TEXAS INSTRUMENTS

TUSB544 USB TYPE-C™、8.1Gbps、マルチプロトコル・リニア・リドライバ

1 特長

- プロトコルに依存しない反転可能な4チャネルのリニア・リドライバで、最高8.1Gbpsに対応。
  - USB Type-CのUSB 3.1 Gen 1、および代替モードとしてDisplayPort 1.4に対応
- USB 3.1とDisplayPortマルチプレクサが統合されたプロセッサをサポートし、Type-Cアプリケーションに対応
- Type-Cケーブル内の信号コンディショニングをサポート
- SBU信号用のクロスポイント・マルチプレクサ
- 4.05GHzにおいて最高11dBのリニア・イコライゼーション
- チャネル方向とイコライゼーションをGPIOおよびI²Cにより制御
- USB電力状態の監視とDPリンク・トレーニングのスヌーピングによる高度な電力管理
- GPIOまたはI²Cにより設定可能
- ホットプラグ対応
- 3.3V単一電源
- 工業用温度範囲: -40℃〜85℃ (TUSB544I)
- 商業用温度範囲: 0℃〜70℃ (TUSB544)
- 4mm×6mm、0.4mmピッチ、40ピンのQFNパッケージ

2 アプリケーション

- タブレット
- ノートブックPC
- デスクトップPC
- ドッキング・ステーション

3 概要

TUSB544は、USB Type-C Altモードのリドライバ・スイッチで、最高8.1Gbpsのデータ速度に対応できます。このリニア・リドライバはプロトコルに依存せず、VESA DisplayPortを含むUSB Type-C Altモードのインターフェイスをサポートできます。

TUSB544には、いくつかのレベルの受信リニア・イコライゼーションがあり、ケーブルおよびボード配線での損失によるシンボル間干渉(ISI)を補償できます。単一の3.3V電源で動作し、商業用温度範囲と工業用温度範囲のバージョンがあります。

TUSB544の4つのレーンはすべて反転可能なため、多用途な信号コンディショナーとして、多くのアプリケーションに使用できます。

Pin Functions

PIN		I/O	DESCRIPTION
NO.	NAME		
1	VCC	P	3.3 V Power Supply
2	UEQ1/A1	4 Level I	This pin along with UEQ0 sets the high-frequency equalizer gain for upstream facing URX1, URX2, UTX1, UTX2 receivers. Up to 9.4 dB of EQ available. In I²C mode, this pin will also set TUSB544 I²C address. Refer to 表 10.
3	CFG0	4 Level I	CFG0. This pin along with CFG1 will select VOD linearity range and DC gain for all the downstream and upstream channels. Refer to 表 8 for VOD linearity range and DC gain options.
4	CFG1	4 Level I	CFG1. This pin along with CFG0 will set VOD linearity range and DC gain for all the downstream and upstream channels. Refer to 表 8 for VOD linearity range and DC gain options.
5	SWAP	2 Level I	This pin swaps all the channel directions and EQ settings of downstream facing and upstream facing data path inputs. 0 – Do not swap channel directions and EQ settings (Default) 1. – Swap channel directions and EQ settings.
6	VCC	P	3.3V Power Supply
7	SLP_S0#	2 Level I	This pin when asserted low will disable Receiver Detect functionality. While this pin is low and TUSB544 is in U2/U3, TUSB544 will disable LOS and LFPS detection circuitry and RX termination for both channels will remain enabled. If this pin is low and TUSB544 is in Disconnect state, the RX detect functionality will be disabled and RX termination for both channels will be disabled. 0 – RX Detect disabled 1 – RX Detect enabled (Default)
8	DIR0	2 Level I	This pin along with DIR1 sets the data path signal direction format. Refer to 表 4 for signal direction formats.
9	URX2p	Diff I/O	Differential positive input/output for upstream facing RX2 port.
10	URX2n	Diff I/O	Differential negative input/output for upstream facing RX2 port.
11	DIR1	2 Level I/O	This pin along with DIR0 sets the data path signal direction format. Refer to 表 4 for signal direction formats.
12	UTX2p	Diff I/O	Differential positive input/output for upstream facing TX2 port.
13	UTX2n	Diff I/O	Differential negative input/output for upstream facing TX2 port.

