

# UCC5871-Q1 30A 絶縁型 IGBT/SiC MOSFET ゲート・ドライバ、車載アプリケーション用先進保護機能付き

## 1 特長

- 分割出力ドライバは、30A のピーク・ソース (供給) 電流と 30A のピーク・シンク (吸い込み) 電流を実現
- 150ns (最大値) の伝搬遅延時間とプログラマブルな最小パルス除去を備えたインターロックおよび貫通電流保護機能
- 1 次側と 2 次側のアクティブ短絡 (ASC) をサポート
- 設定可能なパワー・トランジスタ保護機能
  - DESATに基づく短絡保護機能
  - シャント抵抗を使った過電流および短絡保護機能
  - NTCによる過熱保護
  - パワー・トランジスタ障害時のプログラマブル・ソフト・ターンオフ (STO) と 2 レベル・ターンオフ (2LTOFF)
- 機能安全準拠**
  - 機能安全アプリケーション向けに開発
  - ASIL DまでのISO 26262システム設計を支援するドキュメントを提供
- 診断機能内蔵:
  - 保護コンパレータのための内蔵セルフ・テスト (BIST)
  - IN+からトランジスタのゲートへの経路の整合性
  - パワー・トランジスタのスレッショルドの監視
  - 内部クロックの監視
  - フォルト・アラーム (nFLT1) および警告 (nFLT2) 出力
- 内蔵の 4A アクティブ・ミラー・クランプまたは外付けのミラー・クランプ・トランジスタ用外部駆動 (任意)
- 先進の高電圧クランプ制御
- 内部および外部電源の低電圧および過電圧保護
- 低電源またはフローティング入力時の、アクティブ出力プルダウンおよびデフォルト Low 出力
- ドライバ・ダイ温度センシングおよび過熱保護機能
- $V_{CM} = 1000V$  で  $100kV/\mu s$  以上のコモン・モード過渡耐性 (CMTI)
- SPIベースのデバイス再構成、検証、監視、診断機能
- 内蔵 10 ビット ADC によるパワー・トランジスタ温度、電圧、電流の監視

## 2 アプリケーション

- HEV および EV トラクション・インバータ
- HEV および EV 電源モジュール

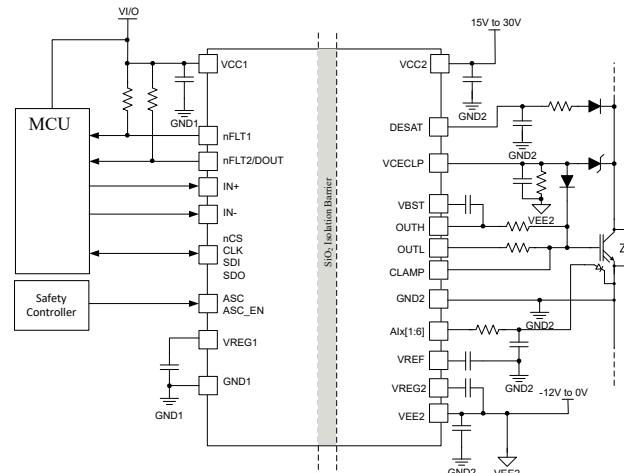

## 3 概要

UCC5871-Q1 デバイスは、EV/HEV アプリケーションの大電力 SiC MOSFET および IGBT を駆動するための高度に構成可能な絶縁型シングル・チャネル・ゲート・ドライバです。シャント抵抗を使った過電流保護、NTC を使った過熱保護、DESAT 検出などのパワー・トランジスタ保護機能には、これらのフォルト中の選択可能なソフト・ターンオフまたは 2 レベルのターンオフが含まれます。アプリケーションのサイズをさらに小さくするため、UCC5871-Q1 は、スイッチング中の 4A アクティブ・ミラー・クランプとドライバに電力が供給されていない間のアクティブ・ゲート・プルダウンを内蔵しています。内蔵の 10 ビット ADC を使うと、最大 6 つのアナログ入力とゲート・ドライバ温度を監視することでシステム管理を強化できます。システム設計を簡素化する診断および検出機能を内蔵しています。これらの機能のパラメータとスレッショルドは SPI インターフェイスを使って設定できるため、本デバイスはほとんどすべての SiC MOSFET または IGBT と組み合わせて使用できます。

