

## ADS7043 Ultra-Low Power, Ultra-Small Size, 12-Bit, 1-MSPS, SAR ADC

### 1 Features

- Industry's First SAR ADC with Nanowatt Power Consumption:
  - 243  $\mu$ W at 1 MSPS with 1.8-V AVDD
  - 780  $\mu$ W at 1 MSPS with 3-V AVDD
  - 78  $\mu$ W at 100 kSPS with 3-V AVDD
  - Less than 1  $\mu$ W at 1 kSPS with 3-V AVDD
- Industry's Smallest SAR ADC:
  - X2QFN-8 Package with 2.25-mm<sup>2</sup> Footprint
- 1-MSPS Throughput with Zero Data Latency
- Wide Operating Range:
  - AVDD: 1.65 V to 3.6 V
  - DVDD: 1.65 V to 3.6 V (Independent of AVDD)
  - Temperature Range: –40°C to 125°C
- Excellent Performance:
  - 12-Bit Resolution with NMC
  - $\pm 1$ -LSB (Max) DNL and INL
  - 70-dB SNR with 3-V AVDD
  - 80-dB THD with 3-V AVDD
- Unipolar, Pseudo-Differential Input Range: –AVDD / 2 to AVDD / 2
- Integrated Offset Calibration
- SPI™-Compatible Serial Interface: 16 MHz
- JESD8-7A Compliant Digital I/O

### 2 Applications

- Low-Power Data Acquisition
- Battery-Powered Handheld Equipment
- Level Sensors
- Ultrasonic Flow Meters
- Motor Controls
- Wearable Fitness
- Portable Medical Equipment
- Hard Drives
- Glucose Meters

### 3 Description

The ADS7043 is a 1-MSPS, analog-to-digital converter (ADC). The device supports a wide analog input voltage range ( $\pm 0.825$  V to  $\pm 1.8$  V) and includes a capacitor-based, successive-approximation register (SAR) ADC with an inherent sample-and-hold circuit. The SPI-compatible serial interface is controlled by the  $\overline{\text{CS}}$  and  $\text{SCLK}$  signals. The input signal is sampled with the  $\overline{\text{CS}}$  falling edge and SCLK is used for conversion and serial data output. The device supports a wide digital supply range (1.65 V to 3.6 V), enabling direct interface to a variety of host controllers. The device complies with the JESD8-7A standard for normal DVDD range (1.65 V to 1.95 V).

The device is available in 8-pin, miniature, leaded, and X2QFN packages and is specified for operation from –40°C to 125°C. Miniature form-factor and extremely low-power consumption make this device suitable for space-constrained, battery-powered applications.

#### Device Information<sup>(1)</sup>

| PART NAME | PACKAGE   | BODY SIZE (NOM)   |
|-----------|-----------|-------------------|
| ADS7043   | X2QFN (8) | 1.50 mm × 1.50 mm |
|           | VSSOP (8) | 2.30 mm × 2.00 mm |

(1) For all available packages, see the orderable addendum at the end of the datasheet.

#### Typical Application

NOTE: The device is smaller than a 0805 (2012 metric) SMD component.

## 4 Revision History

| Changes from Revision C (February 2015) to Revision D                                                                    | Page      |
|--------------------------------------------------------------------------------------------------------------------------|-----------|
| • Changed <a href="#">Figure 1</a> .....                                                                                 | <b>8</b>  |
| • Changed <i>Serial Interface</i> section: changed last half of first paragraph, changed <a href="#">Figure 35</a> ..... | <b>19</b> |
| • Changed <a href="#">Figure 38</a> .....                                                                                | <b>22</b> |
| • Added <i>Community Resources</i> section .....                                                                         | <b>30</b> |

