

TPSI3052-Q1 JAJSKC8C - APRIL 2022 - REVISED AUGUST 2023

# TPSI3052-Q1 15-V ゲート電源内蔵、車載用強化絶縁スイッチ・ドライバ

### 1 特長

- 絶縁型二次電源は不要
- 外部パワー・トランジスタまたは SCR を駆動
- 5-kV<sub>RMS</sub> reinforced isolation
- 1.5/3A ピークのソースおよびシンク電流の 15-V ゲー ト・ドライブ
- 外部補助回路に対して最大 50mW の電力を供給
- AC または DC スイッチングをサポート
- 2線式または3線式モードをサポート
- 7レベルの電力伝送、抵抗が選択可能
- 機能安全対応
  - 機能安全システム設計に役立つ資料を利用可能
- 車載アプリケーション用に AEC Q-100 認定済み:
  - 温度グレード 1:-40~+125℃、TA
- 安全関連認証
  - DIN EN IEC 60747-17 (VDE 0884-17) に準拠し た強化絶縁耐圧:7071V<sub>PK</sub>
  - UL 1577 に準拠した絶縁耐圧:5kV<sub>RMS</sub> (1 分間)

## 2 アプリケーション

- ソリッド・ステート・リレー (SSR)
- バッテリ・マネージメント・システム
- オンボード・チャージャ
- ハイブリッド車、電気自動車、パワートレイン・システム
- ビル・オートメーション
- ファクトリ・オートメーションおよび制御

## 3 概要

TPSI3052-Q1 は、統合型の絶縁スイッチ・ドライバで、外 部パワー・スイッチと組み合わせることにより、完全な絶縁 型ソリッド・ステート・リレー (SSR) を形成します。公称ゲー ト駆動電圧 15 V で、1.5/3.0A ピークのソースおよびシン ク電流という性能を備えているので、さまざまな外部パワ ー・スイッチを選択して、幅広いアプリケーションに対応で きます。TPSI3052-Q1 は、1 次側から供給された電源に よって独自の2次バイアス電源を生成するので、絶縁型 の 2 次側電源バイアスは不要です。さらに、TPSI3052-Q1 は、各種のアプリケーションのニーズに対応する外部 のサポート回路に電力を供給することもできます。

TPSI3052-Q1 は、必要な入力ピンの数によって 2 つの 動作モードをサポートしています。2 線式モードは、通常 は機械式リレーの駆動に使用され、スイッチの制御に必要 なピンは 2 本だけで、6.5V~48V の広い電圧範囲で動 作できます。3線式モードでは、3V~5.5Vの1次電源が 外部から供給され、スイッチは別のイネーブルによって制 御されます。TPSI3052S-Q1 は、スイッチの制御方式とし て、3線式モードのみで利用可能なワンショット・イネーブ ルを備えています。この機能は、通常は電流パルス 1 つ だけでトリガできる SCR の駆動に便利です。

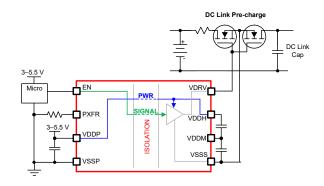

2 次側は、15 V の安定化されたフローティング電源レー ルを提供し、2次側バイアス電源を必要とせずに各種パワ ー・スイッチを駆動します。このアプリケーションは、DC ア プリケーション用のシングル・パワー・スイッチ、または AC アプリケーション用のデュアル・バック・ツー・バック・パワ ー・スイッチ、および各種 SCR を駆動できます。 TPSI3052-Q1 の内蔵絶縁保護は、非常に堅牢で、従来 の機械式リレーやフォトカプラに比べて高信頼性、低消費 電力で、温度範囲が広くなっています。

TPSI3052-Q1 の電力伝送は、PXFR ピンと VSSP の間 の外付け抵抗を使って、7 つの電力レベル設定のいずれ かを選択することにより調整できます。この操作により、ア プリケーションのニーズに応じて、2次側の供給電力と消 費電力とのトレードオフが可能になります。

### パッケージ情報

部品番号	パッケージ <sup>(1)</sup>	本体サイズ (公称)			
TPSI3052-Q1	SOIC 8ピン (DWZ)	7 50mm x 5 85mm			
TPSI3052S-Q1	3010 8 L > (DVVZ)	7.5011111 ~ 5.0511111			

利用可能なすべてのパッケージについては、データシートの末尾 (1) にある注文情報を参照してください。

# **5 Pin Configuration and Functions**

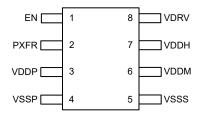

図 5-1. TPSI3052-Q1, TPSI3052S-Q1 8-Pin SOIC Top View

表 5-1. Pin Functions

	PIN		TYPE <sup>(1)</sup>	DESCRIPTION
NO.	NAME	"0	IIFE(/	DESCRIP HON
1	EN	I	_	Active high driver enable
2	PXFR	ı	_	Power transfer can be adjusted by selecting one of seven power level settings using an external resistor from the PXFR pin to VSSP. In three-wire mode, a given resistor setting sets the duty cycle of the power converter (see 表 8-1) and hence the amount of power transferred. In two-wire mode, a given resistor setting adjusts the current limit of the EN pin (see 表 8-2) and hence the amount of power transferred.
3	VDDP	_	Р	Power supply for primary side
4	VSSP	_	GND	Ground supply for primary side
5	VSSS	_	GND	Ground supply for secondary side
6	VDDM	_	Р	Generated mid supply
7	VDDH	_	Р	Generated high supply
8	VDRV	0	_	Active high driver output

<sup>(1)</sup> P = power, GND = ground, NC = no connect

## **6 Specifications**

## **6.1 Absolute Maximum Ratings**

over operating free-air temperature range (unless otherwise noted)(1)

	PARAMETER <sup>(1)</sup>	MIN	MAX	UNIT
Primary Side Supply <sup>(2)</sup>	VDDP	-0.3	6	V
Primary Side Supply <sup>(2)</sup>	EN	-0.3	60	V
Primary Side Supply <sup>(2)</sup>	PXFR	-0.3	60	V
Secondary Side Supply <sup>(3)</sup>	VDRV	-0.3	18	V
Secondary Side Supply <sup>(3)</sup>	VDDH	-0.3	18	V
Secondary Side Supply <sup>(3)</sup>	VDDM	-0.3	6	V
Secondary Side Supply <sup>(3)</sup>	VDDH-VDDM	-0.3	12	V
Junction temperature, T <sub>J</sub>	Junction temperature, T <sub>J</sub>	-40	150	°C
Storage tempe	rature, T <sub>stg</sub>	-65	150	°C

<sup>(1)</sup> Operation outside the Absolute Maximum Ratings may cause permanent device damage. Absolute Maximum Ratings do not imply functional operation of the device at these or any other conditions beyond those listed under Recommended Operating Conditions. If used outside the Recommended Operating Conditions but within the Absolute Maximum Ratings, the device may not be fully functional, and this may affect device reliability, functionality, performance, and shorten the device lifetime.

- (2) All voltage values are with respect to VSSP.
- (3) All voltage values are with respect to VSSS.

### 6.2 ESD Ratings

				VALUE	UNIT
		Human body model (HBM), per AEC Q100 HBM ESD classification level 2	D-002 <sup>(1)</sup>	±2000	
V <sub>(ESD)</sub> Electrostatic discharge	Electrostatic discharge	Charged device model (CDM), per AEC	Corner pins (1, 4, 5, and 8)	±750	V
	Q100-011 CDM ESD classification level C4B		Other pins	±500	

<sup>(1)</sup> AEC Q100-002 indicates that HBM stressing must be in accordance with the ANSI/ESDA/JEDEC JS-001 specification.

## **6.3 Recommended Operating Conditions**

over operating free-air temperature range (unless otherwise noted)

		MIN	NOM MAX	UNIT
VDDP	Primary side supply voltage in three-wire mode <sup>(1)</sup>	3.0	5.5	V
EN	Enable in two-wire mode <sup>(1)</sup>	0	48.0	V
EIN	Enable in three-wire mode <sup>(1)</sup>	0	5.5	V
PXFR	Power transfer control <sup>(1)</sup>	0	5.5	V
C	Decoupling capacitance on VDDP and VSSP, two-wire mode <sup>(3)</sup>	220	330	nF
C <sub>VDDP</sub>	Decoupling capacitance on VDDP and VSSP, three-wire mode <sup>(3)</sup>	0.22	20	μF
C <sub>DIV1</sub> (2)	Decoupling capacitance across VDDH and VDDM <sup>(3)</sup>	0.004	15	μF
C <sub>DIV2</sub> (2)	Decoupling capacitances across VDDM and VSSS <sup>(3)</sup>	0.012	40	μF
T <sub>A</sub>	Ambient operating temperature	-40	125	°C

## **6.3 Recommended Operating Conditions (continued)**

over operating free-air temperature range (unless otherwise noted)

		MIN	NOM MAX	UNIT
T <sub>J</sub>	Operating junction temperature	-40	150	°C
$ \Delta V_{EN}/\Delta t $	EN rise and fall rates, two-wire mode.	65		V/ms

- (1) All voltage values are with respect to VSSP.
- (2)  $C_{DIV1}$  and  $C_{DIV2}$  should be of same type and tolerance.  $C_{DIV2}$  capacitance value should be at least three times the capacitance value of  $C_{DIV1}$  i.e.  $C_{DIV2} \ge 3 \times C_{DIV1}$ .
- (3) All capacitance values are absolute. Derating should be applied where necessary.

