TUSB4041I-Q1
JAJSUV7C – JULY 2015 – REVISED JULY 2024

TUSB4041I-Q1 4 ポート USB 2.0 ハブ

1 特長

- 車載アプリケーション認定済み
- 下記結果で AEC-Q100 認定済み
  - デバイス温度グレード 3：動作時周囲温度範囲：-40℃～85℃
  - デバイス HBM ESD 分類レベル 2
  - デバイス CDM ESD 分類レベル C5
- 4 ポート USB 2.0 ハブ
- USB 2.0 ハブ機能：
  - MTT (Multiple Transaction Translator) ハブ：4 つのトランザクション トランスレータ
  - トランザクション トランスレータごとに 4 つの非同期エンドポイント バッファ
- USB バッテリ充電をサポート
  - CDP モード (上流ポート接続時)
  - DCP モード (上流ポート未接続時)
  - DCP モードは中国電気通信業界標準 YD/T 1591-2009 に準拠
  - D+ および D- デバイダ モードをサポート
- ポート単位または一括制御のパワー スイッチングおよび過電流通知入力
- OTP ROM、シリアル EEPROM、または I^{2}C/SMBus ターゲット インターフェイスで次のカスタム構成に対応：
  - V$_{ID}$ および P$_{ID}$
  - カスタマイズ可能なポート
  - メーカーおよび製品文字列 (OTP ROM は除く)
  - シリアル番号 (OTP ROM は除く)
- ピン選択か、EEPROM または I^{2}C、または SMBus ターゲット インターフェイスを使用したアプリケーション機能選択
- 128 ビットの UUID (Universally Unique Identifier) を提供
- USB 2.0 上流ポート経由でオンボードおよびイン システムの OTP および EEPROM プログラミングをサポート
- 単一クロック入力、24MHz の水晶振動子または発振器
- DM/DP 極性スワップ
- Type C 互換
- 特別なドライバ要件なし、USB スタックをサポートする任意のオペレーティング システムでシームレスに動作
- 64 ピン HTQFP パッケージ (PAP)

2 アプリケーション

- 車載用
- コンピュータ システム
- ドッキング ステーション
- モニタ
- セットトップ ボックス

3 概要

TUSB4041I-Q1 デバイスは 4 ポートの USB 2.0 ハブです。このデバイスは、上流ポートで高速またはフルスピードの USB 接続を実現します。このデバイスは、下流ポートで高速、フルスピード、低速の USB 接続も実現します。上流ポートが、高速、フルスピード、低速の接続のみをサポートする電気的環境に接続されている場合、下流ポートで高速、フルスピード、低速 USB 接続が有効になります。上流ポートがフルスピードまたは低速接続のみをサポートする電気的環境に接続されている場合、USB 高速接続は下流ポートでディセーブルされます。

TUSB4041I-Q1 デバイスには、ポートごと、または一括の電力スイッチングと過電流保護が搭載されています。このデバイスはバッテリ充電アプリケーションにも対応しています。

ポート パワー個別制御のハブは、各下流ポートへの給電を USB ホストのリクエストに応じてオン / オフします。また、ポート パワー個別制御のハブが過電流イベントを検出した場合には、影響を受ける下流ポートへの電力だけがオフになります。

一括制御のハブは、いずれかのポートで電力が必要になると、すべての下流ポートへの給電をオンにします。下流ポートへの給電は、すべてのポートが給電を停止できる状態にならない限り、オフになりません。また、一括制御のハブが過電流イベントを検出すると、すべての下流ポートへの給電がオフになります。

TUSB4041I-Q1 デバイスの下流ポートは、USB Battery Charging Downstream Port (CDP) ハンドシェイクに対応することで、バッテリ充電アプリケーションに対応しています。上流ポートが接続されていないときは、専用充電ポート (DCP) モードもサポートします。DCP モードは、USB バッテリ充電仕様および中国電気通信業界標準 YD/T 1591-2009 に準拠しています。また、自動モードでは、上流ポートの未接続時に BC デバイスとデバイダ モード充電ソリューションをサポートするデバイスが透過的にサポートされます。

TUSB4041I-Q1 デバイスは、バッテリ充電のサポートなどいくつかの機能についてピン ストラップ構成を提供しており、OTP ROM、I^2C EEPROM、または P_{ID}、V_{ID}、およびカスタム ポートと PHY 構成用の I^2C/SMBus ターゲット インターフェイスにより、カスタマイズを行います。また、I^2C EEPROM または I^2C/SMBus ターゲット インターフェイスを使用する場合、カスタム ストリングをサポートします。
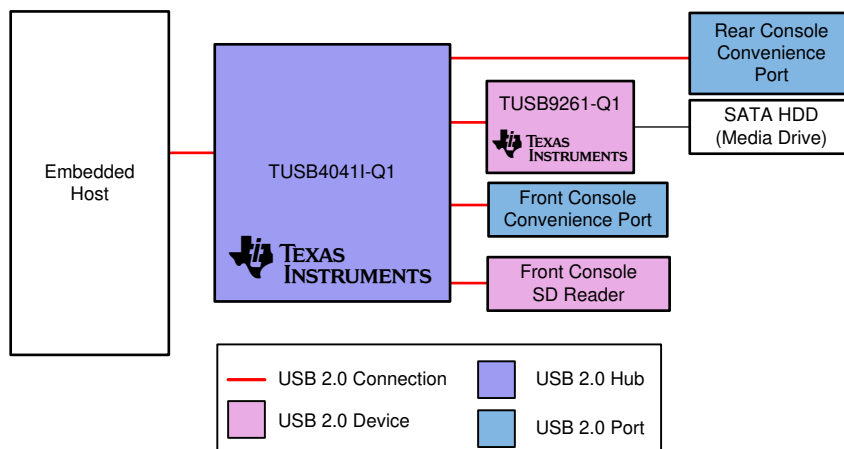

このデバイスは 64 ピンの PAP パッケージで供給され、-40℃〜85℃の温度範囲で動作する産業用バージョンです。

パッケージ情報 [1]

部品番号	パッケージ	パッケージ サイズ[2]
TUSB4041I-Q1	HTQFP (64)	12mm × 12mm

(1)   供給されているすべてのパッケージについては、セクション 11 を参照してください。
(2)   パッケージ サイズ (長さ × 幅) は公称値であり、該当する場合はピンも含まれます。

図 4-1. PAP Package 64-Pin HTQFP With PowerPAD™ Top View

Pin Functions

PIN		I/O[1]	TYPE[1]	DESCRIPTION
NAME	NO.			
CLOCK AND RESET SIGNALS				
GRSTz	18	I	PU	Global power reset. This reset brings all of the TUSB4041I-Q1 device internal registers to the default state. When the GRSTz pin is asserted, the device is completely nonfunctional.
XI	30	I	—	Crystal input. This pin is the crystal input for the internal oscillator. The input can alternately be driven by the output of an external oscillator. When using a crystal, a 1-MΩ feedback resistor is required between the XI and XO pins.
XO	29	O	—	Crystal output. This pin is the crystal output for the internal oscillator. If the XI pin is driven by an external oscillator, this pin can be left unconnected. When using a crystal, a 1-MΩ feedback resistor is required between the XI and XO pins.

