

ADC3641, ADC3642, ADC3643 SBAS886A - OCTOBER 2020 - REVISED MAY 2022

ADC364x 14-bit, 10-MSPS to 65-MSPS, Low-Noise, Low Power Dual Channel ADC

1 Features

- **Dual channel**
- 14-bit 10/25/65 MSPS ADC
- Noise floor: -155 dBFS/Hz
- Ultra-low power with optimized power scaling: 29 mW/ch (10 MSPS) to 72 mW/ch (65 MSPS)
- Latency: 1 clock cycle
- 14-Bit, no missing codes
- INL: ±0.6 LSB: DNL: ±0.2 LSB
- Reference: external or internal
- Industrial temperature range: -40°C to +105°C
- On-chip digital filter (optional)
 - Decimation by 2, 4, 8, 16, 32
 - 32-bit NCO
- DDR and Serial CMOS interface
- Small footprint: 40-VQFN (5 mm × 5 mm) package
- Single 1.8-V supply
- Spectral performance ($f_{IN} = 5 \text{ MHz}$):
 - SNR: 79.0 dBFS
 - SFDR: 93-dBc HD2, HD3 SFDR: 101-dBFS worst spur
- Spectral performance ($f_{IN} = 64 \text{ MHz}$):
 - SNR: 74.0 dBFS
 - SFDR: 84-dBc HD2, HD3 - SFDR: 90-dBFS worst spur

2 Applications

- High-speed data acquisition
- Industrial monitoring
- Thermal imaging
- Imaging and sonar
- Software defined radio
- Power quality
- Communications infrastructure
- High-speed control loops
- Instrumentation
- **Smart grids**
- Spectroscopy
- Source measurement unit (SMU)
- **GPS** receiver
- Sonar
- Substation automation

3 Description

The ADC364x family of devices are low-noise, ultra-low power, 14-bit, 10-MSPS to 65-MSPS dual-channel, high-speed analog-to-digital converters (ADCs). Designed for low power consumption, these devices deliver a noise spectral density of -155 dBFS/Hz, combined with excellent linearity and dynamic range. The ADC364x offers very good dc precision, together with IF sampling support, which make the device an excellent choice for a wide range of applications. High-speed control loops benefit from the short latency of only one clock cycle. The ADC consumes only 72 mW/ch at 65 MSPS, and power consumption scales well with lower sampling rates.

The ADC364x use a DDR or serial CMOS interface to output the data offering lowest power digital interface, together with flexibility to minimize the number of digital interconnects. These devices are a pin-to-pin compatible family with different speed grades. These devices support the extended industrial temperature range of -40 to +105°C.

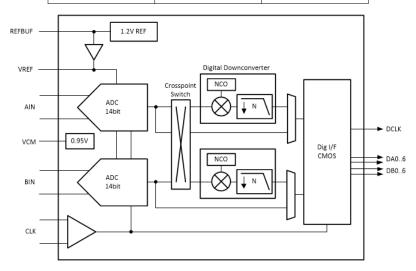

Device Information

PART NUMBER	PACKAGE ⁽¹⁾	BODY SIZE (NOM)		
ADC364x	VQFN (40)	5.00 × 5.00 mm		

For all available packages, see the package option addendum at the end of the data sheet.

Device Comparison

PART NUMBER	RESOLUTION	SAMPLING RATE		
ADC3643	14 BIT	65 MSPS		
ADC3642	14 BIT	25 MSPS		
ADC3641	14 BIT	10 MSPS

4 Revision History

NOTE: Page numbers for previous revisions may differ from page numbers in the current version.

C	hanges from Revision * (October 2020) to Revision A (May 2022)	Page
•	Deleted the Product Preview note from devices ADC3641 and ADC3642 in the Device Comparison to	able1
•	Updated equivalent R _{IN} /C _{IN} plot	28
•	Changed text From SPI register write (address 0x11) To: SPI register write (address 0xE) in the Singl Input section	
•	Added GND symbol to REFGND pin for all voltage reference option diagrams	
	Added condition to resynch during operation to the SYNC section	
•	Added the Output Bit Mapper section	46
•	Added Table 8-12 with default device configuration	52

5 Pin Configuration and Functions

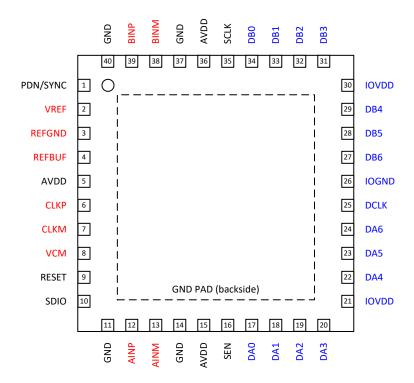

Figure 5-1. RSB Package, 40-Pin WQFN, Top View

Table 5-1. Pin Functions

P	IN	I/O	DESCRIPTION		
NAME NO.		1/0	DESCRIP HON		
INPUT/REFER	RENCE				
AINM 13 I		I	Negative analog input, channel A		
AINP	12	I	Positive analog input, channel A		
BINP	39	I	Positive analog input, channel B		
BINM	38	I	Negative analog input, channel B		
REFBUF 4 I		I	1.2 V external voltage reference input for use with internal reference buffer. Internal 100 km pull-up resistor to AVDD. This pin is also used to configure default operating conditions.		
REFGND 3 I Reference ground input, 0 V		Reference ground input, 0 V			
VCM	8	0	Common-mode voltage output for the analog inputs, 0.95 V		
VREF	2	I	External voltage reference input		
CLOCK					
CLKM	7	I	Negative differential sampling clock input for the ADC		
CLKP	6	I	Positive differential sampling clock input for the ADC		
CONFIGURAT	ION				
PDN/SYNC 1 I		I	Power down/Synchronization input. This pin can be configured via the SPI interface. Active high. This pin has an internal 21 k Ω pull-down resistor.		
RESET	9	I	Hardware reset. Active high. This pin has an internal 21 kΩ pull-down resistor.		

Table 5-1. Pin Functions (continued)

			Table 5-1. Pin Functions (continued)			
	PIN	1/0	DESCRIPTION			
NAME	NO.	1 1/0	DESCRIP HON			
SCLK	35	I	Serial interface clock input. This pin has an internal 21 kΩ pull-down resistor.			
SDIO	10	I	Serial interface data input and output. This pin has an internal 21 kΩ pull-down resistor.			
SEN	16	I	Serial interface enable. Active low. This pin has an internal 21 kΩ pull-up resistor to AVDD.			
DIGITAL IN	TERFACE					
DA0	17	0	CMOS digital data output.			
DA1	18	I/O	CMOS digital data output. Used as FCLK frame clock output for serialized CMOS output modes. Configured using SPI.			
DA2	19	0	CMOS digital data output.			
DA3	20	0	CMOS digital data output.			
DA4	22	0	CMOS digital data output.			
DA5	23	0	CMOS digital data output.			
DA6	24	0	CMOS digital data output.			
DB0	34	0	CMOS digital data output.			
DB1	33	I/O	CMOS digital data output. Used as DCLKIN bit clock input for serialized CMOS output modes. Configured using SPI.			
DB2	32	0	CMOS digital data output.			
DB3	31	0	CMOS digital data output.			
DB4	29	0	CMOS digital data output.			
DB5	28	0	CMOS digital data output.			
DB6	27	0	CMOS digital data output.			
DCLK	25	0	CMOS output for data bit clock.			
POWER SU	PPLY					
AVDD	5,15,36	I	Analog 1.8-V power supply			
GND	11,14,37,40, PowerPAD	I	Ground, 0 V			
IOGND	26	I	Ground, 0 V for digital interface			
IOVDD	21,30	I	1.8-V power supply for digital interface			

6 Specifications

6.1 Absolute Maximum Ratings

over operating free-air temperature range (unless otherwise noted)(1)

PARAMETER	TEST CONDITIONS	MIN	MAX	UNIT
Supply voltage ra	nge, AVDD, IOVDD	-0.3	2.1	V
Supply voltage ra	nge, GND, IOGND, REFGND	-0.3 0.3		V
	AINP/M, BINP/M, CLKP/M, VREF, REFBUF	-0.3	MIN(2.1, AVDD+0.3)	V

lopar po	VDD, IOVDD -0.3 2 IND, IOGND, REFGND -0.3 0 /M, BINP/M, CLKP/M, VREF, REFBUF -0.3 MIN(2.1, AVDD+0 RESET, SCLK, SEN, SDIO -0.3 MIN(2.1, AVDD+0 (DCLKIN) -0.3 MIN(2.1, IOVDD+0 J 1	MIN(2.1, IOVDD+0.3)	V	
Junction temperat	ture, T _J	105		°C
Storage temperat	ure, T _{stg}	-65	150	°C

⁽¹⁾ Stresses beyond those listed under Absolute Maximum Ratings may cause permanent damage to the device. These are stress ratings only, which do not imply functional operation of the device at these or any other conditions beyond those indicated under Recommended Operating Conditions. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.

6.2 ESD Ratings

			VALUE	UNIT
V	Electrostatic discharge	Human body model (HBM), per ANSI/ESDA/JEDEC JS-001, all pins ⁽¹⁾	2500	V
V _(ESD)	Electrostatic discharge	Charged device model (CDM), per ANSI/ESDA/JEDEC JS-002, all pins ⁽²⁾	1000	\ \ \

⁽¹⁾ JEDEC document JEP155 states that 500-V HBM allows safe manufacturing with a standard ESD control process.

6.3 Recommended Operating Conditions

over operating free-air temperature range (unless otherwise noted)

		MIN	NOM	MAX	UNIT
Supply	AVDD ⁽¹⁾	1.75	1.8	1.85	V
voltage range	IOVDD ⁽¹⁾	1.75	1.8	1.85	V
T _A	Operating free-air temperature	-40		105	°C
T _J	Operating junction temperature			105 ⁽²⁾	°C

⁽¹⁾ Measured to GND.

6.4 Thermal Information

		ADC364x	
	THERMAL METRIC ⁽¹⁾	RSB (QFN)	UNIT
		40 Pins	
R _{OJA}	Junction-to-ambient thermal resistance	30.7	°C/W
R _{OJC(top)}	Junction-to-case (top) thermal resistance	16.4	°C/W
R _{OJB}	Junction-to-board thermal resistance	10.5	°C/W
Ψ_{JT}	Junction-to-top characterization parameter	0.2	°C/W
Ψ_{JB}	Junction-to-board characterization parameter	10.5	°C/W
R _{OJC(bot)}	Junction-to-case (bottom) thermal resistance	2.0	°C/W

For more information about traditional and new thermal metrics, see the Semiconductor and IC Package Thermal Metrics application report, SPRA953.

⁽²⁾ JEDEC document JEP157 states that 250-V CDM allows safe manufacturing with a standard ESD control process.

⁽²⁾ Prolonged use above this junction temperature may increase the device failure-in-time (FIT) rate.