#### 6.4 Thermal Information

		DEVICE	
THERMAL METRIC <sup>(1)</sup> (2)		DWZ(SOIC)	UNIT
		8 PINS	
R <sub>OJA</sub>	Junction-to-ambient thermal resistance	89.3	°C/W
R <sub>OJC(top)</sub>	Junction-to-case (top) thermal resistance	40.3	°C/W
R <sub>OJB</sub>	Junction-to-board thermal resistance	45.2	°C/W
Ψ <sub>JT</sub>	Junction-to-top characterization parameter	10.3	°C/W
$\Psi_{JB}$	Junction-to-board characterization parameter	44.4	°C/W

<sup>(1)</sup> Estimate only.

## 6.5 Power Ratings

	PARAMETER	TEST CONDITIONS	MIN	TYP	MAX	UNIT
$P_{D}$	Maximum power dissipation, VDDP.	$\begin{split} &V_{VDDP}=5~V,\\ &R_{PXFR}=20~k\Omega,~three-wire~mode,\\ &C_{VDRV}=100~pF,\\ &C_{DIV1}=33~nF,~C_{DIV2}=100~nF\\ &f_{EN}=1\text{-kHz}~square~wave,}~V_{EN}=5~V~peak\\ &to~peak. \end{split}$			250	mW
	Maximum power dissipation, EN.	$R_{PXFR}$ = 20 kΩ, two-wire mode, $C_{VDRV}$ = 100 pF, $C_{DIV1}$ = 33 nF, $C_{DIV2}$ = 100 nF $f_{EN}$ = 1-kHz square wave, $V_{EN}$ = 48 V peak to peak.k.			350	mW

### 6.6 Insulation Specifications

PARAMETER		TEST CONDITIONS	SPECIFIC ATION	UNIT
CREEPA	AGE AND TRACKING	·		
CLR	External clearance <sup>(1)</sup>	Shortest terminal-to-terminal distance through air	≥ 8.5	mm
CPG	External Creepage <sup>(1)</sup>	Shortest terminal-to-terminal distance across the package surface	≥ 8.5	mm
DTI	Distance through the insulation	Minimum internal gap (internal clearance)	≥ 120	μm
СТІ	Comparative tracking index	DIN EN 60112 (VDE 0303-11); IEC 60112	≥ 600	V
	Material Group	According to IEC 60664-1	I	
	0	Rated mains voltage ≤ 600 V <sub>RMS</sub>	I-IV	
	Overvoltage category per IEC 60664-1	Rated mains voltage ≤ 1000 V <sub>RMS</sub>	1-111	
DIN EN I	EC 60747-17 (VDE 0884-17)	'		

<sup>(2)</sup> For more information about traditional and new thermal metrics, see the Semiconductor and IC Package Thermal Metrics application report.

### 6.6 Insulation Specifications (continued)

	PARAMETER	TEST CONDITIONS	SPECIFIC ATION	UNIT
V <sub>IORM</sub>	Maximum repetitive peak isolation voltage	AC voltage (bipolar)	1414	V <sub>PK</sub>
V	Maximum isolation working voltage	AC voltage (sine wave)	1000	V <sub>RMS</sub>
V <sub>IOWM</sub>	Maximum isolation working voltage	DC voltage	1414	$V_{DC}$
		V <sub>TEST</sub> = V <sub>IOTM</sub> ; t = 60 s (qualification test)	7070	V <sub>PK</sub>
V <sub>IOTM</sub>	Maximum transient isolation voltage	$V_{TEST} = 1.2 \times V_{IOTM}$ ; t = 1 s (100% production test)	8484	V <sub>PK</sub>
V <sub>IMP</sub>	Maximum impulse voltage <sup>(3)</sup>	Tested in air; 1.2/50-µs waveform per IEC 62638-1	9230	V <sub>PK</sub>
V <sub>IOSM</sub>	Maximum surge isolation voltage <sup>(3)</sup>	Tested in oil (qualification test); 1.2/50-µs waveform per IEC 62638-1	12000	V <sub>PK</sub>
		Method a: After input-output safety test subgroup 2/3, $V_{ini} = V_{IOTM},  t_{ini} = 60 \text{ s}; \\ V_{pd(m)} = 1.2 \times V_{IORM},  t_m = 10 \text{ s}.$	≤ 5	
q <sub>pd</sub>	Apparent charge <sup>(4)</sup>	Method a: After environmental tests subgroup 1, $V_{ini} = V_{IOTM}$ , $t_{ini} = 60 \text{ s}$ ; $V_{pd(m)} = 1.6 \times V_{IORM}$ , $t_m = 10 \text{ s}$ .	≤ 5	рС
		Method b1: At routine test (100% production test) and preconditioning (type test), $V_{ini} = V_{IOTM}$ , $t_{ini} = 1$ s; $V_{pd(m)} = 1.875 \times V_{IORM}$ , $t_m = 1$ s.	≤ 5	
C <sub>IO</sub>	Barrier capacitance, input to output <sup>(5)</sup>	$V_{IO} = 0.4 \times \sin(2\pi ft), f = 1 \text{ MHz}$	3	pF
		V <sub>IO</sub> = 500 V, T <sub>A</sub> = 25°C	> 10 <sup>12</sup>	
R <sub>IO</sub>	Insulation resistance, input to output <sup>(5)</sup>	$V_{IO} = 500 \text{ V}, 100^{\circ}\text{C} \le T_{A} \le 125^{\circ}\text{C}$	> 10 <sup>11</sup>	Ω
		V <sub>IO</sub> = 500 V at T <sub>S</sub> = 150°C	> 10 <sup>9</sup>	
	Pollution degree		2	
	Climatic category		40/125/21	
UL 1577			•	
V <sub>ISO</sub>	Withstand isolation voltage	$V_{TEST} = V_{ISO} = 5000 \ V_{RMS}, t = 60 \ s$ (qualification test), $V_{TEST} = 1.2 \times V_{ISO} = 6000 \ V_{RMS}, t = 1 \ s$ (100% production test)	5000	V <sub>RMS</sub>

- (1) Creepage and clearance requirements should be applied according to the specific equipment isolation standards of an application. Care should be taken to maintain the creepage and clearance distance of a board design to ensure that the mounting pads of the isolator on the printed-circuit board do not reduce this distance. Creepage and clearance on a printed-circuit board become equal in certain cases. Techniques such as inserting grooves, ribs, or both on a printed-circuit board are used to help increase these specifications.
- (2) Testing is carried out in air to determine the intrinsic surge immunity of the package.
- (3) Testing is carried out in oil to determine the intrinsic surge immunity of the isolation barrier.
- (4) Apparent charge is electrical discharge caused by a partial discharge (pd).
- (5) All pins on each side of the barrier tied together creating a two-pin device.

## 6.7 Safety-Related Certifications

VDE	UL
Certified according to DIN EN IEC 60747-17 (VDE 0884-17)	Recognized under UL 1577 Component Recognition Program
Reinforced insulation; Maximum transient isolation voltage, 7071 $V_{PK};$ Maximum repetitive peak isolation voltage, 1414 $V_{PK};$ Maximum surge isolation voltage, 12000 $V_{PK}$	Single protection, 5000 V <sub>RMS</sub>

## 6.8 Safety Limiting Values

	PARAMETER <sup>(1)</sup> (2)	TEST CONDITIONS	MIN	TYP	MAX	UNIT
		$R_{\theta JA}$ = 89.3°C/W, $V_{VDDP}$ = 5.5 V, $T_{J}$ = 150°C, $T_{A}$ = 25°C, three-wire mode.			254	
I <sub>S</sub>	Safety input, output, or supply current	$R_{\theta,JA} = 89.3$ °C/W, $V_{EN} = 24$ V, $T_{J} = 150$ °C, $T_{A} = 25$ °C, two-wire mode.			58	mA
		$R_{\theta JA} = 89.3 ^{\circ}\text{C/W}, V_{EN} = 48  \text{V},$ $T_J = 150 ^{\circ}\text{C}, T_A = 25 ^{\circ}\text{C},$ two-wire mode.			29	
P <sub>S</sub>	Safety input, output, or total power	R <sub>0JA</sub> = 89.3°C/W, T <sub>J</sub> = 150°C, T <sub>A</sub> = 25°C.			1.4	W
T <sub>S</sub>	Maximum safety temperature				150	°C

- (1) Safety limiting intends to minimize potential damage to the isolation barrier upon failure of input or output circuitry. A failure of the I/O can allow low resistance to ground or the supply and, without current limiting, dissipate sufficient power to overheat the die and damage the isolation barrier, potentially leading to secondary system failures.
- (2) The safety-limiting constraint is the maximum junction temperature specified in the data sheet. The power dissipation and junction-to-air thermal impedance of the device installed in the application hardware determines the junction temperature. The assumed junction-to-air thermal resistance in the Thermal Information table is that of a device installed on a high-K test board for leaded surface-mount packages. The power is the recommended maximum input voltage times the current. The junction temperature is then the ambient temperature plus the power times the junction-to-air thermal resistance.

