TEXAS INSTRUMENTS

LP50xx 18/24 チャネル、12 ビット、PWM 超低静止電流、I²C RGB LED ドライバ

1 特長

- 動作電圧範囲：
  - V_{CC} 範囲：2.7V～5.5V
  - EN、SDA、SCL ピンは 1.8V、3.3V、5V の電源レールに対応
  - 最大出力電圧：6V
- 24 個の高精度定電流シンク
  - V_{CC} の全範囲で、チャネルごとに最大 25.5mA
  - $V_{CC} ≥ 3.3V$ のとき、チャネルごとに最大 35mA
  - デバイス間誤差：±7%、チャネル間誤差：±7%
- 非常に低い静止電流
  - シャットダウン モード：EN Low で最大値 1µA
  - パワー セーブ モード：EN High、すべての LED が 30ms を超えてオフのとき標準値 10µA
- 各チャネルに 12 ビット、29kHz の PWM ジェネレータを内蔵：
  - チャネルごとに独立の色混合レジスタ
  - RGB LED モジュールごとに独立の輝度制御レジスタ
  - 対数的または線形的スケールの輝度制御を選択可能
  - 3 相 PWM シフト方式を搭載
- 3 つのプログラム可能バンク (R、G、B) により、各色をソフトウェアで簡単に制御
- 2 つの外部ハードウェア アドレス ピンにより、最大 4 つのデバイスに接続可能
- ブロードキャスト スレーブ アドレスにより、複数のデバイスを同時に構成可能
- 自動インクリメント機能により、1 回の伝送で連続する複数のレジスタを書き込み / 読み取り可能
- 最大 400kHz のファスト モード I²C 速度

2 アプリケーション

次のような機器の LED ライティング、インジケータ ライト、および装飾用ライト

- スマート スピーカ (音声アシスタント付き)
- スマート ホーム家電
- ビデオ ドアベル
- 電子スマート ロック
- 煙感知器と熱感知器
- STB および DVR
- スマート ルータ
- ハンドヘルド デバイス

3 概要
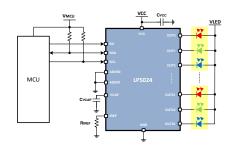

スマート ホームや、ヒューマン マシン インターフェイスを活用する他のアプリケーションでは、高性能の RGB LED ドライバが必要となります。フラッシュ、ブリージング、追跡などの LED アニメーション効果により、ユーザー向けの環境を大幅に改良できます。またシステム ノイズが最小限であることは不可欠です。

LP50xx デバイスは、18 または 24 チャネルの定電流シンク LED ドライバです。LP50xx デバイスにはカラー ミキシングおよび輝度制御機能が内蔵されており、事前設定によりソフトウェアのコーディング処理を簡素化できます。12 ビット、29kHz の PWM ジェネレータが各チャネルに内蔵されているため、LED で円滑に、鮮明な色を再現でき、可聴ノイズが除去されます。

製品情報 [(1)]

部品番号	パッケージ	本体サイズ (公称)
LP5024	VQFN (32)	4.00mm × 4.00mm
LP5018	VQFN (32)	4.00mm × 4.00mm
	VSSOP (28)	7.30mm × 3.00mm

(1)   利用可能なすべてのパッケージについては、データシートの末尾にある注文情報を参照してください。

4 概要 (続き)

LP50xx デバイスは、29kHz のスイッチング周波数、12 ビットの PWM 分解能で各 LED の出力を制御するので、スムーズな調光効果を達成でき、可聴周波数のノイズが排除されます。カラー ミキシングと輝度の制御レジスタを別々に制御できるため、ソフトウェアのコーディングが明快になります。フェードイン、フェードアウト型のブリージング効果を行う際、グローバルな R、G、B バンクの制御により、マイクロコントローラの負荷が大幅に減少します。また、LP50xx デバイスには PWM 位相シフト機能も実装されており、LED が同時にオンになるときの入力電力バジェットを低減するために役立ちます。

LP50xx デバイスには、自動パワーセービング モードが実装されており、非常に低い静止電流を実現しています。すべてのチャネルが 30ms の間オフのとき、デバイスの合計消費電力は 10μA まで低下するため、LP50xx デバイスはバッテリ駆動の最終製品に適しています。

6 Specifications

6.1 Absolute Maximum Ratings

over operating ambient temperature range (unless otherwise noted)[1]

	MIN	MAX	UNIT
Voltage on EN, IREF, OUTx, SCL, SDA, VCC	−0.3	6	V
Voltage on ADDRx	−0.3	VCC+0.3	V
Voltage on VCAP	−0.3	2	V
Continuous power dissipation		Internally limited	
Junction temperature, T_{J-MAX}	−40	125	°C
Storage temperature, T_{stg}	−65	150	°C

(1) Stresses beyond those listed under *Absolute Maximum Ratings* may cause permanent damage to the device. These are stress ratings only, which do not imply functional operation of the device at these or any other conditions beyond those indicated under *Recommended Operating Conditions*. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.

