ADC3664-SEP ADC3664-EP 14-Bit, 125MSPS, Low Noise, Low Power Dual Channel ADC

1 Features

- Radiation tolerant (-SEP only):
  - Single-event latch-up (SEL) immune up to LET = 43 MeV-cm^2/mg
  - Single-event functional interrupt (SEFI) characterized up to LET = 43 MeV-cm^2/mg
  - Total ionizing dose (TID): 30krad(Si)
- Enhanced product (-EP and -SEP):
  - Meets ASTM E595 outgassing specification
  - Vendor item drawing (VID)
  - Temperature range: –55°C to 105°C
  - One fabrication, assembly, and test site
  - Gold bond wire, NiPdAu lead finish
  - Wafer lot traceability
  - Extended product life cycle
- Dual channel, 125MSPS ADC
- 14-bit resolution (no missing codes)
- Noise floor: –156.9dBFS/Hz
- Low power consumption: 100mW/ch (at 125MSPS)
- Latency: 2 clock cycles
- Voltage reference options:
  - External: 1 to 125MSPS
  - Internal: 100 to 125MSPS
- Input bandwidth: 200MHz (3dB)
- INL: ±2.6 LSB; DNL: ±0.9 LSB (typical)
- On-chip DSP (optional/bypassable)
  - Decimation by 2, 4, 8, 16, 32
  - 32-bit NCO
- Serial LVDS digital interface (2-, 1- and 1/2-wire)
- Small Footprint: 40 QFN (5 × 5mm) package
- Spectral performance (f_{IN} = 5MHz):
  - SNR: 77.5dBFS
  - SFDR: 84dBc HD2, HD3
  - SFDR: 92dBFS worst spur

2 Applications

- High-speed data acquisition
- Satellite optical communications payloads
- Satellite imaging payloads
- Satellite communication payloads
- Satellite RADAR and LIDAR payloads

3 Description

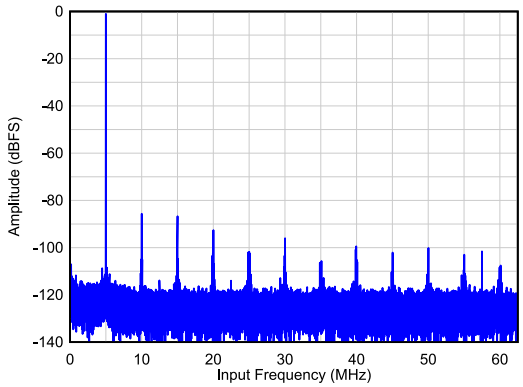
The ADC3664-xEP device is a low-noise, ultra-low power, 14-bit, 125MSPS, high-speed dual channel ADC. Designed for lowest noise performance, the device delivers a noise spectral density of -156.9dBFS/Hz combined with linearity and dynamic range. The ADC3664-xEP offers IF sampling support which makes the device designed for a wide range of applications. High-speed control loops benefit from the short latency as low as one clock cycle. The ADC consumes only 100mW/ch at 125MSPS, and the power consumption scales well with lower sampling rates.

The ADC3664-xEP uses a serial LVDS (SLVDS) interface to output the data which minimizes the number of digital interconnects. The device supports a two-lane, one-lane and half-lane option. The device supports an extended temperature range from –55°C to +105°C.

Package Information

PART NUMBER	PACKAGE(1)	PACKAGE SIZE(2)
ADC3664-SEP	VQFN (40)	5mm × 5mm
ADC3664-EP		

(1) For more information, see Section 12.
(2) The package size (length × width) is a nominal value and includes pins, where applicable.



Single Tone FFT at F_{IN} = 5MHz

Table of Contents

4 Pin Configuration and Functions

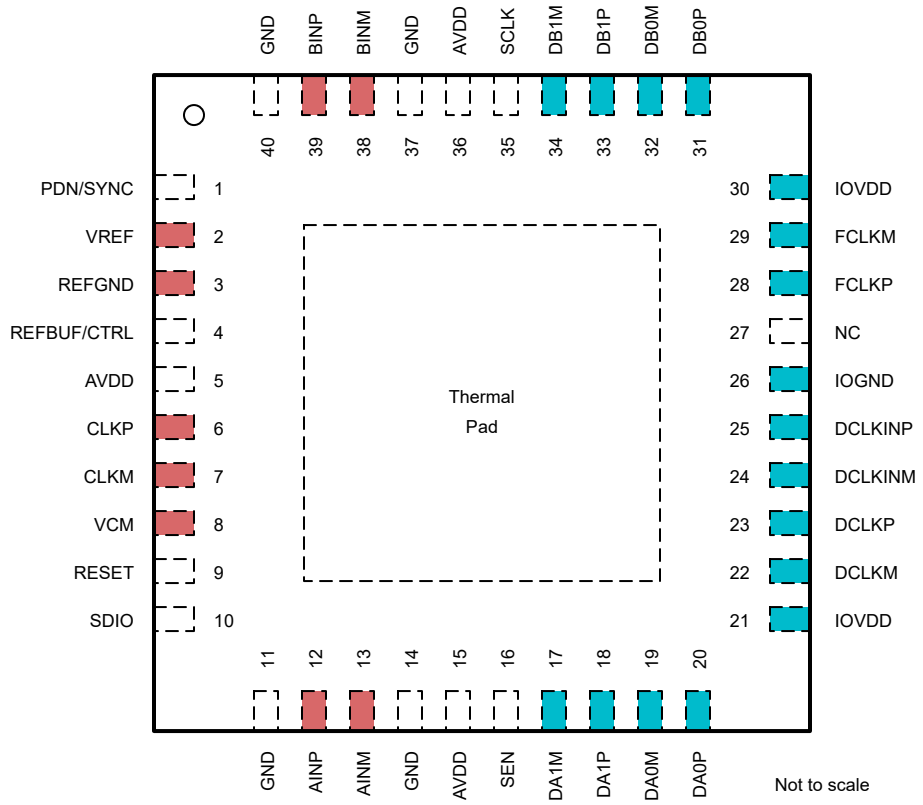


Figure 4-1. RSB (WQFN) Package, 40-Pin (Top View)

Table 4-1. Pin Functions

PIN		TYPE	DESCRIPTION
NAME	NO.		
INPUT/REFERENCE			
AINM	13	I	Negative analog input, channel A
AINP	12	I	Positive analog input, channel A
BINP	39	I	Positive analog input, channel B
BINM	38	I	Negative analog input, channel B
REFGND	3	I	Reference ground input, 0V
VCM	8	O	Common-mode voltage output for the analog inputs, 0.95V
VREF	2	I	External voltage reference input
CLOCK			
CLKM	7	I	Negative differential sampling clock input for the ADC
CLKP	6	I	Positive differential sampling clock input for the ADC
CONFIGURATION			
PDN/SYNC	1	I	Power down/Synchronization input. This pin is configured via the SPI interface. Active high. This pin has an internal 21kΩ pull-down resistor.

Table 4-1. Pin Functions (continued)

PIN		TYPE	DESCRIPTION
NAME	NO.		
REFBUF/ CTRL	4	I	This pin is used to configure the default sampling clock type and voltage reference source upon power up. There is an internal 100kΩ pull up resistor to AVDD.
RESET	9	I	Hardware reset. Active high. This pin has an internal 21kΩ pull-down resistor.
SCLK	35	I	Serial interface clock input. This pin has an internal 21kΩ pull-down resistor.
SDIO	10	I	Serial interface data input and output. This pin has an internal 21kΩ pull-down resistor.
SEN	16	I	Serial interface enable. Active low. This pin has an internal 21kΩ pull-up resistor to AVDD.
NC	27	-	Do not connect
DIGITAL INTERFACE			
DA0P	20	O	Positive differential serial LVDS output for lane 0, channel A.
DA0M	19	O	Negative differential serial LVDS output for lane 0, channel A.
DA1P	18	O	Positive differential serial LVDS output for lane 1, channel A.
DA1M	17	O	Negative differential serial LVDS output for lane 1, channel A.
DB0P	31	O	Positive differential serial LVDS output for lane 0, channel B.
DB0M	32	O	Negative differential serial LVDS output for lane 0, channel B.
DB1P	33	O	Positive differential serial LVDS output for lane 1, channel B.
DB1M	34	O	Negative differential serial LVDS output for lane 1, channel B.
DCLKP	23	O	Positive differential serial LVDS bit clock output.
DCLKM	22	O	Negative differential serial LVDS bit clock output.
FCLKP	28	O	Positive differential serial LVDS frame clock output.
FCLKM	29	O	Negative differential serial LVDS frame clock output.
DCLKINP	25	I	Positive differential serial LVDS bit clock input. Internal 100Ω differential termination.
DCLKINM	24	I	Negative differential serial LVDS bit clock input. Internal 100Ω differential termination.
POWER SUPPLY			
AVDD	5,15,36	I	Analog 1.8V power supply
GND	11,14,37,40, PowerPAD™	I	Ground, 0V
IOGND	26	I	Ground, 0V for digital interface
IOVDD	21,30	I	1.8V power supply for digital interface

5 Specifications

5.1 Absolute Maximum Ratings

over operating free-air temperature range (unless otherwise noted)(1)

PARAMETER	TEST CONDITIONS	MIN	MAX	UNIT
Supply voltage range, AVDD, IOVDD		–0.3	2.1	V
Supply voltage range, GND, IOGND, REFGND		–0.3	0.3	V
Voltage applied to input pins	AINP/M, BINP/M, CLKP/M, VREF, REFBUF	–0.3	MIN(2.1, AVDD+0.3)	V
	PDN/SYNC, RESET, SCLK, SEN, SDIO	–0.3	MIN(2.1, AVDD+0.3)	
	DCLKINP/M	–0.3	MIN(2.1, IOVDD+0.3)	
Junction temperature, T_J			125	°C
Storage temperature, T_{stg}		–65	150	°C

(1) Stresses beyond those listed under *Absolute Maximum Ratings* may cause permanent damage to the device. These are stress ratings only, which do not imply functional operation of the device at these or any other conditions beyond those indicated under *Recommended Operating Conditions*. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.

5.2 ESD Ratings

			VALUE	UNIT
$V_{(ESD)}$	Electrostatic discharge	Human body model (HBM), per ANSI/ESDA/JEDEC JS-001, all pins(1)	2500	V
		Charged device model (CDM), per JEDEC specification JESD22-C101, all pins(2)	1000	

(1) JEDEC document JEP155 states that 500-V HBM allows safe manufacturing with a standard ESD control process.
(2) JEDEC document JEP157 states that 250-V CDM allows safe manufacturing with a standard ESD control process.

5.3 Recommended Operating Conditions

over operating free-air temperature range (unless otherwise noted)

		MIN	NOM	MAX	UNIT
Supply voltage range	AVDD(1)	1.75	1.8	1.85	V
	IOVDD(1)	1.75	1.8	1.85	V
T_A	Operating free-air temperature	–55		105	°C
T_J	Operating junction temperature			105(2)	°C

(1) Measured to GND.
(2) Prolonged use above this junction temperature may increase the device failure-in-time (FIT) rate.

5.4 Thermal Information

THERMAL METRIC(1)		ADC3664-SEP RSB (QFN) 40 Pins	UNIT
$R_{\Theta JA}$	Junction-to-ambient thermal resistance	30.7	°C/W
$R_{\Theta JC(top)}$	Junction-to-case (top) thermal resistance	16.4	°C/W
$R_{\Theta JB}$	Junction-to-board thermal resistance	10.5	°C/W
Ψ_{JT}	Junction-to-top characterization parameter	0.2	°C/W
Ψ_{JB}	Junction-to-board characterization parameter	10.5	°C/W
$R_{\Theta JC(bot)}$	Junction-to-case (bottom) thermal resistance	2.0	°C/W

(1) For more information about traditional and new thermal metrics, see the *Semiconductor and IC Package Thermal Metrics* application report, SPRA953.

5.5 Electrical Characteristics - Power Consumption

Typical values are at T_A = 25°C, full temperature range is T_{MIN} = –55°C to T_{MAX} = 105°C, ADC sampling rate = 125 MSPS, 50% clock duty cycle, AVDD = IOVDD = 1.8 V, external 1.6V reference, and –1-dBFS differential input, unless otherwise noted

PARAMETER		TEST CONDITIONS	MIN	TYP	MAX	UNIT
ADC3664-SEP: 125 MSPS						
I_{AVDD}	Analog supply current	External reference		64	80	mA
I_{IOVDD}	I/O supply current	SLVDS 2-wire		47	72	
P_{DIS}	Power dissipation	External reference, 2-wire		200	274	mW
I_{IOVDD}	I/O supply current	2-wire, 1/2-swing		35		mA
		4x real decimation, 16-bit, 1-wire		50		
		16x real decimation, 16-bit, 1-wire		45		
		16x real decimation, 16-bit, 1/2-wire		41		
		4x complex decimation, 16-bit, 1-wire		57		
		8x complex decimation, 16-bit, 1-wire		54		
		8x complex decimation, 16-bit, 1/2-wire		50		
		16x complex decimation, 16-bit, 1-wire		50		
		16x complex decimation, 16-bit, 1/2-wire		47		
		32x complex decimation, 16-bit, 1-wire		48		
		32x complex decimation, 16-bit, 1/2-wire		43		
I_{AVDD}	Internal reference, additional analog supply current	Enabled via SPI		4		mA
	External 1.2V reference (REFBUF), additional analog supply current			0.5		
	Single ended clock input, reduces analog supply current by			1		
P_{DIS}	Power consumption in global power down mode	Default mask settings		12		mW

5.6 Electrical Characteristics - DC Specifications

Typical values at T_A = 25°C, full temperature range is T_{MIN} = –55°C to T_{MAX} = 105°C, ADC sampling rate = 125 MSPS, 50% clock duty cycle, AVDD = IOVDD = 1.8 V, 1.6 V external reference, and –1-dBFS differential input, unless otherwise noted

PARAMETER		TEST CONDITIONS	MIN	TYP	MAX	UNIT
DC ACCURACY						
No missing codes			14			bits
PSRR		F_{IN} = 1 MHz		35		dB
DNL	Differential nonlinearity	F_{IN} = 5 MHz	-1.8	± 0.9	+1.8	LSB
INL	Integral nonlinearity	F_{IN} = 5 MHz	-7.5	± 2.6	+7.5	LSB
V_{OS_ERR}	Offset error		-55	± 30	55	LSB
V_{OS_DRIFT}	Offset drift over temperature			± 0.06		LSB/ºC
$GAIN_{ERR}$	Gain error	External 1.6V Reference		± 2		%FSR
$GAIN_{DRIFT}$	Gain drift over temperature	External 1.6V Reference		± 57		ppm/ºC
$GAIN_{ERR}$	Gain error	Internal Reference		± 3		%FSR
$GAIN_{DRIFT}$	Gain drift over temperature	Internal Reference		106		ppm/ºC
Transition Noise				0.7		LSB
ADC ANALOG INPUT (AINP/M, BINP/M)						
FS	Input full scale	Differential		3.2		Vpp
V_{CM}	Input common model voltage		0.9	0.95	1.0	V
R_{IN}	Input resistance	Differential at DC		8		kΩ
C_{IN}	Input Capacitance	Differential at DC		5.4		pF
V_{OCM}	Output common mode voltage			0.95		V
BW	Analog Input Bandwidth (-3dB)			200		MHz
Internal Voltage Reference						
V_{REF}	Internal reference voltage			1.6		V
V_{REF} Output Impedance				8		Ω
Reference Input Buffer (REFBUF)						
External reference voltage				1.2		V
External voltage reference (VREF)						
V_{REF}	External voltage reference			1.6		V
Input Current				1		mA
Input impedance				5.3		kΩ
Clock Input (CLKP/M)						
Input clock frequency		External reference	1		125	MHz
		Internal reference	100		125	MHz
V_{ID}	Differential input voltage		0.5	1	3.6	Vpp
V_{CM}	Input common mode voltage			0.9		V
R_{IN}	Single ended input resistance to common mode			5		kΩ
C_{IN}	Single ended input capacitance			1.5		pF
Clock duty cycle			45	50	60	%

5.6 Electrical Characteristics - DC Specifications (continued)

Typical values at T_A = 25°C, full temperature range is T_{MIN} = –55°C to T_{MAX} = 105°C, ADC sampling rate = 125 MSPS, 50% clock duty cycle, AVDD = IOVDD = 1.8 V, 1.6 V external reference, and –1-dBFS differential input, unless otherwise noted

PARAMETER		TEST CONDITIONS	MIN	TYP	MAX	UNIT
Digital Inputs (RESET, PDN, SCLK, SEN, SDIO)						
V_{IH}	High level input voltage		1.4			V
V_{IL}	Low level input voltage				0.4	
I_{IH}	High level input current			90	150	uA
I_{IL}	Low level input current		-150	-90		uA
C_I	Input capacitance			1.5		pF
Digital Output (SDOUT)						
V_{OH}	High level output voltage	I_{LOAD} = -400 uA	IOVDD – 0.1	IOVDD		V
V_{OL}	Low level output voltage	I_{LOAD} = 400 uA			0.1	
SLVDS Interface

7 Detailed Description

7.1 Overview

The ADC3664-xEP is a low noise, ultra-low power 14-bit high-speed dual channel ADC supporting sampling rates up to 125MSPS. The device offers good DC precision together with IF sampling support. Making the device designed for a wide range of applications. The ADC3664-xEP is equipped with an on-chip internal reference option, but also supports the use of an external, high precision 1.6V voltage reference or an external 1.2V reference which is buffered and gained up internally. Because of the inherent low latency architecture, the digital output result is available after as low as one clock cycle on the digital output interface.