## 5 Pin Configuration and Functions

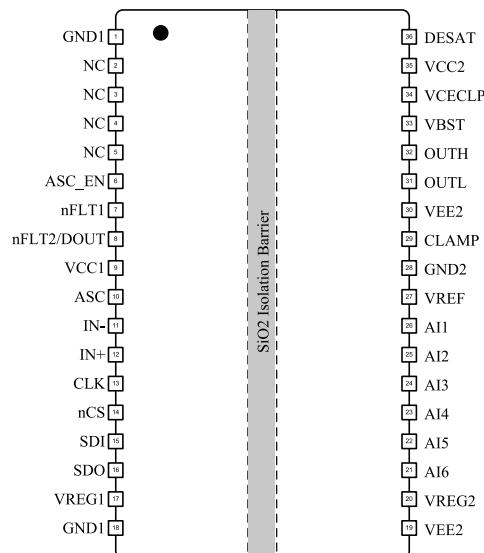

図 5-1. DWJ 36-Pin SOIC Top View

表 5-1. Pin Functions

PIN NO.	I/O <sup>(1)</sup> NAME	DESCRIPTION
1	GND1	G Primary Side Ground. Connect all GND1 pins together and to the PCB ground plane on the primary side.
2	NC	— No internal connection. Connect to GND1.
3	NC	— No internal connection. Connect to GND1.
4	NC	— No internal connection. Connect to GND1.
5	NC	— No internal connection. Connect to GND1.
6	ASC_EN	I Active Short Circuit Enable Input. ASC_EN enables the ASC function and forces the output of the driver to the state defined by the ASC input. If ASC is high, OUTH is pulled high. If ASC is low, OUTL is pulled low.
7	nFLT1	O Fault Indicator Output 1. nFLT1 is used to interrupt the host when a fault occurs. Faults that are unmasked pull nFLT1 low when the fault occurs. nFLT1 is high when all faults are either non-existent or masked.
8	nFLT2/DOUT	O Fault Indicator Output 2. nFLT2 is used to interrupt the host when a fault occurs. Additionally, nFLT2 may be configured as DOUT to provide the host controller a PWM signal with a duty cycle relative to the ADC input of interest. Faults that are unmasked pull nFLT2 low when the fault occurs. nFLT2 is high when all faults are either non-existent or masked.
9	VCC1	P Primary Side Power Supply. Connect a 3V to 5.5V power supply to VCC1. Bypass VCC1 to GND1 with ceramic bulk capacitance as close to the VCC1 pin as possible.
10	ASC	I Active Short Circuit Control Input. ASC sets the drive state when ASC_EN is high. If ASC is high, OUTH is pulled high. If ASC is low, OUTL is pulled low.
11	IN-	I Negative PWM Input. IN- is connected to the IN+ from the opposite arm of the half-bridge. If IN+ and IN- overlap, the Shoot Through Protection (STP) fault is asserted.
12	IN+	I Positive PWM Input. IN+ drives the state of the driver output. With the driver enabled, when IN+ is high, OUTH is pulled high. When IN+ is low, OUTL is pulled low. Drive IN+ with a 1kHz to 50kHz PWM signal, with a logic level determined by the VCC1 voltage. IN+ is connected to the IN- of the opposite arm of the half-bridge. If IN+ and IN- overlap, the Shoot Through Protection (STP) fault is asserted.
13	CLK	I SPI Clock. CLK is the clock signal for the main SPI interface. The SPI interface operates with clock rates up to 4MHz.
14	nCS	I SPI Chip Selection Input. nCS is an active low input used to activate the SPI peripheral device. Drive nCS low during SPI communication. When nCS is high, the CLK and SDI inputs are ignored.
15	SDI	I SPI Data Input. SDI is the data input for the main SPI interface. Data is sampled on the falling edge of CLK, SDI must be in a stable condition to ensure proper communication.