| Changes from Revision B (December 2014) to Revision C                                                                       | Page      |
|-----------------------------------------------------------------------------------------------------------------------------|-----------|
| • Changed <i>Wide Operating Range</i> Features bullet: changed the value of AVDD from 1.8 V to 1.65 V .....                 | <b>1</b>  |
| • Changed the wide analog input voltage range value to $\pm 0.825$ V in first paragraph of <i>Description</i> section ..... | <b>1</b>  |
| • Changed AVDD parameter minimum specification in <i>Recommended Operating Conditions</i> table .....                       | <b>5</b>  |
| • Changed $E_O$ parameter uncalibrated test conditions in <i>Electrical Characteristics</i> table .....                     | <b>6</b>  |
| • Changed <i>Maximum throughput rate</i> parameter test conditions in <i>Electrical Characteristics</i> table .....         | <b>6</b>  |
| • Changed AVDD parameter minimum specification in <i>Electrical Characteristics</i> table .....                             | <b>7</b>  |
| • Changed conditions for <i>Timing Characteristics</i> table: changed range of AVDD and added $C_{LOAD}$ condition .....    | <b>7</b>  |
| • Changed $t_{D\_CKDO}$ specification in <i>Timing Characteristics</i> table .....                                          | <b>7</b>  |
| • Added $f_{SCLK}$ minimum specification to <i>Timing Characteristics</i> table .....                                       | <b>7</b>  |
| • Changed titles of <a href="#">Figure 26</a> to <a href="#">Figure 30</a> .....                                            | <b>12</b> |
| • Changed <i>Reference</i> sub-section in <i>Feature Description</i> section .....                                          | <b>16</b> |
| • Changed AVDD range in description of $f_{CLK-CAL}$ parameter in <a href="#">Table 2</a> .....                             | <b>21</b> |
| • Changed AVDD range in description of $f_{CLK-CAL}$ parameter in <a href="#">Table 3</a> .....                             | <b>22</b> |
| • Changed <i>Reference Circuit</i> section in <i>Application Information</i> .....                                          | <b>25</b> |
| • Added last two sentences to <i>AVDD and DVDD Supply Recommendations</i> section .....                                     | <b>28</b> |

| <b>Changes from Revision A (November 2014) to Revision B</b>       | <b>Page</b>        |
|--------------------------------------------------------------------|--------------------|
| • Changed ESD Ratings table to latest standards .....              | <a href="#">5</a>  |
| • Added footnotes to <i>Electrical Characteristics</i> table ..... | <a href="#">6</a>  |
| • Changed y-axis unit in <a href="#">Figure 30</a> .....           | <a href="#">13</a> |

| <b>Changes from Original (November 2014) to Revision A</b> | <b>Page</b>       |
|------------------------------------------------------------|-------------------|
| • Made changes to product preview data sheet.....          | <a href="#">1</a> |

## 5 Pin Configuration and Functions

### Pin Functions

| NAME                   | PIN NO. |     | I/O            | DESCRIPTION                                                                      |
|------------------------|---------|-----|----------------|----------------------------------------------------------------------------------|
|                        | RUG     | DCU |                |                                                                                  |
| AINM                   | 8       | 5   | Analog input   | Analog signal input, negative                                                    |
| AINP                   | 7       | 6   | Analog input   | Analog signal input, positive                                                    |
| AVDD                   | 6       | 7   | Supply         | Analog power-supply input, also provides the reference voltage to the ADC        |
| $\overline{\text{CS}}$ | 1       | 4   | Digital input  | Chip-select signal, active low                                                   |
| DVDD                   | 4       | 1   | Supply         | Digital I/O supply voltage                                                       |
| GND                    | 5       | 8   | Supply         | Ground for power supply, all analog and digital signals are referred to this pin |
| SCLK                   | 3       | 2   | Digital input  | Serial clock                                                                     |
| SDO                    | 2       | 3   | Digital output | Serial data out                                                                  |

## 6 Specifications

### 6.1 Absolute Maximum Ratings<sup>(1)</sup>

|                                       | MIN  | MAX        | UNIT |
|---------------------------------------|------|------------|------|
| AVDD to GND                           | −0.3 | 3.9        | V    |
| DVDD to GND                           | −0.3 | 3.9        | V    |
| AINP to GND                           | −0.3 | AVDD + 0.3 | V    |
| AINM to GND                           | −0.3 | AVDD + 0.3 | V    |
| Digital input voltage to GND          | −0.3 | DVDD + 0.3 | V    |
| Storage temperature, T <sub>stg</sub> | −60  | 150        | °C   |

- (1) Stresses beyond those listed under *Absolute Maximum Ratings* may cause permanent damage to the device. These are stress ratings only, which do not imply functional operation of the device at these or any other conditions beyond those indicated under *Recommended Operating Conditions*. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.

### 6.2 ESD Ratings

|                                            |                                                                                | VALUE | UNIT |
|--------------------------------------------|--------------------------------------------------------------------------------|-------|------|
| V <sub>(ESD)</sub> Electrostatic discharge | Human body model (HBM), per ANSI/ESDA/JEDEC JS-001 <sup>(1)</sup>              | ±2000 | V    |
|                                            | Charged device model (CDM), per JEDEC specification JESD22-C101 <sup>(2)</sup> | ±1000 |      |

- (1) JEDEC document JEP155 states that 500-V HBM allows safe manufacturing with a standard ESD control process.

- (2) JEDEC document JEP157 states that 250-V CDM allows safe manufacturing with a standard ESD control process.