Note

The ADC3664-xEP supports the following sampling rates:

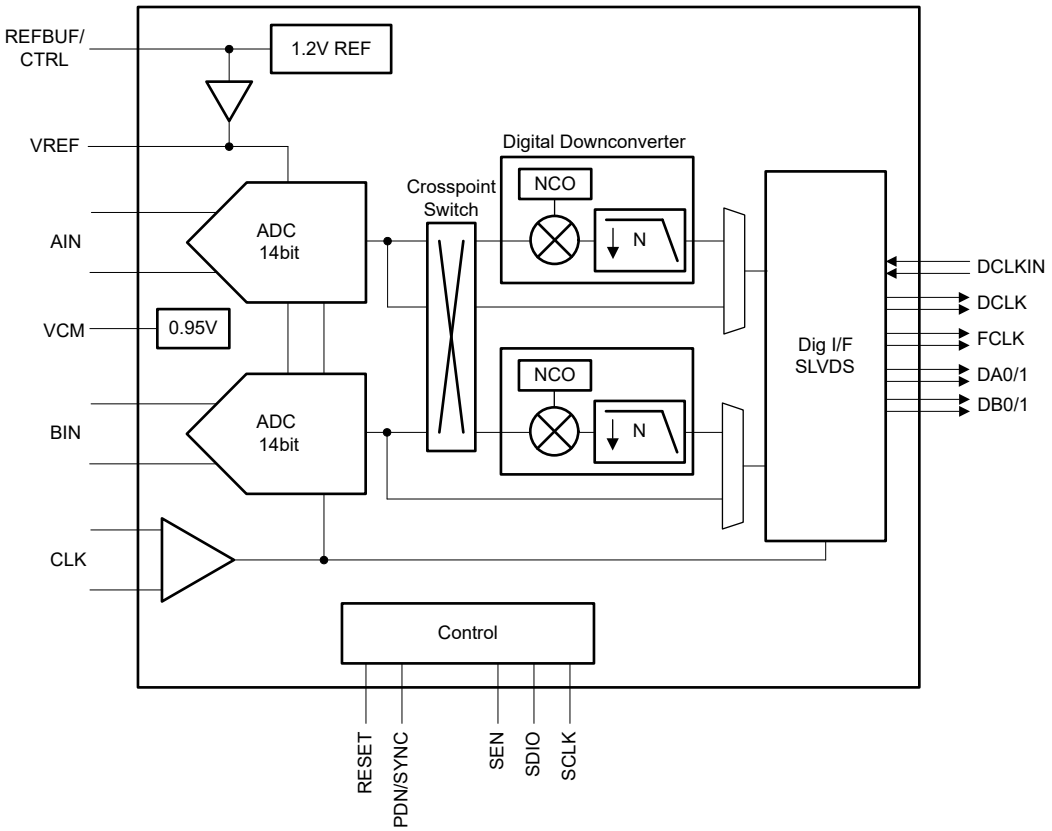
- External Reference: 1 to 125MSPS
- Internal Reference: 100 to 125MSPS

An optional programmable digital down converter enables external anti-alias filter relaxation as well as output data rate reduction. The digital filter provides a 32-bit programmable NCO and supports both real or complex decimation.

The ADC3664-xEP uses a serial LVDS (SLVDS) interface to output the data which minimizes the number of digital interconnects. The device supports a two-lane (2-wire), a one-lane (1-wire) and a half-lane (1/2-wire) option. The ADC3664-xEP includes a digital output formatter which supports output resolutions from 14 to 20-bit.

The device features and control options are set up either through pin configurations or via SPI register writes.

7.2 Functional Block Diagram



7.3 Feature Description

7.3.1 Analog Input

The analog inputs of ADC3664-xEP are intended to be driven differentially. Both AC coupling and DC coupling of the analog inputs is supported. The analog inputs are designed for an input common mode voltage of 0.95V which are provided externally on each input pin. DC-coupled input signals must have a common mode voltage that meets the device input common mode voltage range.

The equivalent input network diagram is shown in Figure 7-1. All four sampling switches, on-resistance shown in red are in same position (open or closed) simultaneously.

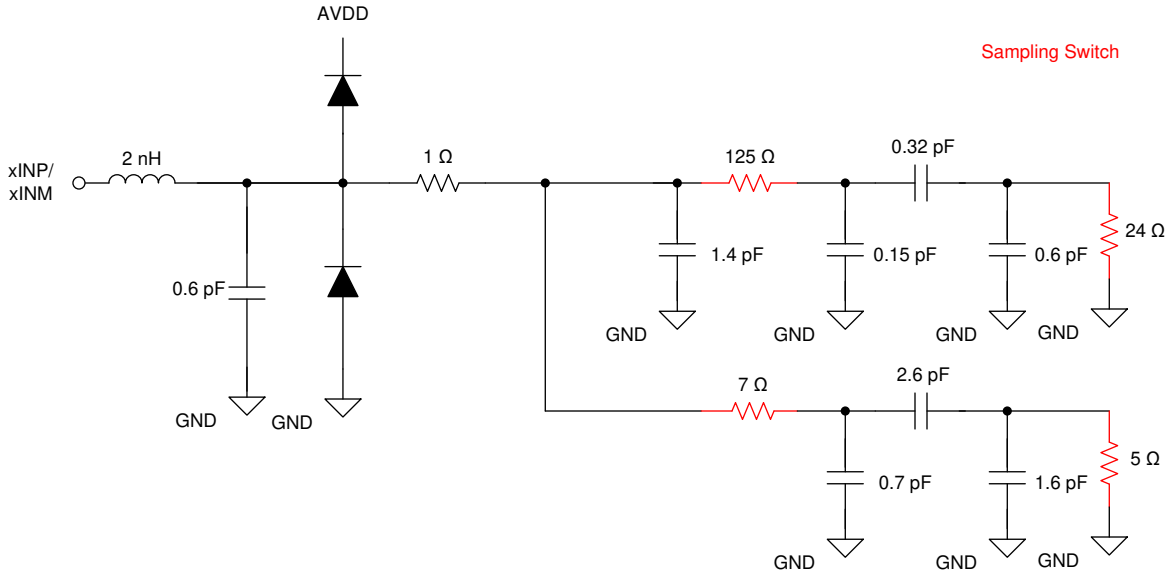


Figure 7-1. Equivalent Input Network

7.3.1.1 Analog Input Bandwidth

Figure 7-2 shows the analog full power input bandwidth of the ADC3664-xEP with a 50Ω differential termination. The −3dB bandwidth is approximately 1.4GHz and the useful input bandwidth with good AC performance is approximately 200MHz.

The equivalent differential input resistance R_{IN} and input capacitance C_{IN} vs frequency are shown in Figure 7-3.

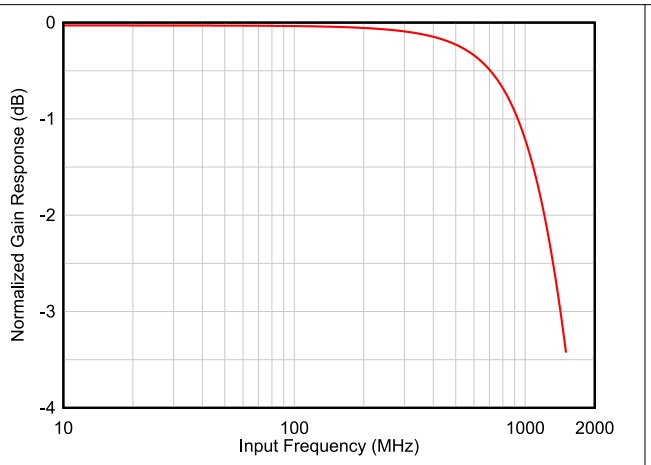

Figure 7-2. ADC Analog Input bandwidth response

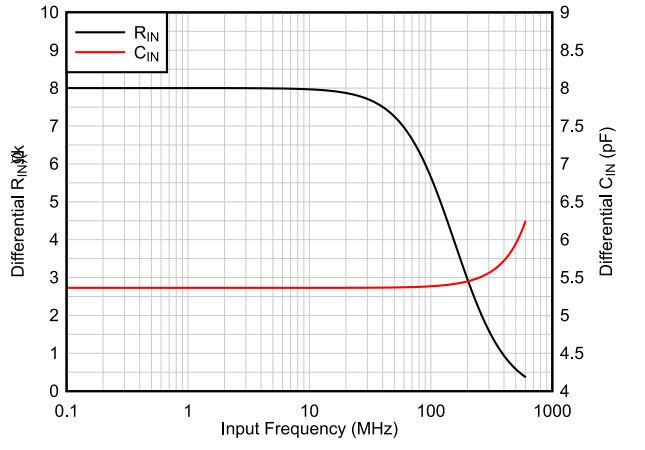

Figure 7-3. Equivalent R_{IN}/C_{IN} vs Input Frequency

7.3.1.2 Analog Front End Design

The ADC3664-xEP is an unbuffered ADC; thus, a passive kick-back filter is recommended to absorb the glitch from the sampling operation. Depending on if the input is driven by a balun or a differential amplifier with low output impedance, a termination network is needed. Additionally, a passive DC bias circuit is needed in AC-coupled applications which is combined with the termination network.

7.3.1.2.1 Sampling Glitch Filter Design

The front end sampling glitch filter is designed to optimize the SNR and HD3 performance of the ADC. The filter performance is dependent on input frequency; therefore, the following filter designs are recommended for different input frequency ranges as shown in Figure 7-4 and Figure 7-5 (assuming 50Ω source impedance).

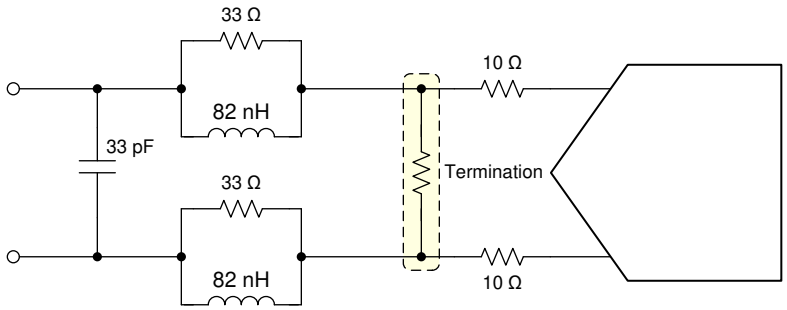

Figure 7-4. Sampling glitch filter example for input frequencies from DC to 60MHz

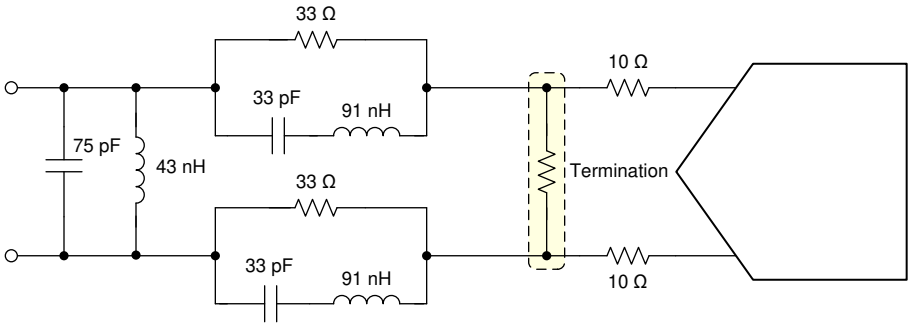

Figure 7-5. Sampling glitch filter example for input frequencies from 60 to 120MHz

7.3.1.2.2 Analog Input Termination and DC Bias

Depending on the input drive circuitry, a termination network and/or DC biasing needs to be provided.

7.3.1.2.2.1 AC-Coupling

The ADC3664-xEP requires external DC bias using the common mode output voltage (VCM) of the ADC together with the termination network as shown in Figure 7-6. The termination is located within the glitch filter network. When using a balun on the input, the termination impedance has to be adjusted to account for the turns ratio of the transformer. When using an amplifier, the termination impedance is adjusted to optimize the amplifier performance.

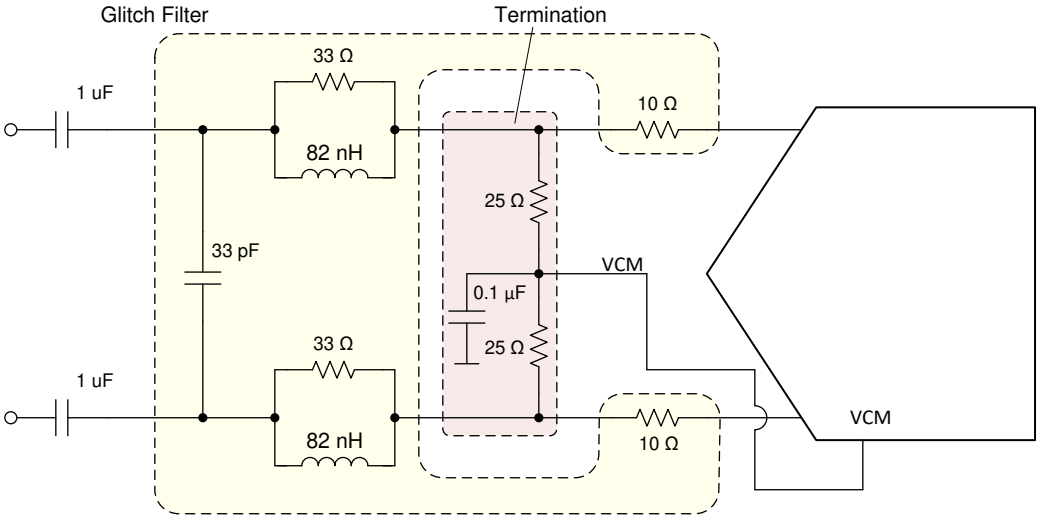

Figure 7-6. AC-Coupling: termination network provides DC bias (glitch filter example for up to 60MHz)

7.3.1.2.2.2 DC-Coupling

In DC coupled applications, the DC bias needs to be provided from the fully differential amplifier (FDA) using VCM output of the ADC as shown in Figure 7-7. The glitch filter in this case is located between the anti-alias filter and the ADC. No termination is needed if the amplifier is located close to the ADC, or if the termination is part of the anti-alias filter.

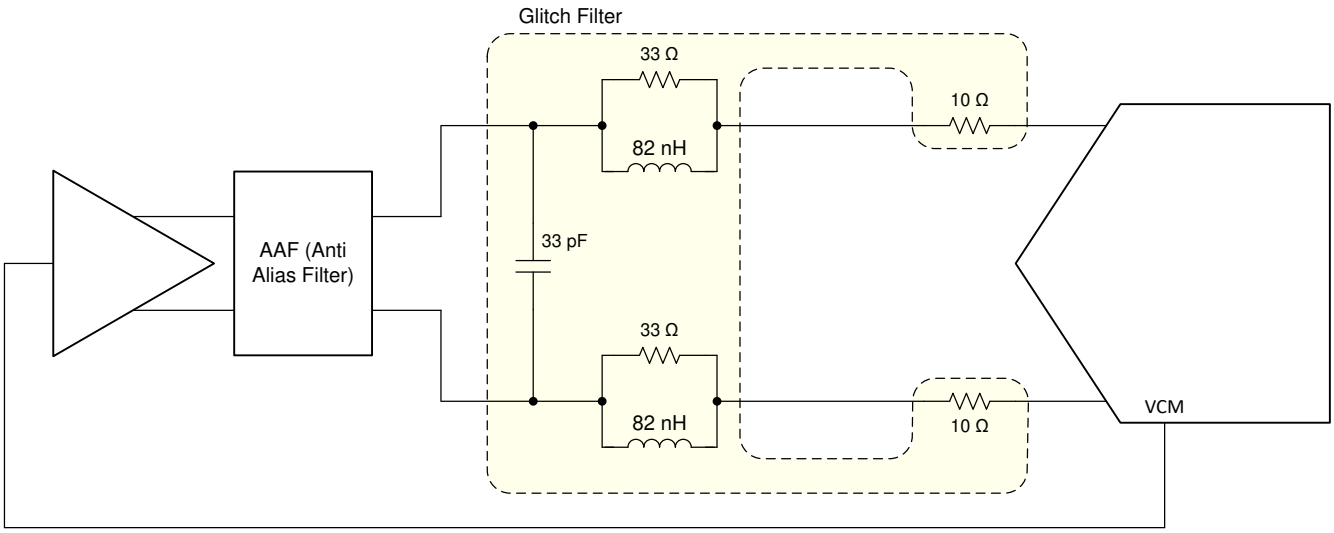

Figure 7-7. DC-Coupling: DC bias provided by FDA (glitch filter example for DC - 60MHz)

7.3.2 Clock Input

To maximize the ADC SNR performance, the external sampling clock should be low jitter and differential signaling with a high slew rate. This is especially important in IF sampling applications (Figure 7-8 and Figure 7-9). For less jitter sensitive applications, the ADC3664-xEP provides the option to operate with single ended signaling which saves additional power consumption.

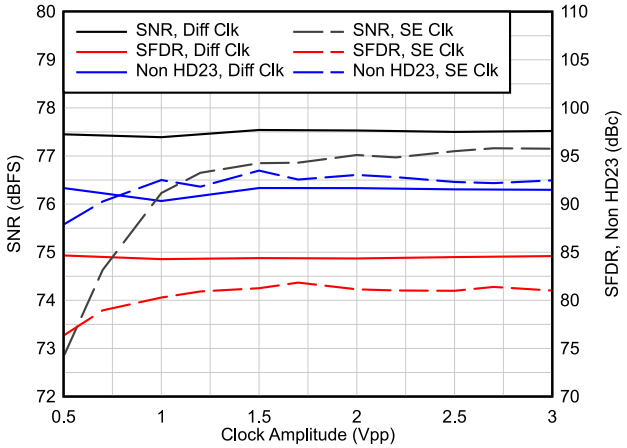

Figure 7-8. AC Performance vs Clock Amplitude for F_{IN} = 5MHz

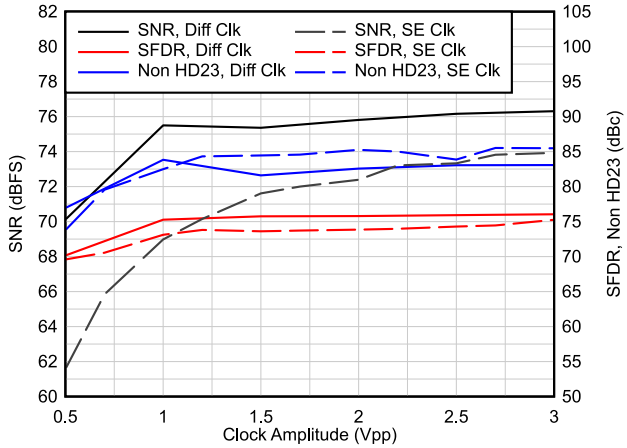

Figure 7-9. AC Performance vs Clock Amplitude for F_{IN} = 70MHz

7.3.2.1 Single Ended vs Differential Clock Input

The ADC3664-xEP is operated using a differential or a single ended clock input where the single ended clock consumes less power consumption. However, clock amplitude impacts the ADC aperture jitter and consequently the SNR. For maximum SNR performance, a large clock signal with fast slew rates needs to be provided.