6.5 Electrical Characteristics - Power Consumption

Typical values are over the operating free-air temperature range, at T_A = 25°C, full temperature range is T_{MIN} = -40°C to T_{MAX} = 105°C, ADC sampling rate = 65 MSPS, 50% clock duty cycle, AVDD, IOVDD = 1.8 V, external 1.6V reference, 5 pF output load, and -1-dBFS differential input, unless otherwise noted

	PARAMETER	TEST CONDITIONS	MIN T	YP MAX	UNIT
ADC3641	- 10 MSPS			,	
I _{AVDD}	Analog supply current	External reference		27	
I _{IOVDD}	I/O supply current ⁽¹⁾	DDR CMOS		5	mA
P _{DIS}	Power dissipation ⁽¹⁾	External reference, DDR CMOS		58	mW
		Serial CMOS 2-wire		5	
I _{IOVDD}	I/O supply current ⁽¹⁾	Serial CMOS 1-wire		5	mA
HOVDD	170 Supply Cultonic	4x complex decimation, Serial CMOS 2-wire		6	
ADC3642	- 25 MSPS				
I _{AVDD}	Analog supply current	External reference		31 42	- A
I _{IOVDD}	I/O supply current ⁽¹⁾	DDR CMOS		8 12	mA
P _{DIS}	Power dissipation ⁽¹⁾	External reference, DDR CMOS		70 97	mW
		Serial CMOS 2-wire		8	
I _{IOVDD}	I/O supply current ⁽¹⁾	4x complex decimation, Serial CMOS 2-wire		12	mA
ADC3643	- 65 MSPS				
I _{AVDD}	Analog supply current	External reference		64 78	
I _{IOVDD}	I/O supply current ⁽¹⁾	DDR CMOS		16 20	mA
P _{DIS}	Power dissipation ⁽¹⁾	External reference, DDR CMOS		144 176	mW
I _{IOVDD}		8x complex decimation, Serial CMOS 2-wire		19	
I _{IOVDD}	1/0	16x complex decimation, Serial CMOS 1-wire		17	^
I _{IOVDD}	I/O supply current ⁽¹⁾	32x complex decimation, Serial CMOS 1-wire		15	- mA
I _{IOVDD}		32x complex decimation, Serial CMOS 1/2-wire		16	
MISCELLA	ANEOUS				
	Internal reference, additional analog s	upply current		2	
I _{AVDD}	External 1.2V reference (REFBUF), additional analog supply current			0.3	mA
'AVDD	Single ended clock input, reduces analog supply current by	Enabled via SPI		0.7	- '''''
D	Power consumption in global power	Default power down mask, internal reference		5	,\^/
P _{DIS}	down mode	Default power down mask, external reference		9	- mW

⁽¹⁾ Measured with full-scale sine wave input signal at specified sample rate, with \sim 5 pF loading on each CMOS output pin.

6.6 Electrical Characteristics - DC Specifications

Typical values are over the operating free-air temperature range, at T_A = 25°C, full temperature range is T_{MIN} = -40°C to T_{MAX} = 105°C, ADC sampling rate = 65 MSPS, 50% clock duty cycle, AVDD, IOVDD = 1.8 V, external 1.6V reference, 5 pF output load, and -1-dBFS differential input, unless otherwise noted

8 Detailed Description

8.1 Overview

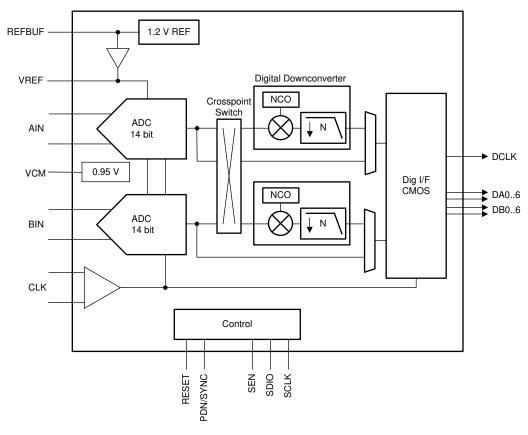

The ADC364x is a low noise, ultra-low power 14-bit high-speed dual channel ADC family supporting sampling rates from 10 to 65 Msps. It offers very good DC precision together with IF sampling support which makes it ideally suited for a wide range of applications. The ADC364x is equipped with an on-chip internal reference option but it also supports the use of an external, high precision 1.6 V voltage reference or an external 1.2 V reference which is buffered and gained up internally. Because of the inherent low latency architecture, the digital output result is available after only one clock cycle. Single ended as well as differential input signaling is supported.

An optional programmable digital down converter enables external anti-alias filter relaxation as well as output data rate reduction. The digital filter provides a 32-bit programmable NCO and supports both real or complex decimation.

The ADC364x family uses a parallel DDR CMOS as well as a 2-wire, 1-wire and 1/2-wire serial CMOS interface to output the data offering lowest power digital interface together with the flexibility to minimize the number of digital interconnects. The ADC364x includes a digital output formatter which supports output resolutions from 14 to 20-bit. The device is a pin-to-pin compatible family with different speed grades.

The device features and control options can be set up either through pin configurations or via SPI register writes.

8.2 Functional Block Diagram

8.3 Feature Description

8.3.1 Analog Input

The analog inputs of ADC364x are intended to be driven differentially. Both AC coupling and DC coupling of the analog inputs is supported. The analog inputs are designed for an input common mode voltage of 0.95 V which must be provided externally on each input pin. DC-coupled input signals must have a common mode voltage that meets the device input common mode voltage range.

The equivalent input network diagram is shown in Figure 8-1. All four sampling switches, on-resistance shown in red, are in same position (open or closed) simultaneously.

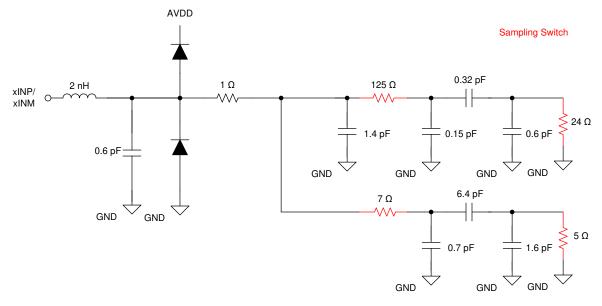

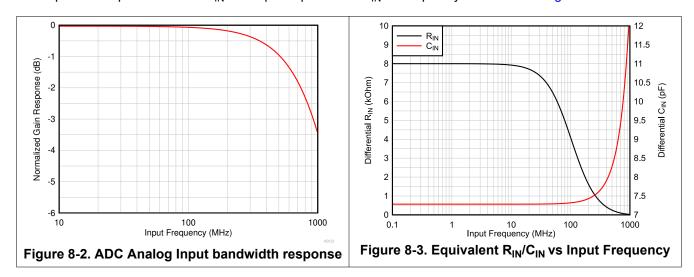

Figure 8-1. Equivalent Input Network

8.3.1.1 Analog Input Bandwidth

Figure 8-2 shows the analog full power input bandwidth of the ADC364x with a 50 Ω . The -3 dB bandwidth is approximately 900 MHz and the useful input bandwidth with good AC performance is approximately 120 MHz.

The equivalent input resistance R_{IN} and input capacitance C_{IN} vs frequency are shown in Figure 8-3.

8.3.1.2 Analog Front End Design

The ADC364x is an unbuffered ADC and thus a passive kick-back filter is recommended to absorb the glitch from the sampling operation. Depending on if the input is driven by a balun or a differential amplifier with low output impedance, a termination network may be needed. Additionally a passive DC bias circuit is required in AC-coupled applications which can be combined with the termination network.

8.3.1.2.1 Sampling Glitch Filter Design

The front end sampling glitch filter is designed to optimize the SNR and HD3 performance of the ADC. The filter performance is dependent on input frequency and therefore the following filter designs are recommended for different input frequency ranges as shown in Figure 8-4 and Figure 8-5 (assuming 50 Ω source impedance).

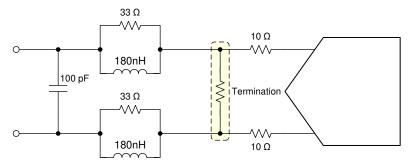

Figure 8-4. Sampling glitch filter example for input frequencies from DC to 30 MHz

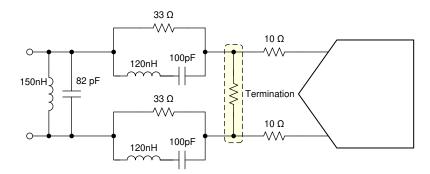

Figure 8-5. Sampling glitch filter example for input frequencies from 30 to 70 MHz

8.3.1.2.2 Single Ended Input

The ADC can be configured to operate with single ended input instead of differential using just the positive signal input. This operating mode must be enabled via SPI register write (address 0xE). The single ended signal is connected to the negative ADC input and both the positive and negative input need to be biased to VCM as shown in Figure 8-6.

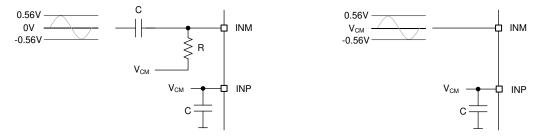

Figure 8-6. Single ended analog input: AC coupled (left) and DC coupled (right)

The signal swing is now reduced by 6-dB (single ended input with 1.125 Vpp vs differential 2.25 Vpp), and the resulting SNR is reduced by 3-dB.

8.3.1.2.3 Analog Input Termination and DC Bias

Depending on the input drive circuitry, a termination network and/or DC biasing needs to be provided.

8.3.1.2.3.1 AC-Coupling

The ADC364x requires external DC bias using the common mode output voltage (VCM) of the ADC together with the termination network as shown in Figure 8-7. The termination is located within the glitch filter network. When using a balun on the input, the termination impedance has to be adjusted to account for the turns ratio of the transformer. When using an amplifier, the termination impedance can be adjusted to optimize the amplifier performance.

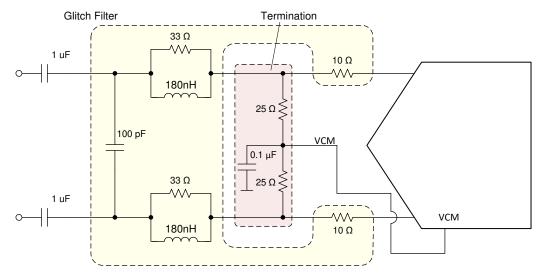

Figure 8-7. AC-Coupling: termination network provides DC bias (glitch filter example for DC - 30 MHz)

8.3.1.2.3.2 DC-Coupling

In DC coupled applications the DC bias needs to be provided from the fully differential amplifier (FDA) using VCM output of the ADC as shown in Figure 8-8. The glitch filter in this case is located between the anti-alias filter and the ADC. No termination may be needed if amplifier is located close to the ADC or if the termination is part of the anti-alias filter.