Pin Functions (continued)

PIN NO.	PIN NAME	I/O	DESCRIPTION
14	VIO_SEL	4 Level I/O	This pin selects I/O voltage levels for the 2-level GPIO configuration pins and the I^{2}C interface: 0 = 3.3-V configuration I/O voltage, 3.3-V I^{2}C interface (Default) R = 3.3-V configuration I/O voltage, 1.8-V I^{2}C interface F = 1.8-V configuration I/O voltage, 3.3-V I^{2}C interface 1 = 1.8-V configuration I/O voltage, 1.8-V I^{2}C interface.
15	UTX1n	Diff I/O	Differential negative input/output for upstream facing TX1 port.
16	UTX1p	Diff I/O	Differential positive input/output for upstream facing TX1 port.
17	I2C_EN	4 Level I	I^{2}C Programming or Pin Strap Programming Select. 0 = GPIO Mode AUX Snoop enabled (I^{2}C disabled) R = TI Test Mode (I^{2}C enabled) F = GPIO Mode, AUX Snoop Disabled (I^{2}C disabled) 1 = I^{2}C enabled.
18	URX1n	Diff I/O	Differential negative input/output for upstream facing RX1 port.
19	URX1p	Diff I/O	Differential positive input/output for upstream facing RX1 port.
20	VCC	P	3.3V Power Supply
21	FLIP/SCL	2 Level I (Failsafe)	In GPIO mode, this is Flip control pin, otherwise this pin is I^{2}C clock.
22	CTL0/SDA	2 Level I (Failsafe)	In GPIO mode, this is a USB3.1 Switch control pin, otherwise this pin is I^{2}C data.
23	CTL1	2 Level I (PD)	DP Alt mode Switch Control Pin. In GPIO mode, this pin will enable or disable DisplayPort functionality. Otherwise DisplayPort functionality is enabled and disabled through I^{2}C registers. L = DisplayPort Disabled. H = DisplayPort Enabled. In I^{2}C mode, this pin is not used by device.
24	AUXp	I/O, CMOS	AUXp. DisplayPort AUX positive I/O connected to the DisplayPort source or sink through an AC coupling capacitor. In addition to AC coupling capacitor, this pin also requires a 100-kΩ resistor to GND between the AC coupling capacitor and the AUXp pin if the TUSB544 is used on the DisplayPort source side, or a 1-MΩ resistor to DP_PWR (3.3V) between the AC coupling capacitor and the AUXp pin if TUSB544 is used on the DisplayPort sink side. This pin along with AUXn is used by the TUSB544 for AUX snooping and is routed to SBU1/2 based on the orientation of the Type-C plug.
25	AUXn	I/O, CMOS	AUXn. DisplayPort AUX I/O connected to the DisplayPort source or sink through an AC coupling capacitor. In addition to AC coupling capacitor, this pin also requires a 100-kΩ resistor to DP_PWR (3.3V) between the AC coupling capacitor and the AUXn pin if the TUSB544 is used on the DisplayPort source side, or a 1-MΩ resistor to GND between the AC coupling capacitor and the AUXn pin if TUSB544 is used on the DisplayPort sink side. This pin along with AUXp is used by the TUSB544 for AUX snooping and is routed to SBU1/2 based on the orientation of the Type-C plug.
26	SBU2	I/O, CMOS	SBU2. When the TUSB544 is used on the DisplayPort source side, this pin should be DC coupled to the SBU2 pin of the Type-C receptacle. When the TUSB544 is used on the DisplayPort sink side, this pin should be DC coupled to the SBU1 pin of the Type-C receptacle. A 2-MΩ resistor to GND is also recommended.
27	SBU1	I/O, CMOS	SBU1. When the TUSB544 is used on the DisplayPort source side, this pin should be DC coupled to the SBU1 pin of the Type-C receptacle. When the TUSB544 is used on the DisplayPort sink side, this pin should be DC coupled to the SBU2 pin of the Type-C receptacle. A 2-MΩ resistor to GND is also recommended.
28	VCC	P	3.3V Power Supply
29	DEQ1	4 Level I	This pin along with DEQ0 sets the high-frequency equalizer gain for downstream facing DRX1, DRX2, DTX1, DTX2 receivers. Up to 11 dB of EQ available.
30	DRX1p	Diff I/O	Differential positive input/output for downstream facing RX1 port.
31	DRX1n	Diff I/O	Differential negative input/output for downstream facing RX1 port.
32	HPDIN	2 Level I (PD)	This pin is an input for Hot Plug Detect received from DisplayPort sink. When HPDIN is low for greater than $t_{CTL1\_DEBOUNCE}$, all DisplayPort lanes are disabled and AUX to SBU switch will remain closed.
33	DTX1p	Diff I/O	Differential positive input/output for downstream facing TX1 port.
34	DTX1n	Diff I/O	Differential negative input/output for downstream facing TX1 port.
35	UEQ0/A0	4 Level I	This pin along with UEQ1 sets the high-frequency equalizer gain for upstream facing URX1, URX2, UTX1, UTX2 receivers. Up to 9.4 dB of EQ available. In I^{2}C mode, this pin will also set TUSB544 I^{2}C address. Refer to 表 10.
36	DTX2n	Diff I/O	Differential negative input/output for downstream facing TX2 port.
37	DTX2p	Diff I/O	Differential positive input/output for downstream facing TX2 port.
38	DEQ0	4 Level I	This pin along with DEQ1 sets the high-frequency equalizer gain for downstream facing DRX1, DRX2, DTX1, DTX2 receivers. Up to 11 dB of EQ available.