- Differential Clock Input: The clock input is AC coupled externally. The device provides internal biasing for that use case.
- Single Ended Clock Input: This mode needs to be configured using SPI register (0x0E, D2 and D0) or with the REFBUF/CTRL pin. In this mode, there is no internal clock biasing; thus, the clock input needs to be DC coupled around a 0.9V center. The unused input needs to be AC coupled to ground.

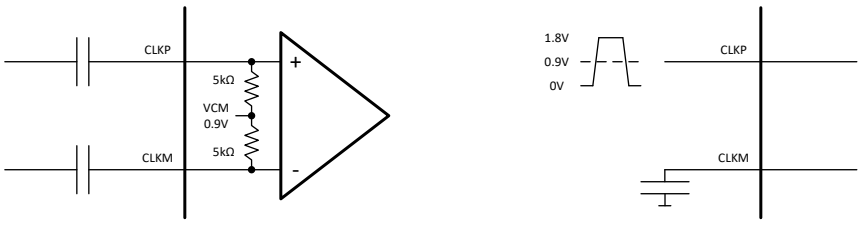

Figure 7-10. External and internal connection using differential (left) and single ended (right) clock input

7.3.3 Voltage Reference

The ADC3664-xEP provides three different options for supplying the voltage reference to the ADC. An external 1.6V reference is directly connected to the VREF input; a voltage 1.2V reference is connected to the REFBUF/CTRL input using the internal gain buffer or the internal 1.2V reference is enabled to generate a 1.6V reference voltage. For best performance, the reference noise should be filtered by connecting a 10µF and a 0.1µF ceramic bypass capacitor to the VREF pin. The internal reference circuitry of the ADC3664-xEP is shown in Figure 7-11.

Note

The voltage reference mode is selected using SPI writes or by using the REFBUF/CTRL pin (default) as a control pin (Section 7.5.1). If the REFBUF/CTRL pin is not used for configuration, the REFBUF/CTRL pin should be connected to AVDD (even though the REFBUF/CTRL pin has a weak internal pullup to AVDD) and the voltage reference option has to be selected using the SPI interface.

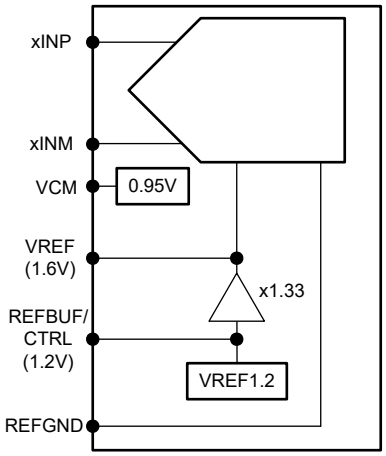

Figure 7-11. Different voltage reference options for ADC3664-xEP

7.3.3.1 Internal voltage reference

The 1.6V reference for the ADC is generated internal using the on-chip 1.2V reference along with the internal gain buffer. A 10µF and a 0.1µF ceramic bypass capacitor (C_{VREF}) must be connected between the VREF and REFGND pins as close to the pins as possible.

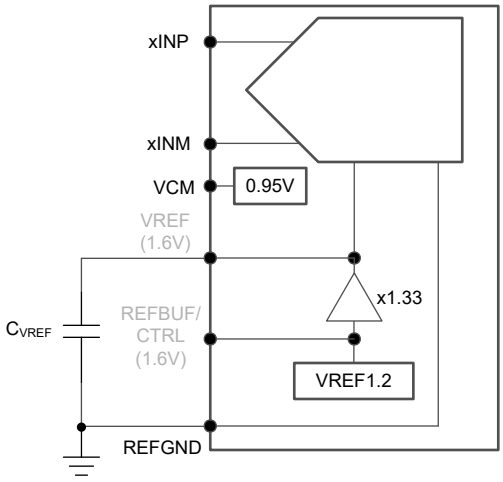

Figure 7-12. Internal reference

7.3.3.2 External voltage reference (VREF)

For highest accuracy and lowest temperature drift, connect the VREF input directly to an external 1.6V reference. A 10µF and a 0.1µF ceramic bypass capacitor (C_{VREF}) are connected between the VREF and REFGND pins and placed as close to the pins as possible is recommended. The load current from the external reference is about 1mA.

Note

The internal reference is also used for other functions inside the device; therefore, the reference amplifier must only be powered down in power down state, but not during normal operation.

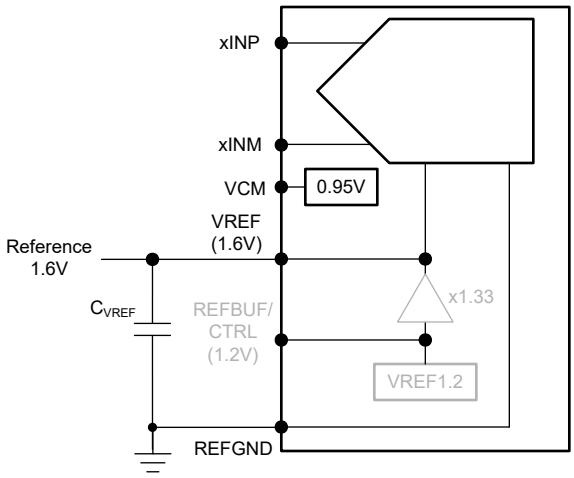

Figure 7-13. External 1.6V reference

7.3.3.3 External voltage reference with internal buffer (REFBUF/CTRL)

The ADC3664-xEP is equipped with an on-chip reference buffer that also includes gain to generate the 1.6V reference voltage from an external 1.2V reference. A 10µF and a 0.1µF ceramic bypass capacitor (C_{VREF}) between the VREF and REFGND pins and a 10uF and a 0.1µF ceramic bypass capacitor between the REFBUF/CTRL and REFGND pins are recommended. Both capacitors should be placed as close to the pins as possible. The load current from the external reference is less than 100µA.

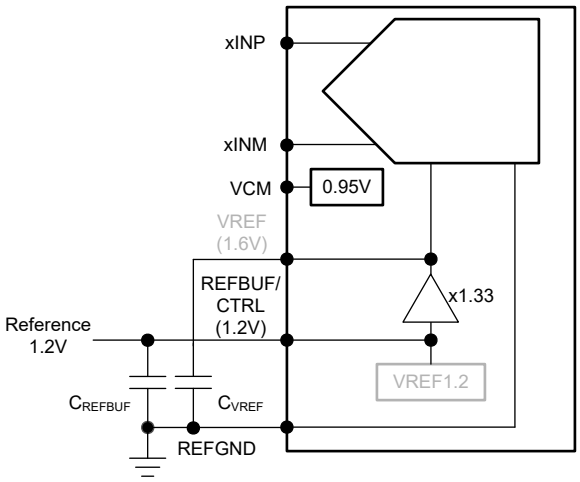

Figure 7-14. External 1.2V reference using internal reference buffer

7.3.4 Digital Down Converter

The ADC3664-xEP includes an optional on-chip digital down conversion (DDC) decimation filter that is enabled via SPI register settings. It supports complex decimation by 2, 4, 8, 16 and 32 using a digital mixer and a 32-bit numerically controlled oscillator (NCO) as shown in Figure 7-15. Furthermore, the device supports a mode with real decimation where the complex mixer is bypassed (NCO should be set to 0 for lowest power consumption) and the digital filter acts as a low pass filter.

Internally the decimation filter calculations are performed with a 20-bit resolution to avoid any SNR degradation due to quantization noise limitation. The Output Formatter truncates to the selected resolution prior to outputting the data on the digital interface.

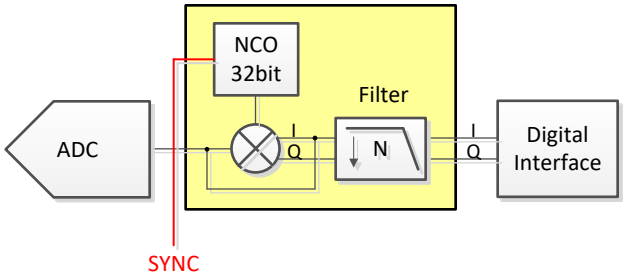

Figure 7-15. Internal Digital Decimation Filter

7.3.4.1 DDC MUX

The ADC3664-xEPcontains a MUX in front of the digital decimation filter which allows the ADC channel A input to be connected to the DDC of channel B.

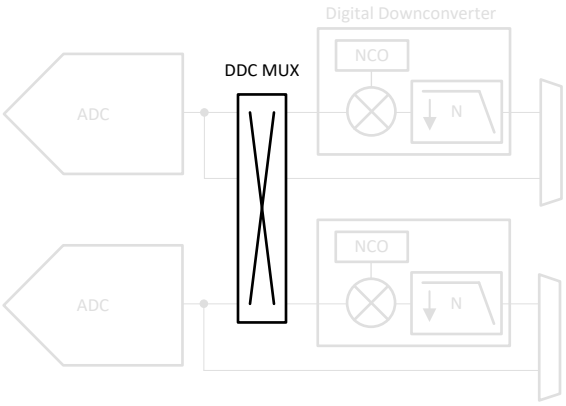

Figure 7-16. DDC MUX

7.3.4.2 Digital Filter Operation

The complex decimation operation is illustrated with an example in Figure 7-17. First the input signal (and the negative image) are frequency shifted by the NCO frequency as shown on the left. Next a digital filter is applied (centered around 0 Hz), and the output data rate is decimated. In this example, the output data rate $F_{S,OUT}$ = F_S/8 with a Nyquist zone of F_S/16. During the complex mixing, the spectrum (signal and noise) is split into real and complex parts, and thus, the amplitude is reduced by 6dB. To compensate this loss, there is a 6dB digital gain option in the decimation filter block that is enabled via SPI write.

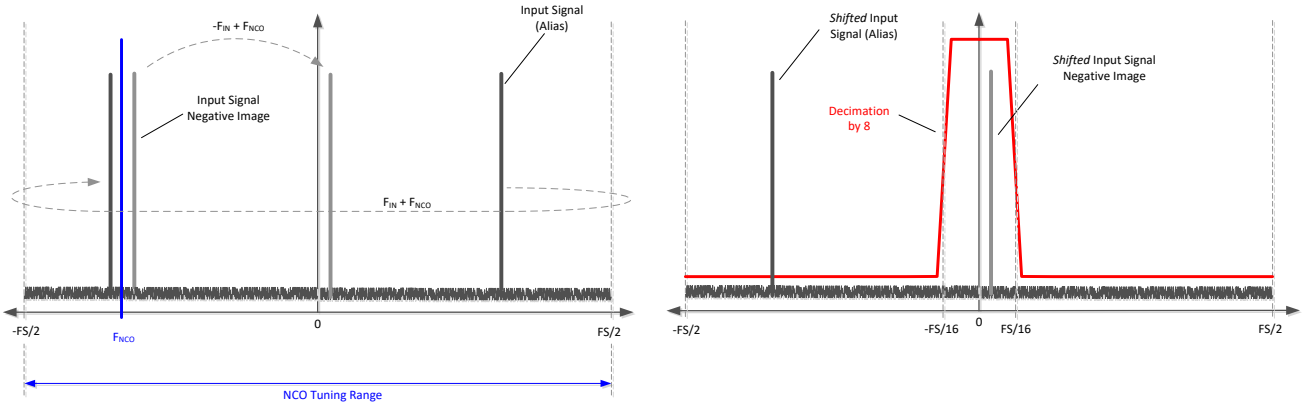

Figure 7-17. Complex decimation illustration

The real decimation operation is illustrated with an example in Figure 7-18. There is no frequency shift happening and only the real portion of the complex digital filter is exercised. The output data rate is decimated. A decimation of 8 results in an output data rate $F_{S,OUT}$ = F_S/8 with a Nyquist zone of F_S/16.

During the real mixing, the spectrum (signal and noise) amplitude is reduced by 3dB. To compensate this loss, there is a 3dB digital gain option in the decimation filter block that is enabled via SPI write.

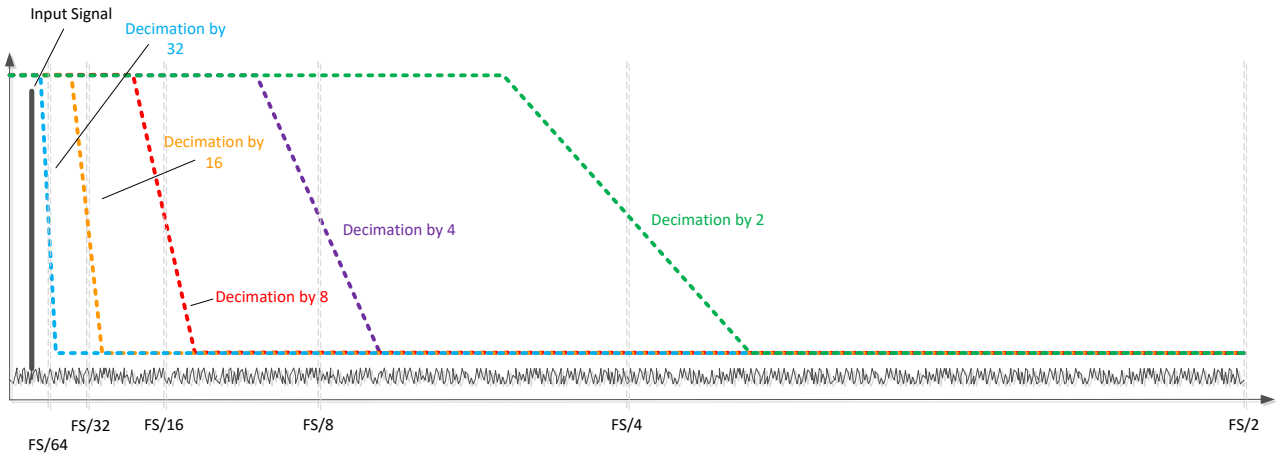

Figure 7-18. Real decimation illustration

7.3.4.3 FS/4 Mixing with Real Output

In this mode, the output after complex decimation gets mixed with FS/4 (FS = output data rate in this case). Instead of a complex output with the input signal centered around 0Hz, the output is transmitted as a real output at twice the data rate and the signal is centered around FS/4 (Fout/4) as illustrated in Figure 7-19.

In this example, complex decimation by 8 is used. The output data is transmitted as a real output with an output rate of Fout = FS'/4 (FS' = ADC sampling rate). The input signal is now centered around FS/4 (Fout/4) or FS'/16.

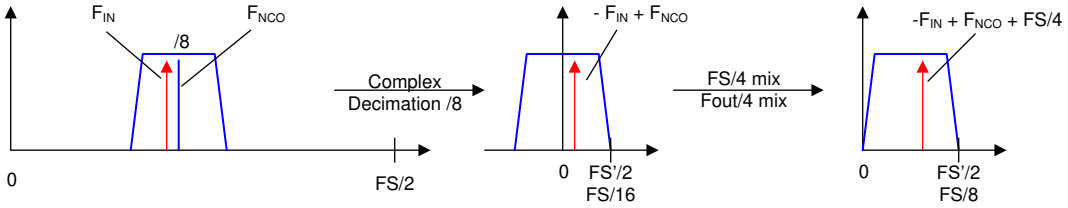

Figure 7-19. FS/4 Mixing with real output

7.3.4.4 Numerically Controlled Oscillator (NCO) and Digital Mixer

The decimation block is equipped with a 32-bit NCO and a digital mixer to fine tune the frequency placement prior to the digital filtering. The oscillator generates a complex exponential sequence of:

$e^{j\omega n}$ (default) or $e^{-j\omega n}$

where: frequency (ω) is specified as a signed number by the 32-bit register setting

The complex exponential sequence is multiplied with the real input from the ADC to mix the desired carrier to a frequency equal to $f_{IN} + f_{NCO}$. The NCO frequency is tuned from $–F_S/2$ to $+F_S/2$ and is processed as a signed, 2s complement number. After programming a new NCO frequency, the MIXER RESTART register bit or SYNC pin has to be toggled for the new frequency to get active. Additionally, the ADC3664-xEP provides the option via SPI to invert the mixer phase.

The NCO frequency setting is set by the 32-bit register value given and calculated as:

$$\text{NCO frequency} = 0 \text{ to } + F_S/2\text{: NCO} = f_{NCO} \times 2^{32} / F_S \quad (1)$$

$$\text{NCO frequency} = -F_S/2 \text{ to } 0\text{: NCO} = (f_{NCO} + F_S) \times 2^{32} / F_S \quad (2)$$

where:

- NCO = NCO register setting (decimal value)
- f_{NCO} = Desired NCO frequency (MHz)
- F_S = ADC sampling rate (MSPS)

The NCO programming is further illustrated with this example:

- ADC sampling rate F_S = 125MSPS
- Input signal f_{IN} = 10MHz
- Desired output frequency f_{OUT} = 0MHz

For this example, there are actually four ways to program the NCO and achieve the desired output frequency as shown in Table 7-1.

Table 7-1. NCO value calculations example

Alias or negative image	f_{NCO}	NCO Value	Mixer Phase	Frequency translation for f_{OUT}
f_{IN} = –10MHz	f_{NCO} = 10MHz	343597384	as is	$f_{OUT} = f_{IN} + f_{NCO}$ = –10MHz +10MHz = 0MHz
f_{IN} = 10MHz	f_{NCO} = –10MHz	4638564680		$f_{OUT} = f_{IN} + f_{NCO}$ = 10MHz + (–10MHz) = 0MHz
f_{IN} = 10MHz	f_{NCO} = 10MHz	343597384	inverted	$f_{OUT} = f_{IN} – f_{NCO}$ = 10MHz – 10MHz = 0MHz
f_{IN} = –10MHz	f_{NCO} = –10MHz	4638564680		$f_{OUT} = f_{IN} – f_{NCO}$ = –10MHz – (–10MHz) = 0MHz

7.3.4.5 Decimation Filter

The ADC3664-xEP supports complex decimation by 2, 4, 8, 16 and 32 with a pass-band bandwidth of approximately 80% and a stopband rejection of at least 85dB. Table 7-2 gives an overview of the pass-band bandwidth of the different decimation settings with respect to ADC sampling rate F_S. In real decimation mode, the output bandwidth is half of the complex bandwidth.