### 6.3 Recommended Operating Conditions

over operating free-air temperature range (unless otherwise noted)

|                                               | MIN  | MAX | UNIT |
|-----------------------------------------------|------|-----|------|
| AVDD Analog supply voltage range              | 1.65 | 3.6 | V    |
| DVDD Digital supply voltage range             | 1.65 | 3.6 | V    |
| T <sub>A</sub> Operating free-air temperature | −40  | 125 | °C   |

### 6.4 Thermal Information

| THERMAL METRIC <sup>(1)</sup> |                                              | ADS7043     |             | UNIT |
|-------------------------------|----------------------------------------------|-------------|-------------|------|
|                               |                                              | RUG (X2QFN) | DCU (VSSOP) |      |
|                               |                                              | 8 PINS      | 8 PINS      |      |
| R <sub>θJA</sub>              | Junction-to-ambient thermal resistance       | 177.5       | 235.8       | °C/W |
| R <sub>θJC(top)</sub>         | Junction-to-case (top) thermal resistance    | 51.5        | 79.8        | °C/W |
| R <sub>θJB</sub>              | Junction-to-board thermal resistance         | 76.7        | 117.6       | °C/W |
| Ψ <sub>JT</sub>               | Junction-to-top characterization parameter   | 1.0         | 8.9         | °C/W |
| Ψ <sub>JB</sub>               | Junction-to-board characterization parameter | 76.7        | 116.5       | °C/W |
| R <sub>θJC(bot)</sub>         | Junction-to-case (bottom) thermal resistance | N/A         | N/A         | °C/W |

- (1) For more information about traditional and new thermal metrics, see the *IC Package Thermal Metrics* application report, [SPRA953](#).

## 6.5 Electrical Characteristics

At  $T_A = -40^{\circ}\text{C}$  to  $125^{\circ}\text{C}$ ,  $\text{AVDD} = 3\text{ V}$ ,  $\text{DVDD} = 1.65\text{ V}$  to  $3.6\text{ V}$ ,  $f_{\text{SAMPLE}} = 1\text{ MSPS}$ , unless otherwise noted.

| PARAMETER                                    |                                               | TEST CONDITIONS                       | MIN          | TYP        | MAX            | UNIT               |
|----------------------------------------------|-----------------------------------------------|---------------------------------------|--------------|------------|----------------|--------------------|
| ANALOG INPUT                                 |                                               |                                       |              |            |                |                    |
| Full-scale input voltage span <sup>(1)</sup> |                                               |                                       | −AVDD / 2    |            | AVDD / 2       | V                  |

(1) Ideal input span; does not include gain or offset error.

(2) LSB means least significant bit.

(3) Refer to the [Offset Calibration](#) section for more details.

(4) All specifications expressed in decibels (dB) refer to the full-scale input (FSR) and are tested with an input signal 0.5 dB below full-scale, unless otherwise specified.

(5) Calculated on the first nine harmonics of the input frequency.

(6) Digital voltage levels comply with the JESD8-7A standard for DVDD from 1.65 V to 1.95 V. See the [Digital Voltage Levels](#) section for more details.

## Electrical Characteristics (continued)

At  $T_A = -40^{\circ}\text{C}$  to  $125^{\circ}\text{C}$ ,  $AVDD = 3\text{ V}$ ,  $DVDD = 1.65\text{ V}$  to  $3.6\text{ V}$ ,  $f_{\text{SAMPLE}} = 1\text{ MSPS}$ , unless otherwise noted.

## 7 Parameter Measurement Information

### 7.1 Digital Voltage Levels

The device complies with the JESD8-7A standard for DVDD from 1.65 V to 1.95 V. [Figure 31](#) shows voltage levels for the digital input and output pins.

**Figure 31. Digital Voltage Levels as per the JESD8-7A Standard**

## 8 Detailed Description

### 8.1 Overview

The ADS7043 is an ultralow-power, ultra-small analog-to-digital converter (ADC) that supports a wide analog input range. The analog input range for the device is defined by the AVDD supply voltage. The device samples the input voltage across the AINP and AINM pins on the  $\overline{CS}$  falling edge and starts the conversion. The clock provided on the SCLK pin is used for conversion and data transfer. During conversions, both the AINP and AINM pins are disconnected from the sampling circuit. After the conversion completes, the sampling capacitors are reconnected across the AINP and AINM pins and the device enters acquisition phase.

The device has an internal offset calibration. The offset calibration can be initiated by the user either on power-up or during normal operation; see the [Offset Calibration](#) section for more details.

The device also provides a simple serial interface to the host controller and operates over a wide range of digital power supplies. The device requires only a 16-MHz SCLK for supporting a throughput of 1 MSPS. The digital interface also complies with the JESD8-7A (normal range) standard. The [Functional Block Diagram](#) section provides a block diagram of the device.

