

# ADS8284 18-BIT, 1-MSPS, Pseudo-Bipolar Differential SAR ADC with On-Chip ADC Driver (OPA) and 4-Channel Differential Multiplexer

## 1 Features

- 1.0-MHz Sample Rate, Zero Latency at Full Speed
- 18-Bit Resolution
- Supports Pseudo-Bipolar Differential Input Range: -4 V to +4 V with 2-V Common-Mode
- Built-In Four Channel, Differential Ended Multiplexer; with Channel Count Selection and Auto/Manual Mode
- On-Board Differential ADC Driver (OPA)
- Buffered Reference Output to Level Shift Bipolar  $\pm 4$ -V Input with External Resistance Divider
- Reference/2 Output to Set Common-Mode for External Signal Conditioner
- 18-/16-/8-Bit Parallel Interface
- SNR: 98.4dB Typ at 2-kHz I/P
- THD: -119dB Typ at 2-kHz I/P
- Power Dissipation: 331.25 mW at 1 MSPS Including ADC Driver
- Internal Reference
- Internal Reference Buffer
- 64-Pin QFN Package

## 2 Applications

- Medical Imaging/CT Scanners
- Automated Test Equipment
- High-Speed Data Acquisition Systems
- High-Speed Closed-Loop Systems

## 3 Description

The ADS8284 is a high-performance analog system-on-chip (SoC) device with an 18-bit, 1-MSPS A/D converter, 4-V internal reference, an on-chip ADC driver (OPA), and a 4-channel differential multiplexer. The channel count of the multiplexer and auto/manual scan modes of the device are user selectable.

The ADC driver is designed to leverage the very high noise performance of the differential ADC at optimum power usage levels.

The ADS8284 outputs a buffered reference signal for level shifting of a  $\pm 4$ -V bipolar signal with an external resistance divider. A  $V_{\text{ref}}/2$  output signal is available to set the common-mode of a signal conditioning circuit. The device also includes an 18-/16-/8-bit parallel interface.

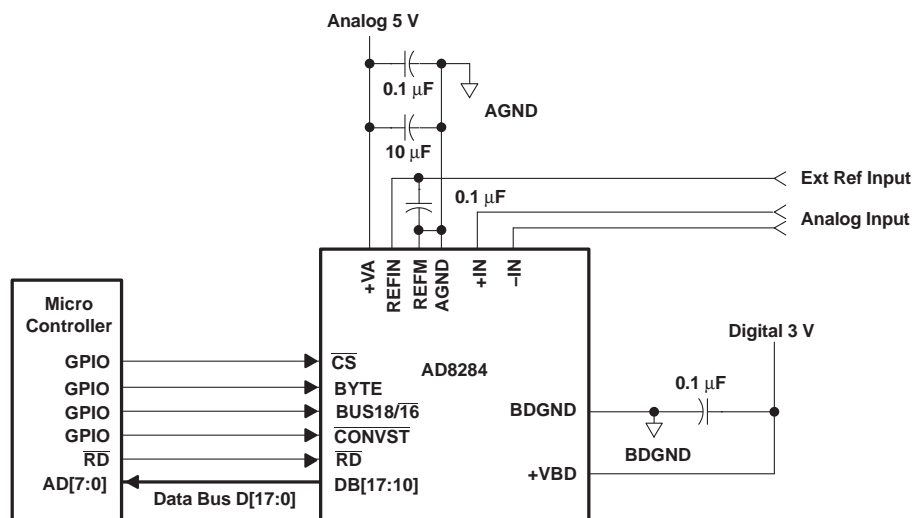

The ADS8284 is available in a 9 mm x 9 mm, 64-pin QFN package and is characterized from -40°C to 85°C.

### Device Information <sup>(1)</sup>

DEVICE NAME	PACKAGE	BODY SIZE
ADS8284	QFN (64)	9mm x 9mm

(1) For all available packages, see the orderable addendum at the end of the data sheet.

### Simplified Schematic

## 4 Revision History

Changes from Original (March 2009) to Revision A	Page
• Changed the data sheet to the new TI standard .....	<b>1</b>
• Added the Device Information table .....	<b>1</b>
• Added the Handling Ratings table .....	<b>6</b>
• Added Reference/2 Voltage Range to the Electrical Characteristics table .....	<b>8</b>
• Added the Power Supply Recommendations section .....	<b>36</b>

