accurate information but may not have conducted destructive testing or chemical analysis on incoming materials and chemicals. TI and TI suppliers consider certain information to be proprietary, and thus CAS numbers and other limited information may not be available for release.

In no event shall TI's liability arising out of such information exceed the total purchase price of the TI part(s) at issue in this document sold by TI to Customer on an annual basis.

TAPE AND REEL INFORMATION

*All dimensions are nominal

Device	Package Type	Package Drawing	Pins	SPQ	Reel Diameter (mm)	Reel Width W1 (mm)	A0 (mm)	B0 (mm)	K0 (mm)	P1 (mm)	W (mm)	Pin1 Quadrant
TPS7A1901DRBR	SON	DRB	8	3000	330.0	12.4	3.3	3.3	1.1	8.0	12.0	Q2
TPS7A1901DRBT	SON	DRB	8	250	180.0	12.4	3.3	3.3	1.1	8.0	12.0	Q2

TAPE AND REEL BOX DIMENSIONS

*All dimensions are nominal

Device	Package Type	Package Drawing	Pins	SPQ	Length (mm)	Width (mm)	Height (mm)

NOTES:

1. All linear dimensions are in millimeters. Any dimensions in parenthesis are for reference only. Dimensioning and tolerancing per ASME Y14.5M.
2. This drawing is subject to change without notice.
3. The package thermal pad must be soldered to the printed circuit board for thermal and mechanical performance.

4. This package is designed to be soldered to a thermal pad on the board. For more information, see Texas Instruments literature number SLUA271 (www.ti.com/lit/slue271).
5. Vias are optional depending on application, refer to device data sheet. If any vias are implemented, refer to their locations shown on this view. It is recommended that vias under paste be filled, plugged or tented.