#### 6.9 Electrical Characteristics

over operating free-air temperature range (unless otherwise noted). Typicals at  $T_A$  = 25°C.  $C_{VDDP}$  = 220 nF (two-wire mode),  $C_{VDDP}$  = 1 µF (three-wire mode),  $C_{DIV1}$  = 5.1 nF,  $C_{DIV2}$  = 15 nF,  $C_{VDRV}$  = 100 pF,  $R_{PXFR}$  = 7.32 k $\Omega$  ±1%

	PARAMETER	TEST CONDITIONS	MIN	TYP	MAX	UNIT
COMMON						
$V_{VDDP\_UV\_R}$	VDDP under-voltage threshold rising	VDDP rising	2.50	2.70	2.90	V

## 8 Detailed Description

### 8.1 Overview

The TPSI3052-Q1 is a fully integrated, reinforced isolated power switch driver, which when combined with an external power switch, forms a complete isolated Solid State Relay (SSR). With a nominal gate drive voltage of 15 V and 1.5/3.0-A peak source and sink current, a large variety of external power switches can be chosen to meet a wide range of applications. The TPSI3052-Q1 generates its own secondary supply from the power received from its primary side, so no isolated secondary bias supply is required.

The *Functional Block Diagram* shows the primary side that includes a transmitter that drives an alternating current into the primary winding of an integrated transformer at a rate determined by the setting of the PXFR pin and the logic state of the EN pin. The transmitter operates at high frequency to optimally drive the transformer to its peak efficiency. In addition, the transmitter uses spread spectrum techniques to greatly improve EMI performance, allowing many applications to achieve CISPR 25 - Class 5. During transmission, data information transfers to the secondary side alongside with the power. On the secondary side, the voltage induced on the secondary winding of the transformer is rectified, and the shunt regulator regulates the output voltage level of VDDH. Lastly, the demodulator decodes the received data information and drives VDRV high or low based on the logic state of the EN pin.

#### 8.2 Functional Block Diagram

#### 8.3 Feature Description

### 8.3.1 Transmission of the Enable State

The TPSI3052-Q1 and TPSI3052S-Q1 use a modulation scheme to transmit the switch enable state information across the isolation barrier. The transmitter modulates the EN signal with an internally generated, high frequency carrier (89-MHz typical), and differentially drives the primary winding of the isolation transformer. The receiver on the secondary side demodulates the received signal and asserts VDRV high or low based on the data received.

#### 8.3.2 Power Transmission

The TPSI3052-Q1 and TPSI3052S-Q1 do not use an isolated supply for their power. The secondary side power is obtained by the transferring of the primary side input power across the isolation transformer. The modulation scheme uses spread spectrum of the high frequency carrier (89-MHz typical) to improve EMI performance assisting applications in meeting the CISPR 25 Class 5 standards.

#### 8.3.3 Gate Driver

The TPSI3052-Q1 and TPSI3052S-Q1 have an integrated gate driver that provides a nominal 15-V gate voltage with 1.5/3.0-A peak source and sink current sufficient for driving many power transistors or Silicon-Controlled Rectifiers (SCR). When driving external power transistors, TI recommends bypass capacitors ( $C_{DIV2} = 3 * C_{DIV1}$ ) from VDDH to VDDM and VDDM to VSSS of 20 times the equivalent gate capacitance.

The gate driver also includes an active clamp keep off circuit. This feature helps to keep the driver output, VDRV, low should power be lost on the secondary supply rails e.g. power loss on the VDDP supply prevents power transfer. Should power be lost, the active clamp keep off circuit will attempt to clamp the voltage of VDRV to under 2 V relative to VSSS.

#### 8.3.4 Modes Overview

The TPSI3052-Q1 and TPSI3052S-Q1 have two modes of operation: two-wire mode and three-wire mode.

In two-wire mode, the power on the primary side is provided directly by the EN pin. Setting EN high causes power transfer to the secondary side. As power transfers, the secondary rails, VDDM and VDDH, begin to rise. After sufficient power is available on the secondary side, VDRV is asserted high. Setting EN low causes VDRV to assert low and halts power transfer to the secondary side.

In three-wire mode, the power on the primary side is provided by a dedicated, low output impedance supply connected to VDDP. In this case, power transfer is independent from the enable state. If VDDP power is present, power is transferred from the primary side to the secondary side regardless of the EN state. In steady state conditions, when sufficient power is available on the secondary side, setting EN high causes VDRV to assert high. Setting EN low causes VDRV to assert low.

In standard enable, available only on the TPSI3052-Q1, VDRV follows the state of the EN pin and is used in most load switch applications. In one-shot enable mode, available only on the TPSI3052S-Q1 in three-wire mode, when a rising transition occurs on EN, VDRV is asserted high momentarily and then automatically asserted low, forming a one-shot pulse on VDRV. This event is useful for driving SCR devices that require only one burst of power to trigger. To re-trigger VDRV, EN must first transition low, followed by another rising transition.

#### 8.3.5 Three-Wire Mode

Three-wire mode is used for applications that require higher levels of power transfer or the shortest propagation delay TPSI3052-Q1 can offer. VDDP is supplied independently from the EN pin by a low output impedance external supply that can deliver the required power. In this mode, power from the primary side to the secondary side always occurs regardless of the state of the EN pin. Setting the EN pin logic high or low asserts or deasserts VDRV, thereby enabling or disabling the external switch, respectively.  $\boxtimes$  8-1 shows the basic setup required for three-wire mode operation which requires EN, VDDP, and VSSP signals. EN can be driven up to 5.5 V which is normally driven from the circuitry residing on the same rail as VDDP. In this example, the TPSI3052-Q1 is being used to drive back-to-back MOSFETs in a common-source configuration.  $C_{VDDP}$  provides the required decoupling capacitance for the VDDP supply rail of the device.  $C_{DIV1}$  and  $C_{DIV2}$  provide the required decoupling capacitances of the VDDH and VDDM supply rails that provide the peak current to drive the external MOSFETs.

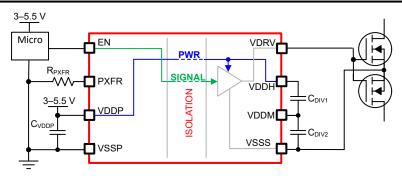

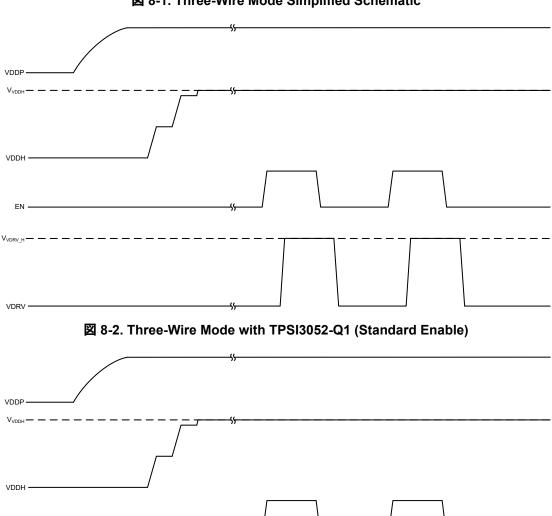

図 8-1. Three-Wire Mode Simplified Schematic

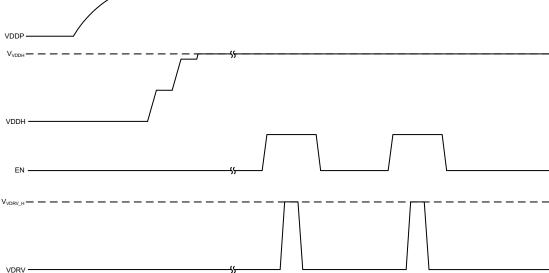

図 8-3. Three-Wire Mode with TPSI3052S-Q1 (One-shot Enable)

To reduce average power, the TPSI3052-Q1 transfers power from the primary side to the secondary side in a burst fashion. The period of the burst is fixed while the burst on time is programmable by selecting one of seven appropriate resistor values, R<sub>PXFR</sub>, from the PXFR to VSSP pins, thereby changing the duty cycle of the power converter. This action provides flexibility in the application, allowing tradeoffs in power consumed versus power delivered. Higher power converter settings increase the burst on time which, in turn, increases average power consumed from the VDDP supply and increases the amount of power transferred to the secondary side VDDH and VDDM supplies. Similarly, lower power converter settings decrease the burst on time which, in turn, decreases average power consumed from the VDDP supply and decreases the amount of power transferred to the secondary side.