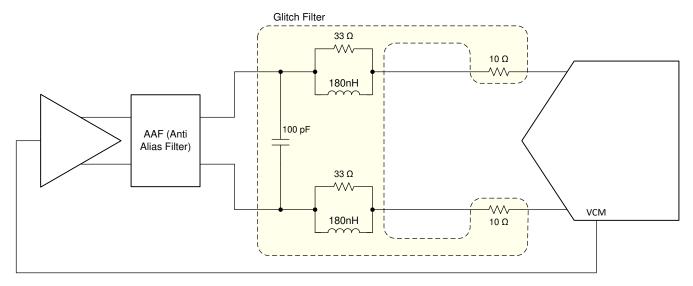

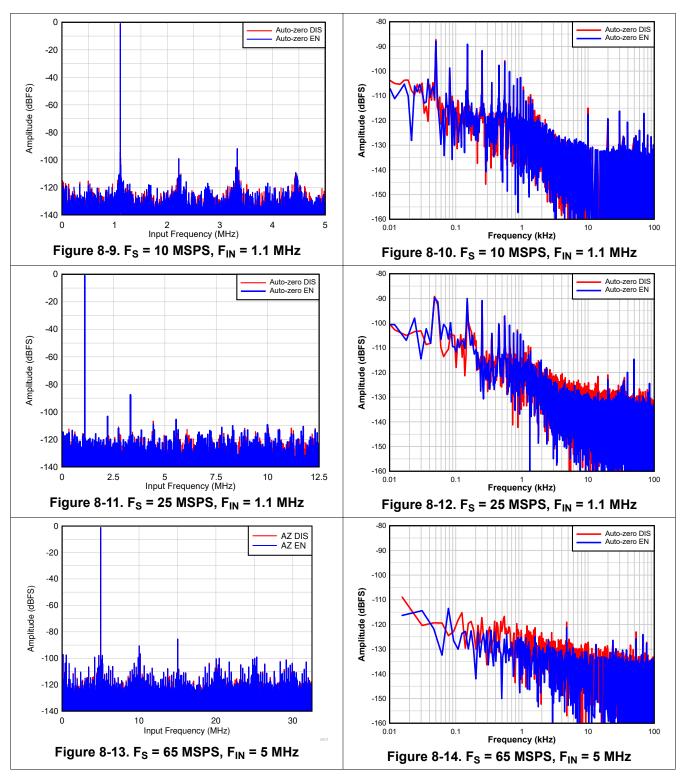

Figure 8-8. DC-Coupling: DC bias provided by FDA (glitch filter example for DC - 30 MHz)

8.3.1.3 Auto-Zero Feature

The ADC364x includes an internal auto-zero front end amplifier circuit which improves the 1/f flicker noise. This auto-zero feature is enabled by default for the ADC3641/2 and can be enabled using SPI register writes for the ADC3643 (register 0x11, D0). The following 4M point FFTs compare auto-zoer feature enabled vs disabled.

8.3.2 Clock Input

In order to maximize the ADC SNR performance, the external sampling clock should be low jitter and differential signaling with a high slew rate. This is especially important in IF sampling applications. For less jitter sensitive applications, the ADC364x provides the option to operate with single ended signaling which saves additional power consumption.

8.3.2.1 Single Ended vs Differential Clock Input

The ADC364x can be operated using a differential or a single ended clock input where the single ended clock consumes less power consumption. However clock amplitude impacts the ADC aperture jitter and consequently the SNR. For maximum SNR performance, a large clock signal with fast slew rates needs to be provided.

- Differential Clock Input: The clock input can be AC coupled externally. The ADC364x provides internal biasing for that use case.
- Single Ended Clock Input: This mode needs to be configured using SPI register (0x0E, D2 and D0) or with the REFBUF pin. In this mode there is no internal clock biasing and thus the clock input needs to be DC coupled around a 0.9V center. The unused input needs to be AC coupled to ground.

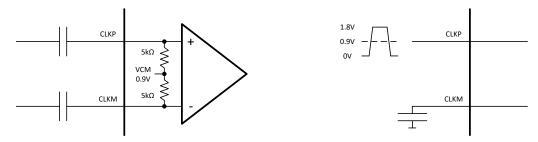

Figure 8-15. External and internal connection using differential (left) and single ended (right) clock input

8.3.2.2 Signal Acquisition Time Adjust

The ADC364x includes a register (DLL PDN (0x11, D2) which increases the signal acquisition time window for clock rates below 40 MSPS from 25% to 50% of the clock period. Increasing the sampling time provides a longer time for the driving amplifier to settle out the signal which can improve the SNR performance of the system.

Note

This register needs to be set for the 65 MSPS speed grade (ADC3643) when operating at sampling rates below 40 MSPS. For the 10 and 25 MSPS device speed grades the sampling time is already set to $T_{\rm S}/2$.

When powering down the DLL, the acquisition time tracks the clock duty cycle (50% is recommended).

Table 8-1. Acquisition time vs DLL PDN setting

SAMPLING CLOCK F _S (MSPS)	DLL PDN (0x11, D2)	ACQUISITION TIME (t _{ACQ})
65	0	T _S / 4
≤ 40	1	T _S / 2

T_S: Sampling clock period

8.3.3 Voltage Reference

The ADC364x provides three different options for supplying the voltage reference to the ADC. An external 1.6 V reference can be directly connected to the VREF input; a voltage 1.2 V reference can be connected to the REFBUF input using the internal gain buffer or the internal 1.2 V reference can be enabled to generate a 1.6 V reference voltage. For best performance, the reference noise should be filtered by connecting a 10 μ F and a 0.1 μ F ceramic bypass capacitor to the VREF pin. The internal reference circuitry of the ADC364x is shown in Figure 8-16.

Note

The voltage reference mode can be selected using SPI writes or by using the REFBUF pin (default) as a control pin (Section 8.5.1).

If the REFBUF pin is not used for configuration, the REFBUF pin should be connected to AVDD (even though the REFBUF pin has a weak internal pullup to AVDD) and the voltage reference option has to be selected using the SPI interface.

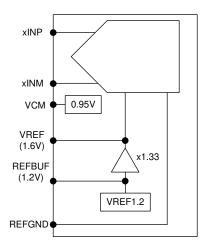

Figure 8-16. Different voltage reference options for ADC364x

8.3.3.1 Internal voltage reference

The 1.6 V reference for the ADC can be generated internal using the on-chip 1.2 V reference along with the internal gain buffer. A 10 μ F and a 0.1 μ F ceramic bypass capacitor (C_{VREF}) should connected between the VREF and REFGND pins as close to the pins as possible.

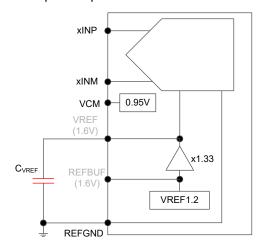

Figure 8-17. Internal reference

8.3.3.2 External voltage reference (VREF)

For highest accuracy and lowest temperature drift, the VREF input can be directly connected to an external 1.6 V reference. A 10 μ F and a 0.1 μ F ceramic bypass capacitor (C_{VREF}) connected between the VREF and REFGND pins and placed as close to the pins as possible is recommended. The load current from the external reference is about 1 mA.

Note: The internal reference is also used for other functions inside the device; therefore, the reference amplifier should only be powered down in power down state but not during normal operation.

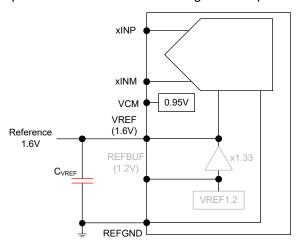

Figure 8-18. External 1.6V reference

8.3.3.3 External voltage reference with internal buffer (REFBUF)

The ADC364x is equipped with an on-chip reference buffer that also includes gain to generate the 1.6 V reference voltage from an external 1.2 V reference. A 10 μ F and a 0.1 μ F ceramic bypass capacitor (C_{VREF}) between the VREF and REFGND pins and a 10 μ F and a 0.1 μ F ceramic bypass capacitor between the REFBUF and REFGND pins are recommended. Both capacitors should be placed as close to the pins as possible. The load current from the external reference is less than 100 μ A.

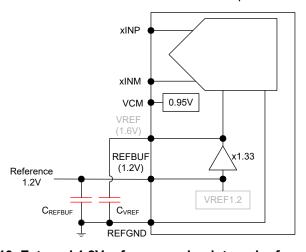

Figure 8-19. External 1.2V reference using internal reference buffer

8.3.4 Digital Down Converter

The ADC364x includes an optional on-chip digital down conversion (DDC) decimation filter that can be enabled via SPI register setting. It supports complex decimation by 2, 4, 8, 16 and 32 using a digital mixer and a 32-bit numerically controlled oscillator (NCO) as shown in Figure 8-20. Furthermore it supports a mode with real decimation where the complex mixer is bypassed (NCO should be set to 0 for lowest power consumption) and the digital filter acts as a low pass filter.

Internally the decimation filter calculations are performed with a 20-bit resolution in order to avoid any SNR degradation due to quantization noise. The Section 8.3.5.4 truncates to the selected resolution prior to outputting the data on the digital interface.

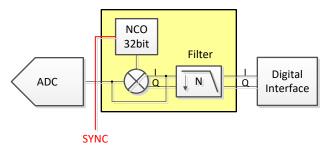

Figure 8-20. Internal Digital Decimation Filter

8.3.4.1 DDC MUX

The ADC364x family contains a MUX in front of the digital decimation filter which allows the ADC channel A input to be connected to the DDC of channel B and vice versa.

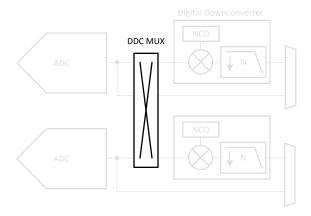

Figure 8-21. DDC MUX

8.3.4.2 Digital Filter Operation

The complex decimation operation is illustrated with an example in Figure 8-22. First the input signal (and the negative image) are frequency shifted by the NCO frequency as shown on the left. Next a digital filter is applied (centered around 0 Hz) and the output data rate is decimated - in this example the output data rate $F_{S,OUT} = F_S/8$ with a Nyquist zone of $F_S/16$. During the complex mixing the spectrum (signal and noise) is split into real and complex parts and thus the amplitude is reduced by 6-dB. In order to compensate this loss, there is a 6-dB digital gain option in the decimation filter block that can be enabled via SPI write.

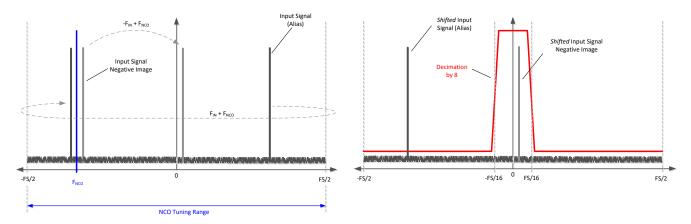

Figure 8-22. Complex decimation illustration

The real decimation operation is illustrated with an example in Figure 8-23. There is no frequency shift happening and only the real portion of the complex digital filter is exercised. The output data rate is decimated - a decimation of 8 would result in an output data rate $F_{S,OUT} = F_S/8$ with a Nyquist zone of $F_S/16$.

During the real mixing the spectrum (signal and noise) amplitude is reduced by 3-dB. In order to compensate this loss, there is a 3-dB digital gain option in the decimation filter block that can be enabled via SPI write.

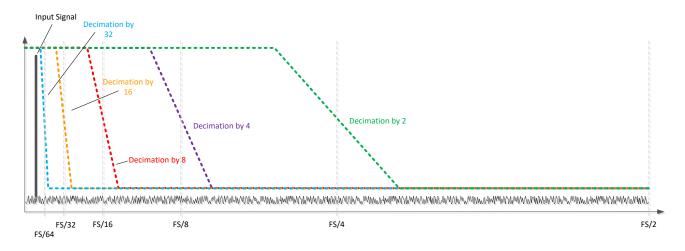

Figure 8-23. Real decimation illustration

8.3.4.2.1 FS/4 Mixing with Real Output

In this mode, the output after complex decimation gets mixed with FS/4 (FS = output data rate in this case). Instead of a complex output with the input signal centered around 0 Hz, the output is transmitted as a real output at twice the data rate and the signal is centered around FS/4 (Fout/4) as illustrated in Figure 8-24.