6 Specifications

6.1 Absolute Maximum Ratings

over operating free-air temperature range (unless otherwise noted)[1]

		MIN	MAX	UNIT
Supply Voltage	V_{CC}	−0.3	4	V
Voltage Range at any input or output pin	Differential voltage between positive and negative inputs	−2.5	2.5	V
	Voltage at differential inputs	−0.5	V_{CC} + 0.5	V
	CMOS Inputs	−0.5	V_{CC} + 0.5	V
Maximum junction temperature, T_J			125	°C
Storage temperature ,T_{STG}		−65	150	°C

(1) Stresses beyond those listed under *Absolute Maximum Ratings* may cause permanent damage to the device. These are stress ratings only, which do not imply functional operation of the device at these or any other conditions beyond those indicated under *Recommended Operating Conditions*. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.

6.2 ESD Ratings

			VALUE	UNIT
$V_{(ESD)}$	Electrostatic discharge	Human-body model (HBM), per ANSI/ESDA/JEDEC JS-001[1]	±6	kV
		Charged-device model (CDM), per JEDEC specification JESD22-C101[2]	±1500	V

(1) JEDEC document JEP155 states that 500-V HBM allows safe manufacturing with a standard ESD control process.
(2) JEDEC document JEP157 states that 250-V CDM allows safe manufacturing with a standard ESD control process.

6.3 Recommended Operating Conditions

over operating free-air temperature range (unless otherwise noted)

			MIN	NOM	MAX	UNIT
V_{CC}	Main power supply		3	3.3	3.6	V
	Supply ramp requirement				100	ms
V_{I2C}	Supply that external resistors on SDA and SCL are pulled up to.		1.70		3.6	V
V_{PSN}	Supply Noise on V_{CC} terminals				100	mV
T_A	Operating free-air temperature	TUSB544	0		70	°C
		TUSB544I	−40		85	°C

6.4 Thermal Information

THERMAL METRIC[1]		TUSB544 RNQ (QFN) 40 PINS	UNIT
$R_{\theta JA}$	Junction-to-ambient thermal resistance	37.6	°C/W
$R_{\theta JC(top)}$	Junction-to-case (top) thermal resistance	20.7	°C/W
$R_{\theta JB}$	Junction-to-board thermal resistance	9.5	°C/W
ψ_{JT}	Junction-to-top characterization parameter	0.2	°C/W

7 Detailed Description

7.1 Overview

The TUSB544 is a USB Type-C Alt Mode redriver switch supporting data rates up to 8.1 Gbps. This device implements 5th generation USB redriver technology. The device is utilized for configurations C, D, E, and F from the VESA DisplayPort Alt Mode on USB Type-C Standard. It can also be configured to support custom USB Type-C alternate modes.

The TUSB544 provides several levels of receive equalization to compensate for cable and board trace loss due to inter-symbol interference (ISI) when USB 3.1 Gen 1 or DisplayPort (or other Alt modes) signals travel across a PCB or cable. This device requires a 3.3V power supply. It comes for both commercial temperature range and industrial temperature range operation.

For host (source) or device (sink) applications the TUSB544 enables the system to pass both transmitter compliance and receiver jitter tolerance tests for USB 3.1 Gen 1 and DisplayPort version 1.4 HBR3. The re-driver recovers incoming data by applying equalization that compensates for channel loss, and drives out signals with a high differential voltage. Each channel has a receiver equalizer with selectable gain settings. Equalization control for upstream and downstream facing ports can be set using UEQ[1:0], and DEQ[1:0] pins respectively or through the I²C interface.

Moreover, the CFG[1:0] or the equivalent I²C registers provide the ability to control the EQ DC gain and the voltage linearity range for all the channels (Refer to 表 8). This flexible control makes it easy to set up the device to pass various standard compliance requirements.

The TUSB544 advanced state machine makes it transparent to hosts and devices. After power up, the TUSB544. periodically performs receiver detection on the TX pairs. If it detects a USB 3.1 Gen 1 receiver, the RX termination is enabled, and the TUSB544 is ready to re-drive.

The TUSB544 provides extremely flexible data path signal direction control using the CTL[1:0], FLIP, DIR[1:0], and SWAP pins or through the I²C interface. Refer to 表 4 for detailed information on the input to output signal pin mapping.

The device ultra-low-power architecture operates at a 3.3 V power supply and achieves enhanced performance. The automatic LFPS De-Emphasis control further enables the system to be USB 3.1 compliant.