### 8.2 Functional Block Diagram

## 8.3 Feature Description

### 8.3.1 Reference

The device uses the analog supply voltage (AVDD) as a reference, as shown in [Figure 32](#). TI recommends decoupling the AVDD pin with a 1- $\mu$ F, low equivalent series resistance (ESR) ceramic capacitor. The AVDD pin functions as a switched capacitor load to the source powering AVDD. The decoupling capacitor provides the instantaneous charge required by the internal circuit and helps in maintaining a stable dc voltage on the AVDD pin. TI recommends powering the AVDD pin with a low output impedance and low-noise regulator (such as the [TPS79101](#)).

**Figure 32. Reference for the Device**

## Feature Description (continued)

### 8.3.2 Analog Input

The device supports pseudo-differential analog inputs. The ADC samples the difference between AINP and AINM and converts for this voltage. The device is capable of accepting a signal from  $AVDD / 2 - 100 \text{ mV}$  to  $AVDD / 2 + 100 \text{ mV}$  on the AINM input and a signal from 0 V to AVDD on the AINP input. Figure 33 represents the equivalent analog input circuits for the sampling stage. The device has a low-pass filter followed by the sampling switch and sampling capacitor. The sampling switch is represented by an  $R_s$  (typically  $50 \Omega$ ) resistor in series with an ideal switch and  $C_s$  (typically  $15 \text{ pF}$ ) is the sampling capacitor. The ESD diodes are connected from both analog inputs to AVDD and ground.

Figure 33. Equivalent Input Circuit for the Sampling Stage

The analog input full-scale range (FSR) is defined by the reference voltage of the ADC. The relationship between the FSR and the reference voltage can be determined by:  $FSR = V_{REF} = AVDD$ .

### 8.3.3 ADC Transfer Function

The device output is in straight binary format. The device resolution can be computed by Equation 1:

$$1 \text{ LSB} = FSR / 2^N$$

where:

- $FSR = V_{REF} = AVDD$  and
- $N = 12$

### 8.3.4 Serial Interface

The device supports a simple, SPI-compatible interface to the external host. The  $\overline{\text{CS}}$  signal defines one conversion and serial transfer frame. A frame starts with a  $\overline{\text{CS}}$  falling edge and ends with a  $\overline{\text{CS}}$  rising edge. The SDO pin outputs the ADC conversion results. [Figure 35](#) shows a detailed timing diagram for the serial interface. A minimum delay of  $t_{\text{SU\_CSCK}}$  must elapse between the  $\overline{\text{CS}}$  falling edge and the first SCLK falling edge. The device uses the clock provided on the SCLK pin for conversion and data transfer. The conversion result is available on the SDO pin with the first two bits set to 0, followed by 12 bits of the conversion result. The first zero is launched on the SDO pin on the  $\overline{\text{CS}}$  falling edge. Subsequent bits (starting with another 0 followed by the conversion result) are launched on the SDO pin on subsequent SCLK falling edges. The SDO output remains low after 14 SCLKs. A  $\overline{\text{CS}}$  rising edge ends the frame and brings the serial data bus to 3-state. For the acquisition of the next sample, a minimum time of  $t_{\text{ACQ}}$  must be provided after the conversion of the current sample is completed. For details on timing specifications, see the [Timing Characteristics](#) table.

The device initiates offset calibration on first  $\overline{\text{CS}}$  falling edge after power-up and the SDO output remains low during the first serial transfer frame after power-up. For details, refer to the [Offset Calibration](#) section.

**Figure 35. Serial Interface Timing Diagram**

## 8.4 Device Functional Modes

### 8.4.1 Offset Calibration

The device includes a feature to calibrate its internal offset. The device initiates offset calibration on the first  $\overline{\text{CS}}$  falling edge after power up and during offset calibration, the analog input pins (AINP and AINM) are disconnected from the sampling stage. After the first serial transfer frame, the device starts operating with either uncalibrated or calibrated offset, depending on the number of SCLKs provided in the first serial transfer frame. Offset calibration can also be initiated by the user during normal operation. Figure 36 shows the offset calibration process. The SDO output remains low during the first serial transfer frame.

The device includes an internal offset calibration register (OCR) that stores the offset calibration result. The OCR is an internal register and cannot be accessed by the user through the serial interface. The OCR is reset to zero on power-up. Therefore, TI recommends calibrating the offset on power-up to bring the offset within the specified limits. If there is a significant change in operating temperature or analog supply voltage, the offset can be recalibrated during normal operation.

- (1) See the [Timing Characteristics](#) section for timing specifications.
- (2) See the [Offset Calibration During Normal Operation](#) section for details.
- (3) See the [Offset Calibration on Power-Up](#) section for details.
- (4) The power recycle on the AVDD supply is required to reset the offset calibration and to bring the device to a power-up state.