In this example, complex decimation by 8 is used. The output data is transmitted as a real output with an output rate of Fout = FS'/4 (FS' = ADC sampling rate). The input signal is now centered around FS/4 (Fout/4) or FS'/16.

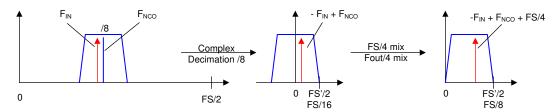

Figure 8-24. FS/4 Mixing with real output

8.3.4.3 Numerically Controlled Oscillator (NCO) and Digital Mixer

The decimation block is equipped with a 32-bit NCO and a digital mixer to fine tune the frequency placement prior to the digital filtering. The oscillator generates a complex exponential sequence of:

e^{jωn} (default) or e^{-jωn}

where: frequency (ω) is specified as a signed number by the 32-bit register setting

The complex exponential sequence is multiplied with the real input from the ADC to mix the desired carrier to a frequency equal to f_{IN} + f_{NCO} . The NCO frequency can be tuned from $-F_S/2$ to $+F_S/2$ and is processed as a signed, 2s complement number. After programming a new NCO frequency, the MIXER RESTART register bit or SYNC pin has to be toggled for the new frequency to get active. Additionally the ADC364x provides the option via SPI to invert the mixer phase.

The NCO frequency setting is set by the 32-bit register value given and calculated as:

NCO frequency = 0 to + $F_S/2$: NCO = $f_{NCO} \times 2^{32} / F_S$

NCO frequency = $-F_S/2$ to 0: NCO = $(f_{NCO} + F_S) \times 2^{32} / F_S$

where:

- NCO = NCO register setting (decimal value)
- f_{NCO} = Desired NCO frequency (MHz)
- F_S = ADC sampling rate (MSPS)

The NCO programming is further illustrated with this example:

- ADC sampling rate $F_S = 65 \text{ MSPS}$
- Input signal $f_{IN} = 10 \text{ MHz}$
- Desired output frequency f_{OUT} = 0 MHz

For this example there are actually four ways to program the NCO and achieve the desired output frequency as shown in Table 8-2.

Table 8-2	. NCO value ca	alculations	example
	NCO Value	Mixer	F

Alias or negative image	f _{NCO}	NCO Value	Mixer Phase	Frequency translation for f _{OUT}
$f_{IN} = -10 \text{ MHz}$	f _{NCO} = 10 MHz	660764199	as is	$f_{OUT} = f_{IN} + f_{NCO} = -10 \text{ MHz} + 10 \text{ MHz} = 0 \text{ MHz}$
f _{IN} = 10 MHz	f _{NCO} = -10 MHz	3634203097	as 15	$f_{OUT} = f_{IN} + f_{NCO} = 10 \text{ MHz} + (-10 \text{ MHz}) = 0 \text{ MHz}$
f _{IN} = 10 MHz	f _{NCO} = 10 MHz	660764199	inverted	$f_{OUT} = f_{IN} - f_{NCO} = 10 \text{ MHz} - 10 \text{ MHz} = 0 \text{ MHz}$
f _{IN} = -10 MHz	f _{NCO} = -10 MHz	3634203097	iliverted	$f_{OUT} = f_{IN} - f_{NCO} = -10 \text{ MHz} - (-10 \text{ MHz}) = 0 \text{ MHz}$

8.3.4.4 Decimation Filter

The ADC364x supports complex decimation by 2, 4, 8, 16 and 32 with a pass-band bandwidth of ~ 80% and a stopband rejection of at least 85dB. Table 8-3 gives an overview of the pass-band bandwidth of the different decimation settings with respect to ADC sampling rate FS. In real decimation mode the output bandwidth is half of the complex bandwidth.

Table 8-3. Decimation Filter Summary and Maximum Available Output Bandwidth

REAL/COMPLEX DECIMATION	DECIMATION SETTING N	OUTPUT RATE	OUTPUT BANDWIDTH	OUTPUT RATE (FS = 65 MSPS)	OUTPUT BANDWIDTH (FS = 65 MSPS)
	2	FS / 2 complex	0.8 × FS / 2	32.5 MSPS complex	26 MHz
	4	FS / 4 complex	0.8 × FS / 4	16.25 MSPS complex	13 MHz
Complex	8	FS / 8 complex	0.8 × FS / 8	8.125 MSPS complex	6.5 MHz

	4	FS / 4 real	0.4 × FS / 4	16.25 MSPS	6.5 MHz
Real	8	FS / 8 real	0.4 × FS / 8	8.125 MSPS	3.25 MHz
	16	FS / 16 real	0.4 × FS / 16	4.0625 MSPS	1.625 MHz
	32	FS / 32 real	0.4 × FS / 32	2.03125 MSPS	0.8125 MHz

The decimation filter responses normalized tot he ADC sampling clock frequency are illustrated in . They are interpreted as follows:

Each figure contains the filter pass-band, transition band(s) and alias or stop-band(s) as shown in Figure 8-26 to Figure 8-35. The x-axis shows the offset frequency (after the NCO frequency shift) normalized to the ADC sampling rate F_S.

For example, in the divide-by-4 complex setup, the output data rate is F_S / 4 complex with a Nyquist zone of F_S / 8 or 0.125 × F_S . The transition band is centered around 0.125 × F_S and the alias transition band is centered at 0.375 × F_S (colored in blue). The stop-bands, which alias on top of the pass-band, are centered at 0.25 × F_S and 0.5 × F_S and are colored in red. The stop-band attenuation is greater than 85 dB.

8.3.4.5 SYNC

The PDN/SYNC pin can be used to synchronize multiple devices using an external SYNC signal. The PDN/SYNC pin can be configured via SPI (SYNC EN bit) from power down to synchronization functionality and is latched in by the rising edge of the sampling clock as shown in Figure 8-36.

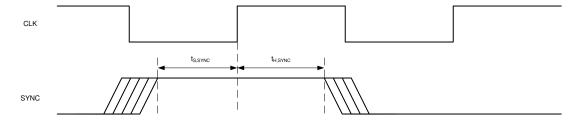

Figure 8-36. External SYNC timing diagram

The synchronization signal is only required when using the decimation filter - either using the SPI SYNC register or the PDN/SYNC pin. It resets internal clock dividers used in the decimation filter and aligns the internal clocks as well as I and Q data within the same sample. If no SYNC signal is given, the internal clock dividers is not be synchronized, which can lead to a fractional delay across different devices. The SYNC signal also resets the NCO phase and loads the new NCO frequency (same as the MIXER RESTART bit).

When trying to resynchronize during operation, the SYNC toggle should occur at 64*K clock cycles, where K is an integer. This provids the phase continuity of the clock divider.

8.3.4.6 Output Formatting with Decimation

8.3.4.6.1 Parallel CMOS

In parallel CMOS mode, the ADC364x device only supports real output with DDR CMOS interface as shown in Figure 8-37 (real decimation). Here the output format is selected to 14-bit since the parallel output bus only supports up to 14-bit.

DDR CMOS

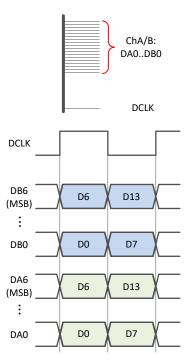

Figure 8-37. Output Data Format in Real Decimation

Table 8-4 illustrates the output interface data rate along with the corresponding DCLK frequency based on real decimation setting (M).

Furthermore the table shows an actual lane rate example with complex decimation by 4.

Table 8-4. Parallel CMOS Data Rate Examples with Decimation

REAL/COMPLEX DECIMATION	DECIMATION SETTING	ADC SAMPLING RATE	DDR CMOS	DCLK	DOUT
Real	M	F _S	DDR	F _S / M	F _S x 2 / M
iteai	4	65 MHz	DDR	16.25 MHz	32.5 MHz

8.3.4.6.2 Serialized CMOS

In serialized CMOS mode, the ADC364x device supports complex decimation output Figure 8-38 and real decimation output Figure 8-39. The examples are shown for 16-bit output for 2-wire (8x serialization) and 1-wire (16x serialization).

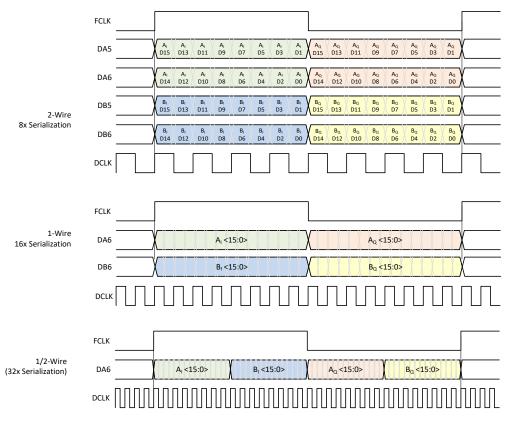

Figure 8-38. Output Data Format in Complex Decimation

Table 8-5 illustrates the output interface data rate along with the corresponding DCLK/DCLKIN and FCLK frequencies based on output resolution (R), number of serial CMOS lanes (L) and complex decimation setting (N).

Furthermore the table shows an actual lane rate example for the 2-, 1- and 1/2-wire interface, 16-bit output resolution and complex decimation by 16.

Table 8-5. Serial CMOS Lane Rate Examples with Complex Decimation and 16-bit Output Resolution

DECIMATION SETTING	ADC SAMPLING RATE	OUTPUT RESOLUTION	# of WIRES	FCLK	DCLKIN, DCLK	DOUT
N	F _S	R	L	F _S /N	[DOUT] / 2	F _S x 2 x R/L/N
	65 MSDS		2	4.0625 MHz	32.5 MHz	65 MHz
16	65 MSPS	16	1	4.0023 WII IZ	65 MHz	130 MHz
	62.5 MSPS		1/2	3.90625 MHz	125 MHz	250 MHz

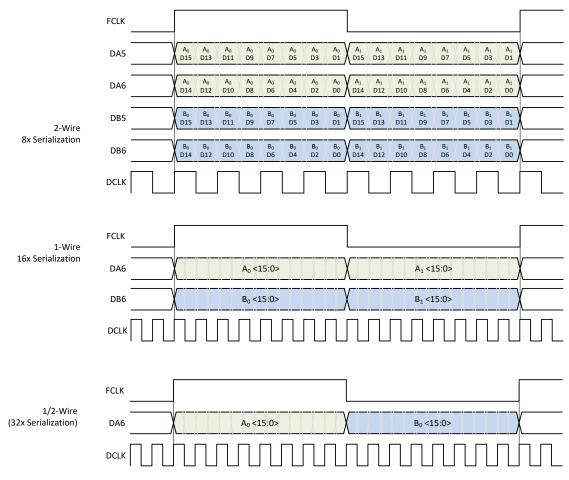

Figure 8-39. Output Data Format in Real Decimation

Table 8-6 illustrates the output interface data rate along with the corresponding DCLK/DCLKIN and FCLK frequencies based on output resolution (R), number of serial CMOS lanes (L) and real decimation setting (M).