Table 7-2. Decimation Filter Summary and Maximum Available Output Bandwidth

REAL/COMPLEX DECIMATION	DECIMATION SETTING N	OUTPUT RATE	OUTPUT BANDWIDTH	OUTPUT RATE (F_S = 125MSPS)	OUTPUT BANDWIDTH (F_S = 125MSPS)
Complex	2	F_S / 2 complex	0.8 × F_S / 2	62.5MSPS complex	50MHz
	4	F_S / 4 complex	0.8 × F_S / 4	31.25MSPS complex	25MHz
	8	F_S / 8 complex	0.8 × F_S / 8	15.625MSPS complex	12.5MHz
	16	F_S / 16 complex	0.8 × F_S / 16	7.8125MSPS complex	6.25MHz
	32	F_S / 32 complex	0.8 × F_S / 32	3.90625MSPS complex	3.125MHz
Real	2	F_S / 2 real	0.4 × F_S / 2	62.5MSPS	25MHz
	4	F_S / 4 real	0.4 × F_S / 4	31.25MSPS	12.5MHz
	8	F_S / 8 real	0.4 × F_S / 8	15.625MSPS	6.25MHz
	16	F_S / 16 real	0.4 × F_S / 16	7.8125MSPS	3.125MHz
	32	F_S / 32 real	0.4 × F_S / 32	3.90625MSPS	1.5625MHz

The decimation filter responses normalized tot he ADC sampling clock frequency are illustrated in Figure 7-21 to Figure 7-30. They are interpreted as follows:

Each figure contains the filter pass-band, transition band(s) and alias or stop-band(s) as shown in Figure 7-20. The x-axis shows the offset frequency (after the NCO frequency shift) normalized to the ADC sampling rate F_S.

For example, in the divide-by-4 complex setup, the output data rate is F_S / 4 complex with a Nyquist zone of F_S / 8 or 0.125 × F_S. The transition band (colored in blue) is centered around 0.125 × F_S and the alias transition band is centered at 0.375 × F_S. The stop-bands (colored in red), which alias on top of the pass-band, are centered at 0.25 × F_S and 0.5 × F_S. The stop-band attenuation is greater than 85dB.

7.3.4.6 SYNC

The PDN/SYNC pin is used to synchronize multiple devices using an external SYNC signal. The PDN/SYNC pin is configured via SPI (SYNC EN bit) from power down to synchronization functionality and is latched in by the rising edge of the sampling clock as shown in Figure 7-31.

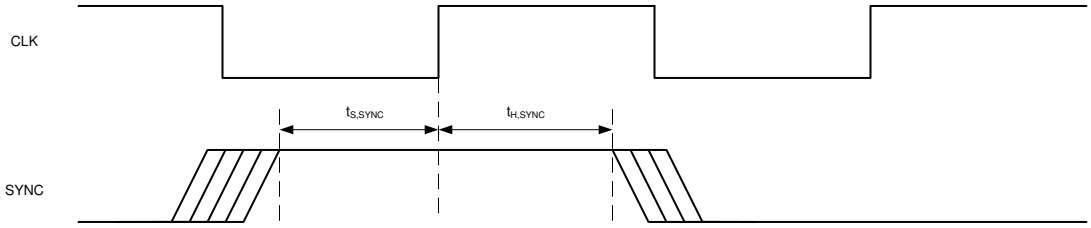

Figure 7-31. External SYNC timing diagram

The synchronization signal is only required when using the decimation filter, either using the SPI SYNC register or the PDN/SYNC pin. Resetting the internal clock dividers used in the decimation filter, and aligning the internal clocks as well as I and Q data within the same sample. If no SYNC signal is given, the internal clock dividers is not be synchronized, which can lead to a fractional delay across different devices. The SYNC signal also resets the NCO phase and loads the new NCO frequency (same as the MIXER RESTART bit).

When trying to resynchronize during operation, the SYNC toggle occurs at 64*K clock cycles, where K is an integer. This provides the phase continuity of the clock divider.

7.3.4.7 Output Formatting with Decimation

When using decimation, the output data is formatted as shown in Figure 7-32 and Figure 7-33. The examples are shown for 16-bit output for 2-wire (8x serialization), 1-wire (16x serialization) and 1/2-wire (32x serialization).

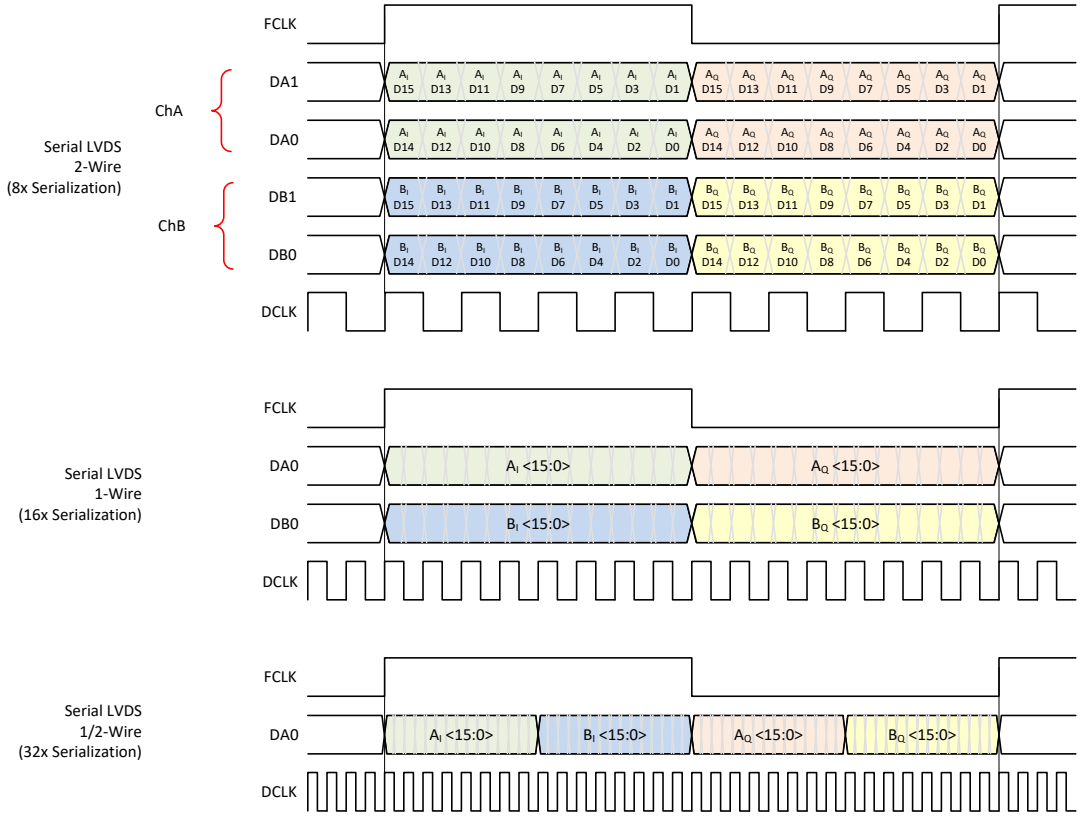

Figure 7-32. Output Data Format in Complex Decimation

Table 7-3 illustrates the output interface data rate along with the corresponding DCLK/DCLKIN and FCLK frequencies based on output resolution (R), number of SLVDS lanes (L) and complex decimation setting (N).

The table shows an actual lane rate example for the 2-, 1- and 1/2-wire interface, 16-bit output resolution and complex decimation by 4.

Table 7-3. Serial LVDS Lane Rate Examples with Complex Decimation and 16-bit Output Resolution

DECIMATION SETTING	ADC SAMPLING RATE	OUTPUT RESOLUTION	# of WIRES	FCLK	DCLKIN, DCLK	DA/B0,1
N	F_S	R	L	F_S / N	[DA/B0,1] / 2	F_S x 2 x R / L / N
4	125MSPS	16	2	31.25MHz	250MHz	500MHz
			1		500MHz	1000MHz
	55MSPS		1/2	15.625MHz	50MHz	1000MHz

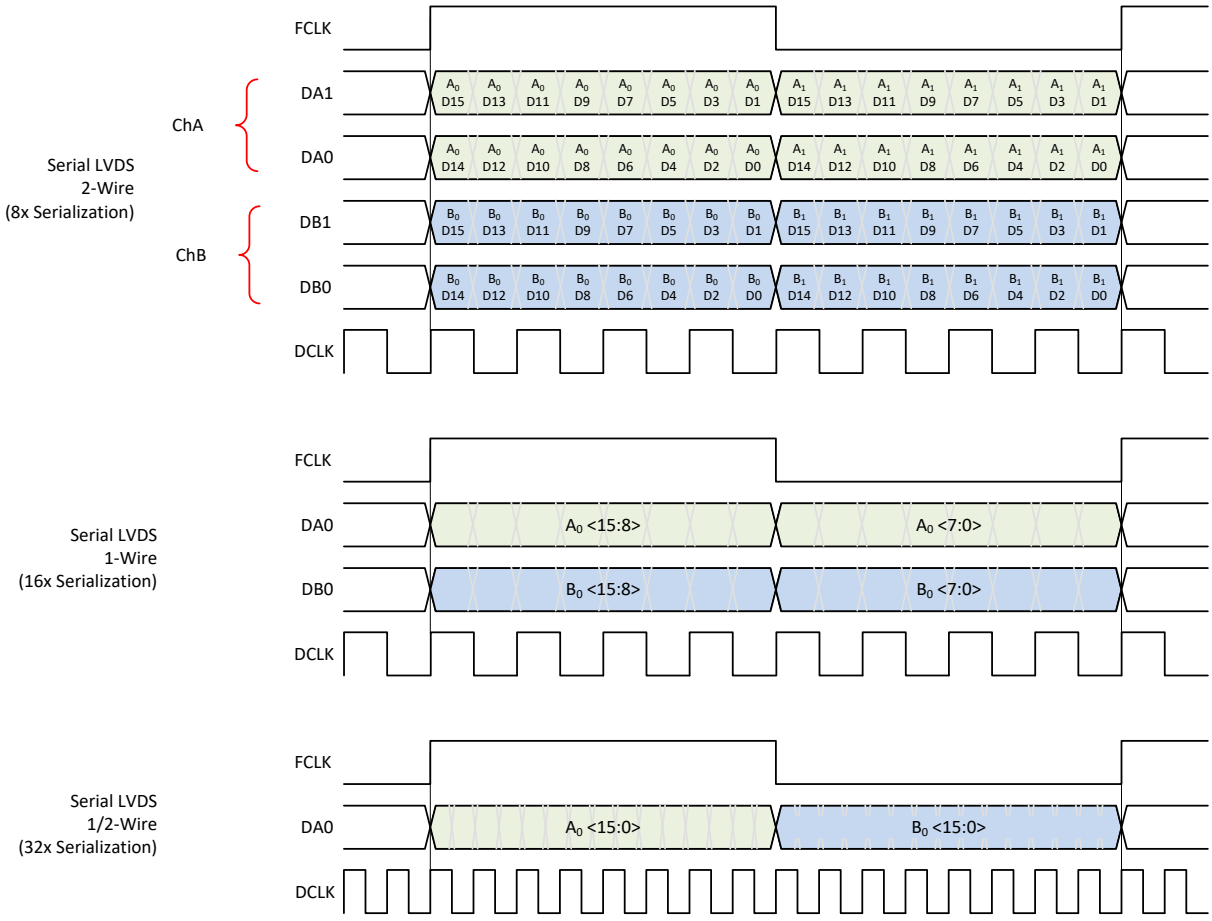

Figure 7-33. Output Data Format in Real Decimation

Table 7-4 illustrates the output interface data rate along with the corresponding DCLK/DCLKIN and FCLK frequencies based on output resolution (R), number of SLVDS lanes (L) and real decimation setting (M).

The table shows an actual lane rate example for the 2-, 1- and 1/2-wire interface, 16-bit output resolution and real decimation by 4.

Table 7-4. Serial LVDS Lane Rate Examples with Real Decimation and 16-bit Output Resolution

DECIMATION SETTING	ADC SAMPLING RATE	OUTPUT RESOLUTION	# of WIRES	FCLK	DCLKIN, DCLK	DA/B0,1
M	F_S	R	L	F_S / M / 2 (L = 2) F_S / M (L = 1, 1/2)	[DA/B0,1] / 2	F_S x R / L / M
4	125MSPS	16	2	15.625MHz	125 MHz	250MHz
			1	31.25MHz	250MHz	500MHz
			1/2		500MHz	1000MHz

7.3.5 Digital Interface

The serial LVDS interface supports the data output with 2-wire, 1-wire and 1/2-wire operation. The actual data output rate depends on the output resolution and number of lanes used.

The ADC3664-xEP requires an external serial LVDS clock input (DCLKIN), which is used to transmit the data out of the ADC along with the data clock (DCLK). The phase relationship between DCLKIN and the sampling clock is irrelevant but both clocks need to be frequency locked. The SLVDS interface is configured using SPI register writes.

7.3.5.1 Output Formatter

The digital output interface uses a flexible output bit mapper (Figure 7-34). The bit mapper takes the 14-bit output directly from the ADC, or from digital filter block, and then reformats to a resolution of 14, 16, 18 or 20-bit. The output serialization factor gets adjusted accordingly for 2-, 1- and 1/2-wire interface mode. The maximum output data rate can not be exceeded independently of output resolution and serialization factor.

When using 16-bit or higher output resolution in non-decimation mode, the 2 LSB are set to 0.

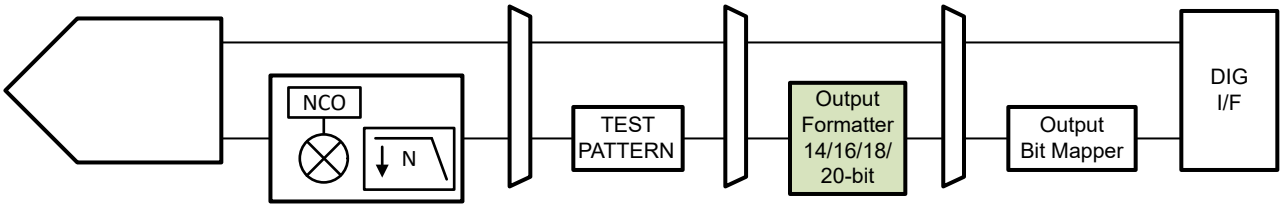

Figure 7-34. Interface output bit mapper

Table 7-5 provides an overview for the resulting serialization factor depending on output resolution and output modes. Note: the DCLKIN frequency needs to be adjusted accordingly as well. Changing the output resolution to 16-bit, 2-wire mode for example results in DCLKIN = F_S * 4 instead of * 3.5.

The output bit mapper is used for bypass and decimation filter.

Table 7-5. Serialization factor vs output resolution for different output modes

OUTPUT RESOLUTION	Interface	SERIALIZATION	FCLK	DCLKIN	DCLK	D0/D1
14-bit (default)	2-Wire	7x	F_S/2	F_S* 3.5	F_S* 3.5	F_S* 7
	1-Wire	14x	F_S	F_S* 7	F_S* 7	F_S* 14
	1/2-Wire	28x	F_S	F_S* 14	F_S* 14	F_S* 28
16-bit	2-Wire	8x	F_S/2	F_S* 4	F_S* 4	F_S* 8
	1-Wire	16x	F_S	F_S* 8	F_S* 8	F_S* 16
	1/2-Wire	32x	F_S	F_S* 16	F_S* 16	F_S* 32
18-bit	2-Wire	9x	F_S/2	F_S* 4.5	F_S* 4.5	F_S* 9
	1-Wire	18x	F_S	F_S* 9	F_S* 9	F_S* 18
	1/2-Wire	36x	F_S	F_S* 18	F_S* 18	F_S* 36
20-bit	2-Wire	10x	F_S/2	F_S* 5	F_S* 5	F_S* 10
	1-Wire	20x	F_S	F_S* 10	F_S* 10	F_S* 20
	1/2-Wire	40x	F_S	F_S* 20	F_S* 20	F_S* 40

The programming sequence to change the output interface and/or resolution from default settings is shown in Output Interface/Mode Configuration.

7.3.5.2 Output Bit Mapper

The output bit mapper allows change to the output bit order for any selected interface mode.

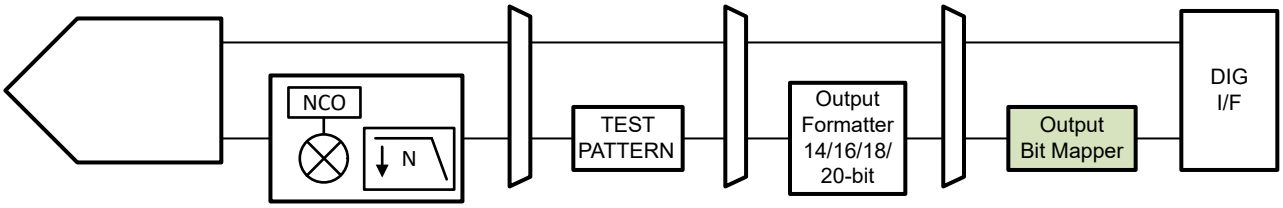

Figure 7-35. Output Bit Mapper

A two step process is used to change the output bit mapping and assemble the output data bus:

1. Both output channel A and B can have up to 20-bit output. Each output bit of either channel has a unique identifier bit as shown in Table 7-6. The MSB starts with bit D19, depending on output resolution chosen, the LSB is from D6 (14-bit) to D0 (20-bit). The *previous sample* is only needed in 2-w mode.
2. The bit mapper is then used to assemble the output sample. The following sections detail how to remap the serial output format.

Table 7-6. Unique identifier of each data bit

Bit	Channel A		Channel B	
	Previous sample (2w only)	Current sample	Previous sample (2w only)	Current sample
D19 (MSB)	0x2D	0x6D	0x29	0x69
D18	0x2C	0x6C	0x28	0x68
D17	0x27	0x67	0x23	0x63
D16	0x26	0x66	0x22	0x62
D15	0x25	0x65	0x21	0x61
D14	0x24	0x64	0x20	0x60
D13	0x1F	0x5F	0x1B	0x5B
D12	0x1E	0x5E	0x1A	0x5A
D11	0x1D	0x5D	0x19	0x59
D10	0x1C	0x5C	0x18	0x58

D2	0x0C	0x4C	0x08	0x48
D1	0x07	0x47	0x03	0x43
D0 (LSB)	0x06	0x46	0x02	0x42

In the serial output mode, a data bit (with unique identifier) needs to be assigned to each location within the serial output stream. There are a total of 40 addresses available per channel. Channel A spans from address 0x39 to 0x60 and channel B from address 0x61 to 0x88. When using complex decimation, the output bit mapper is applied to both the “I” and the “Q” sample.