Pin Functions (続き)

PIN		I/O[1]	TYPE[1]	DESCRIPTION
NAME	NO.			
USB UPSTREAM SIGNALS				
USB_DM_UP	22	I/O	—	USB high-speed differential transceiver (negative)
USB_DP_UP	21	I/O	—	USB high-speed differential transceiver (positive)
USB_R1	32	I	—	Precision resistor reference. Connect a 9.53-kΩ ±1% resistor between the USB_R1 pin and ground.
USB_VBUS	16	I	—	USB upstream port power monitor. The VBUS detection requires a voltage divider. The signal USB_VBUS must be connected to VBUS through a 90.9-kΩ ±1% resistor and to ground through a 10-kΩ ±1% resistor from the signal to ground.
USB DOWNSTREAM SIGNALS				
OVERCUR1z	14	I	PU	USB port 1 overcurrent detection. This pin is used to connect the overcurrent output of the downstream port power switch for port 1. 0 = An overcurrent event occurred. 1 = An overcurrent event has not occurred. This pin can be left unconnected if power management is not implemented. If power management is enabled, review the power switch to determine the necessary external circuitry.
OVERCUR2z	15	I	PU	USB port 2 overcurrent detection. This pin is used to connect the overcurrent output of the downstream port power switch for port 2. 0 = An overcurrent event occurred. 1 = An overcurrent event has not occurred. If power management is not implemented, leave this pin unconnected. If power management is enabled, review the power switch to determine the necessary external circuitry.
OVERCUR3z	12	I	PU	USB port 3 overcurrent detection. This pin is used to connect the overcurrent output of the downstream port power switch for port 3. 0 = An overcurrent event occurred. 1 = An overcurrent event has not occurred. This pin can be left unconnected if power management is not implemented. If power management is enabled, review the power switch to determine the necessary external circuitry.
OVERCUR4z	11	I	PU	USB port 4 overcurrent detection. This pin is used to connect the overcurrent output of the downstream port power switch for port 4. 0 = An overcurrent event occurred. 1 = An overcurrent event has not occurred. This pin can be left unconnected if power management is not implemented. If power management is enabled, review the power switch to determine the necessary external circuitry.
PWRCTL1/BATEN1	4	I/O	PD	USB port 1 power-on control for downstream power and battery charging enable. The pin is used for control of the downstream power switch for port 1. The value of the pin is sampled at the deassertion of reset to determine the value of the battery charging support for port 1 as indicated in the *Battery Charging Support Register* : 0 = Battery charging not supported 1 = Battery charging supported
PWRCTL2/BATEN2	3	I/O	PD	USB port 2 power-on control for downstream power and battery charging enable. The pin is used for control of the downstream power switch for port 2. The value of the pin is sampled at the deassertion of reset to determine the value of the battery charging support for Port 2 as indicated in the *Battery Charging Support Register* : 0 = Battery charging not supported 1 = Battery charging supported

Pin Functions (続き)

PIN		I/O[1]	TYPE[1]	DESCRIPTION
NAME	**NO.**			

PWRCTL3/BATEN3	1	I/O	PD	USB port 3 power-on control for downstream power and battery charging enable. The pin is used for control of the downstream power switch for port 3.
				
				The value of the pin is sampled at the deassertion of reset to determine the value of the battery charging support for Port 3 as indicated in the *Battery Charging Support Register* :
				
				    0 = Battery charging not supported
				
				    1 = Battery charging supported

PWRCTL4/BATEN4	64	I/O	PD	USB port 4 power-on control for downstream power and battery charging enable. The pin is used for control of the downstream power switch for port 4.
				
				The value of the pin is sampled at the deassertion of reset to determine the value of the battery charging support for Port 4 as indicated in the *Battery Charging Support Register* :
				
				    0 = Battery charging not supported
				
				    1 = Battery charging supported

USB_DM_DN1	34	I/O	—	USB high-speed differential transceiver (negative)
USB_DM_DN2	42			
USB_DM_DN3	50			
USB_DM_DN4	57			
USB_DP_DN1	33	I/O	—	USB high-speed differential transceiver (positive)
USB_DP_DN2	41			
USB_DP_DN3	49			
USB_DP_DN4	56			
I^{2}C AND SMBus SIGNALS				

SCL/SMBCLK	6	I/O	PD	I^{2}C clock/SMBus clock. The function of this pin depends on the setting of the SMBUSz input.
				
				    When SMBUSz = 1, this pin functions as the serial clock interface for an I^{2}C EEPROM.
				
				    When SMBUSz = 0, this pin functions as the serial clock interface for an SMBus host.
				
				This pin can be left unconnected if external interface not implemented.

SDA/SMBDAT	5	I/O	PD	I^{2}C data/SMBus data. The function of this pin depends on the setting of the SMBUSz input.
				
				    When SMBUSz = 1, this pin functions as the serial data interface for an I^{2}C EEPROM.
				
				    When SMBUSz = 0, this pin functions as the serial data interface for an SMBus host.
				
				This pin can be left unconnected if the external interface is not implemented.

SMBUSz	7	I/O	PU	I^{2}C/SMBus mode select. The value of the pin is sampled at the deassertion of reset set I^{2}C or SMBus mode as follows:
				
				    1 = I^{2}C mode selected
				
				    0 = SMBus mode selected
				
				This pin can be left unconnected if the external interface is not implemented.
				
				After reset, this signal is driven low by the TUSB4041I-Q1. Because of this behavior, TI recommends not to tie directly to supply, but instead pull up or pull down using external resistor.

Pin Functions (続き)

PIN		I/O[1]	TYPE[1]	DESCRIPTION
NAME	NO.			
TEST AND MISCELLANEOUS SIGNALS				
AUTOENz/ HS_SUSPEND	13	I/O	PU	Automatic charge mode enable/HS suspend status The value of the pin is sampled at the deassertion of reset to determine if automatic mode is enabled as follows: 0 = Automatic mode is enabled on ports that are enabled for battery charging when the hub is unconnected. Note that CDP is not supported on port 1 when operating in automatic mode. 1 = Automatic mode is disabled. This value is also used to set the autoEnz bit in the *Battery Charging Support Register* . After reset, this signal indicates the high-speed USB Suspend status of the upstream port if enabled through the *Additional Feature Configuration Register* . When enabled, a value of 1 indicates the connection is suspended.
FULLPWRMGMTz/ SMBA1	8	I/O	PD	Full power management enable/SMBus address bit 1 The value of the pin is sampled at the deassertion of reset to set the power switch control follows: 0 = Power switching and overcurrent inputs supported 1 = Power switching and overcurrent inputs not supported Full power management is the ability to control power to the downstream ports of the TUSB4041I-Q1 device using PWRCTL[4:1]/BATEN[4:1]. When SMBus mode is enabled using SMBUSz, this pin sets the value of the SMBus target address bit 1. This pin can be left unconnected if full power management and SMBus are not implemented. After reset, this signal is driven low by the TUSB4041I-Q1. Because of this behavior, TI recommends not to tie directly to supply, but instead pull up or pull down using an external resistor. Note: Power switching must be supported for battery charging applications.
GANGED/SMBA2/ HS_UP	10	I/O	PD	Ganged operation enable/SMBus address bit 2/HS connection status upstream port The value of the pin is sampled at the deassertion of reset to set the power switch and overcurrent detection mode as follows: 0 = Individual power control supported when power switching is enabled 1 = Power control gangs supported when power switching is enabled When SMBus mode is enabled using SMBUSz, this pin sets the value of the SMBus target address bit 2. After reset, this signal indicates the high-speed USB connection status of the upstream port if enabled through the *Additional Feature Configuration Register* . When enabled, a value of 1 indicates the upstream port is connected to a high-speed USB capable port. Note: Individual power control must be enabled for battery charging applications.
PWRCTL_POL	9	I/O	PU	Power control polarity. The value of the pin is sampled at the deassertion of reset to set the polarity of PWRCTL[4:1]. 0 = PWRCTL polarity is active low 1 = PWRCTL polarity is active high

