

TS5MP646 4データ・レーン、2:1 MIPIスイッチ(10チャンネル、2:1アナログ・スイッチ)

1 特長

- 電源電圧範囲: 1.65V~5.5V
- 10チャンネルの2:1スイッチ
- 電源オフ保護:
 $V_{DD} = 0V$ のときI/OはHi-Z
- 低い R_{ON} : 標準値4.2Ω
- 帯域幅: 3GHz
- 非常に低いクロストーク: -40dB
- 低消費電力のディセーブル・モード
- 1.8V互換のロジック入力
- JESD 22を超えるESD保護
 - 人体モデル(HBM) 2000V

2 アプリケーション

- 携帯電話
- タブレット
- PC/ノートPC
- 仮想現実および拡張現実
- ドローン
- カメラ・ベースのカーコード・スキャナ
- 医療用
- IPネットカム

3 概要

TS5MP646は、4データ・レーンのMIPIスイッチです。このデバイスは最適化された10チャンネル(5差動)の単極双投スイッチで、高速アプリケーションで使用されます。

TS5MP646は、複数のMIPI準拠デバイスを単一のCSI/DSI、C-PHY/D-PHYモジュールに接続しやすくするよう設計されています。

このデバイスは帯域幅が3GHzで、チャンネル間のスキューが低く、信号の劣化が少なく、レイアウト損失を補償するため広いマージンがあります。消費電流が小さいため、携帯電話や他の個人用電子機器など、低消費電力のアプリケーションの要求を満たすことができます。

製品情報⁽¹⁾

型番	パッケージ	本体サイズ(公称)
TS5MP646	DSBGA(YFP)	2.42mm×2.42mm

6 Specifications

6.1 Absolute Maximum Ratings

over operating free-air temperature range (unless otherwise noted)⁽¹⁾

		MIN	MAX	UNIT
V_{DD}	Supply Voltage	-0.5	6	V
$V_{I/O}$	Analog voltage range (DxN, CLKN, DxP, CLKP, DAxN, CLKAN, DAxP, CLKAP, DBxN, CLKBN, DBxP, CLKBP)	-0.5	4	V
$V_{SEL}, \overline{V_{OE}}$	Digital Input Voltage (SEL, /OE)	-0.5	6	V
T_J	Junction temperature	-65	150	°C
T_{stg}	Storage temperature	-65	150	°C

- (1) Stresses beyond those listed under *Absolute Maximum Rating* may cause permanent damage to the device. These are stress ratings only, which do not imply functional operation of the device at these or any other conditions beyond those indicated under *Recommended Operating Condition*. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.

6.2 ESD Ratings

			VALUE	UNIT
$V_{(ESD)}$	Electrostatic discharge	Human body model (HBM), per ANSI/ESDA/JEDEC JS-001, all pins ⁽¹⁾	±2000	V
		Charged device model (CDM), per JEDEC specification JESD22-C101, all pins ⁽²⁾	±250	

- (1) JEDEC document JEP155 states that 500-V HBM allows safe manufacturing with a standard ESD control process. [Following sentence optional; see the wiki.] Manufacturing with less than 500-V HBM is possible with the necessary precautions. [Following sentence optional; see the wiki.] Pins listed as ± WWW V and/or ± XXX V may actually have higher performance.
- (2) JEDEC document JEP157 states that 250-V CDM allows safe manufacturing with a standard ESD control process. [Following sentence optional; see the wiki.] Manufacturing with less than 250-V CDM is possible with the necessary precautions. [Following sentence optional; see the wiki.] Pins listed as ± YYY V and/or ± ZZZ V may actually have higher performance.

6.3 Recommended Operating Conditions

over operating free-air temperature range (unless otherwise noted)

		MIN	NOM	MAX	UNIT
V _{DD}	Supply Voltage	1.65		5.5	V
V _{I/O}	Analog voltage range (DxN, CLKN, DxP, CLKP, DAxN, CLKAN, DAxP, CLKAP, DBxN, CLKBN, DBxP, CLKBP)	0		3.6	V
V _(SEL) V _(OE)	Digital Input Voltage	0		5.5	V
I _{I/O}	Continuous I/O current	-35		35	mA
T _A	Operating ambient temperature	-40		85	°C
T _J	Junction temperature	-65		150	°C

6.4 Thermal Information

THERMAL METRIC ⁽¹⁾		TS5MP646	UNIT
		YFP	
		36	
R _{θJA}	Junction-to-ambient thermal resistance	57.6	°C/W
R _{θJC(top)}	Junction-to-case (top) thermal resistance	0.3	°C/W
R _{θJB}	Junction-to-board thermal resistance	12.6	°C/W
Ψ _{JT}	Junction-to-top characterization parameter	0.2	°C/W
Ψ _{JB}	Junction-to-board characterization parameter	12.7	°C/W
R _{θJC(bot)}	Junction-to-case (bottom) thermal resistance	N/A	°C/W

(1) For more information about traditional and new thermal metrics, see the [Semiconductor and IC Package Thermal Metrics](#) application report.