7.2 Functional Block Diagram
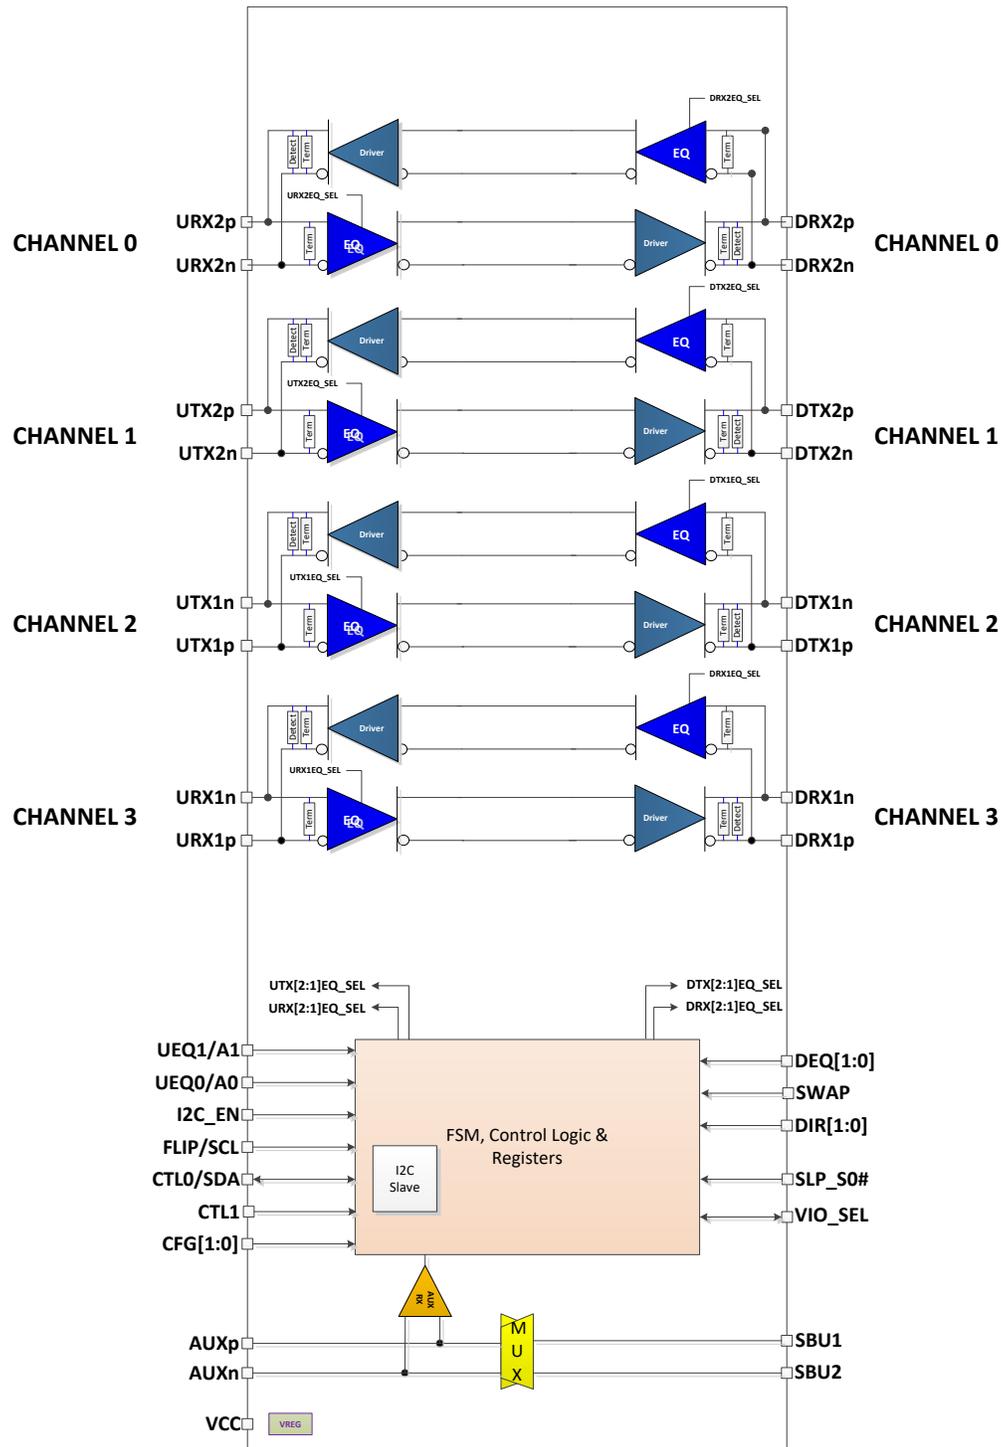

7.3 Feature Description

7.3.1 USB 3.1

The TUSB544 supports USB 3.1 data rates up to 5 Gbps. The TUSB544 supports all the USB defined power states (U0, U1, U2, and U3). Because the TUSB544 is a linear redriver, it can't decode USB3.1 physical layer traffic. The TUSB544 monitors the actual physical layer conditions like receiver termination, electrical idle, LFPS, and SuperSpeed signaling rate to determine the USB power state of the USB3.1 interface.