5 Specifications

5.1 Absolute Maximum Ratings

over operating free-air temperature (unless otherwise noted)[1]

		MIN	MAX	UNIT
Supply voltage	V_{DD} steady-state supply voltage	–0.3	1.4	V
	V_{DD33} steady-state supply voltage	–0.3	3.8	V
Voltage	USB_VBUS pin	–0.3	1.4	V
	XI pins	–0.3	2.45	V
	All other pins	–0.3	3.8	V
Junction temperature, $T_{J(max)}$		–40	125	°C
Storage temperature, T_{stg}		–65	150	°C

(1) Stresses beyond those listed as *Absolute Maximum Ratings* may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated as *Recommended Operating Conditions* is not implied. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.

5.2 ESD Ratings

			VALUE	UNIT
$V_{(ESD)}$	Electrostatic discharge	Human-body model (HBM), per AEC Q100-002[1]	±2000	V
		Charged-device model (CDM), per AEC Q100-011	±750	

(1) AEC Q100-002 indicates that HBM stressing shall be in accordance with the ANSI/ESDA/JEDEC JS-001 specification.

5.3 Recommended Operating Conditions

over operating free-air temperature range (unless otherwise noted)

		MIN	NOM	MAX	UNIT
V_{DD} [1]	1.1-V supply voltage	0.99	1.1	1.26	V
V_{DD33}	3.3-V supply voltage	3	3.3	3.6	V
$V_{(USB\_VBUS)}$	Voltage at USB_VBUS pin	0		1.155	V
T_A	Operating free-air temperature	–40		85	°C
T_J	Operating junction temperature	–40		105	°C

(1) A 1.05-V, 1.1-V, or 1.2-V supply may be used as long as minimum and maximum supply conditions are met.

5.4 Thermal Information

	THERMAL METRIC[1]	TUSB4041I-Q1 PAP (HTQFP) 64 PINS	UNIT
$R_{\theta JA}$	Junction-to-ambient thermal resistance	26.2	°C/W
$R_{\theta JC(top)}$	Junction-to-case (top) thermal resistance	11.5	°C/W
$R_{\theta JB}$	Junction-to-board thermal resistance	10.4	°C/W
Ψ_{JT}	Junction-to-top characterization parameter	0.2	°C/W
Ψ_{JB}	Junction-to-board characterization parameter	10.3	°C/W
$R_{\theta JC(bot)}$	Junction-to-case (bottom) thermal resistance	0.6	°C/W

(1) For more information about traditional and new thermal metrics, see the Semiconductor and IC Package Thermal Metrics application note.

5.5 3.3-V I/O Electrical Characteristics

over operating free-air temperature range (unless otherwise noted)

PARAMETER		OPERATION	TEST CONDITIONS	MIN	TYP	MAX	UNIT
V_{IH}	High-level input voltage[1]	V_{DD33}		2		V_{DD33}	V
V_{IL}	Low-level input voltage[1]	V_{DD33}	JTAG pins only	0		0.55	V
			Other pins	0		0.8	
V_I	Input voltage			0		V_{DD33}	V
V_O	Output voltage[2]			0		V_{DD33}	V
t_t	Input transition time (t_r and t_f)			0		25	ns
V_{hys}	Input hysteresis[3]					0.13 x V_{DD33}	V
V_{OH}	High-level output voltage	V_{DD33}	I_{OH} = –4 mA	2.4			V
V_{OL}	Low-level output voltage	V_{DD33}	I_{OL} = 4 mA			0.4	V
I_{OZ}	High-impedance, output current[2]	V_{DD33}	V_I = 0 to V_{DD33}			±20	µA
$I_{OZ(P)}$	High-impedance, output current with internal pullup or pulldown resistor[4]	V_{DD33}	V_I = 0 to V_{DD33}			±250	µA
I_I	Input current[5]	V_{DD33}	V_I = 0 to V_{DD33}			±15	µA

(1) Applies to external inputs and bidirectional buffers.
(2) Applies to external outputs and bidirectional buffers.
(3) Applies to GRSTz.
(4) Applies to pins with internal pull-ups and pull-downs.
(5) Applies to external input buffers.

Product Folder Links: *TUSB4041I-Q1*
English Data Sheet: SLLSEK4

5.6 Power-Up Timing Requirements

		MIN	NOM	MAX	UNIT
t_{d1}	VDD33 stable before VDD stable[1]	See [2]			ms
t_{d2}	VDD and VDD33 stable before deassertion of GRSTz	3			ms
t_{su_io}	Setup for MISC inputs[3] sampled at the deassertion of GRSTz	0.1			µs
t_{hd_io}	Hold for MISC inputs[3] sampled at the deassertion of GRSTz	0.1			µs
t_{VDD33_RAMP}	VDD33 supply ramp requirements	0.2		100	ms
t_{VDD_RAMP}	VDD supply ramp requirements	0.2		100	ms

(1)   An active reset is required if the VDD33 supply is stable before the VDD11 supply. This active Reset shall meet the 3ms power-up delay counting from both power supplies being stable to the de-assertion of GRSTz.
(2)   The VDD33 and VDD have no power-on relationship unless GRSTz is only connected to a capacitor to GND. Then VDD must be stable minimum of 10 µs before the VDD33.
(3)   MISC pins sampled at de-assertion of GRSTz: FULLPWRMGMTz, GANGED, PWRCTL_POL, SMBUSz, BATEN[4:1], and AUTOENz.
図 5-1. Power-Up Timing Requirements

5.7 Hub Input Supply Current

Typical values measured at T_A = 25°C

PARAMETER	V_{DD33}	V_{DD}	UNIT
	3.3 V	1.1 V	
LOW POWER MODES			
Power on (after reset)	2.3	28	mA
Upstream disconnect	2.3	28	mA
Suspend	2.5	33	mA
ACTIVE MODES (US STATE AND DS STATE)			
2.0 host / 1 HS device	45	63	mA
2.0 host / 4 HS devices	76	86	mA

6 Detailed Description

6.1 Overview

The TUSB4041I-Q1 device is a four-port USB 2.0 hub. The device provides USB high-speed and full-speed connections on the upstream port and provides USB high-speed, full-speed, or low-speed connections on the downstream ports. When the upstream port is connected to an electrical environment that only supports high-speed connections. USB high-speed connectivity is enabled on the downstream ports. When the upstream port is connected to an electrical environment that only supports full-speed and low-speed connections. USB high-speed connectivity is disabled on the downstream ports.