7.3.5.2.1 2-Wire Mode

In this mode, both the current and the previous sample have to be used in the address space as shown in Figure 7-36. The address order is different for 14/18-bit and 16/20-bit.

Note

There are unused addresses between samples for resolution less than 20-bit (gray back ground), which is skipped if not used.

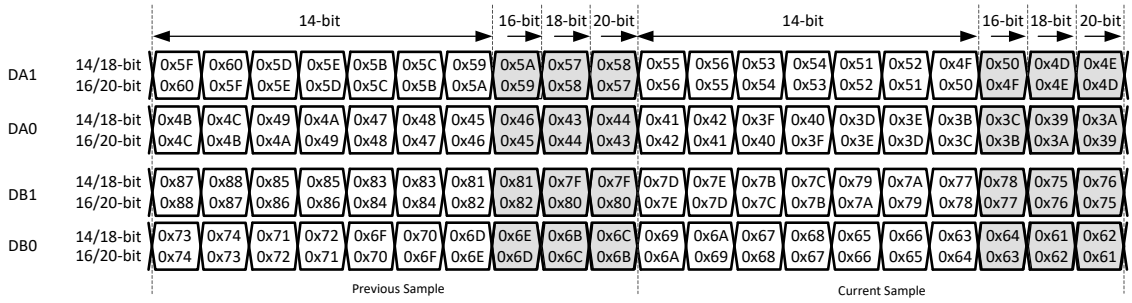

Figure 7-36. 2-wire output bit mapper

In the following example (Figure 7-37), the 16-bit 2-wire serial output is reordered to where lane DA1/DB1 carries the 8 MSB and lane DA0/DB0 carries 8 LSBs.

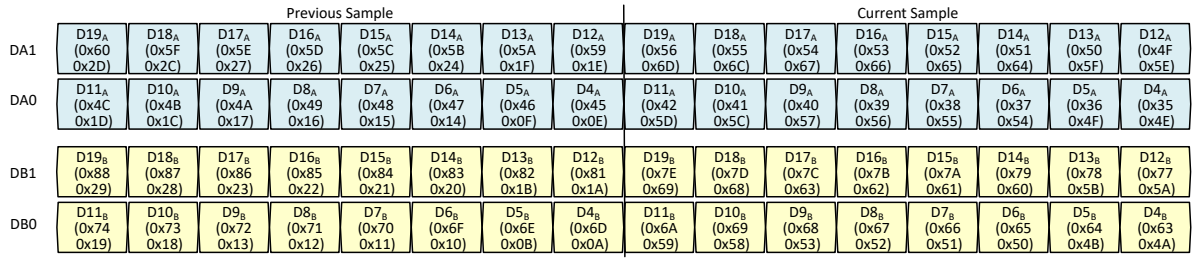

Figure 7-37. Example: 2-wire output bit mapping

7.3.5.2.2 1-Wire Mode

Only the *current sample* needs to programmed in the address space. If desired, *current sample* is duplicated on DA1/DB1 as well (using addresses shown below) to have a redundant output. If lane DA1/DB1 is powered up.

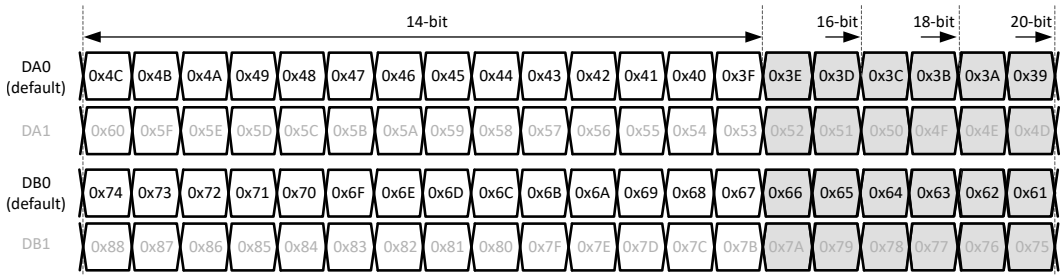

Figure 7-38. 1-wire output bit mapping

7.3.5.2.3 ½-Wire Mode

The output is only lane DA0 and the sample order are programmed into the 40 addresses of chA (from 0x39 to 0x60). Covering 2 samples (one for chA, one for chB) as shown below. To have a redundant output, duplicate on DB0 as well (using addresses shown Figure 7-39). Lane DB0 is powered up in that case.

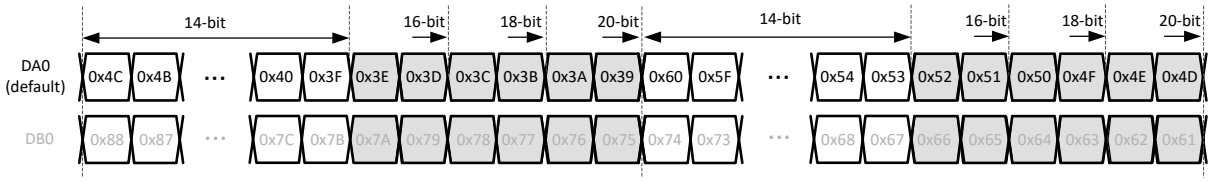

Figure 7-39. 1/2-wire output bit mapping

7.3.5.3 Output Interface and Mode Configuration

The following sequence summarizes all the relevant registers for changing the output interface and/or enabling the decimation filter. Steps 1 and 2 must come first since the E-Fuse load reset the SPI writes, the remaining steps can come in any order.

Table 7-7. Configuration steps for changing interface or decimation

7.3.5.3.1 Configuration Example

The following is a step by step programming example to configure the ADC3664-xEP to complex decimation by 8 with 1-wire SLVDS and 16-bit output.

1. 0x07 (address) 0x6C (load bit mapper configuration for 16-bit output with 1-wire SLVDS)
2. 0x13 0x01, wait 1 ms, 0x13 0x00 (load e-fuse)
3. 0x19 0x80 (configure FCLK)
4. 0x1B 0x88 (select 16-bit output resolution)
5. 0x20 0xFF, 0x21 0xFF, 0x22 0x0F (configure FCLK pattern)
6. 0x24 0x06 (enable decimation filter)
7. 0x25 0x30 (configure complex decimation by 8)
8. 0x2A/B/C/D and 0x31/32/33/34 (program NCO frequency)
9. 0x27/0x2E 0x08 (configure Q-delay register bit)
10. 0x26 0xAA, 0x26 0x88 (set digital mixer gain to 6-dB and toggle the mixer update)

7.3.5.4 Output Data Format

The output data is configured to two's complement (default) or offset binary formatting using SPI register writes (register 0x8F and 0x92). Table 7-8 provides an overview for minimum and maximum output codes for the two formatting options. The actual output resolution is set by the output bit mapper.

Table 7-8. Overview of minimum and maximum output codes vs output resolution for different formatting

	Two's Complement (default)		Offset Binary	
RESOLUTION (BIT)	**14**	**16**	**14**	**16**
$V_{IN,MAX}$	0x1FFF	0x7FFF	0x3FFF	0xFFFF
0	0x0000		0x2000	0x8000
$V_{IN,MIN}$	0x2000	0x8000	0x0000	

7.3.6 Test Pattern

To enable in-circuit testing of the digital interface, the following test patterns are supported and enabled via SPI register writes (0x14/0x15/0x16). The test pattern generator is located after the decimation filter as shown in Figure 7-40. In decimation mode (real and complex), the test patterns replace the output data of the DDC; however, channel A controls the test patterns for both channels.

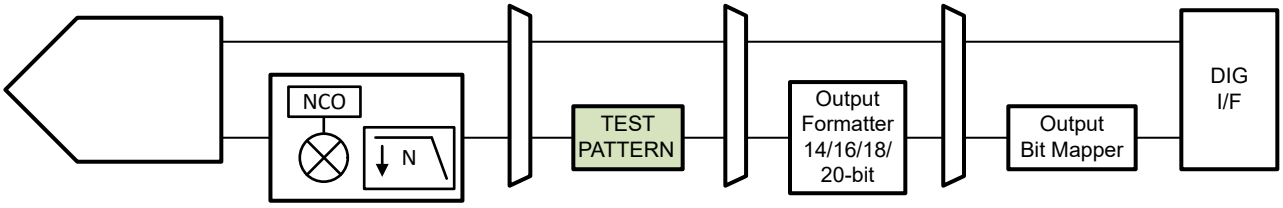

Figure 7-40. Test Pattern Generator

- RAMP Pattern: The step size needs to be configured in the CUSTOM PAT register according to the native resolution of the ADC. When selecting a higher output resolution, the additional LSBs is still 0 in RAMP pattern mode.
  - 00001: 18-bit output resolution
  - 00100: 16-bit output resolution
  - 10000: 14-bit output resolution
- Custom Pattern: Configured in the CUSTOM PAT register

7.4 Device Functional Modes

7.4.1 Normal operation

In normal operating mode, the entire ADC full scale range gets converted to a digital output with 14-bit resolution. The output is available in as little as 1 clock cycle on the digital outputs.

7.4.2 Power Down Options

A global power down mode is enabled through SPI as well as using the power down pin (PDN/SYNC). There is an internal pull-down 21kΩ resistor on the PDN/SYNC input pin and the pin is active high, so the pin must be pulled high externally to enter global power down mode.

The SPI register map provides the capability to enable or disable individual blocks directly or via PDN pin mask to trade off power consumption vs wake up time as shown in Table 7-9.

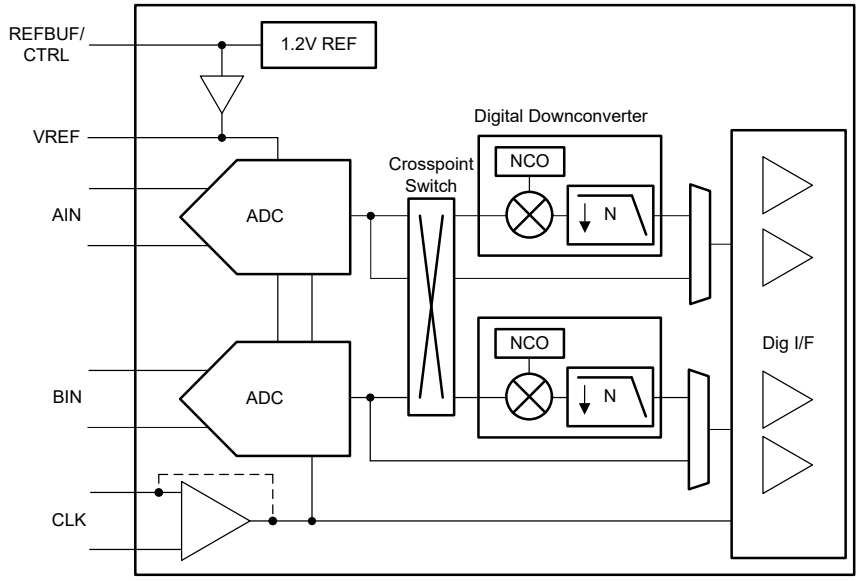

Figure 7-41. Power Down Configurations

Table 7-9. Overview of Power Down Options

Function/ Register	PDN via SPI	Mask for Global PDN	Feature - Default	Power Impact	Wake-up time	Comment
ADC	Yes	-	Enabled			Both ADC channels are included in Global PDN automatically
Reference gain amplifier	Yes	Yes	Enabled	~ 0.4mA	~3us	Should only be powered down in power down state.
Internal 1.2V reference	Yes		External ref	~ 1-3.5mA	~3ms	Internal/external reference selection is available through SPI and REFBUF/CTRL pin.
Clock buffer	Yes		Differential clock	~ 1mA	n/a	Single ended clock input saves ~ 1mA compared to differential. Some programmability is available through the REFBUF/CTRL pin.
Output interface drivers	Yes	-	Enabled	varies	n/a	Depending on output interface mode, unused output drivers are powered down for maximum power savings
Decimation filter	Yes	-	Disabled	see the Electrical table	n/a	

7.5 Programming

The device is primarily configured and controlled using the serial programming interface (SPI). However, the device can operate in a default configuration without requiring the SPI interface. The power down function as well as internal or external reference configuration is possible via pin control (PDN/SYNC and REFBUF/CTRL pin).

Note

The power down command (via PIN or SPI) only goes in effect with the ADC sampling clock present.

After initial power up, the default operating configuration is shown in Table 7-10.

Table 7-10. Default device configuration after power up

FEATURE	DEFAULT
Signal Input	Differential
Clock Input	Differential
Reference	External
Decimation	DDC bypass
Interface	2-wire
Output Format	2s complement

7.5.1 Configuration using PINs only

The ADC voltage reference is selected using the REFBUF/CTRL pin. Even though there is an internal 100kΩ pull-up resistor to AVDD, the REFBUF/CTRL pin should be set to a voltage externally and not left floating. When using a voltage divider to set the REFBUF/CTRL voltage (R1 and R2 in Figure 7-42), resistor values < 5kΩ should be used.

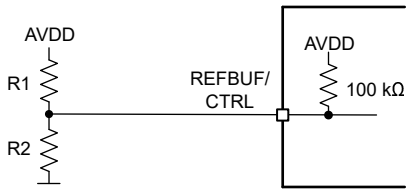

Figure 7-42. Configuration of external voltage on REFBUF/CTRL pin

Table 7-11. REFBUF/CTRL voltage levels control voltage reference selection

REFBUF/CTRL VOLTAGE	VOLTAGE REFERENCE OPTION	CLOCKING OPTION
> 1.7V (Default)	External reference	Differential clock input
1.2V (1.15-1.25V)	External 1.2V input on REFBUF/CTRL pin using internal gain buffer	Differential clock input
0.5 - 0.7V	Internal reference	Differential clock input
< 0.1V	Internal reference	Single ended clock input

7.5.2 Configuration using the SPI interface

The device has a set of internal registers that are accessed by the serial interface formed by the SEN (serial interface enable), SCLK (serial interface clock) and SDIO (serial interface data input/output) pins. Serially shifting bits into the device is enabled when SEN is low. Serial data input are latched at every SCLK rising edge when SEN is active (low). The serial data are loaded into the register at every 24th SCLK rising edge when SEN is low. When the word length exceeds a multiple of 24 bits, the excess bits are ignored. Data is loaded in multiples of 24-bit words within a single active SEN pulse. The interface can function with SCLK frequencies from 12MHz down to low speeds (of a few hertz) and also with a non-50% SCLK duty cycle.

7.5.2.1 Register Write

The internal registers are programmed following these steps:

1. Drive the SEN pin low
2. Set the R/W bit to 0 (bit A15 of the 16-bit address) and bits A[14:12] in address field to 0.
3. Initiate a serial interface cycle by specifying the address of the register (A[11:0]) whose content is written and
4. Write the 8-bit data that are latched in on the SCLK rising edges

Figure 7-43 shows the timing requirements for the serial register write operation.

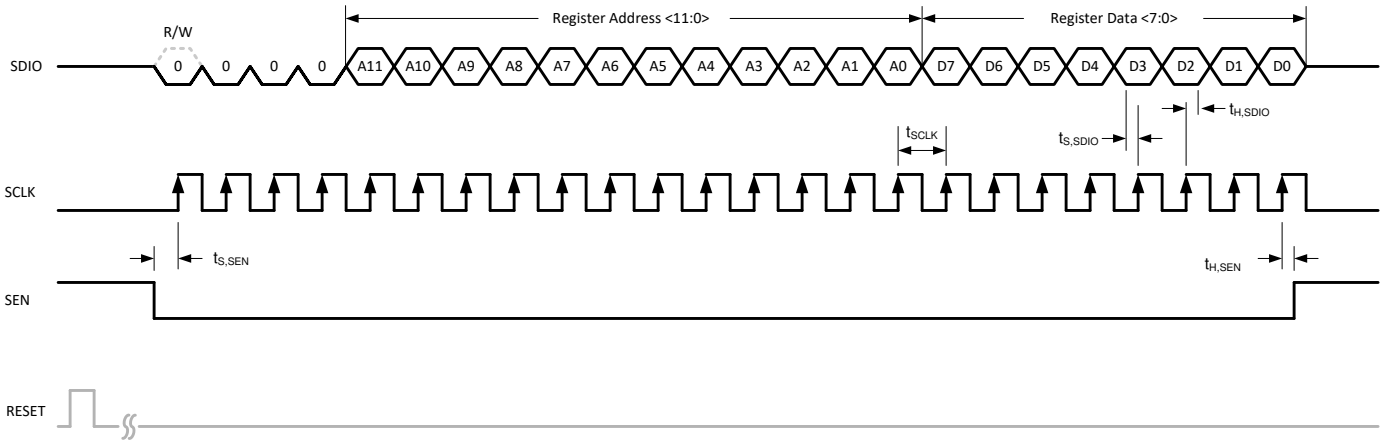

Figure 7-43. Serial Register Write Timing Diagram

7.5.2.2 Register Read

The device includes a mode where the contents of the internal registers are read back using the SDIO pin. This readback mode is useful as a diagnostic check to verify the serial interface communication between the external controller and the ADC. The procedure to read the contents of the serial registers is as follows:

1. Drive the SEN pin low
2. Set the R/W bit (A15) to 1. This setting disables any further writes to the registers. Set A[14:12] in address field to 0.
3. Initiate a serial interface cycle specifying the address of the register (A[11:0]) whose content must be read
4. The device launches the contents (D[7:0]) of the selected register on the SDIO pin on SCLK falling edge
5. The external controller can capture the contents on the SCLK rising edge

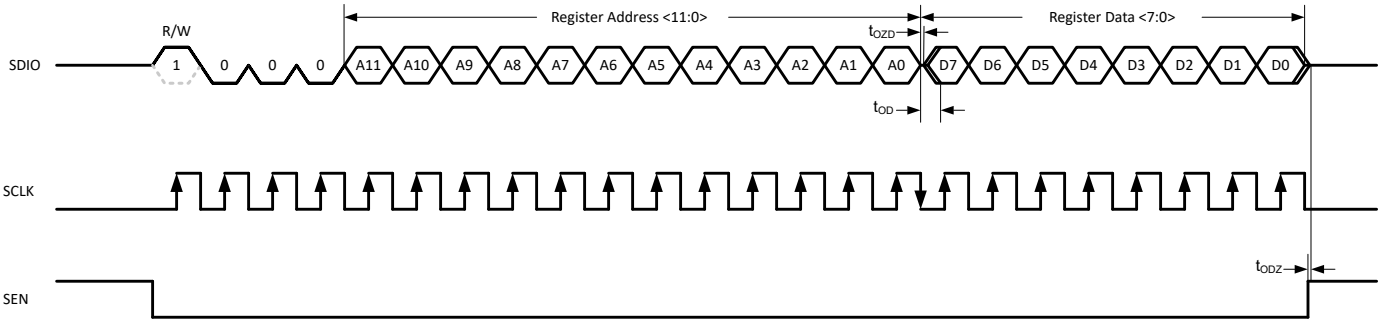

Figure 7-44. Serial Register Read Timing Diagram

8 Application Information Disclaimer

Note

Information in the following applications sections is not part of the TI component specification, and TI does not warrant its accuracy or completeness. TI's customers are responsible for determining suitability of components for their purposes, as well as validating and testing their design implementation to confirm system functionality.