The TUSB544 features an intelligent low frequency periodic signaling (LFPS) detector. The LFPS detector automatically senses the low frequency signals and disables receiver equalization functionality. When not receiving LFPS, the TUSB544 will enable receiver equalization based on the UEQ[1:0] and DEQ[1:0] pins or values programmed into UEQ[3:0]_SEL, and DEQ[3:0]_SEL registers.

7.3.2 DisplayPort

The TUSB544 supports up to 4 DisplayPort lanes at data rates up to 8.1Gbps (HBR3). The TUSB544, when configured in DisplayPort mode, monitors the native AUX traffic as it traverses between DisplayPort source and DisplayPort sink. For the purposes of reducing power, the TUSB544 will manage the number of active DisplayPort lanes based on the content of the AUX transactions. The TUSB544 snoops native AUX writes to DisplayPort sink's DPCD registers 00101h (LANE_COUNT_SET) and 00600h (SET_POWER_STATE). TUSB544 will disable/enable lanes based on value written to LANE_COUNT_SET. The TUSB544 will disable all lanes when SET_POWER_STATE is in the D3. Otherwise active lanes will be based on value of LANE_COUNT_SET.

DisplayPort AUX snooping is enabled by default but can be disabled by changing the AUX_SNOOP_DISABLE register. Once AUX snoop is disabled, management of TUSB544's DisplayPort lanes are controlled through various configuration registers.

7.3.3 4-Level Inputs

The TUSB544 has (I2C_EN, UEQ[1:0], DEQ[1:0], CFG[1:0], and A[1:0]) 4-level inputs pins that are used to control the equalization gain, voltage linearity range, and place TUSB544 into different modes of operation. These 4-level inputs utilize a resistor divider to help set the 4 valid levels and provide a wider range of control settings. There are internal pull-up and a pull-down resisters. These resistors together with the external resistor connection combine to achieve the desired voltage level.

表 1. 4-Level Control Pin Settings

LEVEL	SETTINGS
0	Option 1: Tie 1 KΩ 5% to GND. Option 2: Tie directly to GND.
R	Tie 20 KΩ 5% to GND.
F	Float (leave pin open)
1	Option 1: Tie 1 KΩ 5%to V_{CC}. Option 2: Tie directly to V_{CC}.

注

All four-level inputs are latched on rising edge of internal reset. After T_{cfg_hd}, the internal pull-up and pull-down resistors will be isolated in order to save power.

7.3.4 Receiver Linear Equalization

The purpose of receiver equalization is to compensate for channel insertion loss and inter-symbol interference in the system. The receiver overcomes these losses by attenuating the low frequency components of the signals with respect to the high frequency components. The proper gain setting should be selected to match the channel insertion loss. Two 4-level input pins enable up to 16 possible equalization settings. The upstream path, and the downstream path each have their own two 4-level inputs for equalization settings; UEQ[1:0] and DEQ[1:0] respectively. The TUSB544 also provides the flexibility of adjusting equalization settings through I^2C registers URX[2:1]EQ_SEL, UTX[2:1]EQ_SEL, DRX[2:1]EQ_SEL, and DTX[2:1]EQ_SEL for each individual channel and for each direction (upstream or downstream) .

7.4 Device Functional Modes

7.4.1 Device Configuration in GPIO Mode

The TUSB544 is in GPIO configuration when I2C_EN = "0" or "F". The TUSB544 supports operational combinations with USB and two different Type-C Alternate Modes.. One combination includes USB and Alternate Mode DisplayPort, and the other combination includes USB and custom Alternate Mode. For each operational combination the data path directions can be further set using the DIR[1:0] pins or through I2C to enable the device to operate in the source or sink sides. Please refer to 表 2 for all the configuration of all the operational modes.

When the device is set to operate in a USB and Alternate Mode DisplayPort the following configurations can be further set: USB3.1 only, 2 DisplayPort lanes + USB3.1, or 4 DisplayPort lanes (no USB3.1). The CTL1 pin controls whether DisplayPort is enabled. The combination of CTL1 and CTL0 selects between USB3.1 only, 2 lanes of DisplayPort, or 4-lanes of DisplayPort as detailed in 表 2. The AUXP/N to SBU1/2 mapping is controlled based on 表 3..