6.2 Functional Block Diagram

Product Folder Links: *TUSB4041I-Q1*

English Data Sheet: SLLSEK4
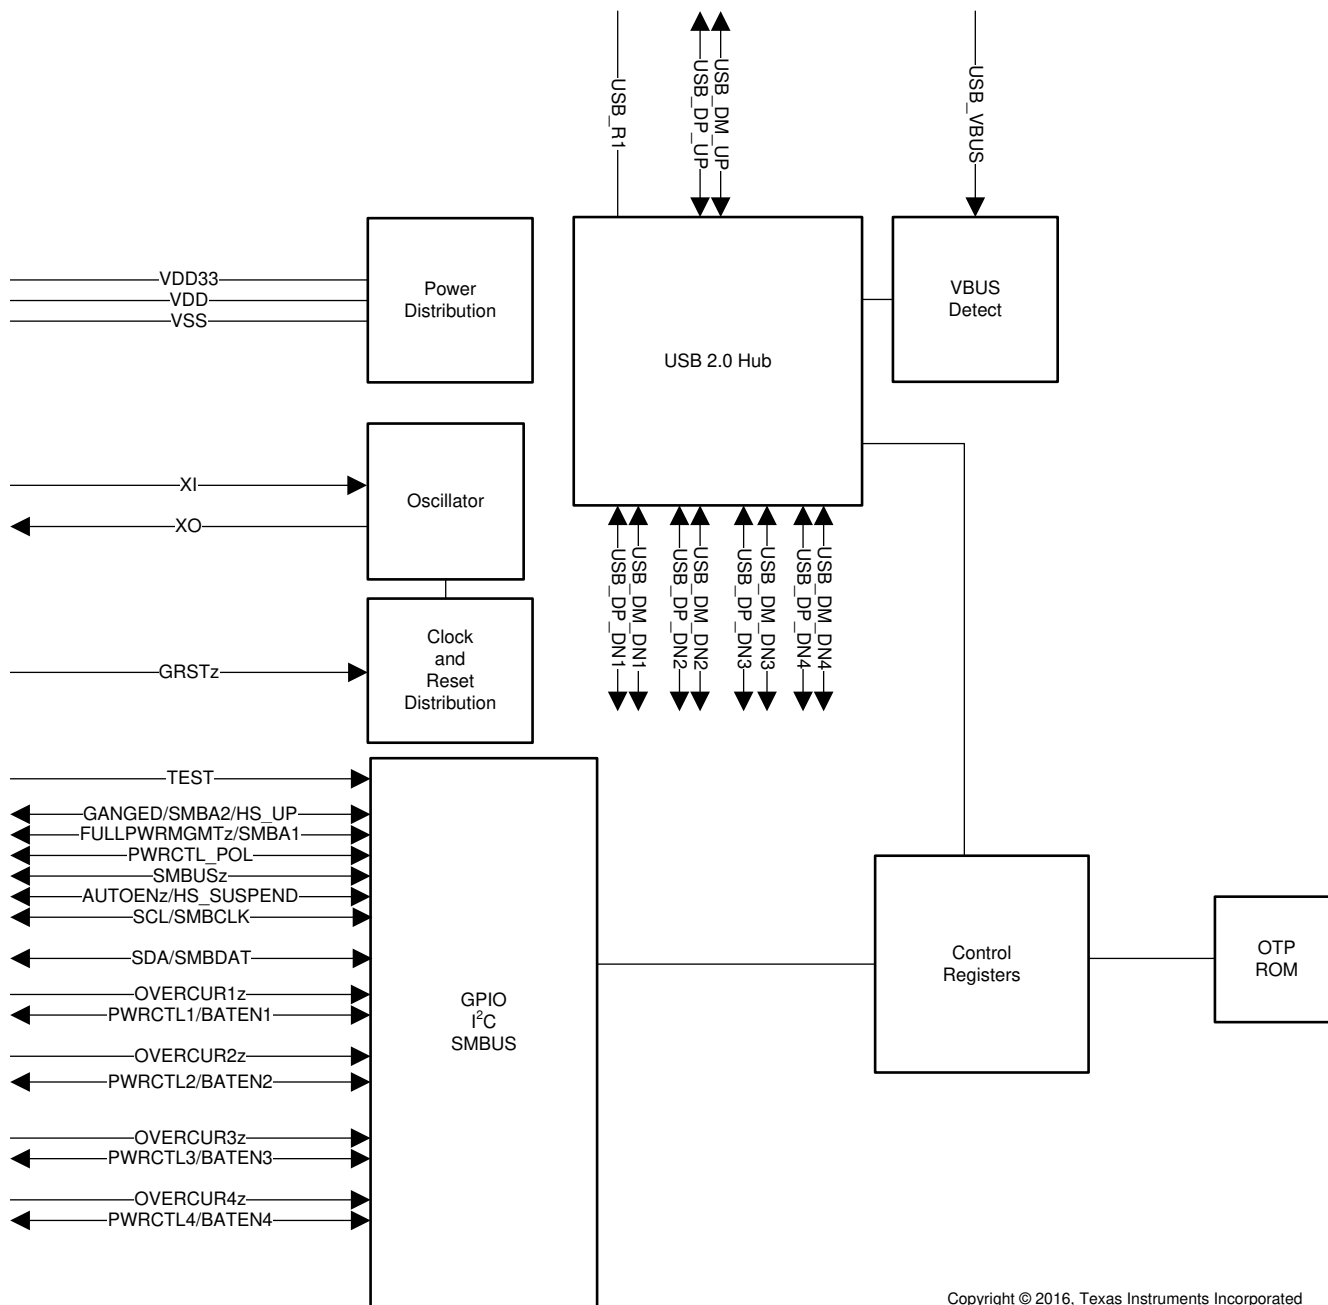

6.3 Feature Description

6.3.1 Battery Charging Features

The TUSB4041I-Q1 device provides support for USB battery charging. Battery charging support can be enabled on a per port basis through the REG_6h(batEn[3:0]).

Battery charging support includes both CDP and DCP modes. The DCP mode is compliant with the Chinese Telecommunications Industry Standard YD/T 1591-2009.

In addition to standard DCP mode, the TUSB4041I-Q1 device provides a mode (AUTOMODE), which automatically provides support for DCP devices and devices that support custom charging indication. When in AUTOMODE, the port automatically switches between a divider mode and the DCP mode depending on the portable device connected. The divided mode places a fixed DC voltage on the ports DP and DM signals, which allows some devices to identify the capabilities of the charger. The default divider mode indicates support for up to 10 W. The divider mode can be configured to report a legacy current setting (up to 5 W) through REG_Ah(HiCurAcpModeEn).

The battery charging mode for each port is dependent on the state of Reg_6h(batEn[n]), the status of the VBUS input, and the state of REG_Ah(autoModeEnz) upstream port as identified in 表 6-1.

表 6-1. TUSB4041I-Q1 Battery Charging Modes

batEn[n]	VBUS	autoModeEnz	BC MODE PORT *x* (*x = n* + 1)
0	Don't care	Don't care	Don't Care
1	<4 V	0	Automode[1] [2]
		1	DCP[3] [4]
	>4 V	Don't care	CDP[3]

(1) Auto-mode automatically selects divider-mode or DCP mode.
(2) Divider mode can be configured for legacy current mode through register settings.
(3) Attached USB device is USB battery-charging specification revision 1.2 compliant
(4) Chinese Telecommunications Industry Standard YD/T 1591-2009

6.3.2 USB Power Management

The TUSB4041I-Q1 device can be configured for power-switched applications using either per-port or ganged power-enable controls and overcurrent status inputs.