Furthermore the table shows an actual lane rate example for the 2-, 1- and 1/2-wire interface, 16-bit output resolution and real decimation by 16.

Table 8-6. Serial CMOS Lane Rate Examples with Real Decimation and 16-bit Output Resolution

DECIMATION SETTING	ADC SAMPLING RATE	OUTPUT RESOLUTION	# of WIRES	FCLK	DCLKIN, DCLK	DOUT
М	Fs	R	L	F _S / M / 2 (L = 2) F _S / M (L = 1, 1/2)	[DOUT] / 2	F _S x R / L / M
			2	2.03125 MHz	16.25 MHz	32.5 MHz
16	65 MSPS	16	1	4.0625 MHz	32.5 MHz	65 MHz
			1/2	4.0025 WIFIZ	65 MHz	130 MHz

8.3.5 Digital Interface

The ADC364x family supports two different CMOS output modes - parallel DDR output and serialized CMOS output formats.

8.3.5.1 Parallel CMOS Output

The low power CMOS interface supports a double data rate (DDR) output interface. In DDR output mode the output clock is generated inside the ADC364x. The digital interface can be configured using SPI register writes.

8.3.5.2 Serialized CMOS output

In this mode the output data is serialized and transmitted over 2, 1 or 1/2 wires. Due to CMOS output speed limitation this mode is only available for reduced output data rates. This mode is similar to the multi-SPI interface.

In this operating mode, the ADC364x requires an external serial clock input (DCLKIN), which is used to transmit the data out of the ADC along with the data clock (DCLK). The phase relationship between DCLKIN and the sampling clock is irrelevant but both clocks need to be frequency locked. The serial CMOS interface is configured using SPI register writes.

8.3.5.2.1 SDR Output Clocking

The ADC364x provides a SDR output clocking option for all serial CMOS output modes (including decimation) which is enabled using the SPI interface. In serial CMOS mode by default the data is output on rising and falling edge of DCLK. In SDR clocking mode, DCLKIN has to be twice as fast as the default DCLKIN so that the output data are clocked out only on DCLK rising edge.

Internally DCLKIN is divided by 2 for data processing and this operation can add 1 extra clock cycle latency to the ADC latency.

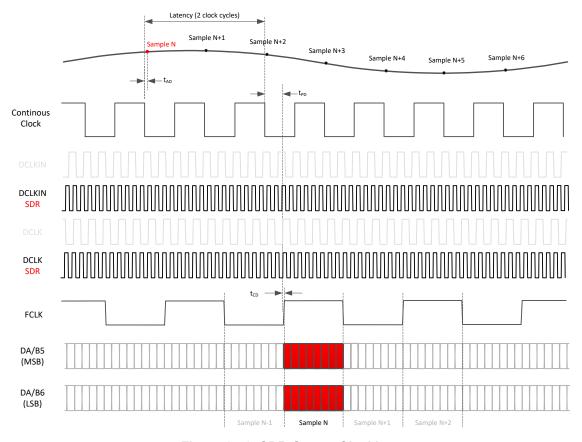

Figure 8-40. SDR Output Clocking

8.3.5.3 Output Data Format

The output data can be configured to two's complement (default) or offset binary formatting using SPI register writes (register 0x8F and 0x92). Table 8-7 provides an overview for minimum and maximum output codes for the two formatting options. The actual output resolution is set by the output bit mapper.

Table 8-7. Overview of minimum and maximum output codes vs output resolution for different formatting

	Two's Comple	ement (default)	Offset Binary		
RESOLUTION (BIT)	14	16	14	16	
$V_{IN,MAX}$	0x1FFF	0x7FFF	0x3FFF	0xFFFF	
0	0x0	000	0x2000	0x8000	
V _{IN,MIN}	0x2000	0x8000	8000 0x0000		

8.3.5.4 Output Formatter

The digital output interface uses a flexible output bit mapper as shown in Figure 8-41. The bit mapper takes the 14-bit output directly from the ADC or from digital filter block and reformats it to a resolution of 14, 16, 18 or 20-bit. With parallel output format the maximum output resolution supported is 14-bit. With serial CMOS output the output serialization factor gets adjusted accordingly for 2-, 1- and 1/2-wire interface mode. When using a higher resolution output in non-decimation mode, the 2 LSBs are set to 0. The maximum output data rate can not be exceeded independently of output resolution and serialization factor.

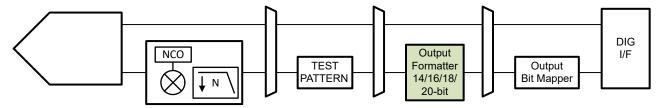

Figure 8-41. Interface output bit mapper

Table 8-8 provides an overview for the resulting serialization factor depending on output resolution and output modes. Note that the DCLKIN frequency needs to be adjusted accordingly as well. Changing the output resolution to 16-bit, 2-wire mode for example would result in DCLKIN = F_S * 4 instead of * 3.5.

The output bit mapper can be used for bypass and decimation filter.

Table 8-8. Serialization factor vs output resolution for different output modes

OUTPUT RESOLUTION	Interface	SERIALIZATION	FCLK	DCLKIN	DCLK	D0/D1
	2-Wire	7x	F _S /2	F _S * 3.5	F _S * 3.5	F _S * 7
14-bit (default)	1-Wire	14x	F _S	F _S * 7	F _S * 7	F _S * 14
	½-Wire	28x	F _S	F _S * 14	F _S * 14	F _S * 28
	2-Wire	8x	F _S /2	F _S * 4	F _S * 4	F _S * 8
16-bit	1-Wire	16x	F _S	F _S * 8	F _S * 8	F _S * 16
	½-Wire	32x	F _S	F _S * 16	F _S * 16	F _S * 32
	2-Wire	9x	F _S /2	F _S * 4.5	F _S * 4.5	F _S * 9
18-bit	1-Wire	18x	F _S	F _S * 9	F _S * 9	F _S * 18
	½-Wire	36x	F _S	F _S * 18	F _S * 18	F _S * 36
	2-Wire	10x	F _S /2	F _S * 5	F _S * 5	F _S * 10
20-bit	1-Wire	20x	F _S	F _S * 10	F _S * 10	F _S * 20
	½-Wire	40x	F _S	F _S * 20	F _S * 20	F _S * 40

The programming sequence to change the output interface and/or resolution from default settings is shown in Section 8.3.5.6.

8.3.5.5 Output Bit Mapper

The output bit mapper allows to change the output bit order for any selected interface mode.

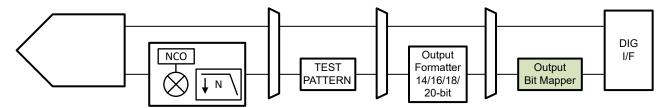

Figure 8-42. Output Bit Mapper

It is a two step process to change the output bit mapping and assemble the output data bus:

- 1. Both channel A and B can have up to 20-bit output. Each output bit of either channel has a unique identifier bit as shown in the Table 8-9 below. The MSB starts with bit D19 depending on output resolution chosen the LSB would be D6 (14-bit) to D0 (20-bit). The 'previous sample' is only needed in 2-w mode.
- 2. The bit mapper is then used to assemble the output sample. The following sections detail how to remap both a parallel and a serial output format.

Table 8-9. Unique identifier of each data bit

5.4	Bit Channel A Channel B										
Bit	Chan	nei A	Chan	nei B							
	Previous sample (2-w only)	Current sample	Previous sample (2-w only)	Current sample							
D19 (MSB)	0x2D	0x6D	0x29	0x69							
D18	0x2C	0x6C	0x28	0x68							
D17	0x27	0x67	0x23	0x63							
D16	0x26	0x66	0x22	0x62							
D15	0x25	0x65	0x21	0x61							
D14	0x24	0x64	0x20	0x60							
D13	0x1F	0x5F	0x1B	0x5B							
D12	0x1E	0x5E	0x1A	0x5A							
D11	0x1D	0x5D	0x19	0x59							
D10	0x1C	0x5C	0x18	0x58							
D9	0x17	0x57	0x13	0x53							
D8	0x16	0x56	0x12	0x52							
D7	0x15	0x55	0x11	0x51							
D6	0x14	0x54	0x10	0x50							
D5	0x0F	0x4F	0x0B	0x4B							
D4	0x0E	0x4E	0x0A	0x4A							
D3	0x0D	0x4D	0x09	0x49							
D2	0x0C	0x4C	0x08	0x48							
D1	0x07	0x47	0x03	0x43							
D0 (LSB)	0x06	0x46	0x02	0x42							

In **parallel DDR** mode, a data bit (with unique identifier) needs to be assigned to each output pin for both the rising and the falling edge of the DCLK using the register addresses as shown in Figure 8-43. The example on the right shows the output data bus remapped to where all 14 bit of channel A is output on DCLK rising edge followed by all 14 bit of channel B on DCLK falling edge.

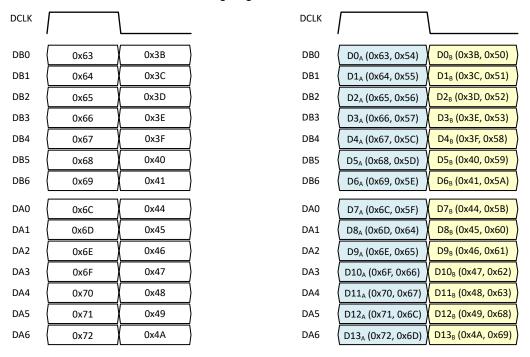

Figure 8-43. DDR output timing diagram with output mapping (left) and example (right)

In the serial output mode, a data bit (with unique identifier) needs to be assigned to each location within the serial output stream. There are a total of 40 addresses available per channel. Channel A spans from address 0x39 to 0x60 and channel B from address 0x61 to 0x88. When using complex decimation, the output bit mapper is applied to both the "I" and the "Q" sample.

2-wire mode: in this mode both the current and the previous sample have to be used in the address space as shown in Figure 8-44 below. The address order is different for 14/18-bit and 16/20-bit. Note: there are unused addresses between samples for resolution less than 20-bit (grey back ground), which can be skipped if not used.

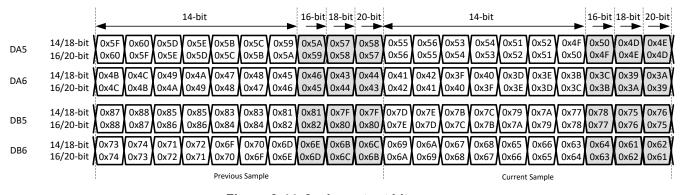

Figure 8-44. 2-wire output bit mapper

In the following example (Figure 8-45), the 16-bit 2-wire serial output is reordered to where lane DA5/DB5 carries the 8 MSB and lane DA6/DB6 carries 8 LSBs.