When the device is set to operate in a USB and custom Alternate Mode the following configurations can be further set: USB3.1 only, 2 Channels of custom Alternate Mode + USB3.1, or 4 Channels of custom Alternate Mode (no USB3.1). The CTL1 pin controls whether custom Alternate Mode is enabled. The combination of CTL1 and CTL0 selects between USB3.1 only, 2 channels of custom Alternate Mode, or 4 channels of custom Alternate Mode as detailed in 表 2. The AUXP/N to SBU1/2 mapping is controlled based on 表 3.

Further data path direction control can be achieved using the SWAP pin. When set high, the SWAP pin reverses the data path direction on all the channels and swaps the equalization settings of the upstream and downstream facing input ports. This pin may be found useful in active cable application with TUSB544 installed on only one end. The SWAP pin can be set based on which cable end is plugged to the source or sink side receptacle

After power-up (VCC from 0 V to 3.3 V), the TUSB544 will default to USB3.1 mode. The USB PD controller, upon detecting no device attached to Type-C port or USB3.1 operation not required by attached device, must take TUSB544 out of USB3.1 mode by transitioning the CTL0 pin from L to H and back to L.

7.4.2 Device Configuration in I2C Mode

The TUSB544 is in I^{2}C mode when I2C_EN is equal to "1". The same configurations defined in GPIO mode are also available in I^{2}C mode. The TUSB544's USB3.1, DisplayPort, and custom Alternate Mode configuration is controlled based on 表 5. The AUXP/N to SBU1/2 mapping control is based on 表 5.

7.4.3 DisplayPort Mode

The TUSB544 supports up to four DisplayPort lanes at datarates up to 8.1Gbps. TUSB544 can be enabled for DisplayPort through GPIO control or through I²C register control. In GPIO mode, DisplayPort is controlled based on 表 2. When not in GPIO mode, enable of DisplayPort functionality is controlled through I²C registers.

7.4.4 Custom Alternate Mode

The TUSB544 supports up to two lanes (or 4 channels) of custom Alternate Mode at datarates up to 8.1Gbps. TUSB544 can be enabled for custom Alternate Mode through GPIO control or through I²C register control. in GPIO mode, custom Alternate Mode is controlled based on 表 2. When not in GPIO mode, enable of custom Alternate Mode functionality is controlled through I²C registers. In I²C mode, the operation of this mode requires setting AUX_SNOOP_DISABLE register 13h bit 7 to 0.

7.4.5 Linear EQ Configuration

TUSB544 receiver lanes have controls for receiver equalization for upstream and downstream facing ports. The receiver equalization gain value can be controlled either through I²C registers or through GPIOs. 表 7 details the gain value for each available combination when TUSB544 is in GPIO mode. These same options are also available per channel and for upstream and downstream facing ports in I²C mode by updating registers URX[2:1]EQ_SEL, UTX[2:1]EQ_SEL, DRX[2:1]EQ_SEL, and DTX[2:1]EQ_SEL.

7.4.6   Adjustable VOD Linear Range and DC Gain

The CFG0 and CFG1 pins can be used to adjust the TUSB544 differential output voltage (VOD) swing linear range and receiver equalization DC gain for both downstream and upstream data path directions. 表 8 details the available options.

7.4.7   USB3.1 modes

The TUSB544 monitors the physical layer conditions like receiver termination, electrical idle, LFPS, and SuperSpeed signaling rate to determine the state of the USB3.1 interface. Depending on the state of the USB 3.1 interface, the TUSB544 can be in one of four primary modes of operation when USB 3.1 is enabled (CTL0 = H or CTLSEL0 = 1b1): Disconnect, U2/U3, U1, and U0.

The Disconnect mode is the state in which TUSB544 has not detected far-end termination on both upstream facing port (UFP) or downstream facing port (DFP). The disconnect mode is the lowest power mode of each of the four modes. The TUSB544 will remain in this mode until far-end receiver termination has been detected on both UFP and DFP. The TUSB544 will immediately exit this mode and enter U0 once far-end termination is detected.

Once in U0 mode, the TUSB544 will redrive all traffic received on UFP and DFP. U0 is the highest power mode of all USB3.1 modes. The TUSB544 will remain in U0 mode until electrical idle occurs on both UFP and DFP. Upon detecting electrical idle, the TUSB544 will immediately transition to U1.

The U1 mode is the intermediate mode between U0 mode and U2/U3 mode. In U1 mode, the TUSB544's UFP and DFP receiver termination will remain enabled. The UFP and DFP transmitter DC common mode is maintained. The power consumption in U1 will be similar to power consumption of U0.

Next to the disconnect mode, the U2 and U3 mode is next lowest power state. While in this mode, the TUSB544 will periodically perform far-end receiver detection. Anytime the far-end receiver termination is not detected on either UFP or DFP, the TUSB544 will leave the U2 and U3 mode and transition to the Disconnect mode. It will also monitor for a valid LFPS. Upon detection of a valid LFPS, the TUSB544 will immediately transition to the U0 mode. In U2 and U3 mode, the TUSB544's receiver terminations will remain enabled but the TX DC common mode voltage will not be maintained.