**表 5-1. Pin Functions (continued)**

<b>PIN</b>		<b>I/O<sup>(1)</sup></b>	<b>DESCRIPTION</b>
<b>NO.</b>	<b>NAME</b>		
16	SDO	O	SPI Data Output. SDO is the data output for the main SPI interface. Data is clocked out on the falling edge of CLK, SDO is changed with a rising edge of CLK.
17	V <sub>REG1</sub>	P	Internal Voltage Regulator Output. VREG1 provides a 1.8V rail for internal primary-side circuits. Bypass VREG1 to GND1 with at least 4.7μF of ceramic capacitance. Do not put any additional load on VREG1.
18	GND1	G	Primary Side Ground. Connect all GND1 pins together and to the PCB ground plane on the primary side.
19	V <sub>EE2</sub>	P	Secondary Negative Power Supply. Connect all VEE2 supply inputs together. Connect a -12V to 0V power supply to VEE2. The total voltage rail from VCC2 to VEE2 must not exceed 30V. Bypass VEE2 to GND2 with at least 1uF of ceramic capacitance as close to the VEE1 pin as possible.
20	V <sub>REG2</sub>	P	Internal voltage regulator output. VREG2 provides a 1.8V rail for internal secondary-side circuits. Bypass VREG2 to VEE2 with at least 4.7μF of ceramic capacitance. Do not put any additional load on VREG2.
21	AI6	I	Analog Input 6. AI6 is a multi-function input. It is configurable as an input to the internal ADC, a power FET current sense protection comparator input, and an ASC input for the secondary side.
22	AI5	I	Analog Input 5. AI5 is a multi-function input. It is configurable as an input to the internal ADC, a power FET over temperature protection comparator input, and an ASC_EN input for the secondary side.
23	AI4	I	Analog Input 4. AI4 is a multi-function input. It is configurable as an input to the internal ADC and a power FET current sense protection comparator input.
24	AI3	I	Analog Input 3. AI3 is a multi-function input. It is configurable as an input to the internal ADC and a power FET current sense protection comparator input.
25	AI2	I	Analog Input 2. AI2 is a multi-function input. It is configurable as an input to the internal ADC and a power FET current sense protection comparator input.
26	AI1	I	Analog Input 1. AI1 is a multi-function input. It is configurable as an input to the internal ADC and a power FET current sense protection comparator input.
27	V <sub>REF</sub>	P	Internal ADC Voltage Regulator Output. VREF provides an internal 4V, reference for the ADC. Bypass VREF to GND2 with at least 1uF of ceramic capacitance. If an external reference is desired, disable the internal VREF using the SPI register, and connect a 4V reference supply to VREF. Loads up to 5mA on VREF are allowed.
28	GND2	G	Gate Drive Common Input. Connect GND2 to the power FET source/ IGBT emitter. All Alx inputs, VREF, and DESAT are referenced to GND2.
29	CLAMP	IO	Miller Clamp Input. The CLAMP input is used to hold the gate of the power FET strongly to VEE2 while the power FET is "off". CLAMP is configurable as an internal Miller clamp, or to drive an external clamping circuit. When using the internal clamping function, connect CLAMP directly to the power FET gate. When configured as an external clamp, connect CLAMP to the gate of an external pulldown MOSFET.
30	V <sub>EE2</sub>	P	Secondary negative power supply. Connect all VEE2 supply inputs together. Connect a -12V to 0V power supply to VEE2. The total voltage rail from VCC2 to VEE2 must not exceed 30V. Bypass VEE2 to GND2 with at least 1uF of ceramic capacitance as close to the VEE2 pin as possible. Additional capacitance may be needed depending on the required drive current.
31	OUTL	O	Negative Gate Drive Voltage Output. When the driver is active, OUTL drives the gate of the power FET low when INP is low. Connect OUTL to the gate of the power FET through a gate resistor. The value of the gate resistor is chosen based on the slew rate required for the application.
32	OUTH	O	Positive Gate Drive Voltage Output. When the driver is active, OUTH drives the gate of the power FET high when INP is high. Connect OUTH to the gate of the power FET through a gate resistor. The value of the gate resistor is chosen based on the slew rate required for the application.
33	V <sub>BST</sub>	P	Bootstrap Supply. VBST supplies power for the OUTH drive. Connect a 0.1μF ceramic capacitor between VBST and OUTH.
34	V <sub>CCECLP</sub>	I	VCE Clamp Input. VCECLP clamps to a diode above the VCC2 rail and indicates a fault when the voltage at VCECLP is above the VCECLP <sub>th</sub> threshold. Bypass VCECLP to VEE2 with ceramic capacitor and, in parallel, connect a resistor. Additionally, connect VCECLP to the anode of a zener diode to the collector of the power FET.
35	V <sub>C2</sub>	P	Secondary Positive Power Supply. Connect a 15V to 30V power supply to VCC2. The total voltage rail from VCC2 to VEE2 must not exceed 30V. Bypass VCC2 to GND2 and VCC2 to VEE2 with bulk ceramic capacitance as close to the VCC2 pin as possible. Additional capacitance may be needed depending on the required drive current.