6.2 ESD Ratings

			VALUE	UNIT
$V_{(ESD)}$	Electrostatic discharge	Human-body model (HBM), per ANSI/ESDA/JEDEC JS-001[1]	±4000	V
		Charged-device model (CDM), per JEDEC specification JESD22-C101[2]	±1500	

(1) JEDEC document JEP155 states that 500-V HBM allows safe manufacturing with a standard ESD control process. Pins listed as ±1500 V may actually have higher performance.
(2) JEDEC document JEP157 states that 250-V CDM allows safe manufacturing with a standard ESD control process. Pins listed as ±500 V may actually have higher performance.

6.3 Recommended Operating Conditions

over operating ambient temperature range (unless otherwise noted)

	MIN	MAX	UNIT
Input voltage on VCC	2.7	5.5	V
Voltage on OUTx	0	5.5	V
Voltage on ADDRx, EN, SDA, SCL	0	5.5	V
Operating ambient temperature, T_A	−40	85	°C

6.4 Thermal Information

	THERMAL METRIC[1]	LP5018 or LP5024		UNIT
		RSM (VQFN)	DGS (VSSOP)

7 Detailed Description

7.1 Overview

The LP50xx device is an 18- or 24-channel constant-current-sink LED driver. The LP50xx device includes all necessary power rails, an on-chip oscillator, and a two-wire serial I²C interface. The maximum constant-current value of all channels is set by a single external resistor. Two hardware address pins allow up to four devices on the same bus. An automatic power-saving mode is implemented to keep the total current consumption under 10µA, which makes the LP50xx device a potential choice for battery-powered end-equipment.

The LP50xx device is optimized for RGB LEDs regarding to both live effects and software efforts. The LP50xx device controls each LED output with 12-bit PWM resolution at 29kHz switching frequency, which helps achieve a smooth dimming effect and eliminates audible noise. The independent color-mixing and intensity-control registers make the software coding straightforward. When targeting a fade-in, fade-out type breathing effect, the global RGB bank control reduces the microcontroller loading significantly. The LP50xx device also implements a PWM phase-shifting function to help reduce the input power budget when LEDs turn on simultaneously.

7.2 Functional Block Diagram

Product Folder Links: *LP5018 LP5024*

English Data Sheet: SLVSEB8

7.3 Feature Description

7.3.1 PWM Control for Each Channel

Most traditional LED drivers are designed for the single-color LEDs, in which the high-resolution PWM generator is used for intensity control only. However, for RGB LEDs, both the color mixing and intensity control should be addressed to achieve the target effect. With the traditional solution, the users must handle the color mixing and intensity control simultaneously with a single PWM register. Several undesired effects occur: the limited dimming steps, the complex software design, and the color distortion when using a logarithmic scale control.

The LP50xx device is designed with independent color mixing and intensity control, which makes the RGB LED effects fancy and the control experience straightforward. With the inputs of the color-mixing register and the intensity-control register, the final PWM generator output for each channel is 12-bit resolution and 29kHz dimming frequency, which helps achieve a smooth dimming effect and eliminates audible noise. See 図 7-1.
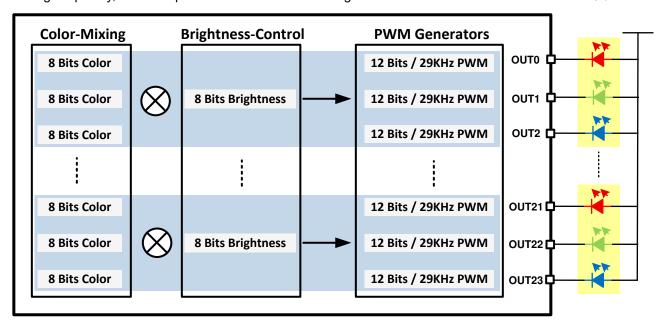

図 7-1. PWM Control Scheme for Each Channel

7.3.1.1 Independent Color Mixing Per RGB LED Module

Each output channel has its own individual 8-bit color-setting register (OUTx_COLOR). The device allows every RGB LED module to achieve >16 million (256 × 256 × 256) color-mixing.