表 8-1 summarizes the three-wire mode power transfer selection.

	& 0-1. Three-wife Mode Fower Transfer Selection

表 8-1. Three-Wire Mode Power Transfer Selection

- (1) Standard resistor (EIA E96), 1% tolerance, nominal value.
- (2)  $R_{PXFR} \ge 100 \text{ k}\Omega$  or  $R_{PXFR} \le 1 \text{ k}\Omega$  sets the duty cycle of the power converter to 13.3%.

### 8.3.6 Two-Wire Mode

図 8-4 shows the basic setup required for two-wire mode operation, which requires the EN signal and VSSP ground signal. EN can be driven up to 48 V. No current limiting resistor is required on EN because the TPSI3052-Q1 limits the input current based on the values set by the  $R_{PXFR}$  resistor (see 表 8-2). In this example, the TPSI3052-Q1 is being used to drive back-to-back MOSFETs in a common-source configuration.  $C_{VDDP}$  provides the required decoupling capacitance for the VDDP supply rail of the device.  $C_{DIV1}$  and  $C_{DIV2}$  provide the required decoupling capacitance of the VDDH and VDDM supply rails that provide the peak current to drive the external MOSFETs.

☑ 8-5 shows the typical operation in two-wire mode configured for standard enable. The application drives EN to a logic high and the TPSI3052-Q1 begins its power-up sequence. During power up, the current provided by the EN pin, I<sub>EN</sub>, begins to charge up the external capacitance, C<sub>VDDP</sub>, and the voltage on VDDP begins to rise until it reaches V<sub>VDDP\_H</sub>. After VDDP reaches its peak, V<sub>VDDP\_H</sub>, the TPSI3052-Q1 transfers stored energy on C<sub>VDDP</sub> to the secondary side for a fixed time (3.3-µs typical) which begins to charge up the VDDH (and VDDM) secondary side rails thereby discharging the voltage on VDDP. In steady state, this results in an average voltage on VDDP, V<sub>VDDP\_AVG</sub>. This cycle repeats until the VDDH (and VDDM) secondary side rails are fully charged. The time required to fully charge VDDH depends on several factors including the values of C<sub>VDDP</sub>, C<sub>DIV1</sub>, C<sub>DIV2</sub>, R<sub>PXFR</sub>, and the overall power transfer efficiency. After VDDH is fully charged, VDRV is asserted high and remains high while the EN pin remains at a logic high. When the application drives the EN pin to a logic low, the charge on VDDP begins to discharge. Prior to VDDP reaching its UVLO falling threshold, TPSI3052-Q1 signals information from the primary side to the secondary side to de-assert VDRV and drive it low. Because power is no longer being transferred, all rails begin to fully discharge.

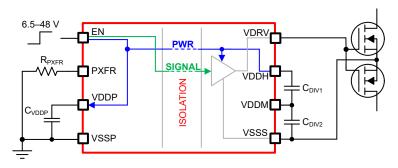

図 8-4. Two-Wire Mode Simplified Schematic

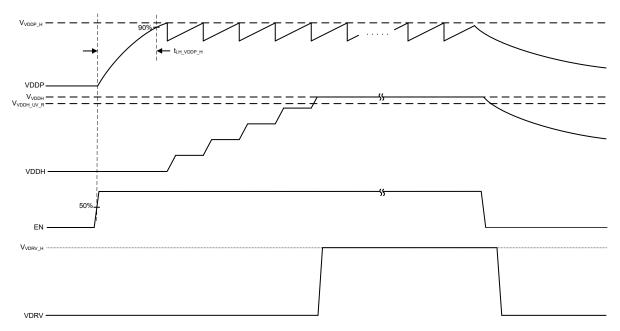

図 8-5. Two-Wire Mode with Standard Enable (TPSI3052-Q1 Only)

In two-wire mode, power is supplied directly by the EN pin. When EN is asserted high, the TPSI3052-Q1 transfers power to the secondary side for a fixed time (3.3- $\mu$ s nominal) while the time period varies. The period varies due to the hysteretic control of the power transfer that ensures the average current supplied through the EN pin is maintained. The amount of average current, and hence the amount of power transferred, is programmable by selecting one of seven appropriate resistor values,  $R_{PXFR}$ , from the PXFR to VSSP pins. Higher settings of  $R_{PXFR}$  increase  $I_{EN}$  which increases the average power consumed from the EN pin and increases the amount of power transferred to the secondary side VDDH supply. Similarly, lower settings of  $R_{PXFR}$  decrease  $I_{EN}$ , which decreases the average power consumed from the EN pin and decreases the amount of power transferred to the secondary side.

表 8-2 summarizes the two-wire mode power selection.

#### 表 8-2. Two-Wire Mode Power Selection

R <sub>PXFR</sub> (1) (2)	I <sub>EN</sub> (Two-Wire Mode, Nominal)	Description
7.32 kΩ	1.9 mA	
9.09 kΩ	2.8 mA	
11 kΩ	3.7 mA	The device supports seven, fixed EN input current limit options selected by the
12.7 kΩ	4.5 mA	corresponding R <sub>PXFR</sub> specified value. Higher current limit selections lead to increased power transfer and consumption. During power up, the EN input current
14.7 kΩ	5.2 mA	limit is determined and remains fixed at that setting until VDDP power cycles.
16.5 kΩ	6.0 mA	
20 kΩ	6.7 mA	

- (1) Standard resistor (EIA E96), 1% tolerance, nominal value.
- (2)  $R_{PXFR} \ge 100 \text{ k}\Omega \text{ or } R_{PXFR} \le 1 \text{ k}\Omega \text{ sets the } I_{EN} \text{ to } 1.9 \text{ mA}.$

## 8.3.7 VDDP, VDDH, and VDDM Undervoltage Lockout (UVLO)

TPSI3052-Q1 and TPSI3052S-Q1 implement an internal UVLO protection feature for both input and output power supplies, VDDP, VDDH, and VDDM. When VDDP is lower than the UVLO threshold voltage, power ceases to be transferred to the VDDM and VDDH rails. Over time the VDDH and VDDM rails will begin to discharge. If enough charge is available on VDDP, the device will attempt to signal VDRV to assert low. If not enough charge is available on VDDP, a timeout mechanism will ensure VDRV asserts low after the timeout has been reached. When either VDDH or VDDM are lower than their respective UVLO thresholds, VDRV will be asserted low regardless of the EN state. The UVLO protection blocks feature hysteresis, which helps to improve the noise immunity of the power supply. During turn-on and turn-off, the driver sources and sinks a peak transient current, which can result in voltage drop of the VDDH, VDDM power supplies. The internal UVLO protection block ignores the associated noise during these normal switching transients.

### 8.3.8 Power Supply and EN Sequencing

During power up, the device will automatically determine if two-wire or three-wire mode is to be entered. Once two-wire or three-wire mode is determined, the mode is maintained until another power cycle is performed. Therefore, it is important to understand different scenarios that may affect the device operation.

In two-wire mode, the device is supplied power from a single external voltage source via EN, which charges the  $C_{VDDP}$  capacitance on VDDP. The voltage supply is required to meet the power supply needs at the selected PXFR setting, as well as, meet the recommended minimum ramp time,  $|\Delta V_{EN}/\Delta t|$ . To ensure two-wire mode is entered properly,  $V_{EN}$  must reach  $V_{IH\_EN}$  prior to  $V_{VDDP}$  reaching  $V_{VDDP\_UV\_R}$ . This is summarized in  $\boxtimes$  8-6. Similarly, it is recommend that  $V_{EN}$  meet the minimum recommended ramp down time to  $V_{IL\_EN}$ . Too slow a ramp down time may cause insufficient power to be transferred while slowly transitioning between  $V_{IH\_EN}$  and  $V_{IL\_EN}$  leading to intermittent de-assertions and assertions of VDRV. This may continue until the power transfer reduces sufficiently to maintain VDRV low.