**表 5-1. Pin Functions (continued)**

<b>PIN</b>		<b>I/O<sup>(1)</sup></b>	<b>DESCRIPTION</b>
<b>NO.</b>	<b>NAME</b>		
36	DESAT	I	Desaturation based Short Circuit Detection Input. DESAT is used to detect a short circuit in the power FET. Bypass DESAT to GND2 with a ceramic capacitor to program the DESAT blanking time. In parallel, connect a schottky diode with the cathode connected to the DESAT. Additionally, connect DESAT to a resistor to the anode of a diode to the collector of the power FET to adjust the DESAT protection threshold. DESAT detects a fault when the VCE voltage of the power FET exceeds the defined threshold while the power FET is on.

- (1) Creepage and clearance requirements should be applied according to the specific equipment isolation standards of an application. Care should be taken to maintain the creepage and clearance distance of a board design to ensure that the mounting pads of the isolator on the printed-circuit board do not reduce this distance. Creepage and clearance on a printed-circuit board become equal in certain cases. Techniques such as inserting grooves, ribs, or both on a printed-circuit board are used to help increase these specifications.
- (2) All pins on each side of the barrier tied together creating a two-pin device.

## 6.7 Safety Limiting Values

Safety limiting<sup>(1)</sup> intends to minimize potential damage to the isolation barrier upon failure of input or output circuitry.

PARAMETER	TEST CONDITIONS	MIN	TYP	MAX	UNIT
T <sub>S</sub>	Maximum safety temperature			150	°C

- (1) The maximum safety temperature, TS, has the same value as the maximum junction temperature, TJ, specified for the device. The IS and PS parameters represent the safety current and safety power respectively. The maximum limits of IS and PS should not be exceeded. These limits vary with the ambient temperature, TA. The junction-to-air thermal resistance, R<sub>θJA</sub>, in the table is that of a device installed on a high-K test board for leaded surface-mount packages. Use these equations to calculate the value for each parameter:  $TJ = TA + R_{\theta JA} \times P$ , where P is the power dissipated in the device.  $TJ(max) = TS = TA + R_{\theta JA} \times PS$ , where  $TJ(max)$  is the maximum allowed junction temperature.  $PS = IS \times VI$ , where VI is the maximum input voltage.

## 7 Layout

### 7.1 Layout Guidelines

One must pay close attention to PCB layout in order to achieve optimum performance for the device.

#### 7.1.1 Component Placement

- Low-ESR and low-ESL capacitors must be connected close to the device between the VCC1 and GND1 pins and between the VCC2, VEE2 and GND2 pins to support high peak currents when turning on the external power transistor.
- Place the VBST and VREF caps as close to the device as possible.