7.3.1.2 Independent Intensity Control Per RGB LED Module

When color is fixed, the independent intensity-control is used to achieve accurate and flexible dimming control for every RGB LED module.

7.3.1.2.1 Intensity-Control Register Configuration

Every three consecutive output channels are assigned to their respective intensity-control register (LEDx_BRIGHTNESS). For example, OUT0, OUT1, and OUT2 are assigned to LED0_BRIGHTNESS, so it is recommended to connect the RGB LEDs in the sequence as shown in LED Bank Control . The LP50xx device allows 256-step intensity control for each RGB LED module, which helps achieve a smooth dimming effect.

Keeping FFh (default value) in the LED0_BRIGHTNESS register results in 100% dimming duty cycle. With this setting, users can just configure the color mixing register by channel to achieve the target dimming effect in a single-color LED application.

7.3.1.2.2 Logarithmic- or Linear-Scale Intensity Control

For human-eye-friendly visual performance, a logarithmic-scale dimming curve is usually implemented in LED drivers. However, for RGB LEDs, if using a single register to achieve both color mixing and intensity control, color distortion can be observed easily when using a logarithmic scale. The LP50xx device, with independent color-mixing and intensity-control registers, implements the logarithmic scale dimming control inside the intensity control function, which solves the color distortion issue effectively. See 図 7-2. Also, the LP50xx device allows users to configure the dimming scale either logarithmically or linearly through the global Log_Scale_EN register. If a special dimming curve is desired, using the linear scale with software correction is the most flexible approach. See 図 7-3.

Brightness Control

図 7-2. Logarithmic- or Linear-Scale Intensity Control

図 7-3. Logarithmic vs Linear Dimming Curve

7.3.1.3 12-Bit, 29-kHz PWM Generator Per Channel

7.3.1.3.1 PWM Generator

With the inputs of the color mixing and the intensity control, the final output PWM duty cycle is defined as the product obtained by multiplying the color-mixing register value by the related intensity-control register value. The

final output PWM duty cycle has 12 bits of control accuracy, which is achieved by a 9 bits of pure PWM resolution and 3 bits of digital dithering control. For 3-bit dithering, every eighth pulse is made 1 LSB longer to increase the average value by 1 / 8th. The LP50xx device allows users to enable or disable the dithering function through the PWM_Dithering_EN register. When enabled (default), the output PWM duty-cycle accuracy is 12 bits. When disabled, the output PWM duty-cycle accuracy is 9 bits.

To eliminate the audible noise due to the PWM switching, the LP50xx device sets the PWM switching frequency at 29-kHz, above the 20-kHz human hearing range.

7.3.1.4 PWM Phase-Shifting

A PWM phase-shifting scheme allows delaying the time when each LED driver is active. When the LED drivers are not activated simultaneously, the peak load current from the pre-stage power supply is significantly decreased. The scheme also reduces input-current ripple and ceramic-capacitor audible ringing. LED drivers are grouped into three different phases.

- Phase 1—the rising edge of the PWM pulse is fixed. The falling edge of the pulse is changed when the duty cycle changes. Phase 1 is applied to LED0, LED3, …, LED21.
- Phase 2—the middle point of the PWM pulse is fixed. The pulse spreads in both directions when the PWM duty cycle is increased. Phase 2 is applied to LED1, LED4, …, LED22.
- Phase 3—the falling edge of the PWM pulse is fixed. The rising edge of the pulse is changed when the duty cycle changes. Phase 3 is applied to LED2, LED5, …, LED23.

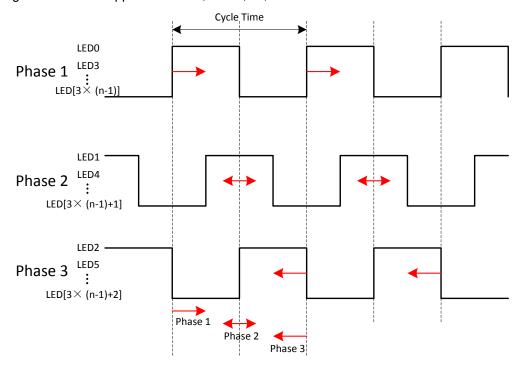

図 7-4. PWM Phase-Shifting

7.3.2 LED Bank Control

For most LED-animation effects, like blinking and breathing, all the RGB LEDs have the same lighting pattern. Instead of controlling the individual LED separately, which occupies the microcontroller resources heavily, the LP50xx device provides an easy coding approach, the LED bank control.