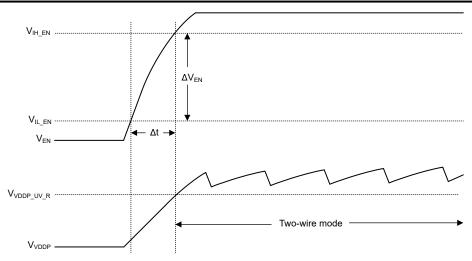

図 8-6. Two-wire Mode Entry

In most three-wire mode applications, EN and VDDP are supplied by the same voltage rail and source. It is recommended that  $V_{EN}$  remain below  $V_{IL\_EN}$  until  $V_{VDDP}$  reaches  $V_{VDDP\_UV\_R}$ . It is also possible in some applications to connect EN directly to the VDDP supply. These two scenarios are shown in  $\boxtimes$  8-7.

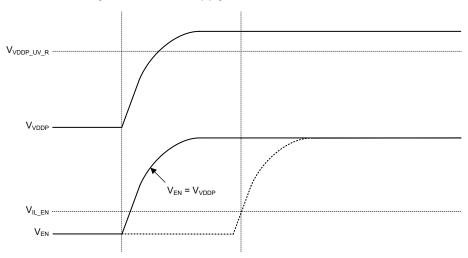

図 8-7. Three-wire Mode Power Sequences

In three-wire mode applications with separate voltage sources supplying EN and VDDP, it is recommended that  $V_{EN}$  remain below  $V_{IL\_EN}$  until  $V_{VDDP}$  reaches  $V_{VDDP\_UV\_R}$ . If  $V_{EN}$  reaches  $V_{IH\_EN}$  prior to  $V_{VDDP}$  reaching  $V_{VDDP\_UV\_R}$ , current from the supply that sources EN will attempt to power VDDP. Depending on the other supply's impedance residing on VDDP and the amount of power available from the EN pin,  $V_{VDDP}$  may begin to rise and eventually exceed  $V_{VDDP\_UV\_R}$ . At that point, the device will begin to transfer power to the secondary and start charging the VDDM and VDDH rails. If VDDP remains above  $V_{VDDP\_UV\_R}$ , the device will continue to transfer power to the secondary eventually charging the VDDM and VDDH rails and VDRV may assert high.

#### 8.3.9 Thermal Shutdown

The device contains an integrated temperature sensor to monitor its local temperature. When the sensor reaches its threshold, it automatically ceases power transfer from the primary side to the secondary side. In addition, if power is still present on VDDP, the driver is automatically asserted low. The power transfer is disabled until the local temperature reduces enough to re-engage.

### **8.4 Device Functional Modes**

表 8-3 summarizes the functional modes for the TPSI3052-Q1 and TPSI3052S-Q1.

## 9 Application and Implementation

注

以下のアプリケーション情報は、TIの製品仕様に含まれるものではなく、TIではその正確性または完全性を保証いたしません。個々の目的に対する製品の適合性については、お客様の責任で判断していただくことになります。お客様は自身の設計実装を検証しテストすることで、システムの機能を確認する必要があります。

## 9.1 Application Information

The TPSI3052-Q1 is a fully integrated, isolated switch driver with integrated bias, which when combined with an external power switch, forms a complete isolated solid state relay solution. With a nominal gate drive voltage of 15 V with 1.5/3.0-A peak source and sink current, a large variety of external power switches such as MOSFETs, IGBTs, or SCRs can be chosen to meet a wide range of applications. The TPSI3052-Q1 generates its own secondary bias supply from the power received from its primary side, so no isolated secondary supply bias is required.

The TPSI3052-Q1 supports two modes of operation based on the number of input pins required. In two-wire mode, typically found in driving mechanical relays, controlling the switch requires only two pins and supports a wide voltage range of operation of 6.5 V to 48 V. In three-wire mode, the primary supply of 3 V to 5.5 V is supplied externally, and the switch is controlled through a separate enable. Available in three-wire mode only, the TPSI3052S-Q1 features a one-shot enable for the switch control. This feature is useful for driving SCRs that typically require only one pulse of current to trigger.

The secondary side provides a regulated, floating supply rail of 15 V for driving a large variety of power switches with no need for a secondary bias supply. The TPSI3052-Q1 can support driving single power switch, dual back-to-back, parallel power switches for a variety of AC or DC applications. The TPSI3052-Q1 integrated isolation protection is extremely robust with much higher reliability, lower power consumption, and increased temperature ranges than those found using traditional mechanical relays and optocouplers.

The power dissipation of the TPSI3052-Q1 can be adjusted by an external resistor from the PXFR pin to VSSP. This feature allows for tradeoffs in power dissipation versus power provided on the secondary depending on the needs of the application.

### 9.2 Typical Application

The circuits in ⊠ 9-1 and ⊠ 9-2 show a typical application for driving silicon based MOSFETs in three-wire mode and two-wire mode, respectively.

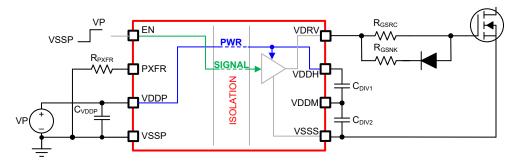

図 9-1. TPSI3052-Q1 Three-Wire Mode Driving MOSFETs

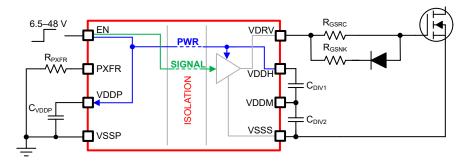

図 9-2. TPSI3052-Q1 Two-Wire Mode Driving MOSFETs

#### 9.2.1 Design Requirements

表 9-1 lists the design requirements of the TPSI3052-Q1 gate driver.

<b>2</b> ,							
DESIGN PARAMETERS							
Total gate capacitance	100 nC						
FET turn-on time	1 μs						
Propagation delay	< 4 µs						
Switching frequency	10 kHz						
Supply voltage (VDDP)	5 V ± 5%						

表 9-1. TPSI3052-Q1 Design Requirements

### 9.2.2 Detailed Design Procedure

#### 9.2.2.1 Two-Wire or Three-Wire Mode Selection

The first design decision is to determine if two-wire or three-wire mode can be used in the application. For this design, note that the overall propagation delay is less than 4 µs and only three-wire mode is able to meet this requirement. In this case, two-wire mode is not applicable. Two-wire mode, due to its limited power transfer, is typically limited to very low frequency applications of less than a few kHz or when enable times are not critical.

#### 9.2.2.2 Standard Enable, One-Shot Enable

Next, based on the application a decision must be if standard enable or one-shot enable mode is required. In this design, assume that after the switch is enabled, it is desired that the switch remain enabled until commanded to be disabled. Therefore, standard enable mode is assumed. In most applications that involve driving FETs, standard enable is appropriate. If driving SCRs or TRIACS, one-shot mode can be beneficial.

## 9.2.2.3 C<sub>DIV1</sub>, C<sub>DIV2</sub> Capacitance

The  $C_{DIV1}$  and  $C_{DIV2}$  capacitances required depends on the amount of drop that can be tolerated on the VDDH rail during switching of the external load. The charge stored on the CDIV1 and CDIV2 capacitances is used to provide the current to the load during switching. During switching, charge sharing occurs and the voltage on VDDH drops. At a minimum, TI recommends that the total capacitance formed by the series combination of  $C_{DIV1}$  and  $C_{DIV2}$  be sized to be at least 30 times the total gate capacitance to be switched. This sizing results in an approximate 0.5-V drop of the VDDH supply rail that is used to supply power to the VDRV signal.  $\pm$  1 and  $\pm$  2 can be to used to calculate the amount of capacitance required for a specified voltage drop.

 $C_{DIV1}$  and  $C_{DIV2}$  must be of the same type and tolerance.

$$C_{DIV1} = \left(\frac{n+1}{n}\right) \times \frac{Q_{LOAD}}{\Delta V}, \ n \ge 3.0 \tag{1}$$

$$C_{DIV2} = n \times C_{DIV1}, \ n \ge 3.0 \tag{2}$$

where

- n is a real number greater than or equal to 3.0.
- C<sub>DIV1</sub> is the external capacitance from VDDH to VDDM.
- C<sub>DIV2</sub> is the external capacitance from VDDM to VSSS.
- Q<sub>LOAD</sub> is the total charge of the load from VDRV to VSSS.
- ΔV is the voltage drop on VDDH when switching the load.

注

 $C_{\text{DIV1}}$  and  $C_{\text{DIV2}}$  represent absolute capacitances and components selected must be adjusted for tolerances and any derating necessary to achieve the required capacitances.

Larger values of  $\Delta V$  can be used in the application, but excessive droop can cause the VDDH undervoltage lockout falling threshold ( $V_{VDDH\_UVLO\_F}$ ) to be reached and cause VDRV to be asserted low. Note that as the series combination of  $C_{DIV1}$  and  $C_{DIV2}$  capacitances increases relative to  $Q_{LOAD}$ , the VDDH supply voltage drop decreases, but the initial charging of the VDDH supply voltage during power up increases.

