

ABSTRACT

This report discusses the radiation characterization results of the THVD9491-SEP fault-protected full-duplex RS-422/RS-485 transceiver. The study was done to determine Total Ionizing Dose (TID) effects under high dose rate (HDR) up to 30krad(Si) as a one-time characterization. The results show that all samples passed within the specified limits up to 30krad(Si). Radiation Lot Acceptance Testing (RLAT) will be performed using 5 units at a dose level of 30krad(Si) per MIL-STD-883 TM 1019. All future wafer lots will be tested under the same conditions.

The THVD9491-SEP is packaged in a space enhanced plastic for low outgassing characteristics and is Single Event Latch-Up (SEL) immune up to 43MeV-cm² / mg, which makes the device an option for low Earth orbit space applications.

1 Device Information

The THVD9491-SEP is a space enhanced, $\pm 40V$ faultprotected full-duplex RS-422/RS-485 transceiver using a $1.65V$ to $5.5V$ logic supply for data and enable logic signals, and a $3V$ to $5.5V$ bus side supply. The device has a slew rate select feature that enables the use at two maximum speeds based on the SLR pin setting.

The device features integrated IEC ESD protection, eliminating the need for external system-level protection components. The $\pm 12V$ input commonmode range makes reliable data communication over longer cable run lengths and/or in the presence of large ground loop voltages. Enhanced 250mV receiver hysteresis provides high noise rejection. In addition, the receiver fail-safe feature makes sure of a logic high when the inputs are open or shorted together.

2 Total Dose Test Setup

2.1 Test Overview

The THVD9491-SEP samples were irradiated at a high dose rate of 168.26rad(Si)/s up to 30krad(Si) (115.74mrad(Si)/s effective does rate with 72 hour anneal) and then put through full electrical parametric testing on the production Automated Test Equipment (ATE). Additionally, other THVD9491-SEP samples were irradiated at a low dose rate of 9.56E-03rad(Si)/s up to 30krad(Si) and then put through full electrical parametric testing on the production Automated Test Equipment (ATE). Both sample sets were functional and passed all electrical parametric tests with readings within data sheet electrical specification limits.

The THVD9491-SEP LBC9 process technology contains Bipolar and CMOS components. In addition to an HDR TID, an ELDRS characterization was performed on technology process node (LBC9) that is used by this product. Results showed that worst case values post-irradiation were still within pre-radiation specification limits for both HDR and LDR, hence no ELDRS effects were exhibited. Thus, HDR will be performed on each wafer lot for future RLAT testing.

2.2 Test Description and Facilities

The THVD9491-SEP HDR exposure was performed on biased devices in a Co-60 gamma cell at a TI facility in Dallas, Texas. The un-attenuated dose rate of this cell is 168.26rads(Si)/s (115.74mrad(Si)/s effective does rate with 72 hour anneal). After exposure, the devices were packed in dry ice (per MIL-STD-883 Method 1019.9 section 3.10) and full post radiation electrical evaluation using Texas Instruments ATE was conducted. ATE test limits are set per data sheet electrical limits based on qualification and characterization data. Post radiation measurements were taken within 30 minutes of removing the devices from the dry ice container. The devices were allowed to reach room temperature prior to electrical post radiation measurements.

2.3 Test Setup Details

The devices were tested in biased conditions as described in the following sections.

2.3.1 Bias Diagram

Figure 2-1 shows the bias conditions for each pin during irradiation.

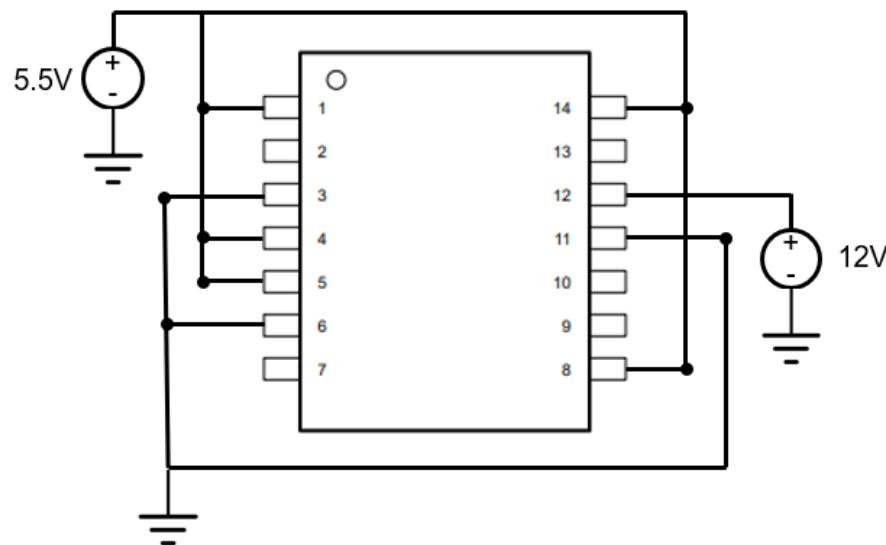

Figure 2-1. THVD9491-SEP Biased Diagram

2.4 Test Configuration and Condition

The main HDR irradiation characterization was performed at 10krad, 20krad and 30krad. The HDR RLAT units that were irradiated to 30krad(Si) were annealed at 25°C for 72 hours. Units irradiated to 30krad(Si) and were annealed for 72 hours are denoted as 31krad(Si) in the [Section 5](#). ATE parametric testing was completed before and after the anneal

[Table 2-1](#) lists the serialized samples used for TID Radiation Lot Acceptance Testing (RLAT).

3 TID Characterization Test Results

3.1 TID Characterization Summary Results

The parametric data for the THVD9491-SEP passes to 30krad(Si) HDR TID irradiation. The drifts of the electrical parameters through HDR were within the data sheet limits.

Overall, the THVD9491-SEP showed a strong degree of hardness to HDR TID irradiation up to 30krad(Si). The measurements taken post-irradiation for each sample set showed a marginal shift for most parameters at each dose level. The parameters that did show a greater degree of change between pre- and post-irradiation were still within the electrical performance characteristics specified in the data sheet electrical parameters. In accordance with MIL-STD-883K section 3.13.1.1, this device does not exhibit ELDRS effects due to every spec parameter post irradiation remaining below the pre-irradiation electrical specification limits at a low dose rate. For the datasheet electrical parameters and associated tests, see "THVD9491-SEP Datasheet".

See [Section 5](#) for HDR report up to 30krad(Si).