Each channel can be configured as either independent control or bank control through the LEDx_Bank_EN register. When LEDx_Bank_EN = 0 (default), the LED is controlled independently by the related color-mixing and intensity-control registers. When LEDx_Bank_EN = 1, the LP50xx device drives the LEDs in LED bank-control mode. The LED bank has its own independent PWM control scheme, which is the same structure as the PWM

scheme of each channel. For more details, see *PWM Control for Each Channel* . When a channel is configured in LED bank-control mode, the related color mixing and intensity control is governed by the bank control registers (BANK_A_COLOR, BANK_B_COLOR, BANK_C_COLOR, and BANK_BRIGHTNESS) regardless of the inputs on its own color-mixing and intensity-control registers.

English Data Sheet: SLVSEB8

With the bank control configuration, the LP50xx device enables users to achieve smooth and live LED effects globally with an ultrasimple software effort. 図 7-6 shows an example using LED0 as an independent RGB indicator and others with group breathing effect.

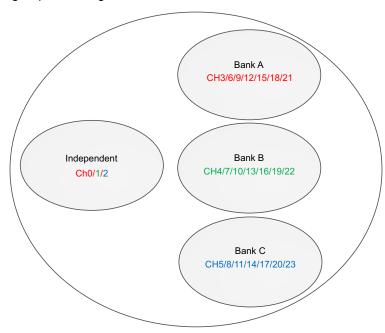

図 7-6. Bank PWM Control Example (Applicable to LP5024 VQFN and LP5018 VQFN only)

7.3.3 Current Range Setting

The constant-current value (I_{SET}) of all 24 channels is set by a single external resistor, R_{IREF}. The value of R_{IREF} can be calculated by 式 1.

$$R_{IREF} = K_{IREF} \times \frac{V_{IREF}}{I_{SET}}$$

(1)

where:

- K_{IREF} = 105
- V_{IREF} = 0.7V

With the IREF pin floating, the output current is close to zero. With the IREF pin shorted to GND, the LP50xx device provides internal current-limit protection, and the output-channel maximum current is limited to I_{LIM}.

The LP50xx device supports two levels of maximum output current, I_{MAX}.

- When V_{CC} is in the range from 2.7V to 5.5V, and the Max_Current_Option (bit) = 0, I_{MAX} = 25.5mA.
- When V_{CC} is in the range from 3.3V to 5.5V, and the Max_Current_Option (bit) = 1, I_{MAX} = 35mA.

7.3.4 Automatic Power-Save Mode

When all the LED outputs are inactive, the LP50xx device is able to enter power-save mode automatically, thus lowering idle-current consumption down to 10µA (typical). Automatic power-save mode is enabled when register bit Power_Save_EN = 1 (default) and all the LEDs are off for a duration of >30ms. Almost all analog blocks are powered down in power-save mode. If any I^{2}C command to the device occurs, the LP50xx device returns to NORMAL mode.

7.3.5 Protection Features

7.3.5.1 Thermal Shutdown

The LP50xx device implements a thermal shutdown mechanism to protect the device from damage due to overheating. When the junction temperature rises to 160°C (typical), the device switches into shutdown mode. The LP50xx device releases thermal shutdown when the junction temperature of the device is reduced to 145°C (typical).

7.3.5.2 UVLO

The LP50xx device has an internal comparator that monitors the voltage at V_{CC}. When V_{CC} is below V_{UVF}, reset is active and the LP50xx device is in the INITIALIZATION state.
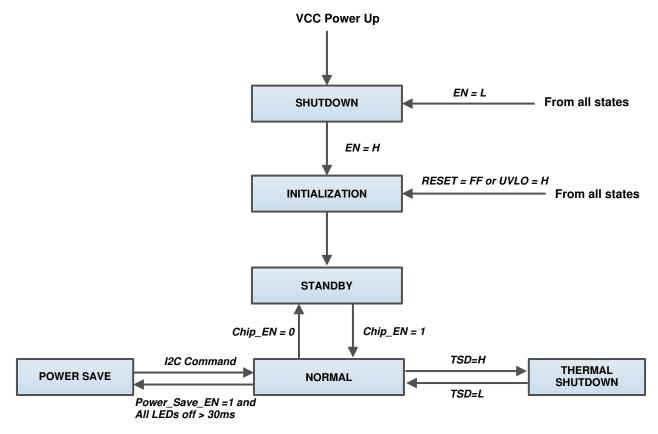