For this design, assuming n = 3 and  $\Delta V \approx 0.5$  V, then

$$C_{DIV1} = \left(\frac{3+1}{3}\right) \times \frac{120 \, nC}{0.5 \, V} = 320 \, nF$$
 (3)

$$C_{DIV2} = 3 \times 320 \, nF = 960 \, nF \tag{4}$$

For this design,  $C_{DIV1}$  = 330 nF and  $C_{DIV2}$  = 1  $\mu$ F standard capacitor values were selected.

### 9.2.2.4 R<sub>PXFR</sub> Selection

The selection of R<sub>PXFR</sub> allows for a tradeoff between power consumed and power delivered, as described in the *Three-wire Mode* section. For this design, one must choose an appropriate R<sub>PXFR</sub> selection that ensures enough power is transferred to support the amount of load being driven at the specified switching frequency.

During switching of the load,  $Q_{LOAD}$  of charge on VDDH is transferred to the load and VDDH supply voltage droops. After each switching cycle, this charge must be replenished before the next switching cycle occurs. This action ensures that the charge residing on VDDH does not deplete over time due to subsequent switching cycles of the load. The time it takes to recover this charge,  $t_{RECOVER}$ , can be estimated as follows:

$$t_{RECOVER} = \frac{1}{f_{MAX}} \cong \frac{Q_{LOAD}}{I_{OUT}} \tag{5}$$

where

- Q<sub>LOAD</sub> is the load charge in Coulombs.
- I<sub>OUT</sub> is the average current available from VDDH supply in Amperes (A).
- f<sub>MAX</sub> is maximum switching frequency in Hertz (Hz).

For this design,  $Q_{LOAD} = 100 \text{ nC}$  and  $f_{MAX} = 10 \text{ kHz}$  are known, so  $I_{OUT}$  required can be estimated as

$$I_{OUT} \cong 100 \, nC \times 10 \, kHz = 1.0 \, mA \tag{6}$$

 $I_{OUT}$  represents the minimum average current required to meet the design requirements. Using the TPSI3052-Q1 calculator tool, one can easily find the  $R_{PXFR}$  necessary by referring to the  $I_{OUT}$  or  $f_{MAX}$  columns directly.  $\gtrsim$  9-2 shows the results from the tool, assuming VDDP = 4.75 V, to account for the supply tolerance specified in the design requirements. The TPSI3052-Q1 Calculator tool can be found at *Design Calculator*.

表 9-3 summarizes the various output parameters of the calculator tool.

### 表 9-3. TPSI3052-Q1 Calculator Tool Parameter Descriptions

Parameter	Description
R <sub>PXFR</sub>	External resistor setting that controls the amount of power transferred to the load by adjusting the duty cycle. Higher R <sub>PXFR</sub> settings lead to increased power transfer and power consumption.
Power Converter Duty Cycle	Nominal duty cycle of the power converter. Higher R <sub>PXFR</sub> settings leads to higher duty cycles of the power converter and higher power transfer.
I <sub>VDDP</sub>	Average current consumed from the VDDP supply
P <sub>IN</sub>	Average power consumed from the VDDP supply
P <sub>OUT</sub>	Average power delivered to the VDDH supply
I <sub>OUT</sub>	Average current delivered to the VDDH supply
tstart	Start-up time from VDDP rising until VDDH supply rail is fully charged. This parameter assumes VDDH and VDDM supply rails are fully discharged initially.
t <sub>RECOVER</sub>	Represents the time for the VDDH rail to recover after switching the load present on VDRV
f <sub>MAX</sub>	Maximum switching frequency possible for a given R <sub>PXFR</sub> setting for the applied loading conditions
I <sub>AUX_MAX</sub>	Maximum auxiliary current available at current user input settings. There is an inverse relationship between $f_{MAX}$ and $I_{AUX\_MAX}$ .

For this design example,  $R_{PXFR}$  must be configured to the 9.09-k $\Omega$  setting or higher to transfer enough power to support switching the specified load at the required 10-kHz frequency.

### 9.2.2.5 C<sub>VDDP</sub> Capacitance

For two-wire mode, the recommended capacitance C<sub>VDDP</sub> from VDDP to VSSP is 220 nF.

For this design, three-wire mode is required to meet the design requirements. For three-wire mode, increasing the amount of capacitance,  $C_{VDDP}$ , improves the ripple on the VDDP supply. For this design, 1  $\mu$ F in parallel with 100 nF is used.

## 9.2.2.6 Gate Driver Output Resistor

The optional external gate driver resistors, R<sub>GSRC</sub> and R<sub>GSNK</sub>, along with the diode are used to:

- 1. Limit ringing caused by parasitic inductances and capacitances
- 2. Limit ringing caused by high voltage switching dv/dt, high current switching di/dt, and body-diode reverse recovery
- 3. Fine-tune gate drive strength for sourcing and sinking
- 4. Reduce electromagnetic interference (EMI)

The TPSI3052-Q1 has a pullup structure with a P-channel MOSFET with a peak source current of 1.5 A. Therefore, the peak source current can be predicted with:

$$I_{O+} \cong min \left( 1.5 A, \frac{V_{VDDH}}{R_{DSON\_VDRV} + R_{GSRC} + R_{GFET\_INT}} \right)$$
 (7)

#### where

- R<sub>GSRC</sub>: external turn-on resistance.
- R<sub>DSON VDRV</sub>: TPSI3052-Q1 driver on resistance in high state. See Electrical Characteristics.
- V<sub>VDDH</sub>: VDDH voltage. Assumed 15.1 V in this example.
- R<sub>GFET\_INT</sub>: external power transistor internal gate resistance, found in the power transistor data sheet.
   Assume 0 Ω for this example.
- I<sub>O+</sub>: peak source current. The minimum value between 1.5 A, the gate driver peak source current, and the calculated value based on the gate drive loop resistance.

For this example, R<sub>DSON VDRV</sub> = 2.5 $\Omega$ , R<sub>GSRC</sub> = 10  $\Omega$ , and R<sub>GFET INT</sub> = 0  $\Omega$  results in:

$$I_{O+} \cong min\left(1.5 A, \frac{15.1 V}{2.5 \Omega + 10 \Omega + 0 \Omega}\right) = 1.21 A$$
 (8)

Similarly, the TPSI3052-Q1 has a pulldown structure with an N-channel MOSFET with a peak sink current of 3.0 A. Therefore, assuming  $R_{GFET\ INT} = 0\ \Omega$ , the peak sink current can be predicted with:

$$I_{O-} \cong min \left[ 3.0 \text{ A, } (V_{VDDH} \times (R_{GSRC} + R_{GSNK}) - R_{GSRC} \times V_F) \times \frac{1}{R_{GSRC} \times R_{GSNK} + R_{DSON\_VDRV} \times (R_{GSRC} + R_{GSNK})} \right]$$
(9)

#### where

- R<sub>GSRC</sub>: external turn-on resistance.
- R<sub>GSNK</sub>: external turn-off resistance.
- R<sub>DSON VDRV</sub>: TPSI3052-Q1 driver on resistance in low state. See *Electrical Characteristics*.
- V<sub>VDDH</sub>: VDDH voltage. Assumed 15.1 V in this example.
- V<sub>F</sub>: diode forward voltage drop. Assumed 0.7 V in this example.
- I<sub>O</sub>: peak sink current. The minimum value between 3.0 A, the gate driver peak sink current, and the
  calculated value based on the gate drive loop resistance.

For this example, assuming R<sub>DSON VDRV</sub> = 1.7  $\Omega$ , R<sub>GSRC</sub> = 10  $\Omega$ , R<sub>GSNK</sub> = 5.0  $\Omega$ , and R<sub>GFET INT</sub> = 0  $\Omega$ , results in:

$$I_{O-} \cong min \left[ 3.0 \text{ A, } (15.1 \text{ V} \times (10 \Omega + 5 \Omega) - 10\Omega \times 0.7 \text{ V}) \times \frac{1}{10 \Omega \times 5 \Omega + 1.7 \Omega \times (10\Omega + 5 \Omega)} \right] = 2.91 \text{ A}$$
 (10)

Importantly, the estimated peak current is also influenced by PCB layout and load capacitance. Parasitic inductance in the gate driver loop can slow down the peak gate drive current and introduce overshoot and undershoot. Therefore, TI strongly recommends to minimize the gate driver loop.

#### 9.2.2.7 Start-up Time and Recovery Time

As described in the  $C_{DIV1}$ ,  $C_{DIV2}$  Capacitance section, the start-up time of the fully discharged VDDH rail depends on the amount of capacitance present on the VDDH supply. The rate at which this capacitance is charged depends on the amount of power transferred from the primary side to the secondary side. The amount of power transferred can be adjusted by choosing  $R_{PXFR}$ . Increasing the resistor settings for  $R_{PXFR}$  transfers more power from the primary supply (VDDP) to the secondary supply (VDDH), thereby reducing the overall start-up and recovery times.