8.1 Application Information

A spectrum analyzer is a typical frequency domain application for the ADC3664-xEP and the front end circuitry is similar to several other systems such as software defined radio (SDR), sonar, radar or communications. Some applications require frequency coverage including DC or near DC (such as: sonar) which is included in this example.

(3)

8.2 Typical Application

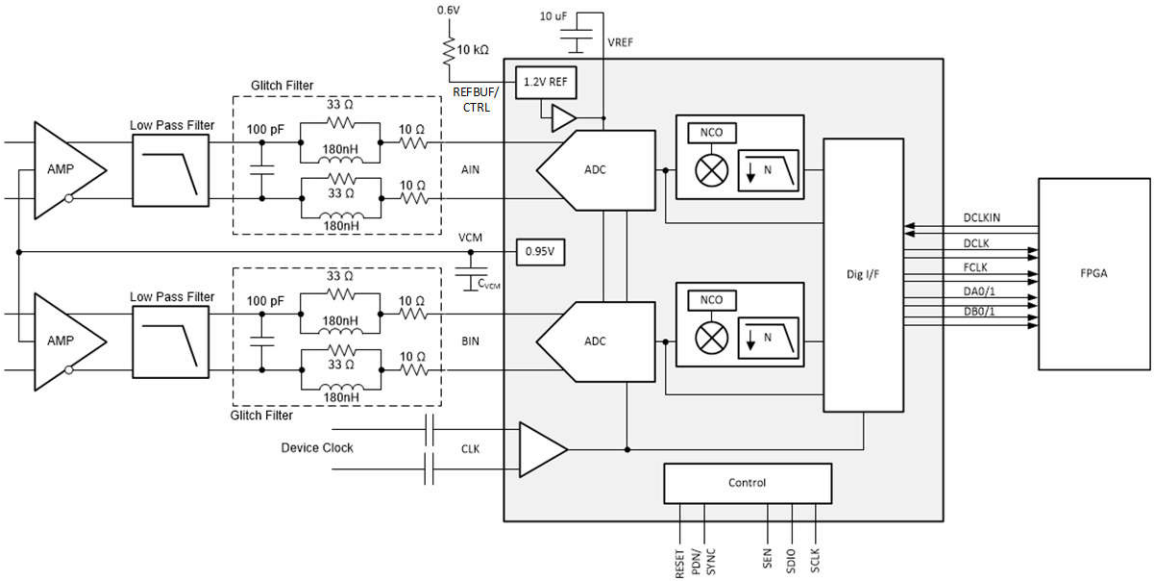

Figure 8-1. Typical configuration for a spectrum analyzer with DC support

8.2.1 Design Requirements

Frequency domain applications cover a wide range of frequencies from low input frequencies at or near DC in the 1st Nyquist zone to undersampling in higher Nyquist zones. If low input frequency is supported, the input has to be DC coupled and the ADC driven by a fully differential amplifier (FDA). If low frequency support is not needed, then AC coupling and use of a balun is more suitable.

The internal reference is used since DC precision is not needed. However, the ADC AC performance is highly dependent on the quality of the external clock source. If in-band interferes are present, then the ADC SFDR performance is a key care about as well. A higher ADC sampling rate is desirable to relax the external anti-aliasing filter. An internal decimation filter is used to reduce the digital output rate afterwards.

Table 8-1. Design key care-abouts

FEATURE	DESCRIPTION
Signal Bandwidth	DC to 30MHz
Input Driver	Single ended to differential signal conversion and DC coupling

Table 8-1. Design key care-abouts (continued)

FEATURE	DESCRIPTION
Clock Source	External clock with low jitter

When designing the amplifier/filter driving circuit, the ADC input full-scale voltage needs to be taken into consideration. For example, the ADC3664-xEP input full-scale is 3.2Vpp. When factoring in approximately 1dB for insertion loss of the filter, then the amplifier needs to deliver close to 3.6Vpp. The amplifier distortion performance degrades with a larger output swing. Considering the ADC common mode input voltage, the amplifier may not be able to deliver the full swing. The ADC3664-xEP provides an output common mode voltage of 0.95V, and the THS4541 for example can only swing within 250mV of the negative supply. A unipolar 3.3V amplifier power supply limits the maximum voltage swing to approximately 2.8Vpp. If a larger output swing is required (factoring in filter insertion loss), then a negative supply for the amplifier is needed to eliminate that limitation. Additionally input voltage protection diodes is needed to protect the ADC from over-voltage events.

Table 8-2. Output voltage swing of THS4541 vs power supply

DEVICE	MIN OUTPUT VOLTAGE	MAX SWING WITH 3.3V/ 0V SUPPLY	MAX SWING WITH 3.3V/ -1V SUPPLY
THS4541	VS- + 250mV	2.8Vpp	6.8Vpp

8.2.2 Detailed Design Procedure

8.2.2.1 Input Signal Path

The THS4541 provides a good low power option to drive the ADC inputs. Table 8-3 provides an overview of the THS4541 with power consumption and usable frequency.

Table 8-3. Fully Differential Amplifier Options

DEVICE	CURRENT (IQ) PER CHANNEL	USABLE FREQUENCY RANGE
THS4541	10mA	< 70MHz

The low pass filter design (topology, filter order) is driven by the application itself. However, when designing the low pass filter, the optimum load impedance for the amplifier should be taken into consideration as well. Between the low pass filter and the ADC input the sampling glitch filter needs to added as well as shown in Section 7.3.1.2.1. In this example, the DC - 30MHz glitch filter is selected.

8.2.2.2 Sampling Clock

Applications operating with low input frequencies (such as DC to 30MHz) typically are less sensitive to performance degradation due to clock jitter. The internal ADC aperture jitter improves with faster rise and fall times (that is, square wave vs sine wave). Table 8-4 provides an overview of the estimated SNR performance of the ADC3664-xEP based on different amounts of jitter of the external clock source. The SNR is estimated based on ADC3664-xEP thermal noise of 77.5dBFS and input signal at −1dBFS.

Termination of the clock input should be considered for long clock traces.

Table 8-4. ADC SNR performance across vs input frequency for different amounts of external clock jitter

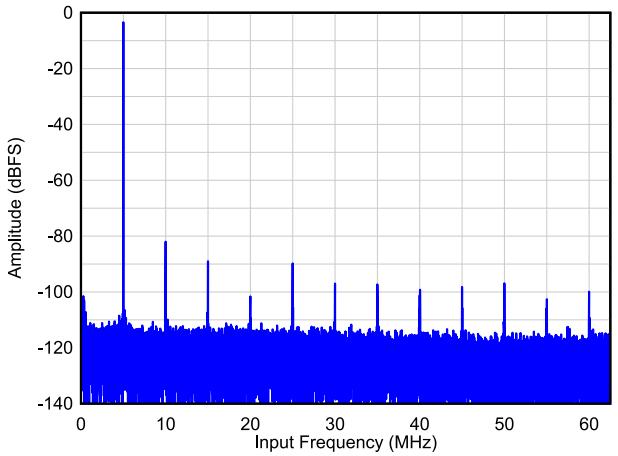
INPUT FREQUENCY	$T_{J,EXT}$ = 100fs	$T_{J,EXT}$ = 250fs	$T_{J,EXT}$ = 500fs	$T_{J,EXT}$ = 1ps
10MHz	77.4	77.4	77.3	76.8
20MHz	77.3	77.2	76.7	75.1
30MHz	77.1	76.8	75.8	73.2

8.2.2.3 Voltage Reference

The ADC3664-xEP is configured to internal reference operation by applying 0.6V to the REFBUF/CTRL pin.

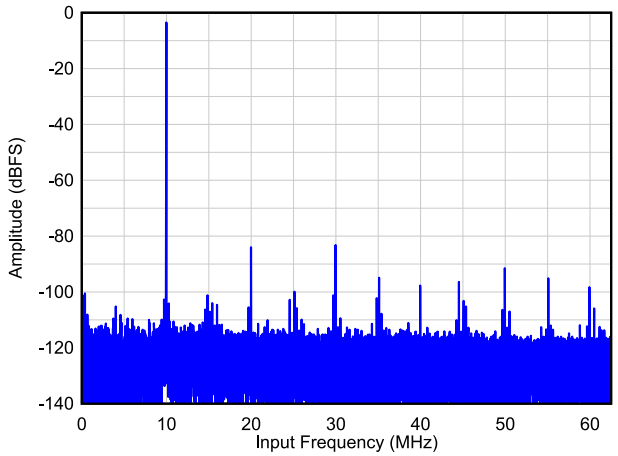
8.2.3 Application Curves

The following FFT plots show the performance of THS4541 driving the ADC3664-xEP operated at 125MSPS with a full-scale input at -1dBFS with input frequencies at 5, 10 and 20MHz.



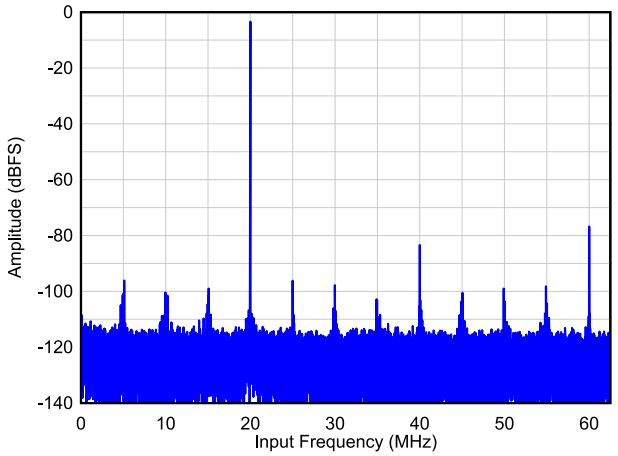
SNR = 76.4dBFS, HD23 = 83dBc, Non HD23 = 89dBFS

Figure 8-2. Single Tone FFT at F_{IN} = 5MHz



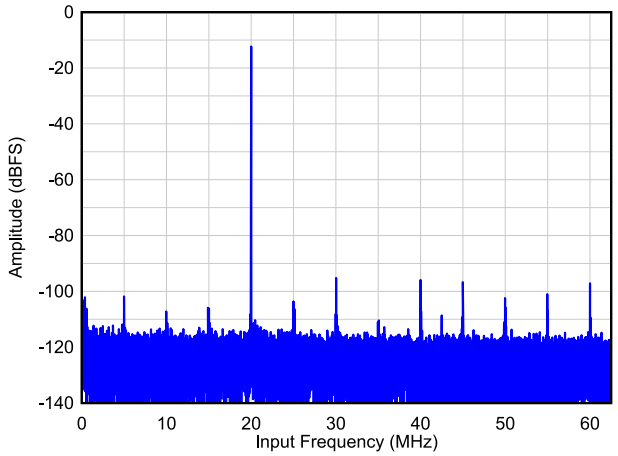
SNR = 75.8dBFS, HD23 = 82dBc, Non HD23 = 88dBFS

Figure 8-3. Single Tone FFT at F_{IN} = 10MHz



SNR = 75.6dBFS, HD23 = 74dBc, Non HD23 = 94dBFS

Figure 8-4. Single Tone FFT at F_{IN} = 20MHz



A_{IN} = -10dBFS, SNR = 76.9dBFS, HD23 = 83dBc, Non HD23 = 93dBFS

Figure 8-5. Single Tone FFT at F_{IN} = 20MHz

8.3 Initialization Set Up

After power-up, the internal registers must be initialized to their default values through a hardware reset by applying a high pulse on the RESET pin, as shown in Figure 8-6.

1. Apply AVDD and IOVDD (no specific sequence required). After AVDD is applied, the internal bandgap reference powers up and settles out in approximately 2ms.
2. Configure REFBUF/CTRL pin (pull high or low even if configured via SPI later on) and apply the sampling clock.
3. Apply hardware reset. After hardware reset is released, the default registers are loaded from internal fuses and the internal power up capacitor calibration is initiated. The calibration takes approximately 200000 clock cycles.
4. Begin programming using SPI interface.

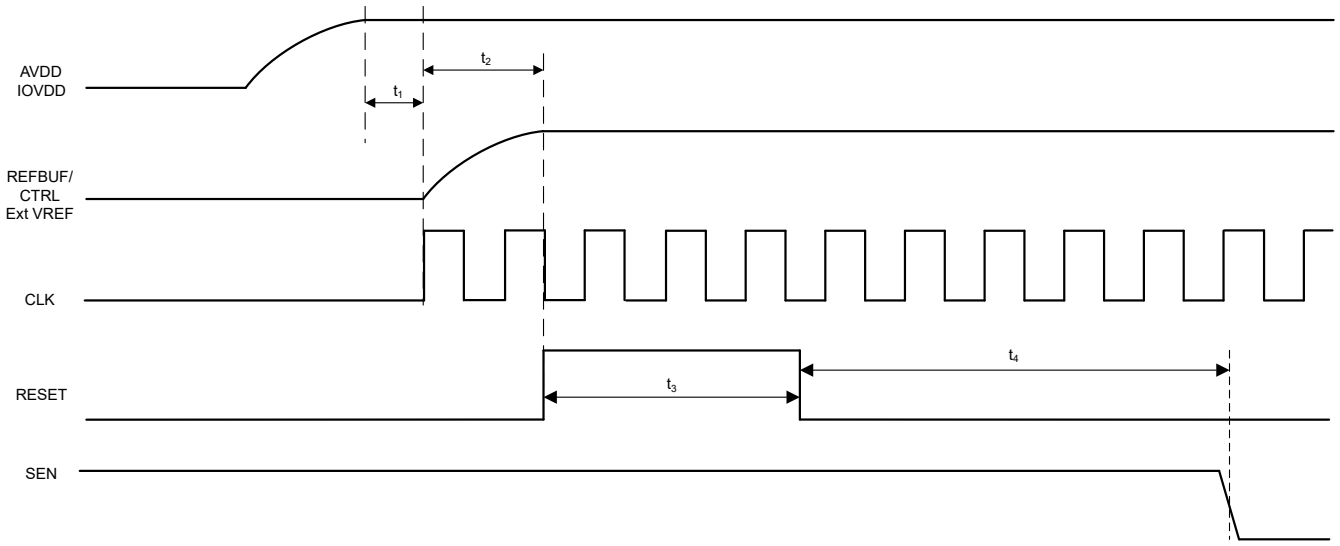


Figure 8-6. Initialization of serial registers after power up

Table 8-5. Power-up timing

		MIN	TYP	MAX	UNIT
t_1	Power-on delay: delay from power up to logic level of REFBUF/CTRL pin	2			ms
t_2	Delay from REFBUF/CTRL pin logic level to RESET rising edge	100			ns
t_3	RESET pulse width	1			us
t_4	Delay from RESET disable to SEN active	~ 200000			clock cycles

8.3.1 Register Initialization During Operation

If required, the serial interface registers are cleared and reset to default settings during operation either:

- through a hardware reset or
- by applying a software reset. When using the serial interface, set the RESET bit (D0 in register address 0x00) high. This setting initializes the internal registers to the default values and then self-resets the RESET bit low. In this case, the RESET pin is kept low.

After hardware or software reset, the wait time is also approximately 200000 clock cycles before the SPI registers are programmed.

8.4 Power Supply Recommendations

The ADC3664-xEP requires two different power-supplies. The AVDD rail provides power for the internal analog circuits and the ADC while the IOVDD rail powers the digital interface and the internal digital circuits like decimation filter or output interface mapper. Power sequencing is not required.

The AVDD power supply must be low noise to achieve data sheet performance. In applications operating near DC, the 1/f noise contribution of the power supply needs to be considered as well. The ADC is designed for very good PSRR which aides with the power supply filter design.

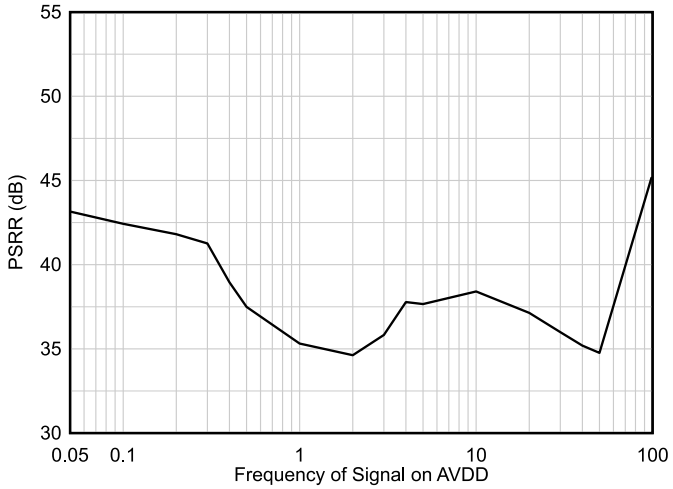

Figure 8-7. Power supply rejection ratio (PSRR) vs frequency

There are two recommended power-supply architectures:

1. Step down using high-efficiency switching converters, followed by a second stage of regulation using a low noise LDO to provide switching noise reduction and improved voltage accuracy.
2. Directly step down the final ADC supply voltage using high-efficiency switching converters. This approach provides the best efficiency, but care must be taken to make sure the switching noise is minimized to prevent degraded ADC performance.