7.4 Device Functional Modes

図 7-7. Functional Modes

- **INITIALIZATION**: The device enters into INITIALIZATION mode when EN = H. In this mode, all the registers are reset. Entry can also be from any state, if the RESET (register) = FFh or UVLO is active.
- **NORMAL**: The device enters the NORMAL mode when Chip_EN (register) = 1. I_{CC} is 10mA (typical).
- **POWER SAVE**: The device automatically enters the POWER SAVE mode when Power_Save_EN (register) = 1 and all the LEDs are off for a duration of > 30ms. In POWER SAVE mode, analog blocks are disabled to minimize power consumption, but the registers retain the data and keep it available via I^{2}C. I_{CC} is 10µA (typical). In case of any I^{2}C command to this device, it returns to the NORMAL mode.
- **SHUTDOWN**: The device enters into SHUTDOWN mode from all states on V_{CC} power up or when EN = L. I_{CC} is < 1µA (maximum).
- **STANDBY**: The device enters the STANDBY mode when Chip_EN (register) = 0. In this mode, all the OUTx pins are shut down, but the registers retain the data and keep it available via I^{2}C. STANDBY is the low-power-consumption mode, when all circuit functions are disabled. I_{CC} is 10µA (typical).

- **THERMAL SHUTDOWN**: The device automatically enters the THERMAL SHUTDOWN mode when the junction temperature exceeds 160°C (typical). In this mode, all the OUTx outputs are shut down. If the junction temperature decreases below 145°C (typical), the device returns to the NORMAL mode.

7.5 Programming

7.5.1 I^{2}C Interface

The I^{2}C-compatible two-wire serial interface provides access to the programmable functions and registers on the device. This protocol uses a two-wire interface for bidirectional communications between the devices connected to the bus. The two interface lines are the serial data line (SDA) and the serial clock line (SCL). Every device on the bus is assigned a unique address and acts as either a master or a slave depending on whether it generates or receives the serial clock, SCL. The SCL and SDA lines should each have a pullup resistor placed somewhere on the line and remain HIGH even when the bus is idle.

7.5.1.1 Data Validity

The data on SDA line must be stable during the HIGH period of the clock signal (SCL). In other words, the state of the data line can only be changed when the clock signal is LOW.

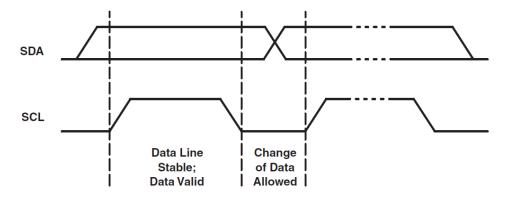

図 7-8. Data Validity

7.5.1.2 Start and Stop Conditions

START and STOP conditions classify the beginning and the end of the data transfer session. A START condition is defined as the SDA signal transitioning from HIGH to LOW while the SCL line is HIGH. A STOP condition is defined as the SDA transitioning from LOW to HIGH while SCL is HIGH. The bus master always generates START and STOP conditions. The bus is considered to be busy after a START condition and free after a STOP condition. During data transmission, the bus master can generate repeated START conditions. First START and repeated START conditions are functionally equivalent.

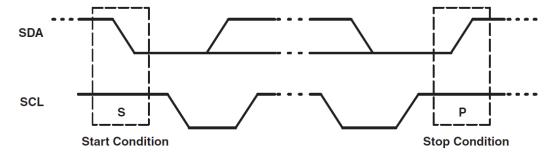

図 7-9. Start and Stop Conditions

7.5.1.3 Transferring Data

Every byte put on the SDA line must be eight bits long, with the most-significant bit (MSB) being transferred first. Each byte of data must be followed by an acknowledge bit. The acknowledge-related clock pulse is generated by the master. The master releases the SDA line (HIGH) during the acknowledge clock pulse. The device pulls down the SDA line during the ninth clock pulse, signifying an acknowledge. The device generates an acknowledge after each byte has been received.

There is one exception to the acknowledge-after-every-byte rule. When the master is the receiver, it must indicate to the transmitter an end of data by not acknowledging (negative acknowledge) the last byte clocked out of the slave. This negative acknowledge still includes the acknowledge clock pulse (generated by the master), but the SDA line is not pulled down.

After the START condition, the bus master sends a chip address. This address is seven bits long followed by an eighth bit which is a data direction bit (READ or WRITE). For the eighth bit, a 0 indicates a WRITE, and a 1 indicates a READ. The second byte selects the register to which the data is written. The third byte contains data to write to the selected register.