### 9.2.2.8 Supplying Auxiliary Current, IAUX From VDDM

The TPSI3052-Q1 is capable of providing power from VDDM to support external auxiliary circuitry as shown in 9-3. In this case, the required transfer power must include the additional power consumed by the auxiliary circuitry on the VDDM rail. The R<sub>PXFR</sub> value must be set to meet the overall power requirements.

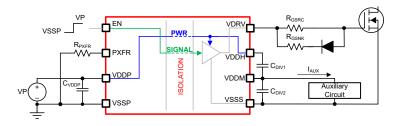

図 9-3. Supplying Auxiliary Power From VDDM

As an example, assume that the auxiliary circuitry requires an average current of 4 mA. 表 9-4 summarizes the results from the TPSI3052-Q1 calculator tool. The Calculator tool can be found at *Design Calculator*.

表 9-4. Results from the TPSI3052-Q1 Calculator Tool,  $T_A = 25^{\circ}$ C, Three-Wire Mode with  $I_{AUX} = 4$  mA

R <sub>PXFR</sub> , kΩ	Power Converter Duty Cycle, %	I <sub>VDDP</sub> , mA	P <sub>IN</sub> , mW	P <sub>OUT</sub> , mW	I <sub>OUT</sub> , mA	t <sub>START</sub> , μs	t <sub>RECOVER</sub> , μs	f <sub>EN_MAX</sub> , kHz	I <sub>AUX_MAX</sub> , mA
7.32	13.3	5.3	25.0	5.9	0.35	N/A	N/A	N/A	N/A
9.09	21.1	8.3	39.6	10.0	0.62	N/A	N/A	N/A	N/A
11	40.0	15.8	75.1	26.8	1.74	N/A	N/A	N/A	N/A
12.7	53.3	21.1	100.1	36.1	2.35	3557	96.0	10.4	4.1
14.7	66.7	26.4	125.2	45.5	2.98	2285	60.1	16.6	6.0
16.5	80.0	31.6	150.2	58.8	3.86	1549	39.3	25.5	8.6
20	93.3	36.9	175.2	68.8	4.52	1262	31.2	32.1	10.0

Based on the results in 表 9-4, several observations can be made:

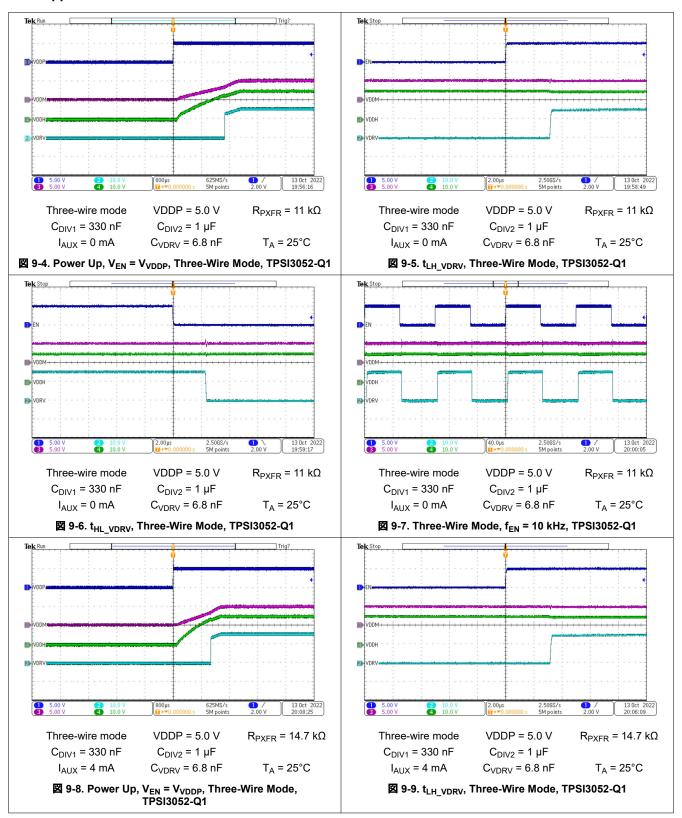

- With  $R_{PXFR}$  = 7.32 k $\Omega$ ,  $R_{PXFR}$  = 9.09 k $\Omega$ , and  $R_{PXFR}$  = 11 k $\Omega$ , insufficient power is available to meet the application power needs specified in the design requirements in  $\frac{1}{2}$  9-1.
- With  $R_{PXFR}$  = 12.7 k $\Omega$  and higher, sufficient power is transferred to meet the specified design requirements, however, for this design,  $R_{PXFR}$  = 14.7 k $\Omega$  was selected for additional margin.
- For a given R<sub>PXFR</sub>, because a significant amount of the transferred power is being provided to the auxiliary circuitry, t<sub>START</sub> is longer, and f<sub>MAX</sub> reduced when compared to the results shown in 表 9-4 with I<sub>AUX</sub> = 0 mA.

### 9.2.2.9 VDDM Ripple Voltage

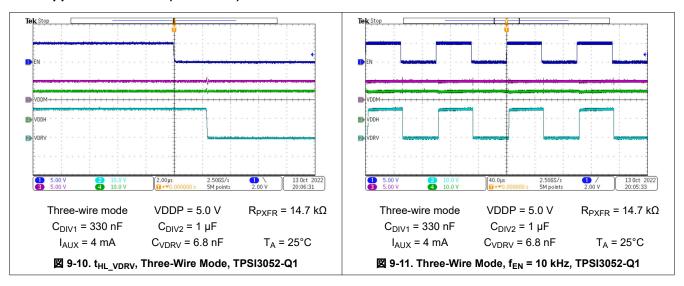

Note that when supplying power from VDDM, that is when  $I_{AUX} > 0$  mA, additional voltage ripple is present on the VDDM rail. For a given  $R_{PXFR}$  setting, this ripple can be reduced by applying additional capacitance from VDDM to VSSS or increasing the  $R_{PXFR}$  setting for more power transfer. For this design example, the ripple on VDDM, VDDM<sub>ripple</sub>, computed in the calculator tool is 35 mV.

#### 9.2.3 Application Curves

#### 9.2.3 Application Curves (continued)

#### 9.2.4 Insulation Lifetime

Insulation lifetime projection data is collected by using industry-standard Time Dependent Dielectric Breakdown (TDDB) test method. In this test, all pins on each side of the barrier are tied together creating a two-terminal device and high voltage applied between the two sides; See 9-12 for TDDB test setup. The insulation breakdown data is collected at various high voltages switching at 60 Hz over temperature. For reinforced insulation, VDE standard requires the use of TDDB projection line with failure rate of less than 1 part per million (ppm). Even though the expected minimum insulation lifetime is 20 years at the specified working isolation voltage, VDE reinforced certification requires additional safety margin of 20% for working voltage and 87.5% for lifetime which translates into minimum required insulation lifetime of 37.5 years at a working voltage that's 20% higher than the specified value.

 $\boxtimes$  9-13 shows the intrinsic capability of the isolation barrier to withstand high voltage stress over its lifetime. Based on the TDDB data, the intrinsic capability of the insulation is 1000  $V_{RMS}$  with a lifetime of 1184 years.

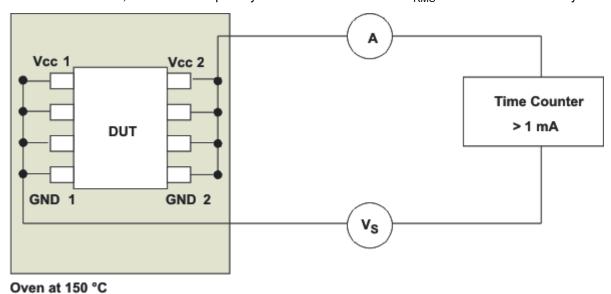

図 9-12. Test Setup for Insulation Lifetime Measurement

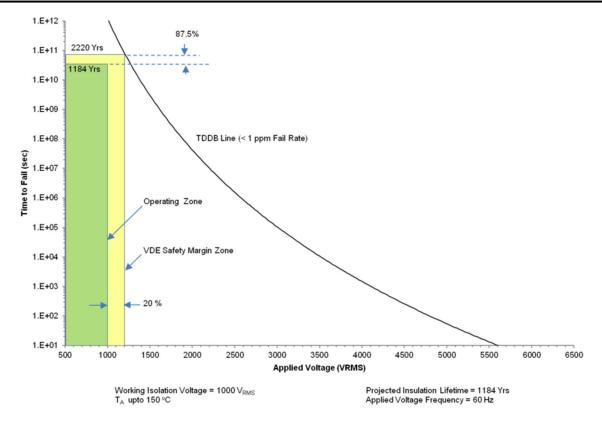

図 9-13. Insulation Lifetime Projection Data

### 9.3 Power Supply Recommendations

In three-wire mode, to help ensure a reliable supply voltage, TI recommends that the  $C_{VDDP}$  capacitance from VDDP to VSSP consists of a 0.1- $\mu$ F bypass capacitor for high frequency decoupling in parallel with a 1  $\mu$ F for low frequency decoupling.