	Previous Sample							Current Sample								
DA5	D19 _A	D18 _A	D17 _A	D16 _A	D15 _A	D14 _A	D13 _A	D12 _A	D19 _A	D18 _A	D17 _A	D16 _A	D15 _A	D14 _A	D13 _A	D12 _A
	(0x60	(0x5F	(0x5E	(0x5D	(0x5C	(0x5B	(0x5A	(0x59	(0x56	(0x55	(0x54	(0x53	(0x52	(0x51	(0x50	(0x4F
	0x2D)	0x2C)	0x27)	0x26)	0x25)	0x24)	0x1F)	0x1E)	0x6D)	0x6C)	0x67)	0x66)	0x65)	0x64)	0x5F)	0x5E)

DB6	D11 _B	D10 _B	D9 _B	D8 _B	D7 _B	D6 _B	D5 _B	D4 _B	D11 _B	D10 _B	D9 _B	D8 _B	D7 _B	D6 _B	D5 _B	D4 _B
	(0x74	(0x73	(0x72	(0x71	(0x70	(0x6F	(0x6E	(0x6D	(0x6A	(0x69	(0x68	(0x67	(0x66	(0x65	(0x64	(0x63
	0x19)	0x18)	0x13)	0x12)	0x11)	0x10)	0x0B)	0x0A)	0x59)	0x58)	0x53)	0x52)	0x51)	0x50)	0x4B)	0x4A)

Figure 8-45. Example: 2-wire output mapping

1-wire mode: Only the 'current' sample needs to programmed in the address space. If desired, it can be duplicated on DA5/DB5 as well (using addresses shown below) in order to have a redundant output. Lane DA5/DB5 needs to be powered up in that case.

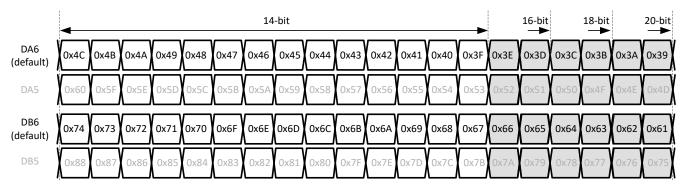

Figure 8-46. 1-wire output bit mapping

½-wire mode: The output is only on lane DA6 and the sample order is programmed into the 40 addresses of chA (from 0x39 to 0x60). It covers 2 samples (one for chA, one for chB) as shown below.

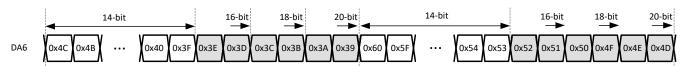

Figure 8-47. 1/2-wire output bit mapping

8.3.5.6 Output Interface/Mode Configuration

The following sequence summarizes all the relevant registers for changing the output interface and/or enabling the decimation filter. Steps 1 and 2 must come first since the E-Fuse load reset the SPI writes, the remaining steps can come in any order.

Table 8-10. Configuration steps for changing interface or decimation

STEP	FEATURE	ADDRESS	onfiguration steps for ch		RIPTION	IIation

8.3.5.6.1 Configuration Example

The following is a step by step programming example to configure the ADC364x to complex decimation by 8 with 1-wire serial CMOS and 16-bit output.

- 1. 0x07 (address) 0x6C (load bit mapper configuration for 16-bit output with 1-wire serial CMOS)
- 2. 0x13 0x01, wait 1 ms, 0x13 0x00 (load e-fuse)
- 3. 0x0A 0xFF, 0x0B 0xEE, 0x0C 0xFD (Power down unused CMOS output buffers to avoid contention)
- 4. 0x18 0x10 (DCLKIN EN for serial CMOS mode)
- 5. 0x19 0x82 (configure FCLK)
- 6. 0x1B 0x88 (select 16-bit output resolution)
- 7. 0x1F 0x50 (DCLKIN EN for serial CMOS mode)
- 8. 0x20 0xFF, 0x21 0xFF, 0x22 0x0F (configure FCLK pattern)
- 9. 0x24 0x06 (enable decimation filter)
- 10. 0x25 0x30 (configure complex decimation by 8)
- 11. 0x2A/B/C/D and 0x31/32/33/34 (program NCO frequency)
- 12. 0x27/0x2E 0x08 (configure Q-delay register bit)
- 13. 0x26 0xAA, 0x26 0x88 (set digital mixer gain to 6-dB and toggle the mixer update)

8.3.6 Test Pattern

In order to enable in-circuit testing of the digital interface, the following test patterns are supported and enabled via SPI register writes (0x14/0x15/0x16). The test pattern generator is located after the decimation filter as shown in Figure 8-48. In decimation mode (real and complex), the test patterns replace the output data of the DDC - however channel A controls the test patterns for both channels.

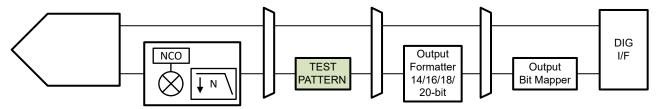

Figure 8-48. Test Pattern Generator

- RAMP Pattern: The step size needs to be configured in the CUSTOM PAT register according to the native resolution of the ADC. When selecting a higher output resolution then the additional LSBs will still be 0 in RAMP pattern mode.
 - 00001: 18-bit output resolution
 - 00100: 16-bit output resolution
 - 10000: 14-bit output resolution
- · Custom Pattern: Configured in the CUSTOM PAT register

8.4 Device Functional Modes

8.4.1 Normal operation

In normal operating mode, the entire ADC full scale range gets converted to a digital output with 14-bit resolution. The output is available in as little as 1 clock cycle on the digital CMOS outputs.

8.4.2 Power Down Options

A global power down mode can be enabled via SPI as well as using the power down pin (PDN/SYNC). There is an internal pull-down 21 $k\Omega$ resistor on the PDN/SYNC input pin and the pin is active high - so the pin needs to be pulled high externally to enter global power down mode.

The SPI register map provides the capability to enable/disable individual blocks directly or via PDN pin mask in order to trade off power consumption vs wake up time as shown in Table 8-11.

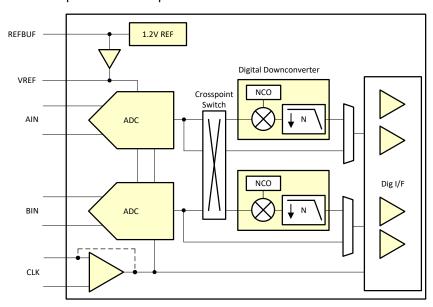

Figure 8-49. Power Down Configurations

Table 8-11. Overview of Power Down Options

Function/ Register	PDN via SPI	Mask for Global PDN	Feature - Default	Power Impact	Wake-up time	Comment
ADC	Yes	-	Enabled			Both ADC channels are included in Global PDN automatically
Reference gain amplifier	Yes		Enabled	~ 0.4 mA	~3 us	Should only be powered down in power down state.
Internal 1.2 V reference	Yes	Yes	External ref	~ 1-3.5 mA	~3 ms	Internal/external reference selection is available through SPI and REFBUF pin.
Clock buffer	Yes	1.55	Differential clock	~ 1 mA	n/a	Single ended clock input saves ~ 1mA compared to differential. Some programmability is available through the REFBUF pin.
Output interface drivers	Yes	-	Enabled	varies	n/a	Depending on output interface mode, unused output drivers can be powered down for maximum power savings
Decimation filter	Yes	-	Disabled	see electrical table	n/a	

8.5 Programming

The device is primarily configured and controlled using the serial programming interface (SPI); however, it can operate in a default configuration without requiring the SPI interface. Furthermore the power down function as well as internal/external reference configuration is possible via pin control (PDN/SYNC pin).

Note

The power down command (via PIN or SPI) only goes in effect with the ADC sampling clock present.

After initial power up, the default operating configuration for each device is shown in Table 8-12.

Table 8-12. Default device configuration after power up

FEATURE	ADC3641	ADC3642	ADC3643			
Signal Input		Differential				
Auto-zero	Enabled	Disabled				
Clock Input	Differential					
Reference		External				
Decimation		DDC Bypass				
Interface	DDR CMOS					
Output Format	2s compliment					

8.5.1 Configuration using PINs only

The ADC voltage reference can be selected using the REFBUF pin. Even though there is an internal 100 k Ω pull-up resistor to AVDD, the REFBUF pin should be set to a voltage externally and not left floating.

Table 8-13. REFBUF voltage levels control voltage reference selection

REFBUF VOLTAGE	VOLTAGE REFERENCE OPTION	CLOCKING OPTION	Digital Interface
> 1.7 V (Default)	External reference	Differential clock input	DDR CMOS
1.2 V (1.15-1.25V)	External 1.2V input on REFBUF pin using internal gain buffer	Differential clock input	DDR CMOS
0.5 - 0.7V	Internal reference	Differential clock input	DDR CMOS
< 0.1V	Internal reference	Single ended clock input	Serial CMOS 2-wire

8.5.2 Configuration using the SPI interface

The device has a set of internal registers that can be accessed by the serial interface formed by the SEN (serial interface enable), SCLK (serial interface clock) and SDIO (serial interface data input/output) pins. Serially shifting bits into the device is enabled when SEN is low. Serial data input are latched at every SCLK rising edge when SEN is active (low). The serial data are loaded into the register at every 24th SCLK rising edge when SEN is low. When the word length exceeds a multiple of 24 bits, the excess bits are ignored. Data can be loaded in multiples of 24-bit words within a single active SEN pulse. The interface can function with SCLK frequencies from 12 MHz down to very low speeds (of a few hertz) and also with a non-50% SCLK duty cycle.

8.5.2.1 Register Write

The internal registers can be programmed following these steps:

- 1. Drive the SEN pin low
- 2. Set the R/W bit to 0 (bit A15 of the 16-bit address) and bits A[14:12] in address field to 0.
- 3. Initiate a serial interface cycle by specifying the address of the register (A[11:0]) whose content is written and
- 4. Write the 8-bit data that are latched in on the SCLK rising edges

Figure 8-50 shows the timing requirements for the serial register write operation.

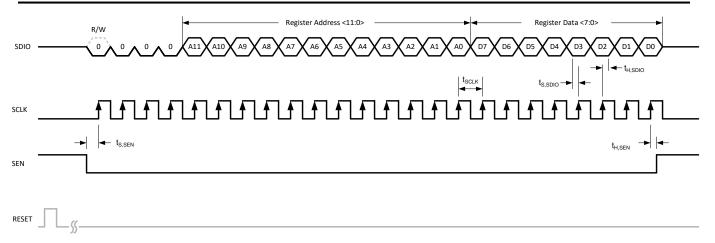

Figure 8-50. Serial Register Write Timing Diagram

8.5.2.2 Register Read

The device includes a mode where the contents of the internal registers can be read back using the SDIO pin. This readback mode can be useful as a diagnostic check to verify the serial interface communication between the external controller and the ADC. The procedure to read the contents of the serial registers is as follows:

- 1. Drive the SEN pin low
- 2. Set the R/W bit (A15) to 1. This setting disables any further writes to the registers. Set A[14:12] in address field to 0.
- 3. Initiate a serial interface cycle specifying the address of the register (A[11:0]) whose content must be read
- 4. The device outputs the contents (D[7:0]) of the selected register on the SDIO pin
- 5. The external controller can latch the contents at the SCLK falling edge