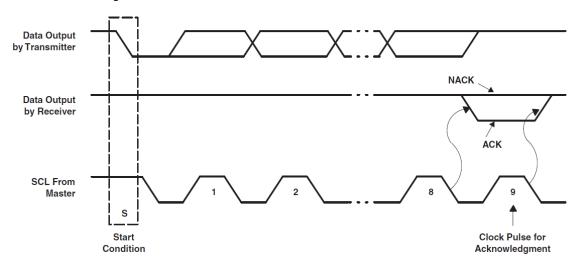

図 7-10. Acknowledge and Not Acknowledge on I^{2}C Bus

7.5.1.4 I^{2}C Slave Addressing

The device slave address is defined by connecting GND or VCC to the ADDR0 and ADDR1 pins. A total of four independent slave addresses can be realized by combinations when GND or VCC is connected to the ADDR0 and ADDR1 pins (see 表 7-2 and 表 7-3).

The device responds to a broadcast slave address regardless of the setting of the ADDR0 and ADDR1 pins. Global writes to the broadcast address can be used for configuring all devices simultaneously. The device supports global read using a broadcast address; however, the data read is only valid if all devices on the I^{2}C bus contain the same value in the addressed register.

表 7-2. Slave-Address Combinations

ADDR1	ADDR0	SLAVE ADDRESS	
		INDEPENDENT	BROADCAST
GND	GND	010 1000	011 1100
GND	VCC	010 1001	
VCC	GND	010 1010	
VCC	VCC	010 1011	

Product Folder Links: *LP5018 LP5024*

English Data Sheet: SLVSEB8

表 7-3. Chip Address

	SLAVE ADDRESS							R/$\overline{W}$
	Bit 7	Bit 6	Bit 5	Bit 4	Bit 3	Bit 2	Bit 1	Bit 0
Independent	0	1	0	1	0	ADDR1	ADDR0	1 or 0
Broadcast	0	1	1	1	1	0	0	1 or 0

7.5.1.5 Control-Register Write Cycle

- The master device generates a start condition.
- The master device sends the slave address (7 bits) and the data direction bit (R/$\overline{W}$ = 0).
- The slave device sends an acknowledge signal if the slave address is correct.
- The master device sends the control register address (8 bits).
- The slave device sends an acknowledge signal.
- The master device sends the data byte to be written to the addressed register.
- The slave device sends an acknowledge signal.
- If the master device sends further data bytes, the control register address of the slave is incremented by 1 after the acknowledge signal. To reduce program load time, the device supports address auto incrementation. The register address is incremented after each 8 data bits.
- The write cycle ends when the master device creates a stop condition.

図 7-11. Write Cycle

7.5.1.6 Control-Register Read Cycle

- The master device generates a start condition.
- The master device sends the slave address (7 bits) and the data direction bit (R/$\overline{W}$ = 0).
- The slave device sends an acknowledge signal if the slave address is correct.
- The master device sends the control register address (8 bits).
- The slave device sends an acknowledge signal.
- The master device generates a repeated-start condition.
- The master device sends the slave address (7 bits) and the data direction bit (R/$\overline{W}$ = 1).
- The slave device sends an acknowledge signal if the slave address is correct.
- The slave device sends the data byte from the addressed register.
- If the master device sends an acknowledge signal, the control-register address is incremented by 1. The slave device sends the data byte from the addressed register. To reduce program load time, the device supports address auto incrementation. The register address is incremented after each 8 data bits.
- The read cycle ends when the master device does not generate an acknowledge signal after a data byte and generates a stop condition.

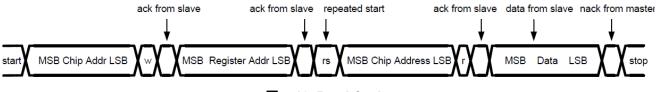

図 7-12. Read Cycle

7.5.1.7 Auto-Increment Feature

The auto-increment feature allows writing or reading several consecutive registers within one transmission. For example, when an 8-bit word is sent to the device, the internal address index counter is incremented by 1, and

the next register is written. The auto-increment feature is enabled by default and can be disabled by setting the Auto_Incr_EN bit = 0 in the DEVICE_CONFIG1 register. The auto-increment feature is applied for the full register address from 0h to FFh.

English Data Sheet: SLVSEB8

7.6 Register Maps

表 7-4 lists the memory-mapped registers of the device.

8 Application and Implementation

注

以下のアプリケーション情報は、TI の製品仕様に含まれるものではなく、TI ではその正確性または完全性を保証いたしません。個々の目的に対する製品の適合性については、お客様の責任で判断していただくことになります。お客様は自身の設計実装を検証しテストすることで、システムの機能を確認する必要があります。

8.1 Application Information

The LP50xx device is an 18- or 24-channel constant-current-sink LED driver. The LP50xx device improves the user experience in color mixing and intensity control, for both live effects and coding effort. The optimized performance for RGB LEDs makes it a good choice for human-machine interaction applications.

