

250mA Dual Outputs AMOLED Display Power Supply

Check for Samples: [TPS65137AS](#)

FEATURES

- 2.5 V to 4.8 V Input Voltage Range
- 0.8% Output Voltage Accuracy V_{POS}
- Excellent Line Transient Regulation
- 250 mA Output Current
- Fixed 4.6 V V_{POS} Output Voltage
- Digitally Programmable V_{NEG} , -2.2V to -5.2V
- -4.9V Default Value for V_{NEG}
- Short Circuit Protection
- Thermal Shutdown
- 3mm × 3mm 10-Pin QFN Package

DESCRIPTION

The TPS65137AS is designed to drive AMOLED displays (Active Matrix Organic Light Emitting Diode) requiring positive and negative voltage supply rails. The device integrates a boost converter with LDO post regulator and an inverting buckboost converter suitable for battery operated products. The digital control pin (CTRL) allows programming the negative output voltage in digital steps. The TPS65137AS uses a novel technology enabling excellent line and load regulation. This is required to avoid disturbance of the AMOLED display by the input voltage fluctuations occurring during transmit periods in mobile phones.

APPLICATIONS

- Active Matrix OLED

TYPICAL APPLICATION

Please be aware that an important notice concerning availability, standard warranty, and use in critical applications of Texas Instruments semiconductor products and disclaimers thereto appears at the end of this data sheet.

This integrated circuit can be damaged by ESD. Texas Instruments recommends that all integrated circuits be handled with appropriate precautions. Failure to observe proper handling and installation procedures can cause damage.

ESD damage can range from subtle performance degradation to complete device failure. Precision integrated circuits may be more susceptible to damage because very small parametric changes could cause the device not to meet its published specifications.

ORDERING INFORMATION⁽¹⁾ ⁽²⁾

T _A	PACKAGE ⁽²⁾	ORDERABLE PART NUMBER	TOP-SIDE MARKING
–40°C to 85°C	10-Pin 3x3 QFN	TPS65137ASDSCR	PPGC

(1) For the most current package and ordering information, see the Package Option Addendum at the end of this document, or see the TI web site at www.ti.com.

(2) Package drawings, thermal data, and symbolization are available at www.ti.com/packaging.

ABSOLUTE MAXIMUM RATINGS

over operating free-air temperature range (unless otherwise noted)⁽¹⁾

		VALUE		UNIT
		MIN	MAX	
Pin Voltage ⁽²⁾	PVIN, SWP, OUTP, CTRL, VL, CB		5.5	V
	OUTN		–6.5	V
	SWN	–6.5	5.5	V

DETAILED DESCRIPTION

The TPS65137AS consists of a boost converter using an LDO as post regulator and an inverting buck-boost converter. The positive output is fixed at 4.6V. The negative output is programmable by a digital interface in the range of –2.2V to –5.2V, the default is –4.9V. The transition time of the negative output is adjustable by the CT pin capacitor.

SOFT START and START-UP SEQUENCE

The device has a soft start to limit the in-rush current. When the device is enabled by the CTRL pin going HIGH, the boost converter starts with a reduced switch current limit. 8ms after CTRL going HIGH, the buck-boost converter starts with the default value of –4.9V. The typical start-up sequence is shown in [Figure 8](#).

Figure 8. Start-up Sequence

SHORT CIRCUIT PROTECTION

The device is protected against short circuits of the outputs to ground and short circuit of the outputs to each other. During normal operation, an error condition is detected if V_{POS} falls below 3.7V for more than 3ms or V_{NEG} gets above 420mV above the programmed value for more than 3ms. In either case, the device goes into shutdown and this state is latched. The input and the outputs are disconnected. To resume normal operation, V_{IN} has to cycle below UVLO or CTRL has to toggle LOW and HIGH.

During start up, an error condition is detected in the following cases:

- V_{POS} is not in regulation 10ms after CTRL goes HIGH.
- V_{NEG} is higher than threshold level 10ms after CTRL goes HIGH.
- V_{NEG} is not in regulation 20ms after CTRL goes HIGH.

In the above cases, the device goes into shutdown and this state is latched. The input and the outputs are disconnected. To resume normal operation, V_{IN} has to cycle below UVLO or CTRL has to toggle LOW and HIGH.

ENABLE (CTRL PIN)

The CTRL pin serves two functions. One is to enable and disable the device the other is the output voltage programming of the device. If the digital interface is not required the CTRL pin can be used as a standard enable pin for the device and the device will come up with its default value on V_{NEG} of –4.9V. When CTRL is pulled high, the device is enabled. The device is shut down with CTRL low.

DIGITAL INTERFACE (CTRL)

The digital interface allows programming the negative output voltage V_{NEG} in digital steps. If the digital output voltage setting is not required then the CTRL pin can also be used as a standard enable pin.

The digital output voltage programming of V_{NEG} is implemented by a simple digital interface with the timing shown in [Figure 9](#).