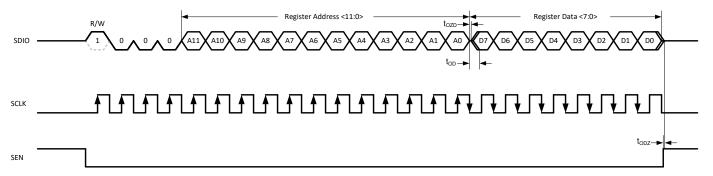

Figure 8-51. Serial Register Read Timing Diagram

				Tield Descriptions
Bit	Field	Туре	Reset	Description
7-5	OP IF MAPPER	R/W	000	Output interface mapper. This register contains the proper output interface bit mapping for the different interfaces. The interface bit mapping is internally loaded from e-fuses and also requires a fuse load command to go into effect (0x13, D0). Register 0x07 along with the E-Fuse Load (0x13, D0) needs to be loaded first in the programming sequence since the E-Fuse load resets the SPI writes. After initial reset the default output interface variant is loaded automatically from fuse internally. However when reading back this register reads 000 until a value is written using SPI. 001: 2-wire, 18 and 14-bit 010: 2-wire, 16-bit 011: 1-wire 100: 0.5-wire 101: DDR others: not used
4	0	R/W	0	Must write 0
3	OP IF EN	R/W	0	Enables changing the default output interface mode (D2-D0).
2-0	OP IF SEL	R/W	000	Selection of the output interface mode. OP IF EN (D3) needs to be enabled also. After initial reset the default output interface is loaded automatically from fuse internally. However when reading back this register reads 000 until a value is written using SPI. 001: DDR CMOS 011: 2-wire 100: 1-wire 101: 0.5-wire others: not used

Table 8-18. Register 0x0A/B/C Field Descriptions

Bit	Field	Туре	Reset	Description
7:0	CMOS OB DIS [23:0]	R/W	0	These register bits power down the individual CMOS output buffers. See Table 8-19 for the actual bit to pin mapping. Unused pins should be powered down (ie set to 1) for maximum power savings. Even though unused outputs don't toggle there is still a small amount of static power (< 1mA) that can be saved by disabling the output buffers. There is a separate control to enable the DCLKIN buffer in register 0x1F (D6) and 0x18 (D4). DCLK output buffer is powered down using register 0x1F (D4). NOTE: When using serial CMOS interface the CMOS output buffer (0x0A, D3 (DB1)) has to be powered down because it shares the pin with DCLKIN. O: Output buffer enabled 1: Output buffer powered down

Bit	Field	Туре	Reset	Description
7	SYNC PIN EN	R/W	0	This bit controls the functionality of the SYNC/PDN pin. 0: SYNC/PDN pin exercises global power down mode when pin is pulled high. 1: SYNC/PDN pin issues the SYNC command when pin is pulled high.
6	SPI SYNC	R/W	0	Toggling this bit issues the SYNC command using the SPI register write. SYNC using SPI must be enabled as well (D5). This bit doesn't self reset to 0. 0: Normal operation 1: SYNC command issued.
5	SPI SYNC EN	R/W	0	This bit enables synchronization using SPI instead of the SYNC/PDN pin. 0: Synchronization using SPI register bit disabled. 1: Synchronization using SPI register bit enabled.
4	0	R/W	0	Must write 0
3	REF CTL	R/W	0	This bit determines if the REFBUF pin controls the voltage reference selection or the SPI register (D2-D1). 0: The REFBUF pin selects the voltage reference option. 1: Voltage reference is selected using SPI (D2-D1) and single ended clock using D0.
2-1	REF SEL	R/W	00	Selects of the voltage reference option. REF CTRL (D3) must be set to 1. 00: Internal reference 01: External voltage reference (1.2V) using internal reference buffer (REFBUF) 10: External voltage reference 11: not used
0	SE CLK EN	R/W	0	Selects single ended clock input and powers down the differential sampling clock input buffer. REF CRTL (D3) must be set to 1. 0: Differential clock input 1: Single ended clock input

Bit	Field	Туре	Reset	Description
7-6	0	R/W	0	Must write 0
5	SE A	R/W	0	This bit enables single ended analog input, channel A. In this mode the SNR reduces by 3-dB. 0: Differential input 1: Single ended input
4	SE B	R/W	0	This bit enables single ended analog input, channel B. In this mode the SNR reduces by 3-dB. 0: Differential input 1: Single ended input
3	0	R/W	0	Must write 0
2	DLL PDN	R/W	0	This register applies ONLY to the ADC3643. It powers down the internal DLL, which is used to adjust the sampling time. This register must only be enabled when operating at sampling rates below 40 MSPS. When DLL PDN bit is enabled the sampling time is directly dependent on sampling clock duty cycle (with a 50/50 duty the sampling time is $T_{\rm S}/2$). 0: Sampling time is $T_{\rm S}/4$ 1: Sampling time is $T_{\rm S}/2$ (only for sampling rates below 40 MSPS).
1	0	R/W	0	Must write 0
0	AZ EN	R/W	0/1	This bit enables the internal auto-zero circuitry. It is enabled by default for the ADC3641/42 and disabled for the ADC3643. 0: Auto-zero disabled 1: Auto-zero enabled

9 Application and Implementation

Note

Information in the following applications sections is not part of the TI component specification, and TI does not warrant its accuracy or completeness. TI's customers are responsible for determining suitability of components for their purposes. Customers should validate and test their design implementation to confirm system functionality.

9.1 Typical Application

A spectrum analyzer is a typical frequency domain application for the ADC364x and its front end circuitry is similar to several other systems such as software defined radio (SDR), radar or communications. Some applications require frequency coverage including DC or near DC (such as, sonar), so it is included in this example.

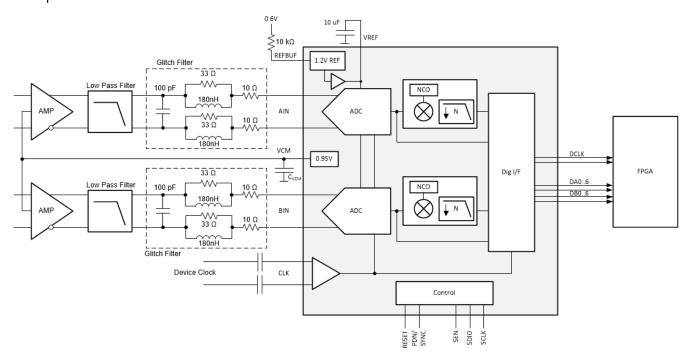

Figure 9-1. Typical configuration for a spectrum analyzer with DC support

9.1.1 Design Requirements

Frequency domain applications cover a wide range of frequencies from low input frequencies at or near DC in the 1st Nyquist zone to undersampling in higher Nyquist zones. If very low input frequency is supported then the input has to be DC coupled and the ADC driven by a fully differential amplifier (FDA). If low frequency support is not needed then AC coupling and use of a balun may be more suitable.

The internal reference is used since DC precision is not needed. However the ADC AC performance is highly dependent on the quality of the external clock source. If in-band interferers can be present then the ADC SFDR performance will be a key care about as well. A higher ADC sampling rate is desirable in order to relax the external anti-aliasing filter – an internal decimation filter can be used to reduce the digital output rate afterwards.

Table 9-1. Design key care-abouts

FEATURE	DESCRIPTION		
Signal Bandwidth	DC to 20 MHz		
Input Driver	Single ended to differential signal conversion and DC coupling		

Table 9-1. Design key care-abouts (continued)

FEATURE	DESCRIPTION
Clock Source	External clock with low jitter

When designing the amplifier/filter driving circuit, the ADC input full-scale voltage needs to be taken into consideration. For example, the ADC364x input full-scale is 2.25 Vpp. When factoring in ~ 1 dB for insertion loss of the filter, then the amplifier needs to deliver close to 2.5 Vpp. The amplifier distortion performance will degrade with a larger output swing and considering the ADC common mode input voltage the amplifier may not be able to deliver the full swing. The ADC364x provides an output common mode voltage of 0.95V and the THS4541 for example can only swing within 250 mV of its negative supply. A unipolar 3.3 V amplifier power supply will thus limit the maximum voltage swing to ~ 2.8Vpp. Additionally input voltage protection diodes may be needed to protect the ADC from over-voltage events.

Table 9-2. Output voltage swing of THS4541 vs power supply

DEVICE MIN OUTPUT VOLTAGE		MAX SWING WITH 3.3 V/ 0 V SUPPLY	
THS4541 VS- + 250 mV		2.8 Vpp	

9.1.2 Detailed Design Procedure

9.1.2.1 Input Signal Path

Depending on desired input signal frequency range the THS4551 and THS4541 provide very good low power options to drive the ADC inputs. Table 9-3 provides a comparison between the THS4551 and THS4541 and the power consumption vs usable frequency trade off.

Table 9-3. Fully Differential Amplifier Options

DEVICE	CURRENT (IQ) PER CHANNEL	USABLE FREQUENCY RANGE	
THS4561	0.8 mA	< 3 MHz	
THS4551	1.4 mA	< 10 MHz	
THS4541	10 mA	< 70 MHz	

The low pass filter design (topology, filter order) is driven by the application itself. However, when designing the low pass filter, the optimum load impedance for the amplifier should be taken into consideration as well. Between the low pass filter and the ADC input the sampling glitch filter needs to added as well as shown in Section 8.3.1.2.1. In this example the DC - 30 MHz glitch filter is selected.

9.1.2.2 Sampling Clock

Applications operating with low input frequencies (such as DC to 20 MHz) typically are less sensitive to performance degradation due to clock jitter. The internal ADC aperture jitter improves with faster rise and fall times (i.e. square wave vs sine wave). Table 9-4 provides an overview of the estimated SNR performance of the ADC364x based on different amounts of jitter of the external clock source. The SNR is estimated based on ADC364x thermal noise of 79 dBFS and input signal at -1dBFS.

Table 9-4. ADC SNR performance across vs input frequency for different amounts of external clock jitter

INPUT FREQUENCY	T _{J,EXT} = 100 fs	T _{J,EXT} = 250 fs	$T_{J,EXT}$ = 500 fs	T _{J,EXT} = 1 ps
5 MHz	79.0	79.0	78.9	78.7
10 MHz	79.0	78.9	78.7	78.0
20 MHz	78.8	78.6	77.9	75.9

Termination of the clock input should be considered for long clock traces.

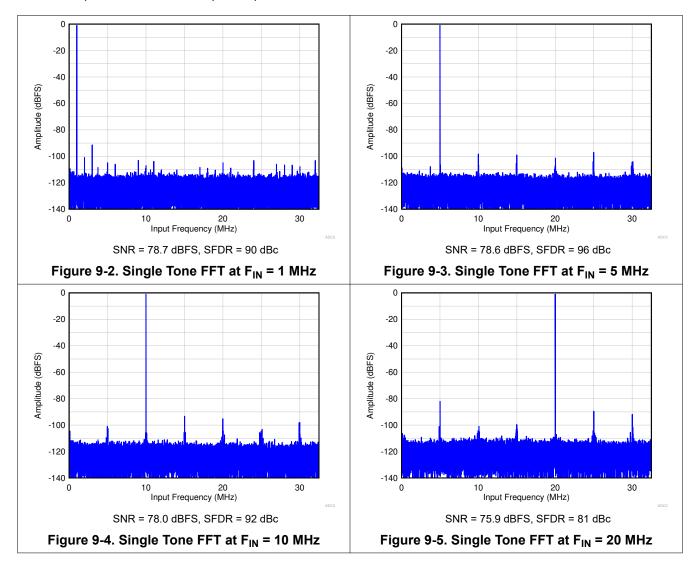

9.1.2.3 Voltage Reference

The ADC364x is configured to internal reference operation by applying 0.6 V to the REFBUF pin.