**Figure 36. Offset Calibration**

## Device Functional Modes (continued)

### 8.4.1.1 Offset Calibration on Power-Up

The device starts offset calibration on the first  $\overline{\text{CS}}$  falling edge after power-up and calibration completes if the  $\overline{\text{CS}}$  pin remains low for at least 16 SCLKs after the first  $\overline{\text{CS}}$  falling edge. The SDO output remains low during calibration. The minimum acquisition time must be provided after calibration for acquiring the first sample. If the device is not provided with at least 16 SCLKs during the first serial transfer frame after power-up, the OCR is not updated. Table 2 provides the timing parameters for offset calibration on power-up.

For subsequent samples, the device adjusts the conversion results with the value stored in the OCR. The conversion result adjusted with the value stored in OCR is provided by the device on the SDO output. Figure 37 shows the timing diagram for offset calibration on power-up.

**Table 2. Offset Calibration on Power-Up**

|                          |                                                                                 | MIN                  | TYP | MAX | UNIT |
|--------------------------|---------------------------------------------------------------------------------|----------------------|-----|-----|------|
| $f_{\text{CLK-CAL}}$     | SCLK frequency for calibration at $2.25\text{ V} < \text{AVDD} < 3.6\text{ V}$  |                      |     | 16  | MHz  |
| $f_{\text{CLK-CAL}}$     | SCLK frequency for calibration at $1.65\text{ V} < \text{AVDD} < 2.25\text{ V}$ |                      |     | 12  | MHz  |
| $t_{\text{POWERUP-CAL}}$ | Calibration time at power-up                                                    | 16 $t_{\text{SCLK}}$ |     |     | ns   |
| $t_{\text{ACQ}}$         | Acquisition time                                                                | 200                  |     |     | ns   |
| $t_{\text{PH-CS}}$       | $\overline{\text{CS}}$ high time                                                | $t_{\text{ACQ}}$     |     |     | ns   |

**Figure 37. Offset Calibration on Power-Up Timing Diagram**

### 8.4.1.2 Offset Calibration During Normal Operation

The offset can also be calibrated during normal device operation. Offset calibration can be done during normal device operation if at least 32 SCLKs are provided in one serial transfer frame. During the first 14 SCLKs, the device converts the sample acquired on the  $\overline{\text{CS}}$  falling edge and provides data on the SDO output. The device initiates the offset calibration on the 17th SCLK falling edge and calibration is completed on the 32nd SCLK falling edge. The SDO output remains low after the 14th SCLK falling edge and SDO goes to 3-state after  $\overline{\text{CS}}$  goes high. If the device is provided with less than 32 SCLKs during a serial transfer frame, the OCR is not updated. Table 3 provides the timing parameters for offset calibration during normal operation.

For subsequent samples, the device adjusts the conversion results with the value stored in OCR. The conversion result adjusted with the value stored in the OCR is provided by the device on the SDO output. Figure 38 shows the timing diagram for offset calibration during normal operation.

**Table 3. Offset Calibration During Normal Operation**

|                      |                                                                                  | MIN                  | TYP | MAX | UNIT |
|----------------------|----------------------------------------------------------------------------------|----------------------|-----|-----|------|
| $f_{\text{CLK-CAL}}$ | SCLK frequency for calibration for $2.25\text{ V} < \text{AVDD} < 3.6\text{ V}$  |                      |     | 16  | MHz  |
| $f_{\text{CLK-CAL}}$ | SCLK frequency for calibration for $1.65\text{ V} < \text{AVDD} < 2.25\text{ V}$ |                      |     | 12  | MHz  |
| $t_{\text{CAL}}$     | Calibration time during normal operation                                         | 16 $t_{\text{SCLK}}$ |     |     | ns   |
| $t_{\text{ACQ}}$     | Acquisition time                                                                 | 200                  |     |     | ns   |
| $t_{\text{PH\_CS}}$  | $\overline{\text{CS}}$ high time                                                 | $t_{\text{ACQ}}$     |     |     | ns   |

## 9 Application and Implementation

### NOTE

Information in the following applications sections is not part of the TI component specification, and TI does not warrant its accuracy or completeness. TI's customers are responsible for determining suitability of components for their purposes. Customers should validate and test their design implementation to confirm system functionality.

### 9.1 Application Information

The two primary circuits required to maximize the performance of a high-precision, successive approximation register (SAR), analog-to-digital converter (ADC) are the input driver and the reference driver circuits. This section details some general principles for designing the input driver circuit, reference driver circuit, and provides some application circuits designed for the ADS7043.

### 9.2 Typical Applications

#### 9.2.1 Single-Supply DAQ with the ADS7043

**Figure 39. DAQ Circuit: Single-Supply DAQ**

##### 9.2.1.1 Design Requirements

The goal of this application is to design a single-supply digital acquisition (DAQ) circuit based on the ADS7043 with SNR greater than 69 dB and THD less than –80 dB for a input signal having an amplitude of  $AVDD / 2$  with a common-mode voltage of  $AVDD / 2$  and input frequencies of 2 kHz at a throughput of 1 MSPS.