8.2 Typical Application

The LP50xx design supports up to four devices in parallel with different configurations on the ADDR0 and ADDR1 pins.

Product Folder Links: *LP5018 LP5024*
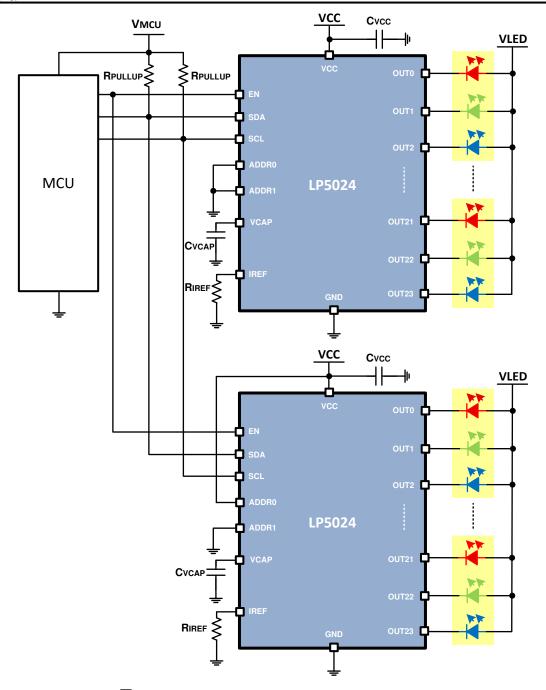

English Data Sheet: SLVSEB8

図 8-1. Driving Dual LP5024 Application Example

8.2.1 Design Requirements

Set the LED current to 15mA using the R_{IREF} resistor.

8.2.2 Detailed Design Procedure

LP50xx scales up the reference current (I_{REF}) set by the external resistor (R_{IREF}) to sink the output current (I_{OUT}) at each output port. The following formula can be used to calculate the external resistor (R_{IREF}):

$$R_{IREF} = K_{IREF} \times \frac{V_{IREF}}{I_{SET}}$$

(2)

The SCL and SDA lines must each have a pullup resistor placed somewhere on the line (the pullup resistors are normally located on the bus master). In typical applications, values of 1.8kΩ to 4.7kΩ are used.
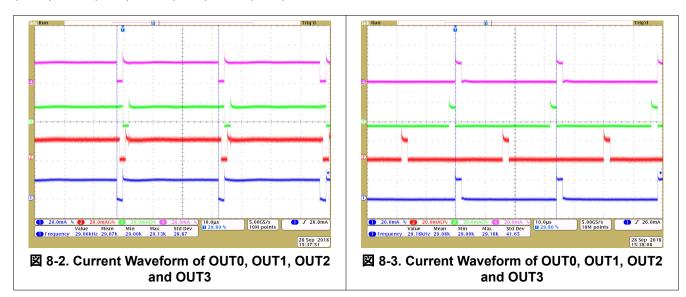

VCAP is internal LDO output pin. This pin must be connected through a 1µF capacitor to GND. Place the capacitor as close to the device as possible.

TI recommends having a 1µF capacitor between VCC and GND to ensure proper operation. Place the capacitor as close to the device as possible.

8.2.3 Application Curves

The test condition for Figure 9-2 is that the testing is under bank control, using the following register values: 0x02 (0xFF), 0x04 (0xA0), 0x05 (0xA0), 0x06 (0xA0).

The test condition for Figure 9-2 is that the testing is under bank control, using the following register values: 0x02 (0xFF), 0x04 (0x10), 0x05 (0x10), 0x06 (0x10).

図 8-2. Current Waveform of OUT0, OUT1, OUT2 and OUT3

図 8-3. Current Waveform of OUT0, OUT1, OUT2 and OUT3

8.3 Power Supply Recommendations

The device is designed to operate from a V_{VCC} input-voltage supply range between 2.7V and 5.5V. This input supply must be well-regulated and able to withstand maximum input current and maintain stable voltage without voltage drop even in a load-transition condition (start-up or rapid intensity change). The resistance of the input supply rail must be low enough that the input-current transient does not cause a drop below a 2.7V level in the LP50xx V_{VCC} supply voltage.

8.4 Layout

8.4.1 Layout Guidelines

To prevent thermal shutdown, the junction temperature, T_J, must be less than $T_{(TSD)}$. If the voltage drop across the output channels is high, the device power dissipation can be large. The LP50xx device has very good thermal performance because of the thermal pad design; however, the PCB layout is also very important to ensure that the device has good thermal performance. Good PCB design can optimize heat transfer, which is essential for the long-term reliability of the device.