9.1.3 Application Curves

The following FFT plots show the performance of THS4541 driving the ADC364x operated at 65 MSPS with a full-scale input at -1 dBFS with input frequencies at 1, 5, 10 and 20 MHz.

9.2 Initialization Set Up

After power-up, the internal registers must be initialized to their default values through a hardware reset by applying a high pulse on the RESET pin, as shown in Figure 9-6.

- 1. Apply AVDD and IOVDD (no specific sequence required). After AVDD is applied the internal bandgap reference will power up and settle out in ~ 2ms.
- 2. Configure REFBUF pin (pull high or low even if configured via SPI later on) and apply the sampling clock.
- 3. Apply hardware reset. After hardware reset is released, the default registers are loaded from internal fuses and the internal power up capacitor calibration is initiated. The calibration takes approximately 200000 clock cycles.
- 4. Begin programming using SPI interface.

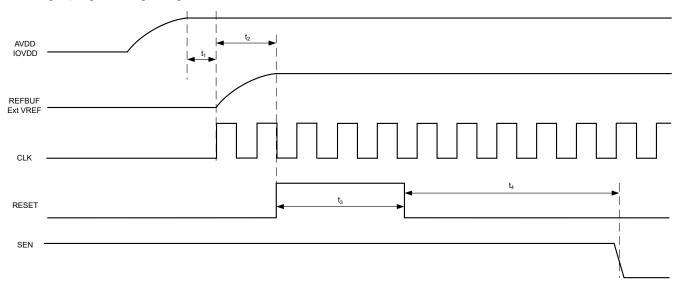

Figure 9-6. Initialization of serial registers after power up

	·				
		MIN	TYP	MAX	UNIT
t ₁	Power-on delay: delay from power up to logic level of REFBUF pin	2			ms
t ₂	Delay from REFBUF pin logic level to RESET rising edge	100			ns
t ₃	RESET pulse width	1			us
t ₄	Delay from RESET disable to SEN active	~ 200000			clock cycles

Table 9-5. Power-up timing

9.2.1 Register Initialization During Operation

If required, the serial interface registers can be cleared and reset to default settings during operation either:

- through a hardware reset or
- by applying a software reset. When using the serial interface, set the RESET bit (D0 in register address 0x00) high. This setting initializes the internal registers to the default values and then self-resets the RESET bit low. In this case, the RESET pin is kept low.

After hardware or software reset the wait time is also ~ 200000 clock cycles before the SPI registers can be programmed.

9.3 Power Supply Recommendations

The ADC364x requires two different power-supplies. The AVDD rail provides power for the internal analog circuits and the ADC itself while the IOVDD rail powers the digital interface and the internal digital circuits like decimation filter or output interface mapper. Power sequencing is not required.

The AVDD power supply must be low noise in order to achieve data sheet performance. In applications operating near DC, the 1/f noise contribution of the power supply needs to be considered as well. The ADC is designed for very good PSRR which aides with the power supply filter design.

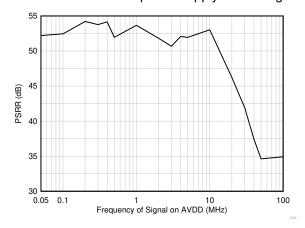

Figure 9-7. Power supply rejection ratio (PSRR) vs frequency

There are two recommended power-supply architectures:

- 1. Step down using high-efficiency switching converters, followed by a second stage of regulation using a low noise LDO to provide switching noise reduction and improved voltage accuracy.
- Directly step down the final ADC supply voltage using high-efficiency switching converters. This approach
 provides the best efficiency, but care must be taken to ensure switching noise is minimized to prevent
 degraded ADC performance.

TI WEBENCH Power Designer can be used to select and design the individual power-supply elements needed: see the WEBENCH Power Designer

Recommended switching regulators for the first stage include the TPS62821, and similar devices.

Recommended low dropout (LDO) linear regulators include the TPS7A4701, TPS7A90, LP5901, and similar devices.

For the switch regulator only approach, the ripple filter must be designed with a notch frequency that aligns with the switching ripple frequency of the DC/DC converter. Note the switching frequency reported from WEBENCH and design the EMI filter and capacitor combination to have the notch frequency centered as needed. Figure 9-8 and Figure 9-9 illustrate the two approaches.

AVDD and IOVDD supply voltages should not be shared in order to prevent digital switching noise from coupling into the analog signal chain.

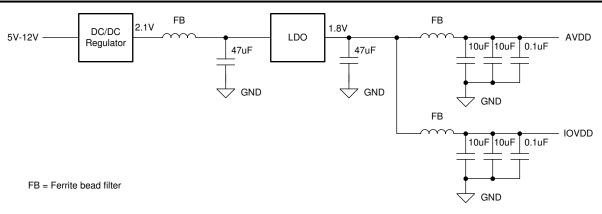

Figure 9-8. Example: LDO Linear Regulator Approach

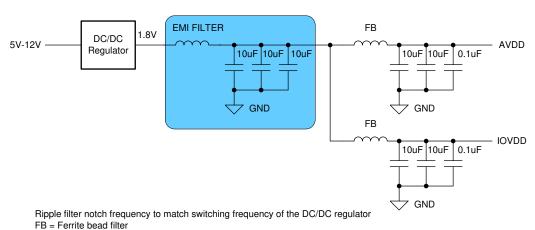

Figure 9-9. Example Switcher-Only Approach

9.4 Layout

9.4.1 Layout Guidelines

There are several critical signals which require specific care during board design:

- 1. Analog input and clock signals
 - Traces should be as short as possible and vias should be avoided where possible to minimize impedance discontinuities.
 - Traces should be routed using loosely coupled 100-Ω differential traces.
 - Differential trace lengths should be matched as close as possible to minimize phase imbalance and HD2 degradation.

2. Digital output interface

A 20 Ω series isolation resistor should be used on each CMOS output and placed close the digital output.
 This isolation resistor limits the output current into the capacitive load and thus minimizes the switching noise inside the ADC. When driving longer distances a buffer should be used. The resistor value should be optimized for the desired output data rate.

3. Voltage reference

- The bypass capacitor should be placed as close to the device pins as possible and connected between VREF and REFGND – on top layer avoiding vias.
- Depending on configuration an additional bypass capacitor between REFBUF and REFGND may be recommended and should also be placed as close to pins as possible on top layer.
- 4. Power and ground connections
 - Provide low resistance connection paths to all power and ground pins.
 - Use power and ground planes instead of traces.

- · Avoid narrow, isolated paths which increase the connection resistance.
- Use a signal/ground/power circuit board stackup to maximize coupling between the ground and power plane.

9.4.2 Layout Example

The following screen shot shows the top layer of the ADC364x EVM.

- Signal and clock inputs are routed as differential signals on the top layer avoiding vias.
- · Serial CMOS output interface lanes with isolation resistor and digital buffer.
- Bypass caps are close to the VREF pin on the top layer avoiding vias.

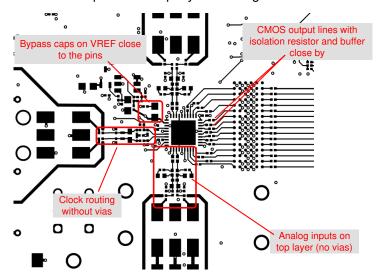

Figure 9-10. Layout example: top layer of ADC364x EVM

10 Device and Documentation Support

10.1 Receiving Notification of Documentation Updates

To receive notification of documentation updates, navigate to the device product folder on ti.com. Click on *Subscribe to updates* to register and receive a weekly digest of any product information that has changed. For change details, review the revision history included in any revised document.

10.2 Support Resources

TI E2E[™] support forums are an engineer's go-to source for fast, verified answers and design help — straight from the experts. Search existing answers or ask your own question to get the quick design help you need.

Linked content is provided "AS IS" by the respective contributors. They do not constitute TI specifications and do not necessarily reflect TI's views; see TI's Terms of Use.

10.3 Trademarks

TI E2E[™] is a trademark of Texas Instruments.

All trademarks are the property of their respective owners.

10.4 Electrostatic Discharge Caution

This integrated circuit can be damaged by ESD. Texas Instruments recommends that all integrated circuits be handled with appropriate precautions. Failure to observe proper handling and installation procedures can cause damage.

ESD damage can range from subtle performance degradation to complete device failure. Precision integrated circuits may be more susceptible to damage because very small parametric changes could cause the device not to meet its published specifications.

10.5 Glossary

TI Glossary

This glossary lists and explains terms, acronyms, and definitions.

11 Mechanical, Packaging, and Orderable Information

The following pages include mechanical, packaging, and orderable information. This information is the most current data available for the designated devices. This data is subject to change without notice and revision of this document. For browser-based versions of this data sheet, refer to the left-hand navigation.

⁽¹⁾ Status: For more details on status, see our product life cycle.

Multiple part markings will be inside parentheses. Only one part marking contained in parentheses and separated by a "~" will appear on a part. If a line is indented then it is a continuation of the previous line and the two combined represent the entire part marking for that device.

⁽²⁾ Material type: When designated, preproduction parts are prototypes/experimental devices, and are not yet approved or released for full production. Testing and final process, including without limitation quality assurance, reliability performance testing, and/or process qualification, may not yet be complete, and this item is subject to further changes or possible discontinuation. If available for ordering, purchases will be subject to an additional waiver at checkout, and are intended for early internal evaluation purposes only. These items are sold without warranties of any kind.

⁽³⁾ RoHS values: Yes, No, RoHS Exempt. See the TI RoHS Statement for additional information and value definition.

⁽⁴⁾ Lead finish/Ball material: Parts may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead finish/Ball material values may wrap to two lines if the finish value exceeds the maximum column width.

⁽⁵⁾ MSL rating/Peak reflow: The moisture sensitivity level ratings and peak solder (reflow) temperatures. In the event that a part has multiple moisture sensitivity ratings, only the lowest level per JEDEC standards is shown. Refer to the shipping label for the actual reflow temperature that will be used to mount the part to the printed circuit board.

⁽⁶⁾ Part marking: There may be an additional marking, which relates to the logo, the lot trace code information, or the environmental category of the part.

TAPE AND REEL INFORMATION

TAPE DIMENSIONS + K0 - P1 - B0 W Cavity - A0 -

A0	Dimension designed to accommodate the component width
В0	Dimension designed to accommodate the component length
K0	Dimension designed to accommodate the component thickness
W	Overall width of the carrier tape
P1	Pitch between successive cavity centers

QUADRANT ASSIGNMENTS FOR PIN 1 ORIENTATION IN TAPE

*All dimensions are nominal

NOTES:

- 1. All linear dimensions are in millimeters. Any dimensions in parenthesis are for reference only. Dimensioning and tolerancing per ASME Y14.5M.
 2. This drawing is subject to change without notice.
- 3. The package thermal pad must be soldered to the printed circuit board for thermal and mechanical performance.

NOTES: (continued)

- 4. This package is designed to be soldered to a thermal pad on the board. For more information, see Texas Instruments literature number SLUA271 (www.ti.com/lit/slua271).
- 5. Vias are optional depending on application, refer to device data sheet. If any vias are implemented, refer to their locations shown on this view. It is recommended that vias under paste be filled, plugged or tented.

NOTES: (continued)

6. Laser cutting apertures with trapezoidal walls and rounded corners may offer better paste release. IPC-7525 may have alternate design recommendations.