Power switch support is enabled by REG_5h(fullPwrMgmtz), and the per-port or ganged mode is configured by REG_5h(ganged).

The TUSB4041I-Q1 device supports both active-high and active-low power-enable controls. The PWRCTL[4:1] polarity is configured by REG_Ah(pwrctlPol).

6.3.3 One-Time Programmable Configuration

The TUSB4041I-Q1 device allows device configuration through one-time programmable (OTP) non-volatile memory. The programming of the OTP is supported using vendor-defined USB device requests. Contact TI for details using the OTP features

表 6-2 lists features that can be configured using the OTP.

表 6-2. OTP Configurable Features

CONFIGURATION REGISTER OFFSET	BIT FIELD	DESCRIPTION
REG_01h	[7:0]	Vendor ID LSB
REG_02h	[7:0]	Vendor ID MSB
REG_03h	[7:0]	Product ID LSB
REG_04h	[7:0]	Product ID MSB
REG_07h	[0]	Port-removable configuration for downstream ports 1. OTP configuration is inverse of rmbl[3:0], that is 1 = not removable, 0 = removable.
REG_07h	[1]	Port-removable configuration for downstream ports 2. OTP configuration is inverse of rmbl[3:0], that is 1 = not removable, 0 = removable.
REG_07h	[2]	Port-removable configuration for downstream ports 3. OTP configuration is inverse of rmbl[3:0], that is 1 = not removable, 0 = removable.

REG_F0h	[3:1]	USB power switch power-on delay

6.3.4 Clock Generation

The TUSB4041I-Q1 device accepts a crystal input to drive an internal oscillator or an external clock source. If a clock is provided to the XI pin instead of a crystal, the XO pin is left open. Otherwise, if a crystal is used, the connection must follow these guidelines. Because the XI and XO pins are coupled to other leads and supplies on the PCB, keep traces as short as possible and away from any switching leads. Minimize the capacitance between the XI and XO pins by shielding C1 and C2 with the clean ground lines.
Copyright © 2016, Texas Instruments Incorporated

図 6-1. TUSB4041I-Q1 Clock

6.3.5 Crystal Requirements

The crystal must be fundamental mode with load capacitance of 12 pF to 24 pF and frequency stability rating of ±100 PPM or better. To ensure proper start-up oscillation condition, TI recommends a maximum crystal equivalent series resistance (ESR) of 50 Ω. If a crystal source is used, use a parallel load capacitor. The exact load capacitance value used depends on the crystal vendor. Refer to the *Selection and Specification for Crystals for Texas Instruments USB 2.0 Devices* for details on how to determine the load capacitance value.

6.3.6 Input Clock Requirements

When using an external clock source such as an oscillator, make sure the reference clock has a frequency stability of ±100 PPM or better and has less than 50-ps absolute peak-to-peak jitter. Tie XI to the 1.8-V clock source, and leave XO floating.

6.3.7 Power-Up and Reset

The TUSB4041I-Q1 device does not have specific power-sequencing requirements with respect to the core power (V_{DD}) or I/O and analog power (V_{DD33}). The core power (V_{DD}) or I/O power (V_{DD33}) can be powered up for an indefinite period of time while the other is not powered up if all of the following constraints are met:

- Observe all maximum ratings and recommended operating conditions.
- Observe all warnings about exposure to maximum rated and recommended conditions, particularly junction temperature. These apply to power transitions and normal operation.
- Limit bus contention to 100 hours over the projected lifetime of the device while V_{DD33} is powered-up.
- Do not exceed the ratings listed in the *Absolute Maximum Ratings* table for bus contention while V_{DD33} is powered-down.

A supply bus is powered-up when the voltage is within the recommended operating range. A supply bus is powered-down when it is below that range, and either stable or in transition.

The device requires a minimum reset duration of 3 ms. This reset duration is defined as the time when the power supplies are in the recommended operating range to the deassertion of the GRSTz pin. Generate the reset pulse using a programmable-delay supervisory device or using an RC circuit.

6.4 Device Functional Modes

6.4.1 External Configuration Interface

The TUSB4041I-Q1 device supports a serial interface for configuration register access. The device can be configured by an attached I^{2}C EEPROM or accessed as a target by an SMBus-capable host controller. The external interface is enabled when both the SCL/SMBCLK and SDA/SMBDAT pins are pulled up to 3.3 V at the deassertion of reset. The mode, I^{2}C controller or SMBus target, is determined by the state of SMBUSz pin at reset.

6.4.2 I^{2}C EEPROM Operation

The TUSB4041I-Q1 device supports a single-controller, standard mode (100 kb/s) connection to a dedicated I^{2}C EEPROM when the I^{2}C interface mode is enabled. In I^{2}C mode, the TUSB4041I-Q1 device reads the contents of the EEPROM at bus address 1010000b using 7-bit addressing starting at address 0.

If the value of the EEPROM contents at byte 00h equals 55h, the TUSB4041I-Q1 device loads the configuration registers according to the EEPROM map. If the first byte is not 55h, the TUSB4041I-Q1 device exits the I^{2}C mode and continues execution with the default values in the configuration registers. The hub does not connect on the upstream port until the configuration is completed. If the hub detected an unprogrammed EEPROM (value other than 55h), the hub enters programming mode and a programming endpoint within the hub is enabled.

注

The bytes located above offset Ah are optional. The requirement for data in those addresses is dependent on the options configured in the *Device Configuration Register* and *Device Configuration Register 2* .

For details on I^{2}C operation, refer to the UM10204 I^{2}C-bus Specification and User Manual.

6.4.3 SMBus Target Operation

When the SMBus interface mode is enabled, the TUSB4041I-Q1 device supports read block and write block protocols as a target-only SMBus device.

The TUSB4041I-Q1 device target address is 1000 1xyz, where:
- x is the state of GANGED/SMBA2/HS_UP pin at reset
- y is the state of FULLPWRMGMTz/SMBA1 pin at reset
- z is the read-write (R/W) bit; 1 = read access, 0 = write access

If the TUSB4041I-Q1 device is addressed by a host using an unsupported protocol, the device does not respond. The TUSB4041I-Q1 device waits indefinitely for configuration by the SMBus host and does not connect on the upstream port until the SMBus host indicates configuration is complete by clearing the CFG_ACTIVE bit.

For details on SMBus requirements, refer to the *System Management Bus (SMBus) Specification*.

7 Application and Implementation

注

以下のアプリケーション情報は、TI の製品仕様に含まれるものではなく、TI ではその正確性または完全性を保証いたしません。個々の目的に対する製品の適合性については、お客様の責任で判断していただくことになります。お客様は自身の設計実装を検証しテストすることで、システムの機能を確認する必要があります。

7.1 Application Information

The TUSB4041I-Q1 device is a four-port USB 2.0 hub. The provides USB high-speed and full-speed connections on the upstream port and provides USB high-speed, full-speed, or low-speed connections on the downstream port. The TUSB4041I-Q1 device can be used in any application that requires additional USB-compliant ports. For example, a specific notebook can only have two downstream USB ports. By using the TUSB4041I-Q1 device, the notebook can increase the downstream port count to five.