Use the following guidelines when designing the device layout:

• Place the C_{VCAP}, C_{VCC} and R_{IREF} as close to the device as possible. Also, TI recommends to put the ground plane as 図 8-4, 図 8-5 and 図 8-6.

Product Folder Links: *LP5018 LP5024*

English Data Sheet: *SLVSEB8*

- Maximize the copper coverage on the PCB to increase the thermal conductivity of the board. The major heat flow path from the package to the ambient is through copper on the PCB. Maximum copper density is extremely important when no heat sinks are attached to the PCB on the other side from the package.
- Add as many thermal vias as possible directly under the package ground pad to optimize the thermal conductivity of the board.
- Use either plated-shut or plugged and capped vias for all the thermal vias on both sides of the board to prevent solder voids.

(1) Status: For more details on status, see our product life cycle.

(2) Material type: When designated, preproduction parts are prototypes/experimental devices, and are not yet approved or released for full production. Testing and final process, including without limitation quality assurance, reliability performance testing, and/or process qualification, may not yet be complete, and this item is subject to further changes or possible discontinuation. If available for ordering, purchases will be subject to an additional waiver at checkout, and are intended for early internal evaluation purposes only. These items are sold without warranties of any kind.

(3) RoHS values: Yes, No, RoHS Exempt. See the TI RoHS Statement for additional information and value definition.

(4) Lead finish/Ball material: Parts may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead finish/Ball material values may wrap to two lines if the finish value exceeds the maximum column width.

(5) MSL rating/Peak reflow: The moisture sensitivity level ratings and peak solder (reflow) temperatures. In the event that a part has multiple moisture sensitivity ratings, only the lowest level per JEDEC standards is shown. Refer to the shipping label for the actual reflow temperature that will be used to mount the part to the printed circuit board.

(6) Part marking: There may be an additional marking, which relates to the logo, the lot trace code information, or the environmental category of the part.

Multiple part markings will be inside parentheses. Only one part marking contained in parentheses and separated by a "~" will appear on a part. If a line is indented then it is a continuation of the previous line and the two combined represent the entire part marking for that device.
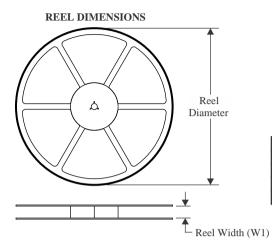

Important Information and Disclaimer: The information provided on this page represents TI's knowledge and belief as of the date that it is provided. TI bases its knowledge and belief on information provided by third parties, and makes no representation or warranty as to the accuracy of such information. Efforts are underway to better integrate information from third parties. TI has taken and continues to take reasonable steps to provide representative and accurate information but may not have conducted destructive testing or chemical analysis on incoming materials and chemicals. TI and TI suppliers consider certain information to be proprietary, and thus CAS numbers and other limited information may not be available for release.
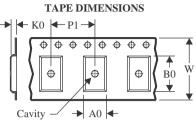

In no event shall TI's liability arising out of such information exceed the total purchase price of the TI part(s) at issue in this document sold by TI to Customer on an annual basis.

NOTES:

1. All linear dimensions are in millimeters. Any dimensions in parenthesis are for reference only. Dimensioning and tolerancing per ASME Y14.5M.
2. This drawing is subject to change without notice.
3. The package thermal pad must be soldered to the printed circuit board for thermal and mechanical performance.

NOTES: (continued)

4. This package is designed to be soldered to a thermal pad on the board. For more information, see Texas Instruments literature number SLUA271 (www.ti.com/lit/slua271).
5. Vias are optional depending on application, refer to device data sheet. If any vias are implemented, refer to their locations shown on this view. It is recommended that vias under paste be filled, plugged or tented.

NOTES:

1. All linear dimensions are in millimeters. Any dimensions in parenthesis are for reference only. Dimensioning and tolerancing per ASME Y14.5M.
2. This drawing is subject to change without notice.
3. This dimension does not include mold flash, protrusions, or gate burrs. Mold flash, protrusions, or gate burrs shall not exceed 0.15 mm per side.
4. No JEDEC registration as of September 2020.
5. Features may differ or may not be present.

NOTES: (continued)

6. Publication IPC-7351 may have alternate designs.
7. Solder mask tolerances between and around signal pads can vary based on board fabrication site.
8. This package is designed to be soldered to a thermal pad on the board. For more information, see Texas Instruments literature numbers SLMA002 (www.ti.com/lit/slma002) and SLMA004 (www.ti.com/lit/slma004).
9. Size of metal pad may vary due to creepage requirement.
10. Vias are optional depending on application, refer to device data sheet. It is recommended that vias under paste be filled, plugged or tented.