##### 9.2.1.2 Detailed Design Procedure

The input driver circuit for a high-precision ADC mainly consists of two parts: a driving amplifier and an antialiasing filter. Careful design of the front-end circuit is critical to meet the linearity and noise performance of a high-precision ADC.

## Typical Applications (continued)

### 9.2.1.2.1 Antialiasing Filter

Converting analog-to-digital signals requires sampling an input signal at a rate greater than or equal to the Nyquist rate. Any higher frequency content in the input signal beyond half the sampling frequency is digitized and folded back into the low-frequency spectrum. This process is called *aliasing*. Therefore, an external, antialiasing filter must be used to remove the harmonic content from the input signal before being sampled by the ADC. An antialiasing filter is designed as a low-pass RC filter, for which the 3-dB bandwidth is optimized for noise, response time, and throughput. For dc signals with fast transients (including multiplexed input signals), a high-bandwidth filter is designed to allow the signal to be accurately set at the ADC inputs during the small acquisition time window. Figure 40 provides the equation for determining the bandwidth of antialiasing filter.

**Figure 40. Antialiasing Filter**

For ac signals, the filter bandwidth must be kept low to band limit the noise fed into the ADC input, thereby increasing the signal-to-noise ratio (SNR) of the system. Besides filtering the noise from the front-end drive circuitry, the RC filter also helps attenuate the sampling charge injection from the switched-capacitor input stage of the ADC. A filter capacitor,  $C_{FLT}$ , is connected across the ADC inputs. This capacitor helps reduce the sampling charge injection and provides a charge bucket to quickly charge the internal sample-and-hold capacitors during the acquisition process. As a rule of thumb, the value of this capacitor must be at least 20 times the specified value of the ADC sampling capacitance. For this device, the input sampling capacitance is equal to 15 pF. Thus, the value of  $C_{FLT}$  must be greater than 300 pF. The capacitor must be a COG- or NPO-type because these capacitor types have a high-Q, low-temperature coefficient, and stable electrical characteristics under varying voltages, frequency, and time.

Note that driving capacitive loads can degrade the phase margin of the input amplifiers, thus making the amplifier marginally unstable. To avoid amplifier stability issues, series isolation resistors ( $R_{FLT}$ ) are used at the output of the amplifiers. A higher value of  $R_{FLT}$  is helpful from the amplifier stability perspective, but adds distortion as a result of interactions with the nonlinear input impedance of the ADC. Distortion increases with source impedance, input signal frequency, and input signal amplitude. Therefore, the selection of  $R_{FLT}$  requires balancing the stability and distortion of the design.

The input amplifier bandwidth must be much higher than the cutoff frequency of the antialiasing filter. TI strongly recommends performing a SPICE simulation to confirm that the amplifier has more than 40° phase margin with the selected filter. Simulation is critical because even with high-bandwidth amplifiers, some amplifiers may require more bandwidth than others to drive similar filters.

## Typical Applications (continued)

### 9.2.1.2.2 Input Amplifier Selection

Selection criteria for the input amplifiers is highly dependent on the input signal type and the performance goals of the data acquisition system. Some key amplifier specifications to consider while selecting an appropriate amplifier to drive the inputs of the ADC are:

- **Small-signal bandwidth:** Select the small-signal bandwidth of the input amplifiers to be high enough to settle the input signal in the acquisition time of the ADC. Higher bandwidth reduces the closed-loop output impedance of the amplifier, thus allowing the amplifier to more easily drive the low cutoff frequency RC filter at the ADC inputs. Higher bandwidth also minimizes the harmonic distortion at higher input frequencies. In order to maintain the overall stability of the input driver circuit, select the amplifier bandwidth as described in [Equation 2](#):

$$GBW \geq 4 \times \frac{1}{2\pi \times 2R_{FLT} \times C_{FLT}}$$

where:

- GBW = Unity-gain bandwidth (2)
- **Noise:** Noise contribution of the front-end amplifiers must be low enough to prevent any degradation in SNR performance of the system. As a rule of thumb, to ensure that the noise performance of the data acquisition system is not limited by the front-end circuit, keep the total noise contribution from the front-end circuit below 20% of the input-referred noise of the ADC. Noise from the input driver circuit is band limited by designing a low cutoff frequency RC filter, as explained in [Equation 3](#).

$$N_G \times \sqrt{2} \times \sqrt{\left(\frac{V_{1/f\_AMP\_PP}}{6.6}\right)^2 + e_{n\_RMS}^2 \times \frac{\pi}{2} \times f_{-3dB}} \leq \frac{1}{5} \times \frac{V_{REF}}{2\sqrt{2}} \times 10^{-\left(\frac{SNR(dB)}{20}\right)}$$

where:

- $V_{1/f\_AMP\_PP}$  is the peak-to-peak flicker noise in  $\mu V_{rms}$ ,
- $e_{n\_RMS}$  is the amplifier broadband noise,
- $f_{-3dB}$  is the  $-3$ -dB bandwidth of the RC filter, and
- $N_G$  is the noise gain of the front-end circuit. (3)
- **Settling time:** For dc signals with fast transients that are common in a multiplexed application, the input signal must settle to the desired accuracy at the inputs of the ADC during the acquisition time window. This condition is critical to maintain the overall linearity performance of the ADC. Typically, the amplifier data sheets specify the output settling performance only up to 0.1% to 0.001%, which may not be sufficient for the desired accuracy. Therefore, always verify the settling behavior of the input driver with TINA™-SPICE simulations before selecting the amplifier.

The [OPA316](#) is selected for this application for its rail-to-rail input and output swing, low-noise (11 nV/ $\sqrt{Hz}$ ), and low-power (400  $\mu A$ ) performance to support a single-supply data acquisition circuit.

### 9.2.1.2.3 Reference Circuit

The analog supply voltage of the device is also used as a voltage reference for conversion. TI recommends decoupling the AVDD pin with a 1- $\mu F$ , low-ESR ceramic capacitor. The minimum capacitor value required for AVDD is 200 nF.

For a step-by-step design procedure, circuit schematics, bill of materials, PCB files, simulation results, and test results, refer to [TI Precision Design TIPD168, Three 12-Bit Data Acquisition Reference Designs Optimized for Low Power and Ultra-Small Form Factor \(TIDU390\)](#).

### 9.2.1.3 Application Curve

Figure 41 shows the FFT plot for the device with a 2-kHz input frequency for the circuit in Figure 39.

SNR = 70.4 dB      THD = -79.5 dB      SINAD = 69.9 dB  
Number of samples = 8192

**Figure 41. Test Results for the ADS7043 and OPA316 for a 2-kHz Input**

## 9.2.2 DAQ Circuit with the ADS7043 for Maximum SINAD at a 250-kHz $f_{IN}$

Figure 42. ADS7043 DAQ Circuit for Maximum SINAD

### 9.2.2.1 Design Requirements

The goal of this application is to design a data acquisition (DAQ) circuit based on the ADS7043 with SINAD greater than 68 dB for input signals having an amplitude of  $AVDD / 2$  with common-mode voltage of  $AVDD / 2$  and input frequencies up to 250 kHz.

### 9.2.2.2 Detailed Design Procedure

See the [Detailed Design Procedure](#) section in the [Single-Supply DAQ with the ADS7043](#) application for further details.

To achieve a SINAD of 68 dB, the operational amplifier must have high bandwidth to settle the input signal within the acquisition time of the ADC. The operational amplifier must have low noise to keep the total system noise below 20% of the input-referred noise of the ADC. For the application circuit shown in [Figure 42](#), the OPA835 is selected for its high-bandwidth (56 MHz) and low-noise (9.3 nV/ $\sqrt{Hz}$ ) performance.

### 9.2.2.3 Application Curve

[Figure 43](#) shows the FFT plot for the device with a 250-kHz input frequency for the circuit shown in [Figure 42](#).

SNR = 69.7 dB      THD = -75.5 dB      SINAD = 68.7 dB

Number of samples = 8192

Figure 43. Test Results for the ADS7043 and OPA835 for a 250-kHz Input

## 10 Power-Supply Recommendations

### 10.1 AVDD and DVDD Supply Recommendations

The device has two separate power supplies: AVDD and DVDD. The device operates on AVDD; DVDD is used for the interface circuits. AVDD and DVDD can be independently set to any value within the permissible ranges. The AVDD supply also defines the full-scale input range of the device. Decouple the AVDD and DVDD pins individually with 1-μF ceramic decoupling capacitors, as shown in Figure 44. The minimum capacitor value required for AVDD and DVDD is 200 nF and 20 nF, respectively. If both supplies are powered from the same source, a minimum capacitor value of 220 nF is required for decoupling.

**Figure 44. Power-Supply Decoupling**

### 10.2 Estimating Digital Power Consumption

The current consumption from the DVDD supply depends on the DVDD voltage, load capacitance on the SDO line, and the output code. The load capacitance on the SDO line is charged by the current from the SDO pin on every rising edge of the data output and is discharged on every falling edge of the data output. The current consumed by the device from the DVDD supply can be calculated by Equation 4:

$$I_{DVDD} = C \times V \times f$$

where:

- C = Load capacitance on the SDO line,
- V = DVDD supply voltage, and
- f = Number of transitions on the SDO output. (4)

The number of transitions on the SDO output depends on the output code, and thus changes with the analog input. The maximum value of f occurs when data output on the SDO change on every SCLK. SDO changing on every SCLK results in an output code of AAAh or 555h. For an output code of AAAh or 555h at a 1-MSPS throughput, the frequency of transitions on the SDO output is 6 MHz.