7.2 Typical Application

A common application for the TUSB4041I-Q1 device is as a self-powered standalone USB-hub product. The product is powered by an external 5-V DC power adapter. In this application, using a USB cable, the upstream port of the TUSB4041I-Q1 device is plugged into a USB host controller. The downstream ports of the TUSB4041I-Q1 device are exposed to users for connecting USB hard drives, cameras, flash drives, and so forth.

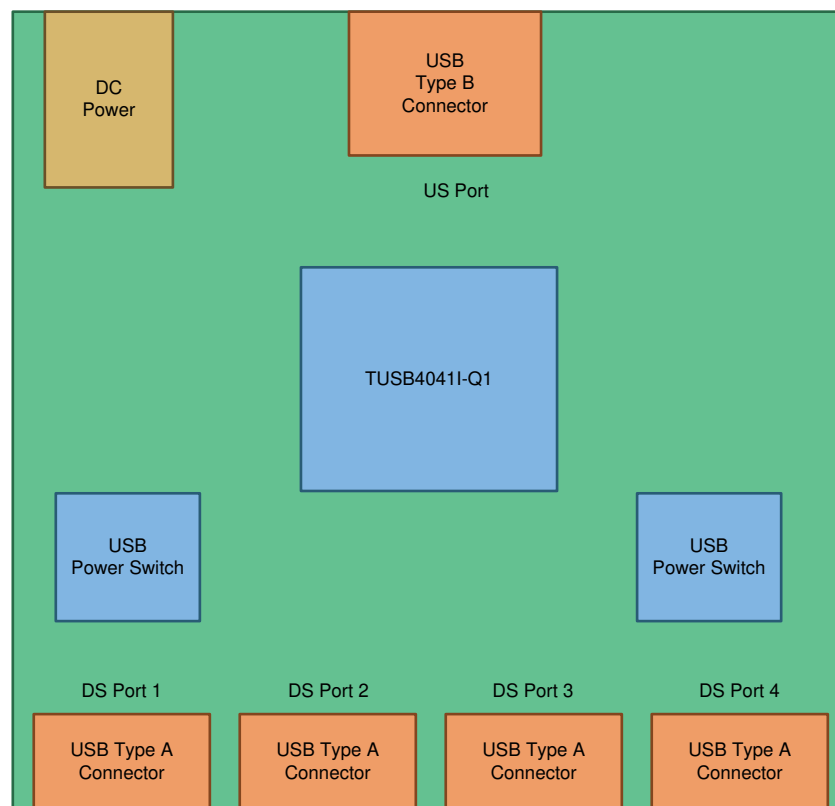

図 7-1. Discrete USB Hub Product

7.2.1 Design Requirements

For this design example, use the parameters listed in 表 7-1.

表 7-1. Design Parameters

DESIGN PARAMETER	EXAMPLE VALUE
V_{DD} supply	1.1 V
VDD33 supply	3.3 V
Upstream port USB support (HS, FS)	HS, FS
Downstream port 1 USB support (HS, FS, LS)	HS, FS, LS
Downstream port 2 USB support (HS, FS, LS)	HS, FS, LS
Downstream port 3 USB support (HS, FS, LS)	HS, FS, LS
Downstream port 4 USB support (HS, FS, LS)	HS, FS, LS
Number of removable downstream ports	4
Number of non-removable downstream ports	0
Full power management of downstream ports	Yes (FULLPWRMGMTZ = 0)
Individual control of downstream port power switch	Yes (GANGED = 0)
Power switch enable polarity	Active high (PWRCTL_POL = 1)
Battery charge support for downstream port 1	Yes
Battery charge support for downstream port 2	Yes
Battery charge support for downstream port 3	Yes
Battery charge support for downstream port 4	Yes
I^2C EEPROM support	No
24-MHz clock source	Crystal

7.2.2 Detailed Design Procedure

7.2.2.1 Upstream Port Implementation

The upstream of the TUSB4041I-Q1 device is connected to a USB2 Type B connector. This particular example has GANGED pin and FULLPWRMGMTZ pin pulled low, which results in individual power support each downstream port. The VBUS signal from the USB2 Type B connector is fed through a voltage divider. The purpose of the voltage divider is to make sure the level meets USB_VBUS input requirements.

図 7-7. VBUS Power Switch Implementation

Product Folder Links: TUSB4041I-Q1

English Data Sheet: SLLSEK4

7.2.2.7 Clock, Reset, and Miscellaneous

The PWRCTL_POL is left unconnected which results in active-high power enable (PWRCTL1, PWRCTL2, PWRCTL3, and PWRCTL4) for a USB VBUS power switch. The 1-µF capacitor on the GRSTN pin can only be used if the VDD11 supply is stable before the VDD33 supply. Depending on the supply ramp of the two supplies, the user may need to adjust the capacitor.

7.3 Power Supply Recommendations

7.3.1 TUSB4041I-Q1 Power Supply

Implement V_{DD} as a single power plane, as well as V_{DD33}.

- The V_{DD} pins of the TUSB4041I-Q1 supply 1.1-V (nominal) power to the core of the TUSB4041I-Q1 device. This power rail can be isolated from all other power rails by a ferrite bead to reduce noise.
- The DC resistance of the ferrite bead on the core power rail can affect the voltage provided to the device because of the high current draw on the power rail. The user may need to adjust the output of the core voltage regulator to account for this, or select a ferrite bead with low DC resistance (less than 0.05 Ω).

- The V_{DD33} pins of the TUSB4041I-Q1 device supply 3.3-V power rail to the I/O of the TUSB4041I-Q1 device. This power rail can be isolated from all other power rails by a ferrite bead to reduce noise.
- All power rails require a 10-µF capacitor or 1-µF capacitors for stability and noise immunity. These bulk capacitors can be placed anywhere on the power rail. Place the smaller decoupling capacitors as close to the TUSB4041I-Q1 power pins as possible with an optimal grouping of two capacitors of differing values per pin.

7.3.2 Downstream Port Power

- A source capable of supplying 5 V and up to 500 mA per port must supply the downstream port power, VBUS. The TUSB4041I-Q1 signals can control the downstream port power switches. Leaving the downstream port power as always enabled is also possible.
- The VBUS of each downstream port requires a large-bulk low-ESR capacitor of 22 µF or larger to limit in-rush current.
- TI recommends the ferrite beads on the VBUS pins of the downstream USB port connections for both ESD and EMI reasons. A 0.1-µF capacitor on the USB connector side of the ferrite provides a low-impedance path to ground for fast rise time ESD current that might have coupled onto the VBUS trace from the cable.

7.3.3 Ground

TI recommends to use only one board ground plane in the design which provides the best image plane for signal traces running above the plane. Connect the thermal pad of the TUSB4041I-Q1 and any of the voltage regulators to this plane with vias. An earth or chassis ground is implemented only near the USB port connectors on a different plane for EMI and ESD purposes.

7.4 Layout

7.4.1 Layout Guidelines

Use the layout guidelines listed in this section for proper PCB layout design.