When SLP_S0# is asserted low it will disable Receiver Detect functionality. While SLP_S0# is low and TUSB544 is in U2 and U3, TUSB544 will disable LOS and LFPS detection circuitry and RX termination for both channels will remain enabled. This allows even lower TUSB544 power consumption while in the U2 and U3 mode. Once SLP_S0# is asserted high, the TUSB544 will again start performing far-end receiver detection as well as monitor LFPS so it can know when to exit the U2 and U3 mode.

When SLP_S0# is asserted low and the TUSB544 is in Disconnect mode, the TUSB544 will remain in Disconnect mode and never perform far-end receiver detection. This allows even lower TUSB544 power consumption while in the Disconnect mode. Once SLP_S0# is asserted high, the TUSB544 will again start performing far-end receiver detection so it can know when to exit the Disconnect mode.

7.5 Programming

For further programmability, the TUSB544 can be controlled using I^{2}C. The SCL and SDA terminals are used for I^{2}C clock and I^{2}C data respectively.

7.5.1 The Following Procedure Should be Followed to Write to TUSB544 I^{2}C Registers:

1. The master initiates a write operation by generating a start condition (S), followed by the TUSB544 7-bit address and a zero-value "W/R" bit to indicate a write cycle .
2. The TUSB544 acknowledges the address cycle.
3. The master presents the sub-address (I^{2}C register within TUSB544) to be written, consisting of one byte of data, MSB-first.
4. The TUSB544 acknowledges the sub-address cycle.
5. The master presents the first byte of data to be written to the I^{2}C register.
6. The TUSB544 acknowledges the byte transfer.
7. The master may continue presenting additional bytes of data to be written, with each byte transfer completing with an acknowledge from the TUSB544.
8. The master terminates the write operation by generating a stop condition (P).

7.5.2 The Following Procedure Should be Followed to Read the TUSB544 I²C Registers:

1. The master initiates a read operation by generating a start condition (S), followed by the TUSB544 7-bit address and a one-value "W/R" bit to indicate a read cycle

2. The TUSB544 acknowledges the address cycle.

3. The TUSB544 transmit the contents of the memory registers MSB-first starting at register 00h or last read sub-address+1. If a write to the TUSB544 I2C register occurred prior to the read, then the TUSB544 shall start at the sub-address specified in the write.

4. The TUSB544 shall wait for either an acknowledge (ACK) or a not-acknowledge (NACK) from the master after each byte transfer; the I²C master acknowledges reception of each data byte transfer.

5. If an ACK is received, the TUSB544 transmits the next byte of data.

6. The master terminates the read operation by generating a stop condition (P).

7.5.3 The Following Procedure Should be Followed for Setting a Starting Sub-Address for I²C Reads:

1. The master initiates a write operation by generating a start condition (S), followed by the TUSB544 7-bit address and a zero-value "W/R" bit to indicate a write cycle.

2. The TUSB544 acknowledges the address cycle.

3. The master presents the sub-address (I²C register within TUSB544) to be written, consisting of one byte of data, MSB-first.

4. The TUSB544 acknowledges the sub-address cycle.

5. The master terminates the write operation by generating a stop condition (P).

注

If no sub-addressing is included for the read procedure, and reads start at register offset 00h and continue byte by byte through the registers until the I²C master terminates the read operation. If a I²C address write occurred prior to the read, then the reads start at the sub-address specified by the address write.

When AUX_SNOOP_DISABLE = 1'b0, the TUSB544 will enable/disable DP lanes based on the snooped value. When AUX_SNOOP_DISABLE = 1'b1, then DP lane enable/disable are determined by state of DPx_DISABLE registers, where x = 0, 1, 2, or 3. This field is reset to 2'b00 by hardware when CTLSEL1 changes from a 1'b1 to a 1'b0.
4-0	LANE_COUNT_SET	RH	0h	This field represents the snooped value of AUX write to DPCD address 0x00101 register. When AUX_SNOOP_DISABLE = 1'b0, TUSB544 will enable DP lanes specified by the snoop value. Unused DP lanes will be disabled to save power. When AUX_SNOOP_DISABLE = 1'b1, then DP lanes enable/disable are determined by DPx_DISABLE registers, where x = 0, 1, 2, or 3. This field is reset to 0x0 by hardware when CTLSEL1 changes from a 1'b1 to a 1'b0.

TI's customers are responsible for determining suitability of components for their purposes. Customers should validate and test their design implementation to confirm system functionality.