Figure 9. Digital Interface Using CTRL

Once CTRL is pulled high the device will come up with its default voltage of $-4.9V$. The device has a 6-bit DAC implemented with the corresponding output voltages as given in the table below. The interface counts now the rising edges applied to the CTRL pin once the device is enabled. For the example above, V_{NEG} is programmed to $-5.0V$ since 3 rising edges are detected. Other output voltages can be programmed according [Table 2](#).

Table 2. Programming Table for V_{NEG}

BIT/RISING EDGES	V_{NEG}	DAC VALUE	BIT/RISING EDGES	V_{NEG}	DAC VALUE
0/ no pulse	$-4.9 V$	00000	16	$-3.7 V$	10000
1	$-5.2 V$	00001	17	$-3.6 V$	10001
2	$-5.1 V$	00010	18	$-3.5 V$	10010
3	$-5.0 V$	00011	19	$-3.4 V$	10011
4	$-4.9 V$	00100	20	$-3.3 V$	10100
5	$-4.8 V$	00101	21	$-3.2 V$	10101
6	$-4.7 V$	00110	22	$-3.1 V$	10110
7	$-4.6 V$	00111	23	$-3.0 V$	10111
8	$-4.5 V$	01000	24	$-2.9 V$	11000

10	$-4.3 V$	01010	26	$-2.7 V$	11010
11	$-4.2 V$	01011	27	$-2.6 V$	11011
12	$-4.1 V$	01100	28	$-2.5 V$	11100
13	$-4.0 V$	01101	29	$-2.4 V$	11101
14	$-3.9 V$	01110	30	$-2.3 V$	11110
15	$-3.8 V$	01111	31	$-2.2 V$	11111

SETTING TRANSITION TIME t_{set} for V_{NEG} (C_T)

The device allows setting the transition time t_{set} using an external capacitor connected to pin CT. The transition time is the time period required to move V_{NEG} from one voltage level to the next programmed voltage level. The capacitor connected to pin CT does not influence the soft start time t_{ss} of the V_{NEG} default value. When the CT pin is left open then the shortest possible transition time is programmed. When connecting a capacitor to the CT pin then the transition time is given by an R-C time constant. This is given by the output impedance of the CT pin typically 325k Ω and the external capacitance. Within one τ the output voltage V_{NEG} has reached 70% of its programmed value. An example is given when using 100nF for C_T .

$$\tau \approx t_{set70\%} = 325 \text{ k}\Omega \times C_T = 325 \text{ k}\Omega \times 100 \text{ nF} = 32.5 \text{ ms}$$

The output voltage is almost at its programmed value after 3τ .

PCB LAYOUT

Figure 10 and Figure 11 show an example of a PCB layout design.

1. Place the input capacitor on VIN and the output capacitor on OUTN as close as possible to the device. Use short and wide traces to connect the input capacitor to VIN and the output capacitor to OUTN.
2. Place the output capacitor on OUTP and the capacitor on CB as close as possible to the device. Use short and wide traces to connect the output capacitor to OUTP.
3. Connect the ground of the CT capacitor to the GND pin, pin 6, directly.
4. Connect the input ground and the output ground on the same board layer, not through vias.

PACKAGING INFORMATION

Orderable part number	Status (1)	Material type (2)	Package Pins	Package qty Carrier	RoHS (3)	Lead finish/ Ball material (4)	MSL rating/ Peak reflow (5)	Op temp (°C)	Part marking (6)
TPS65137ASDSCR	Active	Production	WSON (DSC) 10	3000 LARGE T&R	Yes	NIPDAU NIPDAU	Level-2-260C-1 YEAR	-40 to 85	PPGC
TPS65137ASDSCR.B	Active	Production	WSON (DSC) 10	3000 LARGE T&R	Yes	NIPDAU	Level-2-260C-1 YEAR	-40 to 85	PPGC

- ⁽¹⁾ **Status:** For more details on status, see our [product life cycle](#).
- ⁽²⁾ **Material type:** When designated, preproduction parts are prototypes/experimental devices, and are not yet approved or released for full production. Testing and final process, including without limitation quality assurance, reliability performance testing, and/or process qualification, may not yet be complete, and this item is subject to further changes or possible discontinuation. If available for ordering, purchases will be subject to an additional waiver at checkout, and are intended for early internal evaluation purposes only. These items are sold without warranties of any kind.
- ⁽³⁾ **RoHS values:** Yes, No, RoHS Exempt. See the [TI RoHS Statement](#) for additional information and value definition.
- ⁽⁴⁾ **Lead finish/Ball material:** Parts may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead finish/Ball material values may wrap to two lines if the finish value exceeds the maximum column width.
- ⁽⁵⁾ **MSL rating/Peak reflow:** The moisture sensitivity level ratings and peak solder (reflow) temperatures. In the event that a part has multiple moisture sensitivity ratings, only the lowest level per JEDEC standards is shown. Refer to the shipping label for the actual reflow temperature that will be used to mount the part to the printed circuit board.
- ⁽⁶⁾ **Part marking:** There may be an additional marking, which relates to the logo, the lot trace code information, or the environmental category of the part.

Multiple part markings will be inside parentheses. Only one part marking contained in parentheses and separated by a "-" will appear on a part. If a line is indented then it is a continuation of the previous line and the two combined represent the entire part marking for that device.
