

ABSTRACT

This report covers Total Ionizing Dose (TID) radiation characterization test results of the TMP9R01-SEP (high-accuracy, remote and local temperature sensor). The study shows TID effects under Low Dose Rate (LDR) up to 50krad(Si). TMP9R01-SEP (TMP9R01MDGSTSEP) test results meet and/or exceed specified test limits up to 50krad(Si).

1 Device Information

1.1 Product Description

The TMP9R01-SEP device is a radiation-hardened, high-accuracy, low-power remote temperature sensor monitor with a built-in local temperature sensor. The remote temperature sensors are typically low-cost discrete NPN or PNP transistors, or substrate thermal transistors or diodes that are integral parts of microprocessors, analog-to-digital converters (ADC), digital-to-analog converters (DAC), microcontrollers, or field-programmable gate arrays (FPGA). Temperature is represented as a 12-bit digital code for both local and remote sensors, giving a resolution of 0.0625°C. The two-wire serial interface accepts the SMBus communication protocol with up to nine different pin-programmable addresses.

Advanced features such as series resistance cancellation, programmable non-ideality factor (η -factor), programmable offset, programmable temperature limits, and a programmable digital filter are combined to provide a robust thermal monitoring design with improved accuracy and noise immunity.

The TMP9R01-SEP is designed for multi-location, high-accuracy temperature measurements in a variety of distributed telemetry applications. The integrated local and remote temperature sensors simplify spacecraft housekeeping activities by providing a simple way of measuring temperature gradients. The device is specified for operation over a supply voltage range of 1.7V to 3.6V, and a temperature range of –55°C to 125°C.

2 Total Dose Test Setup

2.1 Test Overview

The TMP9R01-SEP was tested according to MIL-STD-883, Test Method 1019.9. For this testing, Conditions A and D were used. For this test, the product was irradiated up to the target radiation level and then put through full electrical parametric testing on the production Automated Test Equipment (ATE). The device was functional and passed all parametric tests.

2.2 Test Description and Facilities

The TMP9R01-SEP LDR exposure was performed on biased and unbiased devices in a Co60 gamma cell at VPT Rad facility in Chelmsford, Massachusetts. A uniform radiation beam is emitted through a single divergent beam port on the irradiator. A range of dose rates from 0.01 to 0.1 rad(Si)/sec is available by varying the distance to the beam port. Lead-aluminum test boxes provide energy spectrum hardening for the device under test (DUT). The DUT is positioned using a precise and versatile positioning system. An adjacent laboratory area provides a location for bias power supplies, monitoring, and test instrumentation. After exposure, the devices were packed in dry ice (per MIL-STD-883 Method 1019.9 section 3.10) and returned to TI Dallas for a full post radiation electrical evaluation using Texas Instruments production Automated Test Equipment (ATE). ATE guard band test limits are set within SMD electrical limits to verify a minimum Cpk and test error margin based on initial qualification and characterization data. Post radiation measurements were taken within 30 minutes of removal of the devices from the dry ice container. The devices were allowed to reach room temperature prior to electrical post radiation measurements.

2.3 Test Setup Details

The devices under LDR exposure were tested in both; biased and unbiased conditions as described below.

2.3.1 Unbiased

For unbiased LDR conditions, exposure was performed with all pins grounded.

2.3.2 Biased

Figure 2-1 shows bias conditions for each pin during LDR exposure.

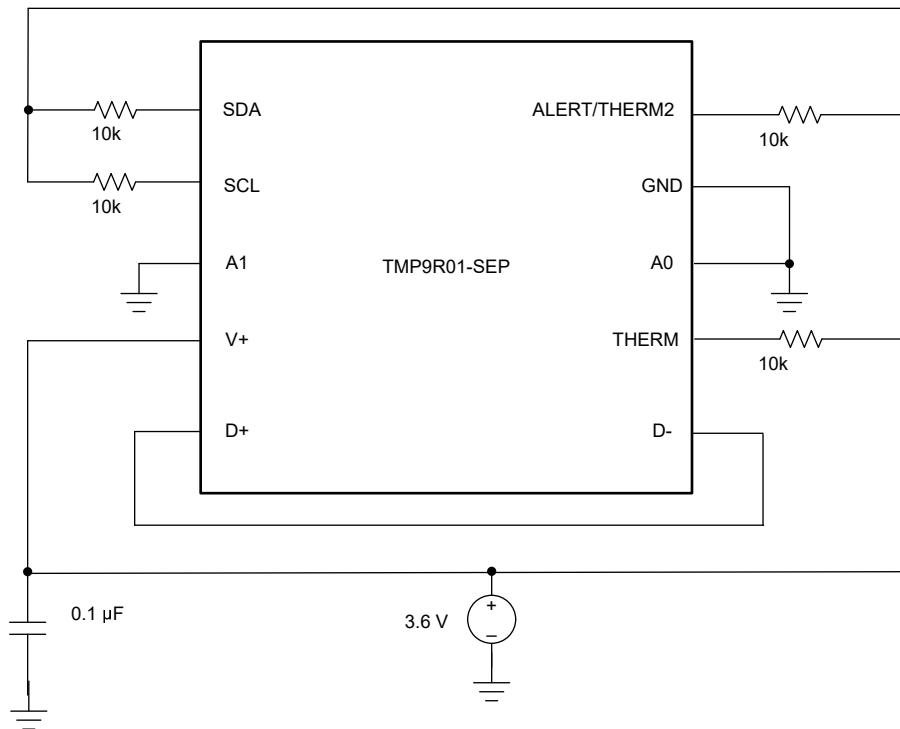

Figure 2-1. Bias Diagram Used in TID Exposure

2.4 Test Configuration and Condition

Devices at LDR were stressed at 20 krad(Si), 30 krad(Si), 50 krad(Si) for biased and unbiased conditions.

End point electrical test is performed on irradiated devices to verify the devices are within specified SMD electrical test limits. MIL-STD-883, Test Method 1019.9, Condition D is used in this case.

Table 2-1 show serialized devices used for LDR RHA characterization.

3 Total Ionizing Dose (RHA) Characterization Test Results

3.1 Total Ionizing Dose RHA Characterization Summary Results

The parametric data for the TMP9R01-SEP passes up to 50-krad(Si) LDR TID per MIL-STD-883, TM1010, condition D.

TID performance is based on “Pre” and “Post” radiation test measurements with respect to SMD electrical min-max specification limits. Measurements were taken at each radiation level shown in [Reference Documents](#). Data and graphs show some increase in quiescent current (IQ) at 1.7V and 3.6V for LDR at higher dose levels. Nonetheless, characterization results for all irradiated devices in the sample are within SMD electrical “Pre-rad” test limits. Both 1.7V and 3.6V supply voltage conditions have similar behavior overall at each exposure level. Tables in [Appendix A](#) depict “Pre & Post” radiation minimum and maximum values measured at each radiation exposure level.

Please see [Appendix A](#) for device specific parameters and graphs.