#### 7.1.2 Grounding Considerations

- It is essential to confine the high peak currents that charge and discharge the transistor gates to a minimal physical area. This decreases the loop inductance and minimize noise on the gate terminals of the transistors. The gate driver must be placed as close as possible to the transistors.
- Pay attention to high current path that includes the bootstrap capacitor. The bootstrap capacitor is recharged on a cycle-by-cycle basis through the diode by the VCC2 bypass capacitor. This recharging occurs in a short time interval and involves a high peak current. Minimizing this loop length and area on the circuit board is important for ensuring reliable operation.

#### 7.1.3 High-Voltage Considerations

- To ensure isolation performance between the primary and secondary side, one should avoid placing any PCB traces or copper below the driver device. A PCB cutout is recommended in order to prevent contamination that may compromise the UCC51870's isolation performance.
- For half-bridge, or high-side/low-side configurations, where the high-side and low-side drivers could operate with a DC-link voltage up to 1000 VDC, one should try to increase the creepage distance of the PCB layout between the high and low-side PCB traces.

#### 7.1.4 Thermal Considerations

- The power dissipated by the device is directly proportional to the drive voltage, heavy capacitive loading, and/or high switching frequency. Proper PCB layout helps dissipate heat from the device to the PCB and minimize junction to board thermal impedance ( $\theta_{JB}$ ).
- Increasing the PCB copper connecting to VCC2 and VEE2 is recommended, with priority on maximizing the connection to VEE2. However, high voltage PCB considerations mentioned above must be maintained.
- If there are multiple layers in the system, it is also recommended to connect the VCC2 and VEE2 to internal ground or power planes through multiple vias of adequate size. However, keep in mind that there shouldn't be any traces/coppers from different high voltage planes overlapping.

### 8.6 Electrostatic Discharge Caution

This integrated circuit can be damaged by ESD. Texas Instruments recommends that all integrated circuits be handled with appropriate precautions. Failure to observe proper handling and installation procedures can cause damage.

ESD damage can range from subtle performance degradation to complete device failure. Precision integrated circuits may be more susceptible to damage because very small parametric changes could cause the device not to meet its published specifications.

## 9 Mechanical, Packaging, and Orderable Information

The following pages include mechanical packaging and orderable information. This information is the most current data available for the designated devices. This data is subject to change without notice and revision of this document. For browser-based versions of this data sheet, refer to the left-hand navigation.

**PACKAGING INFORMATION**

<sup>(1)</sup> **Status:** For more details on status, see our [product life cycle](#).

<sup>(2)</sup> **Material type:** When designated, preproduction parts are prototypes/experimental devices, and are not yet approved or released for full production. Testing and final process, including without limitation quality assurance, reliability performance testing, and/or process qualification, may not yet be complete, and this item is subject to further changes or possible discontinuation. If available for ordering, purchases will be subject to an additional waiver at checkout, and are intended for early internal evaluation purposes only. These items are sold without warranties of any kind.

<sup>(3)</sup> **RoHS values:** Yes, No, RoHS Exempt. See the [TI RoHS Statement](#) for additional information and value definition.

<sup>(4)</sup> **Lead finish/Ball material:** Parts may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead finish/Ball material values may wrap to two lines if the finish value exceeds the maximum column width.

<sup>(5)</sup> **MSL rating/Peak reflow:** The moisture sensitivity level ratings and peak solder (reflow) temperatures. In the event that a part has multiple moisture sensitivity ratings, only the lowest level per JEDEC standards is shown. Refer to the shipping label for the actual reflow temperature that will be used to mount the part to the printed circuit board.

<sup>(6)</sup> **Part marking:** There may be an additional marking, which relates to the logo, the lot trace code information, or the environmental category of the part.

Multiple part markings will be inside parentheses. Only one part marking contained in parentheses and separated by a "~" will appear on a part. If a line is indented then it is a continuation of the previous line and the two combined represent the entire part marking for that device.