6.5 Electrical Characteristics

over operating free-air temperature range (unless otherwise noted)

PARAMETER		TEST CONDITIONS	MIN	TYP	MAX	UNIT
POWER SUPPLY						
I _{DD}	VDD Active Supply Current	V _{DD} = 1.65 V to 5.5 V OE = 0 V SEL = 0 V to 5.5 V Dn, CLKn = 0 V	0	30	60	μA

FIG 19. t_{BBM}

8 Detailed Description

8.1 Overview

The TS5MP646 is a high-speed 4 data lane 2:1 MIPI Switch. The device includes 10 channels (5 differential) with 4 differential data lanes and 1 differential clock lane for D-PHY, CSI or DSI. The switch allows a single MIPI port to interface between two MIPI modules, expanding the number of potential MIPI devices that can be used within a system that is MIPI port limited.

8.3 Feature Description

8.3.1 Powered-Off Protection

When the TS5MP646 is powered off ($V_{DD} = 0$ V) the I/Os and digital logic pins of the device remains in a high impedance state. The crosstalk, off-isolation, and leakage will remain within the electrical specifications. This prevents errant voltages from reaching the rest of the system and maintains isolation when the system is powering up.

Figure 20 shows an example system containing a switch without powered-off protection with the following system level scenario.

1. Subsystem A powers up and starts sending information to Subsystem B that remains unpowered.
2. The I/O voltage back powers the supply rail in Subsystem B.
3. The digital logic is back powered and turns on the switch. The signal is transmitted to Subsystem B before it is powered and damages it.

Figure 20. System Without Powered-Off Protection

With powered-off protection, the switch prevents back powering the supply and the switch remains high-impedance. Subsystem B remains protected.

Figure 21. System With Powered-Off Protection

This feature has the following system level benefits.

- Protects the system from damage.
- Prevents data from being transmitted unintentionally
- Eliminates the need for power sequencing solutions reducing BOM count and cost, simplifying system design and improving reliability.

Feature Description (continued)

8.3.2 1.8-V Logic Compatible Inputs

The TS5MP646 has 1.8-V logic compatible digital inputs for switch control. Regardless of the V_{DD} voltage the digital input thresholds remained fixed, allowing a 1.8-V processor GPIO to control the TS5MP646 without the need for an external translator. This saves both space and BOM cost.

An example setup for a system without a 1.8-V logic compatible input is shown in [Figure 22](#). Here the supply mismatch between the processor and its GPIO output and the supply to the switch require a translator.

Figure 22. System Without 1.8 V Logic Compatible Inputs

With the 1.8 V logic compatibility in the TS5MP646, the translator is built in to the device so that the external components are no longer needed, simplifying the system design and overall cost.

Figure 23. System With 1.8 V Logic Compatible Inputs

8.3.3 Low Power Disable Mode

The TS5MP646 has a low power mode that places all the signal paths in a high impedance state and lowers the current consumption while the device is not in use. To put the device in low power mode and disable the switch, the output enable pin $\overline{OE}$ must be supplied with a logic high signal.

8.4 Device Functional Modes

8.4.1 Pin Functions

The SEL and $\overline{OE}$ pins have a weak 6-M Ω pull-down to prevent floating input logic.

表 1. Function Table

$\overline{OE}$	SEL	Function
H	X	I/O pins High-Impedance
L	L	CLK(P/N) = CLKA(P/N)
		Dn(P/N) = DAn(P/N)
L	H	CLK(P/N) = CLKB(P/N)
		Dn(P/N) = DBn(P/N)

8.4.2 Low Power Disable Mode

While the output enable pin $\overline{OE}$ is supplied with a logic high, the device remains in low power disabled state. This reduces the current consumption substantially and the switches are high impedance. The SEL pin is ignored while the $\overline{OE}$ remains high. Upon exiting low power mode, the switch status reflects the SEL pin as seen in [表 1](#).

8.4.3 Switch Enabled Mode

While the output enable pin $\overline{OE}$ is supplied with a logic low, the device remains in switch enabled mode.

9 Application and Implementation

注

Information in the following applications sections is not part of the TI component specification, and TI does not warrant its accuracy or completeness. TI's customers are responsible for determining suitability of components for their purposes. Customers should validate and test their design implementation to confirm system functionality.

9.1 Application Information

9.2 Typical Application

Figure 24 represents a typical application of the TS5MP646 MIPI switch. The TS5MP646 is used to switch signals between multiple MIPI modules and a single MIPI port on a processor. This expands the capabilities of a single port to handle multiple MIPI modules.

Figure 24. Typical D-PHY Application

Typical Application (continued)

FIG 25. Typical C-PHY Application

9.2.1 Design Requirements

Design requirements of the MIPI standard must be followed. Supply pin decoupling capacitors of 2.2 μF and 100 nF are recommended for best performance. The TS5MP646 has internal 6-M Ω pulldown resistors on SEL and $\overline{\text{OE}}$. The pulldown on these pins ensure that the digital remains in a non-floating state during system power-up to prevent shoot through current spikes and an unknown switch status. By default the switch will power up enabled and with the A path selected until driven externally by the processor.