In two-wire mode, TI recommends that the  $C_{VDDP}$  capacitance placed from VDDP to VSSP consists of a 220-nF capacitor connected close to the device between the VDDP and VSSP pins. The recommended absolute capacitance must be 220 nF, so if derating is required, a higher component value can be needed.

Low-ESR and low-ESL capacitors must be connected close to the device between the VDDP and VSSP pins.

## 9.4 Layout

### 9.4.1 Layout Guidelines

Designers must pay close attention to PCB layout to achieve optimum performance for the TPSI3052-Q1. Some key guidelines are:

- Component placement:
  - Place the driver as close as possible to the power semiconductor to reduce the parasitic inductance of the gate loop on the PCB traces.
  - Connect low-ESR and low-ESL capacitors close to the device between the VDDH and VDDM pins and the VDDM and VSSS pins to bypass noise and to support high peak currents when turning on the external power transistor.
  - Connect low-ESR and low-ESL capacitors close to the device between the VDDP and VSSP pins.
  - Minimize parasitic capacitances on the R<sub>PXFR</sub> pin.
- Grounding considerations:

- Limit the high peak currents that charge and discharge the transistor gates to a minimal physical area.
   This limitation decreases the loop inductance and minimizes noise on the gate terminals of the transistors.
   Place the gate driver as close as possible to the transistors.
- Connect the driver VSSS to the Kelvin connection of MOSFET source or IGBT emitter. If the power device
  does not have a split Kelvin source or emitter, connect the VSSS pin as close as possible to the source or
  emitter terminal of the power device package to separate the gate loop from the high power switching
  loop.
- High-voltage considerations:
  - To ensure isolation performance between the primary and secondary side, avoid placing any PCB traces or copper below the driver device. TI recommends a PCB cutout or groove to prevent contamination that can compromise the isolation performance.
- · Thermal considerations:
  - Proper PCB layout can help dissipate heat from the device to the PCB and minimize junction-to-board thermal impedance (θ<sub>JB</sub>).
  - If the system has multiple layers, TI also recommends connecting the VDDH and VSSS pins to internal
    ground or power planes through multiple vias of adequate size. These vias must be located close to the IC
    pins to maximize thermal conductivity. However, keep in mind that no traces or coppers from different high
    voltage planes are overlapping.

<sup>(1)</sup> Status: For more details on status, see our product life cycle.

Multiple part markings will be inside parentheses. Only one part marking contained in parentheses and separated by a "~" will appear on a part. If a line is indented then it is a continuation of the previous line and the two combined represent the entire part marking for that device.

Important Information and Disclaimer: The information provided on this page represents TI's knowledge and belief as of the date that it is provided. TI bases its knowledge and belief on information provided by third parties, and makes no representation or warranty as to the accuracy of such information. Efforts are underway to better integrate information from third parties. TI has taken and continues to take reasonable steps to provide representative and accurate information but may not have conducted destructive testing or chemical analysis on incoming materials and chemicals. TI and TI suppliers consider certain information to be proprietary, and thus CAS numbers and other limited information may not be available for release.

In no event shall TI's liability arising out of such information exceed the total purchase price of the TI part(s) at issue in this document sold by TI to Customer on an annual basis.

<sup>(2)</sup> Material type: When designated, preproduction parts are prototypes/experimental devices, and are not yet approved or released for full production. Testing and final process, including without limitation quality assurance, reliability performance testing, and/or process qualification, may not yet be complete, and this item is subject to further changes or possible discontinuation. If available for ordering, purchases will be subject to an additional waiver at checkout, and are intended for early internal evaluation purposes only. These items are sold without warranties of any kind.

<sup>(3)</sup> RoHS values: Yes, No, RoHS Exempt. See the TI RoHS Statement for additional information and value definition.

<sup>(4)</sup> Lead finish/Ball material: Parts may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead finish/Ball material values may wrap to two lines if the finish value exceeds the maximum column width.

<sup>(5)</sup> MSL rating/Peak reflow: The moisture sensitivity level ratings and peak solder (reflow) temperatures. In the event that a part has multiple moisture sensitivity ratings, only the lowest level per JEDEC standards is shown. Refer to the shipping label for the actual reflow temperature that will be used to mount the part to the printed circuit board.

<sup>(6)</sup> Part marking: There may be an additional marking, which relates to the logo, the lot trace code information, or the environmental category of the part.

SMALL OUTLINE PACKAGE

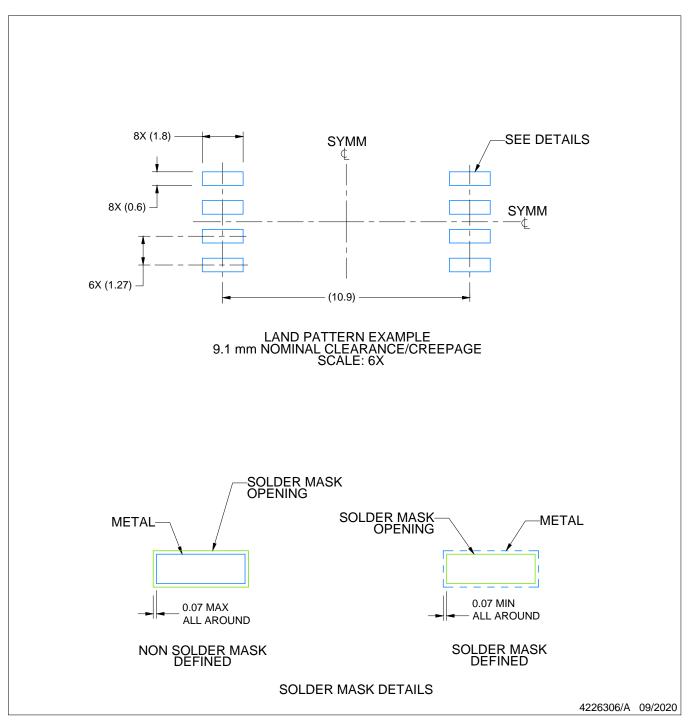

#### NOTES:

- 1. All linear dimensions are in millimeters. Any dimensions in parenthesis are for reference only. Dimensioning and tolerancing per ASME Y14.5M.
- 2. This drawing is subject to change without notice.
- 3. This dimension does not include mold flash, protrusions, or gate burrs. Mold flash, protrusions, or gate burrs shall not exceed 0.15 mm per side.
- 4. This dimension does not include interlead flash. Interlead flash shall not exceed 0.25 mm per side.
- 5. Ref. JEDEC registration MS-013

SMALL OUTLINE PACKAGE

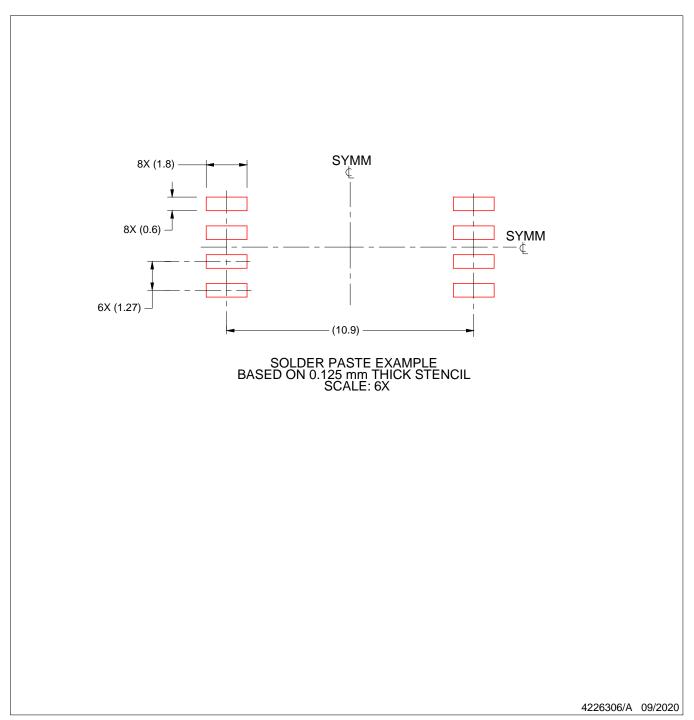

NOTES: (continued)

- 5. Publication IPC-7351 may have alternate designs.
- 6. Solder mask tolerances between and around signal pads can vary based on board fabrication site.

SMALL OUTLINE PACKAGE

NOTES: (continued)

- 7. Laser cutting apertures with trapezoidal walls and rounded corners may offer better paste release. IPC-7525 may have alternate design recommendations.
- 8. Board assembly site may have different recommendations for stencil design.