To keep the current consumption at the lowest possible value, the DVDD supply must be kept at the lowest permissible value and the capacitance on the SDO line must be kept as low as possible.

### 10.3 Optimizing Power Consumed by the Device

- Keep the analog supply voltage (AVDD) as per the analog input full-scale range (FSR) requirement.
- Keep the digital supply voltage (DVDD) at the lowest permissible value.
- Reduce the load capacitance on the SDO output.
- Run the device at optimum throughput. Power consumption reduces with throughput.

## 11 Layout

### 11.1 Layout Guidelines

Figure 45 shows a board layout example for the ADS7043. Use a ground plane underneath the device and partition the PCB into analog and digital sections. Avoid crossing digital lines with the analog signal path and keep the analog input signals and the reference input signals away from noise sources. In Figure 45, the analog input and reference signals are routed on the top and left side of the device while the digital connections are routed on the bottom and right side of the device.

The power sources to the device must be clean and well-bypassed. Use 1- $\mu$ F ceramic bypass capacitors in close proximity to the analog (AVDD) and digital (DVDD) power-supply pins. Avoid placing vias between the AVDD and DVDD pins and the bypass capacitors. Connect all ground pins to the ground plane using short, low-impedance paths. The AVDD supply voltage for the ADS7043 also functions as a reference for the device. Place the decoupling capacitor ( $C_{REF}$ ) for AVDD close to the device AVDD and GND pins.  $C_{REF}$  must be connected to the device pins with thick copper tracks, as shown in Figure 45.

The fly-wheel RC filters are placed close to the device. Among ceramic surface-mount capacitors, COG (NPO) ceramic capacitors provide the best capacitance precision. The type of dielectric used in COG (NPO) ceramic capacitors provides the most stable electrical properties over voltage, frequency, and temperature changes.

### 12.2 Community Resources

The following links connect to TI community resources. Linked contents are provided "AS IS" by the respective contributors. They do not constitute TI specifications and do not necessarily reflect TI's views; see TI's [Terms of Use](#).

**TI E2E™ Online Community** *TI's Engineer-to-Engineer (E2E) Community*. Created to foster collaboration among engineers. At [e2e.ti.com](#), you can ask questions, share knowledge, explore ideas and help solve problems with fellow engineers.

**Design Support** *TI's Design Support* Quickly find helpful E2E forums along with design support tools and contact information for technical support.

### 12.3 Trademarks

E2E is a trademark of Texas Instruments.

TINA is a trademark of Texas Instruments, Inc.

SPI is a trademark of Motorola.

All other trademarks are the property of their respective owners.

### 12.4 Electrostatic Discharge Caution

This integrated circuit can be damaged by ESD. Texas Instruments recommends that all integrated circuits be handled with appropriate precautions. Failure to observe proper handling and installation procedures can cause damage.

ESD damage can range from subtle performance degradation to complete device failure. Precision integrated circuits may be more susceptible to damage because very small parametric changes could cause the device not to meet its published specifications.

<sup>(1)</sup> **Status:** For more details on status, see our [product life cycle](#).

<sup>(2)</sup> **Material type:** When designated, preproduction parts are prototypes/experimental devices, and are not yet approved or released for full production. Testing and final process, including without limitation quality assurance, reliability performance testing, and/or process qualification, may not yet be complete, and this item is subject to further changes or possible discontinuation. If available for ordering, purchases will be subject to an additional waiver at checkout, and are intended for early internal evaluation purposes only. These items are sold without warranties of any kind.

<sup>(3)</sup> **RoHS values:** Yes, No, RoHS Exempt. See the [TI RoHS Statement](#) for additional information and value definition.

<sup>(4)</sup> **Lead finish/Ball material:** Parts may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead finish/Ball material values may wrap to two lines if the finish value exceeds the maximum column width.

<sup>(5)</sup> **MSL rating/Peak reflow:** The moisture sensitivity level ratings and peak solder (reflow) temperatures. In the event that a part has multiple moisture sensitivity ratings, only the lowest level per JEDEC standards is shown. Refer to the shipping label for the actual reflow temperature that will be used to mount the part to the printed circuit board.

<sup>(6)</sup> **Part marking:** There may be an additional marking, which relates to the logo, the lot trace code information, or the environmental category of the part.

Multiple part markings will be inside parentheses. Only one part marking contained in parentheses and separated by a "-" will appear on a part. If a line is indented then it is a continuation of the previous line and the two combined represent the entire part marking for that device.