9.2.2 Detailed Design Procedure

The TS5MP646 can be properly operated without any external components. However, TI recommends that unused I/O signal pins be connected to ground through a 50 Ω resistor to prevent signal reflections and maintain device performance. The NC pins of the device do not require any external connections or terminations and have no connection to the rest of the device internally.

The clock and data lanes can be interchanged as necessary to facilitate the best layout possible for the application. For example, the clock can be placed on the D1 channel and a data lane can be used on the CLK channel if this improves the layout. In addition, the signal lines of the TS5MP646 are routed single ended on the chip die. This makes the device suitable for both differential and single-ended high-speed systems.

Typical Application (continued)

9.2.3 Application Curves

26. Differential Bandwidth

Typical Application (continued)

9.2.3.1 MIPI D-PHY Application

The clock and data lanes can be interchanged as necessary to facilitate the best layout possible for the application. In addition, the signal lines of the TS5MP646 are routed single ended on the chip die. This makes the device suitable for both differential and single-ended high-speed systems. This also allows the positive and negative lines to be interchanged as necessary to facilitate the best layout possible for the application.

D-PHY application includes a differential clock and 4 differential datalanes. All the channels of the device perform similar and the clock or data signals may be interchanged as necessary to facilitate the best layout possible for the application.

Typical Application (continued)

29. MIPI D-PHY Example Pinout

Typical Application (continued)

9.2.3.2 MIPI C-PHY Application

The clock and data lanes can be interchanged as necessary to facilitate the best layout possible for the application. In addition, the signal lines of the TS5MP646 are routed single ended on the chip die. This makes the device suitable for both differential and single-ended high-speed systems. This also allows the positive and negative lines to be interchanged as necessary to facilitate the best layout possible for the application.

C-PHY application includes 3 trios of signals which may be routed on any channel which means there will be one unused channel on the TS5MP646. TI recommends that the unused I/O signal pin be connected to ground through a 50 Ω resistor to prevent signal reflections and maintain device performance.

Typical Application (continued)

10 Power Supply Recommendations

When the TS5MP646 is powered off ($V_{DD} = 0\text{ V}$), the I/Os of the device remains in a high-Z state. The crosstalk, off-isolation, and leakage remain within the electrical [Specifications](#). Power to the device is supplied through the VDD pin. Decoupling capacitors of 100 nF and 2.2 μF are recommended on the supply.

11 Layout

11.1 Layout Guidelines

Place the supply de-coupling capacitors as close to the VDD and GND pin as possible. The spacing between the power traces, supply and ground, and the signal I/O lines, clock and data, should be a minimum of three times the trace width of the signal I/O lines to maintain signal integrity.

The characteristic impedance of the trace(s) must match that of the receiver and transmitter to maintain signal integrity. Route the high-speed traces using a minimum amount of vias and corners. This will reduce the amount of impedance changes.

When it becomes necessary to make the traces turn 90°, use two 45° turns or an arc instead of making a single 90° turn.

Do not route high-speed traces near crystals, oscillators, external clock signals, switching regulators, mounting holes or magnetic devices.

Avoid stubs on the signal lines.

All I/O signal traces should be routed over a continuous ground plane with no interruptions. The minimum width from the edge of the trace to any break in the ground plane must be 3 times the trace width. When routing on PCB inner signal layers, the high speed traces should be between two ground planes and maintain characteristic impedance.

High speed signal traces must be length matched as much as possible to minimize skew between data and clock lines.

⁽¹⁾ **Status:** For more details on status, see our [product life cycle](#).

⁽²⁾ **Material type:** When designated, preproduction parts are prototypes/experimental devices, and are not yet approved or released for full production. Testing and final process, including without limitation quality assurance, reliability performance testing, and/or process qualification, may not yet be complete, and this item is subject to further changes or possible discontinuation. If available for ordering, purchases will be subject to an additional waiver at checkout, and are intended for early internal evaluation purposes only. These items are sold without warranties of any kind.

⁽³⁾ **RoHS values:** Yes, No, RoHS Exempt. See the [TI RoHS Statement](#) for additional information and value definition.

⁽⁴⁾ **Lead finish/Ball material:** Parts may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead finish/Ball material values may wrap to two lines if the finish value exceeds the maximum column width.

⁽⁵⁾ **MSL rating/Peak reflow:** The moisture sensitivity level ratings and peak solder (reflow) temperatures. In the event that a part has multiple moisture sensitivity ratings, only the lowest level per JEDEC standards is shown. Refer to the shipping label for the actual reflow temperature that will be used to mount the part to the printed circuit board.

⁽⁶⁾ **Part marking:** There may be an additional marking, which relates to the logo, the lot trace code information, or the environmental category of the part.

Multiple part markings will be inside parentheses. Only one part marking contained in parentheses and separated by a "~" will appear on a part. If a line is indented then it is a continuation of the previous line and the two combined represent the entire part marking for that device.