7.4.1.1 Placement

- Place a 9.53-kΩ ±1% resistor connected to pin USB_R1 as close as possible to the TUSB4041I-Q1 device.
- Place a 0.1-µF capacitor as close as possible on each V_{DD} and VDD33 power pin.
- Place the ESD and EMI protection devices (if used) as close as possible to the USB connector.
- If a crystal is used, place the crystal as close as possible to the XI and XO pins of the TUSB4041I-Q1 device.
- Place voltage regulators as far away as possible from the TUSB4041I-Q1 device, the crystal, and the differential pairs.
- In general, place the large bulk capacitors associated with each power rail as close as possible to the voltage regulators.

7.4.1.2 Package Specific

- The TUSB4041I-Q1 device package has a 0.5-mm pin pitch.
- The TUSB4041I-Q1 device package has a 4.64-mm × 4.64-mm thermal pad. This thermal pad must be connected to ground through a system of vias.
- Solder mask all vias under device, except for those connected to the thermal pad, to avoid any potential issues with thermal pad layouts.

7.4.1.3 Differential Pairs

This section describes the layout recommendations for all the TUSB4041I-Q1 device differential pairs: USB_DP_XX, USB_DM_XX.

- The differential pairs must be designed with a differential impedance of 90 Ω ± 10%.
- To minimize crosstalk, TI recommends to keep high-speed signals away from each other. Separate each pair by at least 5 times the signal trace width. Separating with ground as depicted in the layout example also helps minimize crosstalk.
- Route all differential pairs on the same layer adjacent to a solid ground plane.
- Do not route differential pairs over any plane split.

- Adding test points causes impedance discontinuity and therefore negatively impacts signal performance. If test points are used, place them in series and symmetrically. Do not place them in a manner that causes stub on the differential pair.
- Avoid 90° turns in trace. Keep the use of bends in differential traces to a minimum. When bends are used, make sure the number of left and right bends are as equal as possible and that the angle of the bend is ≥135°. This guideline minimizes any length mismatch caused by the bends and therefore minimize the impact bends have on EMI.
- Minimize the trace lengths of the differential pair traces. Eight inches is the maximum recommended trace length for USB 2.0 differential pair signals. Longer trace lengths require very careful routing to ensure proper signal integrity.
- Match the etch lengths of the differential pair traces (that is DP and DM). Make sure the USB 2.0 differential pairs do not exceed 50 mils relative trace length difference.
- Minimize the use of vias in the differential pair paths as much as possible. If this is not practical, make sure that the same via type and placement are used for both signals in a pair. Place any vias used as close as possible to the TUSB4041I-Q1 device.
- To ease routing of the USB 2.0 DP and DM pair, the polarity of these pins can be swapped. If this is done, set the appropriate Px_usb2pol register, where x = 0, 1, 2, 3, or 4.
- Do not place power fuses across the differential pair traces.

8 Register Maps

8.1 Configuration Registers

The internal configuration registers are accessed on byte boundaries. The configuration register values are loaded with defaults, but can be overwritten when the TUSB4041I-Q1 device is in I^{2}C or SMBus mode.

表 8-1. Memory Map

BYTE ADDRESS	CONTENTS	EEPROM CONFIGURABLE
00h	ROM Signature Register	No
01h	Vendor ID LSB	Yes
02h	Vendor ID MSB	Yes
03h	Product ID LSB	Yes
04h	Product ID MSB	Yes
05h	Device Configuration Register	Yes
06h	Battery Charging Support Register	Yes
07h	Device Removable Configuration Register	Yes
08h	Port Used Configuration Register	Yes
09h	Reserved	Yes, program to 00h
0Ah	Device Configuration Register 2	Yes

5	pwrctlPol	RW	X	Power enable polarity This bit is loaded at the deassertion of reset with the value of the PWRCTL_POL pin. 0 = PWRCTL polarity is active low. 1 = PWRCTL polarity is active high. When the TUSB4041I-Q1 device is in I^{2}C mode, the TUSB4041I-Q1 device loads this bit from the contents of the EEPROM. When the TUSB4041I-Q1 device is in SMBUS mode, the value can be overwritten by an SMBus host.
4	HiCurAcpModeEn	R/RW	0	High-current ACP mode enable This bit enables the high-current tablet charging mode when the automatic battery charging mode is enabled for downstream ports. 0 = High-current divider mode disabled. Legacy current divider mode enabled. 1 = High-current divider mode enabled This bit is read only unless the customBCfeatures bit is set to 1. If customBCfeatures is 0, the value of this bit reflects the value of the OTP ROM HiCurAcpModeEn bit.
3	cpdEN	RRW	0	Enable device attach detection This bit enables device attach detection (such as a cell-phone detect) when auto mode is enabled. 0 = Device attach detect is disabled in auto mode. 1 = Device attach detect is enabled in auto mode. This bit is read only unless the customBCfeatures bit is set to 1. If customBCfeatures is 0, the value of this bit reflects the value of the OTP ROM cpdEN bit.
2	RSVD	RW	0	Reserved
1	autoModeEnz	RW	X	Automatic mode enable[1] This bit is loaded at the deassertion of reset with the value of the AUTOENz/HS_SUSPEND pin. The automatic mode only applies to downstream ports with battery charging enabled when the upstream port is not connected. Under these conditions: 0 = Automatic mode battery charging features are enabled. 1 = Automatic mode is disabled; only battery-charging DCP mode is supported.
0	RSVD	R	0	Reserved Read only, returns 0 when read.

(1)　When the upstream port is connected, battery charging 1.2 CDP mode is supported on all ports that are enabled for battery charging support regardless of the value of this bit, with the exception of port 1. CDP on port 1 is not supported when automatic mode is enabled.

8.12 USB 2.0 Port Polarity Control Register

Offset = Bh

図 8-11. USB 2.0 Port Polarity Control Register

7	6	5	4	3	2	1	0
customPolarity	RSVD		p4_usb2pol	p3_usb2pol	p2_usb2pol	p1_usb2pol	p0_usb2pol
RW-0	R-0		R/RW-0	R/RW-0	R/RW-0	R/RW-0	R/RW-0

表 8-12. USB 2.0 Port Polarity Control Register Field Descriptions

Bit	Field	Type	Reset	Description
7	customPolarity	RW	0	Custom USB 2.0 polarity This bit controls the ability to write the p[4:0]_usb2pol bits. 0 = The p[4:0]_usb2pol bits are read only, and the values are loaded from the OTP ROM. 1 = The p[4:0]_usb2pol bits are R/W and can be loaded by EEPROM or written by SMBus from this register. This bit can be written simultaneously with the p[4:0]_usb2pol bits
6:5	RSVD	R	0	Reserved Read only, returns 0 when read
4	p4_usb2pol	R/RW	0	Downstream port 4 DM/DP polarity This bit controls the polarity of the port. 0 = USB 2.0 port polarity is as shown in the pinout. 1 = USB 2.0 port polarity is swapped from that shown in the pinout (that is, DM becomes DP, and DP becomes DM). This bit is read only unless the customPolarity bit is set to 1. If customPolarity is 0, the value of this bit reflects the value of the OTP ROM p4_usb2pol bit.
3	p3_usb2pol	R/RW	0	Downstream port 3 DM/DP polarity This bit controls the polarity of the port. 0 = USB 2.0 port polarity is as shown in the pinout. 1 = USB 2.0 port polarity is swapped from that shown in the pinout (that is, DM becomes DP, and DP becomes DM). This bit is read only unless the customPolarity bit is set to 1. If customPolarity is 0, the value of this bit reflects the value of the OTP ROM p3_usb2pol bit.
2	p2_usb2pol	R/RW	0	Downstream port 2 DM/DP polarity This bit controls the polarity of the port. 0 = USB 2.0 port polarity is as shown in the pinout. 1 = USB 2.0 port polarity is swapped from that shown in the pinout (that is, DM becomes DP, and DP becomes DM). This bit is read only unless the customPolarity bit is set to 1. If customPolarity is 0, the value of this bit reflects the value of the OTP ROM p2_usb2pol bit.