TI WEBENCH® Power Designer are used to select and design the individual power-supply elements needed: see the WEBENCH® Power Designer

Recommended switching regulators for the first stage include the TPS7H4010-SEP, and similar devices.

Recommended low dropout (LDO) linear regulators include the TPS73801-SEP, TPS7H1111-SEP, and similar devices.

For the switch regulator only approach, the ripple filter must be designed with a notch frequency that aligns with the switching ripple frequency of the DC/DC converter. Note: the switching frequency reported from WEBENCH® and design the EMI filter and capacitor combination to have the notch frequency centered as needed. Figure 8-8 and Figure 8-9 illustrate the two approaches.

AVDD and IOVDD supply voltages should not be shared to prevent digital switching noise from coupling into the analog signal chain.

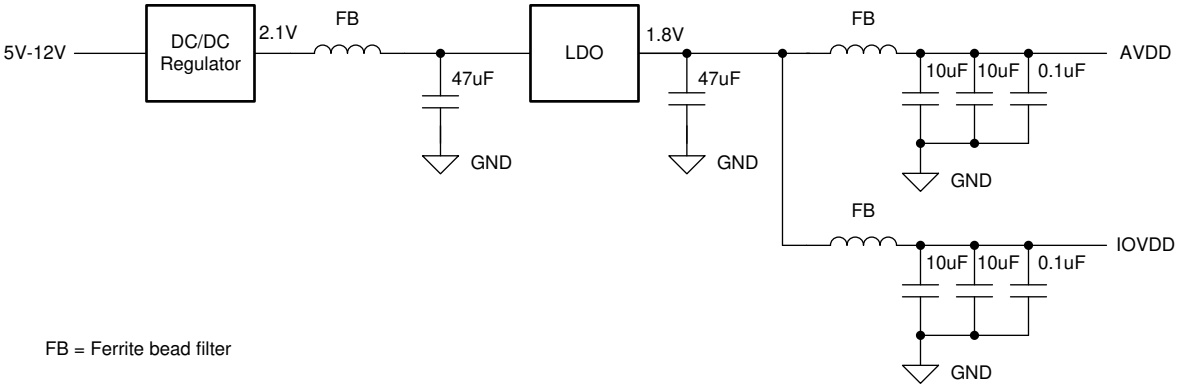

Figure 8-8. Example: LDO Linear Regulator Approach

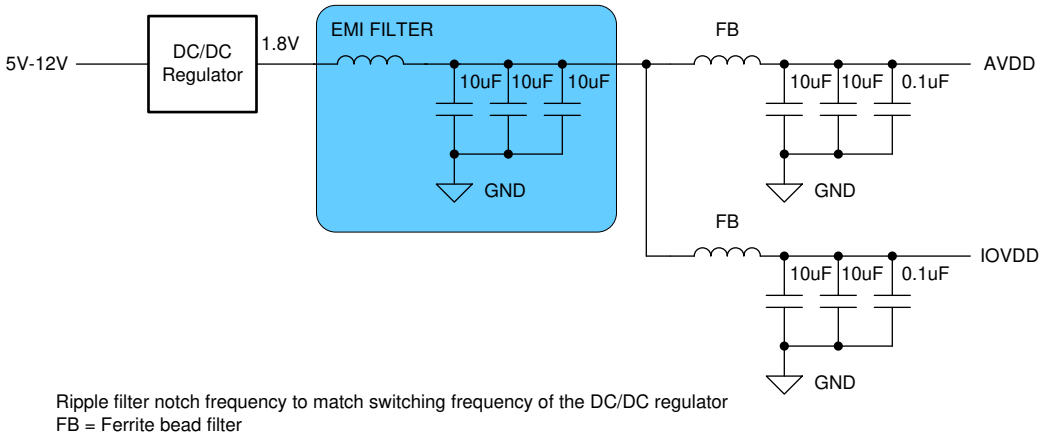

Figure 8-9. Example Switcher-Only Approach

8.5 Layout

8.5.1 Layout Guidelines

There are several critical signals which require specific care during board design:

1. Analog input and clock signals
   - Traces should be as short as possible and vias should be avoided where possible to minimize impedance discontinuities.
   - Traces should be routed using loosely coupled 100Ω differential traces.
   - Differential trace lengths should be matched as close as possible to minimize phase imbalance and HD2 degradation.
2. Digital output interface
   - Traces should be routed using tightly coupled 100Ω differential traces.
3. Voltage reference
   - The bypass capacitor should be placed as close to the device pins as possible and connected between VREF and REFGND, on top layer avoiding vias.
   - Depending on configuration, an additional bypass capacitor between REFBUF/CTRL and REFGND is recommended, and is also placed as close to pins as possible on top layer.
4. Power and ground connections
   - Provide low resistance connection paths to all power and ground pins.
   - Use power and ground planes instead of traces.
   - Avoid narrow, isolated paths which increase the connection resistance.
   - Use a signal/ground/power circuit board stackup to maximize coupling between the ground and power plane.

8.5.2 Layout Example

The following screen shot shows the top layer of the ADC3664EVM.

- Signal and clock inputs are routed as differential signals on the top layer avoiding vias.
- SLVDS output interface lanes are routed differential and length matched
- Bypass caps are close to the VREF pin on the top layer avoiding vias.

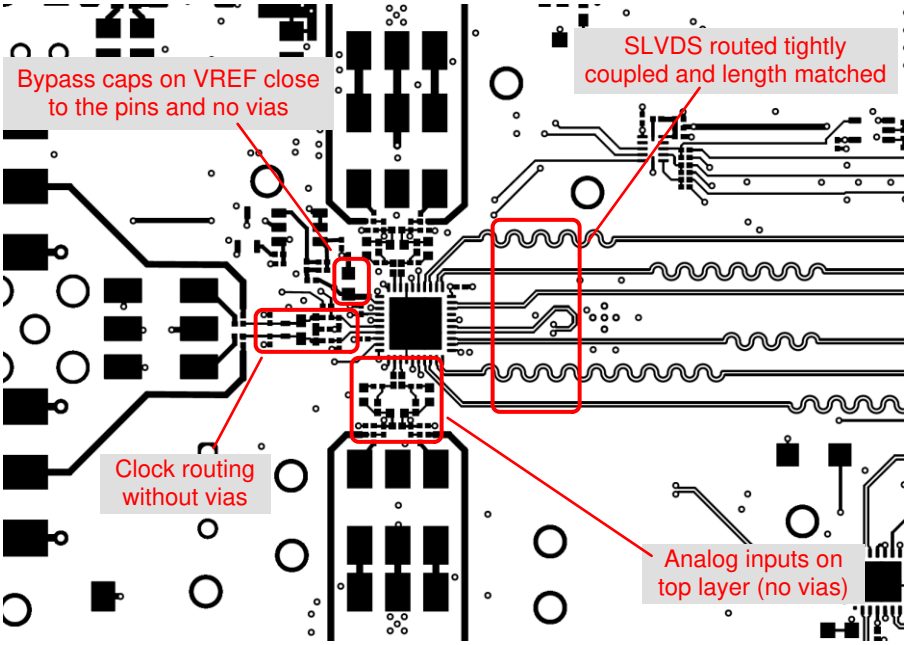

Figure 8-10. Layout example: top layer of ADC3664EVM

9.1 Detailed Register Description

Figure 9-1. Register 0x00

7	6	5	4	3	2	1	0
0	0	0	0	0	0	0	RESET
R/W-0	R/W-0	R/W-0	R/W-0	R/W-0	R/W-0	R/W-0	R/W-0

Table 9-2. Register 0x00 Field Descriptions

Bit	Field	Type	Reset	Description
7-1	0	R/W	0	Must write 0
0	RESET	R/W	0	This bit resets all internal registers to the default values and self clears to 0.

Figure 9-2. Register 0x07

7	6	5	4	3	2	1	0
OP IF MAPPER			0	OP IF EN	OP IF SEL		
R/W-0	R/W-0	R/W-0	R/W-0	R/W-0	R/W-0	R/W-0	R/W-0

Table 9-3. Register 0x07 Field Descriptions

Bit	Field	Type	Reset	Description
7-5	OP IF MAPPER	R/W	000	Output interface mapper. This register contains the proper output interface bit mapping for the different interfaces. The interface bit mapping is internally loaded from e-fuses and also requires a fuse load command to go into effect (0x13, D0). Register 0x07 along with the E-Fuse Load (0x13, D0) needs to be loaded first in the programming sequence since the E-Fuse load resets the SPI writes. After initial reset the default output interface variant is loaded automatically from fuse internally. However, when reading back this register reads 000 until a value is written using SPI. 001: 2-wire, 18 and 14-bit 010: 2-wire, 16-bit 011: 1-wire 100: 0.5-wire others: not used
4	0	R/W	0	Must write 0
3	OP IF EN	R/W	0	Enables changing the default output interface mode (D2-D0).
2-0	OP IF SEL	R/W	000	Selection of the output interface mode. OP IF EN (D3) needs to be enabled also. After initial reset the default output interface is loaded automatically from fuse internally. However, when reading back this register reads 000 until a value is written using SPI. 011: 2-wire 100: 1-wire 101: 0.5-wire others: not used

Table 9-4. Register 0x08 Field Descriptions

Bit	Field	Type	Reset	Description
7-6	0	R/W	0	Must write 0
5	PDN CLKBUF	R/W	0	Powers down sampling clock buffer 0: Clock buffer enabled 1: Clock buffer powered down
4	PDN REFAMP	R/W	0	Powers down internal reference gain amplifier 0: REFAMP enabled 1: REFAMP powered down
3	0	R/W	0	Must write 0
2	PDN A	R/W	0	Powers down ADC channel A 0: ADC channel A enabled 1: ADC channel A powered down
1	PDN B	R/W	0	Powers down ADC channel B 0: ADC channel B enabled 1: ADC channel B powered down
0	PDN GLOBAL	R/W	0	Global power down via SPI 0: Global power disabled 1: Global power down enabled. Power down mask (register 0x0D) determines which internal blocks are powered down.

Table 9-6. Register 0x0D Field Descriptions

Bit	Field	Type	Reset	Description
7-4	0	R/W	0	Must write 0
3	MASK CLKBUF	R/W	0	Global power down mask control for sampling clock input buffer. 0: Clock buffer will get powered down when global power down is exercised. 1: Clock buffer will NOT get powered down when global power down is exercised.
2	MASK REFAMP	R/W	0	Global power down mask control for reference amplifier. 0: Reference amplifier will get powered down when global power down is exercised. 1: Reference amplifier will NOT get powered down when global power down is exercised.
1	MASK BG DIS	R/W	0	Global power down mask control for internal 1.2V bandgap voltage reference. Setting this bit reduces power consumption in global power down mode but increases the wake up time. See the power down option overview. 0: Internal 1.2V bandgap voltage reference will NOT get powered down when global power down is exercised. 1: Internal 1.2V bandgap voltage reference will get powered down when global power down is exercised.
0	0	R/W	0	Must write 0

Figure 9-6. Register 0x0E

SYNC PIN EN	SPI SYNC	SPI SYNC EN	0	REF CTL	REF SEL		SE CLK EN
R/W-0	R/W-0	R/W-0	R/W-0	R/W-0	R/W-0	R/W-0	R/W-0

Table 9-7. Register 0x0E Field Descriptions

Bit	Field	Type	Reset	Description
7	SYNC PIN EN	R/W	0	This bit controls the functionality of the SYNC/PDN pin. 0: SYNC/PDN pin exercises global power down mode when pin is pulled high. 1: SYNC/PDN pin issues the SYNC command when pin is pulled high.
6	SPI SYNC	R/W	0	Toggling this bit issues the SYNC command using the SPI register write. SYNC using SPI must be enabled as well (D5). This bit doesn't self reset to 0. 0: Normal operation 1: SYNC command issued.
5	SPI SYNC EN	R/W	0	This bit enables synchronization using SPI instead of the SYNC/PDN pin. 0: Synchronization using SPI register bit disabled. 1: Synchronization using SPI register bit enabled.
4	0	R/W	0	Must write 0
3	REF CTL	R/W	0	This bit determines if the REFBUF/CTRL pin controls the voltage reference selection or the SPI register (D2-D1). 0: The REFBUF/CTRL pin selects the voltage reference option. 1: Voltage reference is selected using SPI (D2-D1) and single ended clock using D0.
2-1	REF SEL	R/W	00	Selects of the voltage reference option. REF CTRL (D3) must be set to 1. 00: Internal reference 01: External voltage reference (1.2V) using internal reference buffer (REFBUF/CTRL) 10: External voltage reference 11: not used
0	SE CLK EN	R/W	0	Selects single ended clock input and powers down the differential sampling clock input buffer. REF CRTL (D3) must be set to 1. 0: Differential clock input 1: Single ended clock input

Figure 9-7. Register 0x11

0	0	0	0	0	0		E-FUSE LD
R/W-0	R/W-0	R/W-0	R/W-0	R/W-0	R/W-0	R/W-0	R/W-0

Table 9-9. Register 0x13 Field Descriptions

Bit	Field	Type	Reset	Description
7-1	0	R/W	0	Must write 0
0	E-FUSE LD	R/W	0	This register bit loads the internal bit mapping for different interfaces. After setting the interface in register 0x07, this E-FUSE LD bit needs to be set to 1 and reset to 0 for loading to go into effect. Register 0x07 along with the E-Fuse Load (0x13, D0) needs to be loaded first in the programming sequence since the E-Fuse load resets the SPI writes. 0: E-FUSE LOAD set 1: E-FUSE LOAD reset

Table 9-10. Register 0x14/15/16 Field Descriptions

Bit	Field	Type	Reset	Description
7-0	CUSTOM PAT [17:0]	R/W	00000000	This register is used for two purposes: • It sets the constant custom pattern starting from MSB • It sets the RAMP pattern increment step size. 00001: Ramp pattern for 18-bit ADC 00100: Ramp pattern for 16-bit ADC 10000: Ramp pattern for 14-bit ADC
7-5	TEST PAT B	R/W	000	Enables test pattern output mode for channel B (NOTE: The test pattern is set prior to the bit mapper and is based on native resolution of the ADC starting from the MSB). These work in either output format.
				000: Normal output mode (test pattern output disabled) 010: Ramp pattern: need to set proper increment using CUSTOM PAT register 011: Constant Pattern using CUSTOM PAT [17:0] in register 0x14/15/16. others: not used
4-2	TEST PAT A	R/W	000	Enables test pattern output mode for channel A (NOTE: The test pattern is set prior to the bit mapper and is based on native resolution of the ADC starting from the MSB). These work in either output format.
				000: Normal output mode (test pattern output disabled) 010: Ramp pattern: need to set proper increment using CUSTOM PAT register 011: Constant Pattern using CUSTOM PAT [17:0] in register 0x14/15/16. others: not used

7	6	5	4	3	2	1	0
FCLK SRC	0	0	FCLK DIV	0	0	0	TOG FCLK
R/W-0	R/W-0	R/W-0	R/W-0	R/W-0	R/W-0	R/W-0	R/W-0

Table 9-11. Register 0x19 Field Descriptions

Bit	Field	Type	Reset	Description
7	FCLK SRC	R/W	0	User has to select if FCLK signal comes from ADC or from DDC block. Here real decimation is treated same as bypass mode 0: FCLK generated from ADC. FCLK SRC set to 0 for DDC bypass, real decimation mode and 1/2-w complex decimation mode. 1: FCLK generated from DDC block. In complex decimation mode only this bit needs to be set for 2-w and 1-w output interface mode but NOT for 1/2-w mode.
6-5	0	R/W	0	Must write 0
4	FCLK DIV	R/W	0	This bit needs to be set to 1 for 2-w output mode in bypass mode only (non decimation). 0: All output interface modes except 2-w bypass mode.. 1: 2-w output interface mode.
3-1	0	R/W	0	Must write 0
0	TOG FCLK	R/W	0	This bit adjusts the FCLK signal appropriately for 1/2-wire mode where FCLK is stretched to cover channel A and channel B. This bit ONLY needs to be set in 1/2-wire mode with complex decimation mode. 0: all other modes. 1: FCLK for 1/2-wire complex decimation mode.

Table 9-12. Configuration of FCLK SRC and FCLK DIV Register Bits vs Serial Interface

BYPASS/DECIMATION	SERIAL INTERFACE	FCLK SRC	FCLK DIV	TOG FCLK
Decimation Bypass/ Real Decimation	2-wire	0	1	0
	1-wire	0	0	0
	1/2-wire	0	0	0
Complex Decimation	2-wire	1	0	0
	1-wire	1	0	0
	1/2-wire	0	0	1

Table 9-14. Register 0x1B Field Descriptions

Bit	Field	Type	Reset	Description
7	MAPPER EN	R/W	0	This bit enables changing the resolution of the output (including output serialization factor) in bypass mode only. This bit is not needed for 20-bit resolution output. 0: Output bit mapper disabled. 1: Output bit mapper enabled.
6	20B EN	R/W	0	This bit enables 20-bit output resolution which can be useful for very high decimation settings so that quantization noise doesn't impact the ADC performance. 0: 20-bit output resolution disabled. 1: 20-bit output resolution enabled.
5-3	BIT MAPPER RES	R/W	000	Sets the output resolution using the bit mapper. MAPPER EN bit (D6) needs to be enabled when operating in bypass mode.. 000: 18 bit 001: 16 bit 010: 14 bit all others, n/a
2-0	0	R/W	0	Must write 0

Table 9-15. Register Settings for Output Bit Mapper vs Operating Mode

BYPASS/DECIMATION	OUTPUT RESOLUTION	MAPPER EN (D7)	BIT MAPPER RES (D5-D3)
Decimation Bypass	Resolution Change	1	000: 18-bit 001: 16-bit 010: 14-bit
Real Decimation	Resolution Change (default 18-bit)	0	
Complex Decimation		0

Table 9-19. Register 0x24 Field Descriptions

Bit	Field	Type	Reset	Description
7-6	0	R/W	0	Must write 0
5	CH AVG EN	R/W	0	Averages the output of ADC channel A and channel B together. The DDC MUX has to be enabled and set to '11'. The decimation filter needs to be enabled and set to bypass (full rate output) or decimation and DIG BYP set to 1. 0: Channel averaging feature disabled 1: Output of channel A and channel B are averaged: (A+B)/2.
4-3	DDC MUX	R/W	0	Configures DDC MUX in front of the decimation filter. 00: ADC channel A connected to DDC A; ADC Channel B connected to DDC B 01: ADC channel A connected to DDC A and DDC B. 10: ADC channel B connected to DDC A and DDC B. 11: Output of ADC averaging block (see CH AVG EN) given to DDC A and DDC B.
2	DIG BYP	R/W	0	This bit needs to be set to enable digital features block which includes decimation. 0: Digital feature block bypassed - lowest latency 1: Data path includes digital features
1	DDC EN	R/W	0	Enables internal decimation filter for both channels 0: DDC disabled. 1: DDC enabled.
0	0	R/W	0	Must write 0

Table 9-20. Register 0x25 Field Descriptions

Bit	Field	Type	Reset	Description
7	DDC MUX EN	R/W	0	Enables the digital mux between ADCs and decimation filters. This bit is required for DDC mux settings in register 0x24 (D4, D3) to go into effect. 0: DDC mux disabled 1: DDC mux enabled
6-4	DECIMATION	R/W	000	Complex decimation setting. This applies to both channels. 000: Bypass mode (no decimation) 001: Decimation by 2 010: Decimation by 4 011: Decimation by 8 100: Decimation by 16 101: Decimation by 32 others: not used
3	REAL OUT	R/W	0	This bit selects real output decimation. This mode applies to both channels. In this mode, the decimation filter is a low pass filter and no complex mixing is performed to reduce power consumption. For maximum power savings the NCO in this case is set to 0. 0: Complex decimation 1: Real decimation
2-1	0	R/W	0	Must write 0
0	MIX PHASE	R/W	0	This bit used to invert the NCO phase 0: NCO phase as is. 1: NCO phase inverted.