8.1 Application Information

The TUSB544 is a linear redriver designed specifically to compensate for intersymbol interference (ISI) jitter caused by signal attenuation through a passive medium like PCB traces and cables. Because the TUSB544 has four independent inputs, it can be optimized to correct ISI on all those seven inputs through 16 different equalization choices. Placing the TUSB544 between a USB3.1 Host/DisplayPort 1.4 GPU and a USB3.1 Type-C receptacle can correct signal integrity issues resulting in a more robust system.

8.2 Typical Application

Typical Application (continued)

8.2.1   Design Requirements

For this design example, use the parameters shown in 表 25.

表 25. Design Parameters

PARAMETER	VALUE
A to B PCB trace length, X_{AB}	12 inches
C to D PCB trace length, X_{CD}	12 inches
E to F PCB trace length, X_{EF}	2 inches
G to H PCB trace length, X_{GH}	2 inches
PCB trace width	4 mils
AC-coupling capacitor (75 nF to 265 nF)	100 nF
VCC supply (3 V to 3.6 V)	3.3 V
I^2C Mode or GPIO Mode	I^2C Mode. (I2C_EN pin != "0")
1.8V or 3.3V I^2C Interface	3.3V I^2C. Pull-up the I2C_EN pin to 3.3V with a 1K ohm resistor.

8.2.2   Detailed Design Procedure

A typical usage of the TUSB544 device is shown in 図 35. The device can be controlled either through its GPIO pins or through its I^2C interface. In the example shown below, a Type-C PD controller is used to configure the device through the I^2C interface. In I^2C mode, the equalization settings for each receiver can be independently controlled through I^2C registers. For this reason, all of the equalization pins (UEQ[1:0] and DEQ[1:0]) can be left unconnected. If these pins are left unconnected, the TUSB544 7-bit I^2C slave address will be 12h because both UEQ1/A1 and UEQ0/A0 will be at pin level "F". If a different I^2C slave address is desired, UEQ1/A1 and UEQ0/A0 pins should be set to a level which produces the desired I^2C slave address.

9 Power Supply Recommendations

The TUSB544 is designed to operate with a 3.3 V power supply. Levels above those listed in the *Absolute Maximum Ratings* table should not be used. If using a higher voltage system power supply, a voltage regulator can be used to step down to 3.3 V. Decoupling capacitors should be used to reduce noise and improve power supply integrity. A 0.1-µF capacitor should be used on each power pin.

10 Layout

10.1 Layout Guidelines

1. RXP/N and TXP/N pairs should be routed with controlled 90-Ohm differential impedance (+/- 15%).
2. Keep away from other high speed signals.
3. Intra-pair routing should be kept to within 2 mils.
4. Length matching should be near the location of mismatch.
5. Each pair should be separated at least by 3 times the signal trace width.
6. The use of bends in differential traces should be kept to a minimum. When bends are used, the number of left and right bends should be as equal as possible and the angle of the bend should be ≥ 135 degrees. This will minimize any length mismatch causes by the bends and therefore minimize the impact bends have on EMI.
7. Route all differential pairs on the same of layer.
8. The number of VIAS should be kept to a minimum. It is recommended to keep the VIAS count to 2 or less.
9. Keep traces on layers adjacent to ground plane.
10. Do NOT route differential pairs over any plane split.
11. Adding Test points will cause impedance discontinuity; and therefore, negatively impacts signal performance. If test points are used, the test points should be placed in series and symmetrically. The test points must not be placed in a manner that causes a stub on the differential pair.

(1) Status: For more details on status, see our product life cycle.

(2) Material type: When designated, preproduction parts are prototypes/experimental devices, and are not yet approved or released for full production. Testing and final process, including without limitation quality assurance, reliability performance testing, and/or process qualification, may not yet be complete, and this item is subject to further changes or possible discontinuation. If available for ordering, purchases will be subject to an additional waiver at checkout, and are intended for early internal evaluation purposes only. These items are sold without warranties of any kind.

(3) RoHS values: Yes, No, RoHS Exempt. See the TI RoHS Statement for additional information and value definition.

(4) Lead finish/Ball material: Parts may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead finish/Ball material values may wrap to two lines if the finish value exceeds the maximum column width.

(5) MSL rating/Peak reflow: The moisture sensitivity level ratings and peak solder (reflow) temperatures. In the event that a part has multiple moisture sensitivity ratings, only the lowest level per JEDEC standards is shown. Refer to the shipping label for the actual reflow temperature that will be used to mount the part to the printed circuit board.

(6) Part marking: There may be an additional marking, which relates to the logo, the lot trace code information, or the environmental category of the part.

Multiple part markings will be inside parentheses. Only one part marking contained in parentheses and separated by a "~" will appear on a part. If a line is indented then it is a continuation of the previous line and the two combined represent the entire part marking for that device.