表 8-12. **USB 2.0 Port Polarity Control Register Field Descriptions (続き)**

Bit	Field	Type	Reset	Description
1	p1_usb2pol	RRW	0	Downstream port 1 DM/DP polarity This bit controls the polarity of the port. 0 = USB 2.0 port polarity is as shown in the pinout. 1 = USB 2.0 port polarity is swapped from that shown in the pinout (that is, DM becomes DP, and DP becomes DM). This bit is read only unless the customPolarity bit is set to 1. If customPolarity is 0, the value of this bit reflects the value of the OTP ROM p1_usb2pol bit.
0	p0_usb2pol	R/RW	0	Upstream port DM/DP polarity This bit controls the polarity of the port. 0 = USB 2.0 port polarity is as shown in the pinout. 1 = USB 2.0 port polarity is swapped from that shown in the pinout (that is, DM becomes DP, and DP becomes DM). This bit is read only unless the customPolarity bit is set to 1. If customPolarity is 0, the value of this bit reflects the value of the OTP ROM p0_usb2pol bit.

8.13 UUID Byte N Register

Offset = 10h-1Fh

表 8-16. Serial Number String Length Register Field Descriptions

Bit	Field	Type	Reset	Description
7:6	RSVD	R	0	Reserved Read only, returns 0 when read.
5	serNumStringLen[5]	R/RW	0	Serial number string length
4:3	serNumStringLen[4:3]	R/RW	1	The string length in bytes for the serial number string. The default value is
2:0	serNumStringLen[2:0]	R/RW	0	18h indicating that a 24-byte serial number string is supported. The maximum string length is 32 bytes. When the customSernum bit is set to 1, this field can be overwritten by the contents of an attached EEPROM or by an SMBus host. When the field is non-zero, a serial number string of serNumbStringLen bytes is returned at string index 1 from the data contained in the Serial Number String registers.

表 8-22. Additional Feature Configuration Register Field Descriptions

Bit	Field	Type	Reset	Description
7:5	RSVD	R	0	Reserved Read only, returns 0 when read.
4	RSVD	R/RW	0	Reserved.
3:1	pwronTime	RW	0	Power-on delay time When OTP ROM pwronTime field is all 0, this field sets the delay time from the removal disable of PWRCTL to the enable of PWRCTL when transitioning battery charging modes. For example, when disabling the power on a transition from a custom charging mode to dedicated charging port mode. The nominal timing is defined as follows: T_{PWRON_EN} = (pwronTime + 1) x 200 ms　　　　(1) This field can be overwritten by EEPROM contents or by an SMBus host.
0	RSVD	RW	0	Reserved

8.23 Device Status and Command Register

Offset = F8h

図 8-22. Device Status and Command Register

7	6	5	4	3	2	1	0
RSVD						smbusRst	cfgActive
R-0						W1S-0	W1C-0

表 8-23. Device Status and Command Register Field Descriptions

Bit	Field	Type	Reset	Description
7:2	RSVD	R	0	Reserved Read only, returns 0 when read
1	smbusRst	W1S	0	SMBus interface reset This bit loads the registers back to the GRSTz values. This bit is set by writing a 1 and is cleared by hardware on completion of the reset. A write of 0 has no effect.
0	cfgActive	W1C	0	Configuration active This bit indicates that configuration of the TUSB4041I-Q1 device is currently active. The bit is set by hardware when the device enters the I^2C or SMBus mode. The TUSB4041I-Q1 device does not connect on the upstream port while this bit is 1. When in the SMBus mode, this bit must be cleared by the SMBus host to exit the configuration mode and allow the upstream port to connect. The bit is cleared by a writing 1. A write of 0 has no effect.

(1) Status: For more details on status, see our product life cycle.

(2) Material type: When designated, preproduction parts are prototypes/experimental devices, and are not yet approved or released for full production. Testing and final process, including without limitation quality assurance, reliability performance testing, and/or process qualification, may not yet be complete, and this item is subject to further changes or possible discontinuation. If available for ordering, purchases will be subject to an additional waiver at checkout, and are intended for early internal evaluation purposes only. These items are sold without warranties of any kind.

(3) RoHS values: Yes, No, RoHS Exempt. See the TI RoHS Statement for additional information and value definition.

(4) Lead finish/Ball material: Parts may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead finish/Ball material values may wrap to two lines if the finish value exceeds the maximum column width.

(5) MSL rating/Peak reflow: The moisture sensitivity level ratings and peak solder (reflow) temperatures. In the event that a part has multiple moisture sensitivity ratings, only the lowest level per JEDEC standards is shown. Refer to the shipping label for the actual reflow temperature that will be used to mount the part to the printed circuit board.

(6) Part marking: There may be an additional marking, which relates to the logo, the lot trace code information, or the environmental category of the part.

Multiple part markings will be inside parentheses. Only one part marking contained in parentheses and separated by a "~" will appear on a part. If a line is indented then it is a continuation of the previous line and the two combined represent the entire part marking for that device.

Important Information and Disclaimer: The information provided on this page represents TI's knowledge and belief as of the date that it is provided. TI bases its knowledge and belief on information provided by third parties, and makes no representation or warranty as to the accuracy of such information. Efforts are underway to better integrate information from third parties. TI has taken and continues to take reasonable steps to provide representative and accurate information but may not have conducted destructive testing or chemical analysis on incoming materials and chemicals. TI and TI suppliers consider certain information to be proprietary, and thus CAS numbers and other limited information may not be available for release.

In no event shall TI's liability arising out of such information exceed the total purchase price of the TI part(s) at issue in this document sold by TI to Customer on an annual basis.

PAP (S–PQFP–G64)   PowerPAD™ PLASTIC QUAD FLATPACK

THERMAL INFORMATION

This PowerPAD™ package incorporates an exposed thermal pad that is designed to be attached to a printed circuit board (PCB). The thermal pad must be soldered directly to the PCB. After soldering, the PCB can be used as a heatsink. In addition, through the use of thermal vias, the thermal pad can be attached directly to the appropriate copper plane shown in the electrical schematic for the device, or alternatively, can be attached to a special heatsink structure designed into the PCB. This design optimizes the heat transfer from the integrated circuit (IC).

For additional information on the PowerPAD package and how to take advantage of its heat dissipating abilities, refer to Technical Brief, PowerPAD Thermally Enhanced Package, Texas Instruments Literature No. SLMA002 and Application Brief, PowerPAD Made Easy, Texas Instruments Literature No. SLMA004. Both documents are available at www.ti.com.

The exposed thermal pad dimensions for this package are shown in the following illustration.