Table 9-25. Register 0x31/32/33/34 Field Descriptions

Bit	Field	Type	Reset	Description
7-0	NCO B [31:0]	R/W	0	Sets the 32 bit NCO value for decimation filter channel B. The NCO value is $f_{NCO} \times 2^{32}/FS$ In real decimation mode these registers are automatically set to 0.

Figure 9-23. Register 0x39..0x60

7	6	5	4	3	2	1	0
0	0	0	0	0	0	FORMAT A	0
R/W-0	R/W-0	R/W-0	R/W-0	R/W-0	R/W-0	R/W-0	R/W-0

Table 9-28. Register 0x8F Field Descriptions

Bit	Field	Type	Reset	Description
7-2	0	R/W	0	Must write 0
1	FORMAT A	R/W	0	This bit sets the output data format for channel A. Digital bypass register bit (0x24, D2) needs to be enabled as well. 0: 2s complement 1: Offset binary
0	0	R/W	0	Must write 0

Figure 9-26. Register 0x92

7	6	5	4	3	2	1	0
0	0	0	0	0	0	FORMAT B	0
R/W-0	R/W-0	R/W-0	R/W-0	R/W-0	R/W-0	R/W-0	R/W-0

Table 9-29. Register 0x92 Field Descriptions

Bit	Field	Type	Reset	Description
7-2	0	R/W	0	Must write 0
1	FORMAT B	R/W	0	This bit sets the output data format for channel B. Digital bypass register bit (0x24, D2) needs to be enabled as well. 0: 2s complement 1: Offset binary
0	0	R/W	0	Must write 0

10 Device and Documentation Support

10.1 Receiving Notification of Documentation Updates

To receive notification of documentation updates, navigate to the device product folder on ti.com. Click on *Notifications* to register and receive a weekly digest of any product information that has changed. For change details, review the revision history included in any revised document.

10.2 Support Resources

TI E2E™ support forums are an engineer's go-to source for fast, verified answers and design help — straight from the experts. Search existing answers or ask your own question to get the quick design help you need.

Linked content is provided "AS IS" by the respective contributors. They do not constitute TI specifications and do not necessarily reflect TI's views; see TI's Terms of Use.

10.3 Trademarks

PowerPAD™ is a trademark of TI.
TI E2E™ is a trademark of Texas Instruments.
WEBENCH® is a registered trademark of Texas Instruments.
All trademarks are the property of their respective owners.

10.4 Electrostatic Discharge Caution

This integrated circuit can be damaged by ESD. Texas Instruments recommends that all integrated circuits be handled with appropriate precautions. Failure to observe proper handling and installation procedures can cause damage.

ESD damage can range from subtle performance degradation to complete device failure. Precision integrated circuits may be more susceptible to damage because very small parametric changes could cause the device not to meet its published specifications.

10.5 Glossary

TI Glossary — This glossary lists and explains terms, acronyms, and definitions.

11 Revision History

NOTE: Page numbers for previous revisions may differ from page numbers in the current version.

DATE	REVISION	NOTES
April 2025	*	Initial Release

12 Mechanical, Packaging, and Orderable Information

The following pages include mechanical, packaging, and orderable information. This information is the most current data available for the designated devices. This data is subject to change without notice and revision of this document. For browser-based versions of this data sheet, refer to the left-hand navigation.

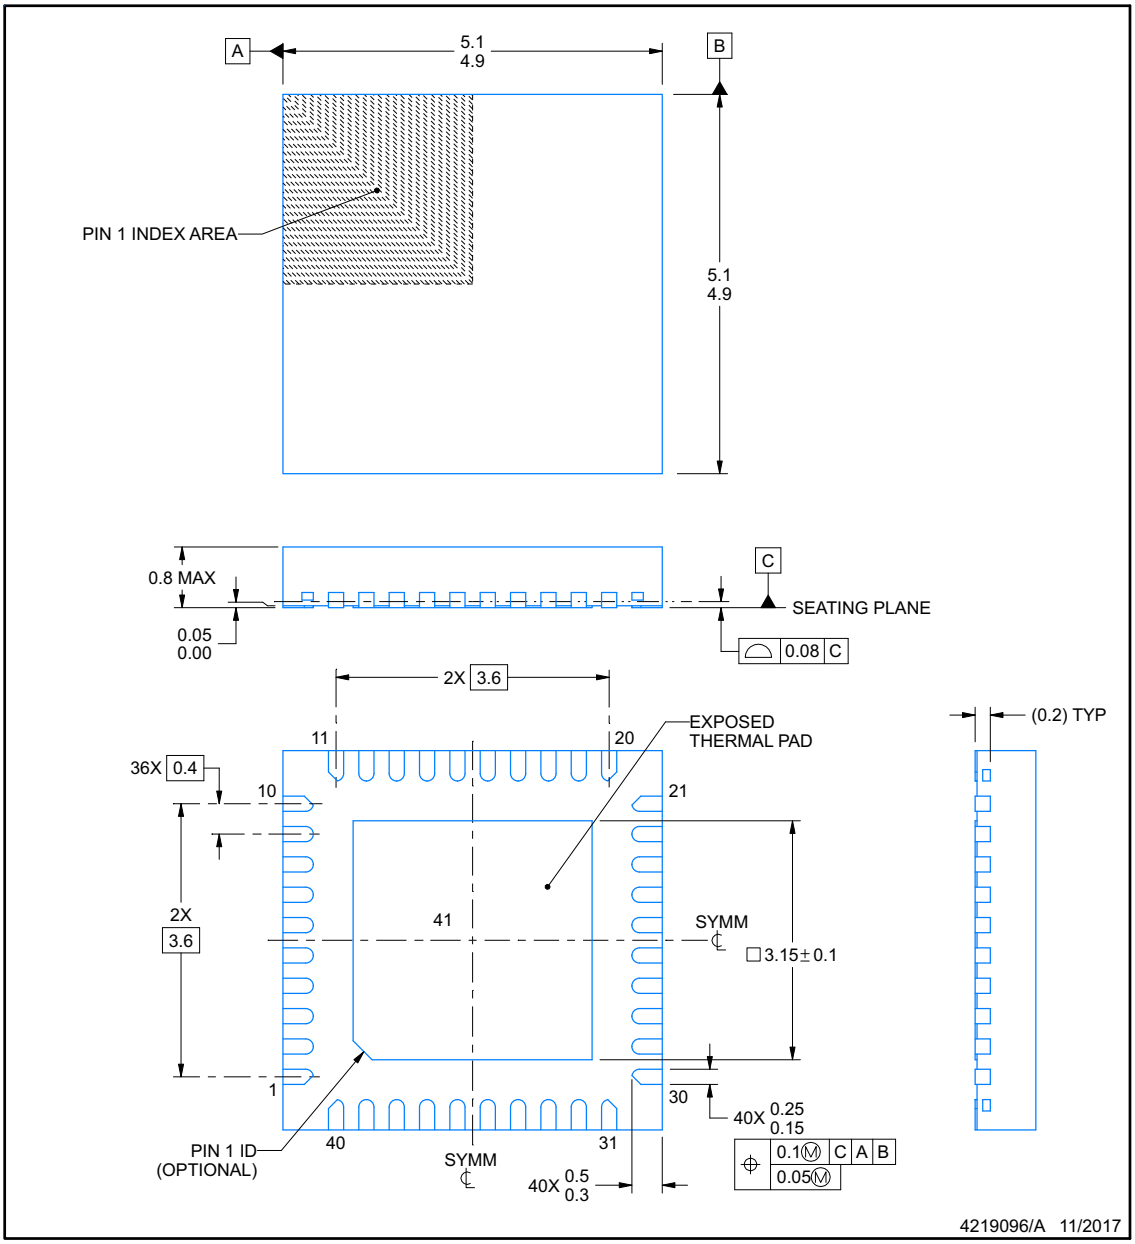
12.1 Mechanical Data

RSB0040E

PACKAGE OUTLINE

WQFN - 0.8 mm max height

PLASTIC QUAD FLATPACK - NO LEAD



NOTES:

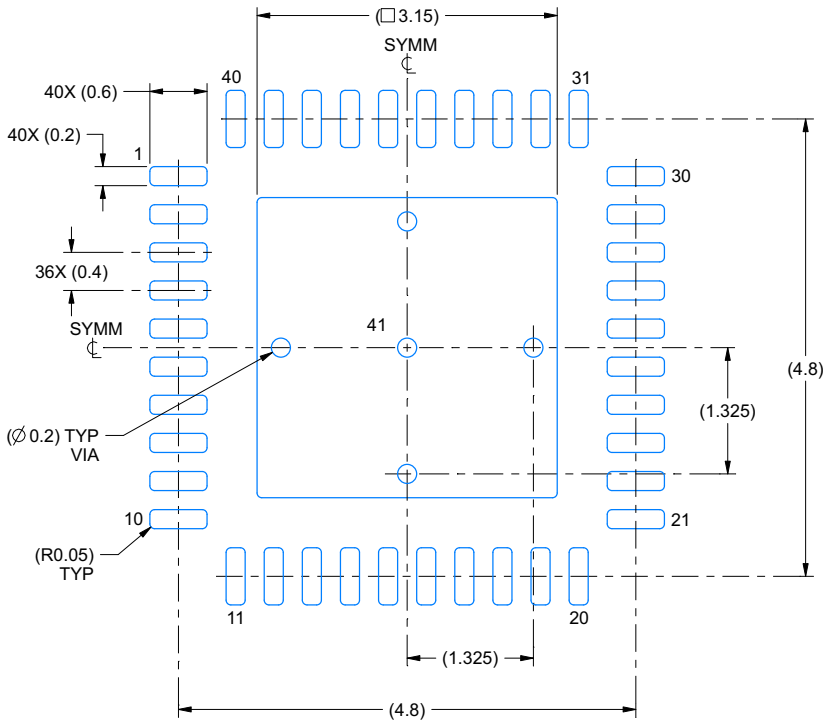
1. All linear dimensions are in millimeters. Any dimensions in parenthesis are for reference only. Dimensioning and tolerancing per ASME Y14.5M.
2. This drawing is subject to change without notice.
3. The package thermal pad must be soldered to the printed circuit board for thermal and mechanical performance.

EXAMPLE BOARD LAYOUT

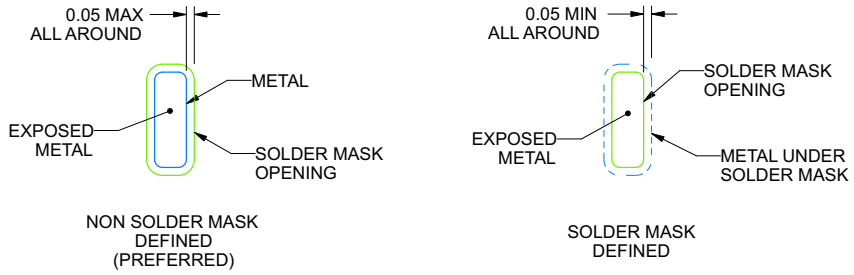
RSB0040E

WQFN - 0.8 mm max height

PLASTIC QUAD FLATPACK - NO LEAD



LAND PATTERN EXAMPLE
EXPOSED METAL SHOWN
SCALE:15X



SOLDER MASK DETAILS

4219096/A 11/2017

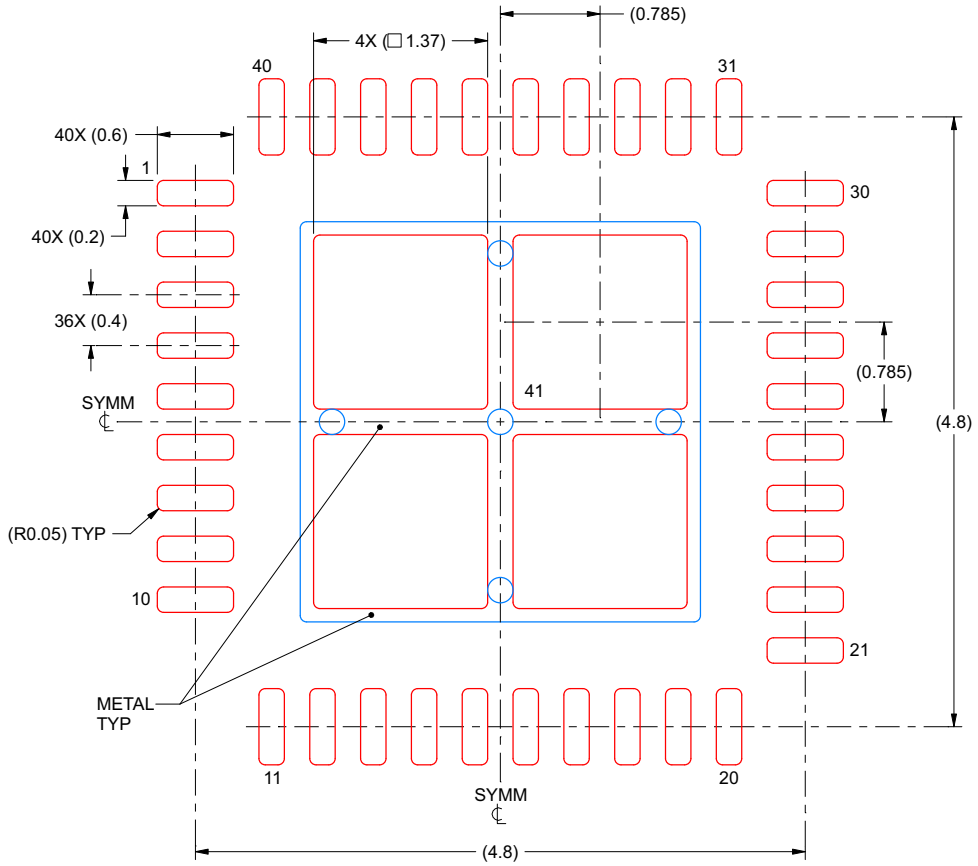
NOTES: (continued)

4. This package is designed to be soldered to a thermal pad on the board. For more information, see Texas Instruments literature number SLUA271 (www.ti.com/lit/slua271).
5. Vias are optional depending on application, refer to device data sheet. If any vias are implemented, refer to their locations shown on this view. It is recommended that vias under paste be filled, plugged or tented.

EXAMPLE STENCIL DESIGN

RSB0040E — **WQFN - 0.8 mm max height**

PLASTIC QUAD FLATPACK - NO LEAD



SOLDER PASTE EXAMPLE
BASED ON 0.1 mm THICK STENCIL

EXPOSED PAD 41
75% PRINTED SOLDER COVERAGE BY AREA UNDER PACKAGE
SCALE:20X

4219096/A 11/2017

NOTES: (continued)

6. Laser cutting apertures with trapezoidal walls and rounded corners may offer better paste release. IPC-7525 may have alternate design recommendations.

PACKAGING INFORMATION

Orderable Device	Status (1)	Package Type	Package Drawing	Pins	Package Qty	Eco Plan (2)	Lead finish/ Ball material (6)	MSL Peak Temp (3)	Op Temp (°C)	Device Marking (4/5)	Samples
ADC3664RSBTSEP	ACTIVE	WQFN	RSB	40	250	RoHS & Green	NIPDAU	Level-3-260C-168 HR	-40 to 105	ADC3664 SEP	Samples
V62/24601-02XE	ACTIVE	WQFN	RSB	40	250	RoHS & Green	NIPDAU	Level-3-260C-168 HR	-55 to 105	ADC3664 SEP	Samples

(1) The marketing status values are defined as follows:
ACTIVE: Product device recommended for new designs.
LIFEBUY: TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.
NRND: Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.
PREVIEW: Device has been announced but is not in production. Samples may or may not be available.
OBSOLETE: TI has discontinued the production of the device.

(2) **RoHS:** TI defines "RoHS" to mean semiconductor products that are compliant with the current EU RoHS requirements for all 10 RoHS substances, including the requirement that RoHS substance do not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, "RoHS" products are suitable for use in specified lead-free processes. TI may reference these types of products as "Pb-Free".
RoHS Exempt: TI defines "RoHS Exempt" to mean products that contain lead but are compliant with EU RoHS pursuant to a specific EU RoHS exemption.
Green: TI defines "Green" to mean the content of Chlorine (Cl) and Bromine (Br) based flame retardants meet JS709B low halogen requirements of <=1000ppm threshold. Antimony trioxide based flame retardants must also meet the <=1000ppm threshold requirement.

(3) MSL, Peak Temp. - The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

(4) There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.

(5) Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a "~" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.

(6) Lead finish/Ball material - Orderable Devices may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead finish/Ball material values may wrap to two lines if the finish value exceeds the maximum column width.

OTHER QUALIFIED VERSIONS OF ADC3664-SEP :

- Space : ADC3664-SP

NOTE: Qualified Version Definitions:

- Space - Radiation tolerant, ceramic packaging and qualified for use in Space-based application

IMPORTANT NOTICE AND DISCLAIMER