**Device Comparison Table**

## 5 Pin Configuration and Function

## Pin Functions

PIN		I/O	DESCRIPTION					
NO	NAME							
MULTIPLEXER INPUT PINS								
17	CH0P	I	Non-inverting analog input for differential multiplexer channel number 0. Device performance is optimized for 50-Ω source impedance at this input.					
18	CH0M	I	Inverting analog input for differential multiplexer channel number 0. Device performance is optimized for 50-Ω source impedance at this input.					
19	CH1P	I	Non-inverting analog input for differential multiplexer channel number 1. Device performance is optimized for 50-Ω source impedance at this input.					
20	CH1M	I	Inverting analog input for differential multiplexer channel number 1. Device performance is optimized for 50-Ω source impedance at this input.					
29	CH2P	I	Non-inverting analog input for differential multiplexer channel number 2. Device performance is optimized for 50-Ω source impedance at this input.					
30	CH2M	I	Inverting analog input for differential multiplexer channel number 2. Device performance is optimized for 50-Ω source impedance at this input.					
31	CH3P	I	Non-inverting analog input for differential multiplexer channel number 3. Device performance is optimized for 50 ohm source impedance at this input.					
32	CH3M	I	Inverting analog input for differential multiplexer channel number 3. Device performance is optimized for 50-Ω source impedance at this input.					
ADC INPUT PINS								
25	INP	I	ADC Non inverting input., connect 1-nF capacitor across INP and INM					
27	INM	I	ADC Inverting input, connect 1-nF capacitor across INP and INM					
REFERENCE INPUT/ OUTPUT PINS								
8, 9	REFM	I	Reference ground.					
10	REFIN	I	Reference Input. Add 0.1-μF decoupling capacitor between REFIN and REFM.					
11	REFOUT	O	Reference Output. Add 1-μF capacitor between the REFOUT pin and REFM pin when internal reference is used.					
14	VCMO	O	This pin outputs REFIN/2 and can be used to set common-mode voltage of differential analog inputs.					
15	BUF-REF	O	Buffered reference output. Useful to level shift bipolar signals using external resistors.					
POWER CONTROL PINS								
21	PD-RBUF	I	High on this pin powers down the reference buffer (BUF-REF).					
MULTIPLEXER CONTROL PINS								
33	AUTO	I	High level on this pin selects auto mode for multiplexer scanning. Low level selects manual mode of multiplexer scanning					
34	C3	I	In auto mode (AUTO = 1) multiplexer channel selection is reset to CH0 on rising edge of MXCLK while C3 = 1. The pin is do not care in manual mode.					
35	C2	I	Acts as multiplexer address bit when AUTO = 0 (manual mode). In auto mode (AUTO = 1) C2 and C1 select the last multiplexer channel (channel count) in the auto scan sequence.					
36	C1	I	Acts as multiplexer address LSB when AUTO = 0 (manual mode). In auto mode (AUTO = 1) C2 and C1 select the last multiplexer channel (channel count) in the auto scan sequence.					
37	MXCLK	I	Multiplexer channel is selected on rising edge of MXCLK irrespective of whether it is auto or manual mode. Device BUSY output can be connected to MXCLK so that device selects next channel at the end of every sample.					
ADC DATA BUS								
42-49, 52-61	Data Bus		8-BIT BUS			16-BIT BUS		18-BIT BUS
			BYTE = 0	BYTE = 1	BYTE = 1	BYTE = 0	BYTE = 0	BYTE = 0
			BUS18/ $\overline{16}$ = 0	BUS18/ $\overline{16}$ = 0	BUS18/ $\overline{16}$ = 1	BUS18/ $\overline{16}$ = 0	BUS18/ $\overline{16}$ = 1	BUS18/ $\overline{16}$ = 0
42	DB17	O	D17 (MSB)	D9	All ones	D17 (MSB)	All ones	D17 (MSB)
43	DB16	O	D16	D8	All ones	D16	All ones	D16
44	DB15	O	D15	D7	All ones	D15	All ones	D15
45	DB14	O	D14	D6	All ones	D14	All ones	D14
46	DB13	O	D13	D5	All ones	D13	All ones	D13
47	DB12	O	D12	D4	All ones	D12	All ones	D12
48	DB11	O	D11	D3	D1	D11	All ones	D11
49	DB10	O	D10	D2	D0 (LSB)	D10	All ones	D10
52	DB9	O	D9	All ones	All ones	D9	All ones	D9
53	DB8	O	D8	All ones	All ones	D8	All ones	D8
54	DB7	O	D7	All ones	All ones	D7	All ones	D7
55	DB6	O	D6	All ones	All ones	D6	All ones	D6
56	DB5	O	D5	All ones	All ones	D5	All ones	D5

**Pin Functions (continued)**

PIN		I/O	DESCRIPTION						
NO	NAME								
57	DB4	O	D4	All ones	All ones	D4	All ones	D4	
58	DB3	O	D3	All ones	All ones	D3	D1	D3	
59	DB2	O	D2	All ones	All ones	D2	D0 (LSB)	D2	
60	DB1	O	D1	All ones	All ones	D1	All ones	D1	
61	DB0	O	D0 (LSB)	All ones	All ones	D0 (LSB)	All ones	D0 (LSB)	
ADC CONTROL PINS									
62	BUSY	O	Status output. This pin is held high when device is converting.						
64	BUS18_16	I	Bus size select input. Used for selecting 18-bit or 16-bit wide bus transfer. Refer to ADC DATA BUS description above.						
1	BYTE	I	Byte Select Input. Used for 8-bit bus reading. Refer to ADC DATA BUS description above.						
2	$\overline{\text{CONVST}}$	I	Convert start. This input is active low and can act independent of the $\overline{\text{CS}}$ input.						
3	$\overline{\text{RD}}$	I	Synchronization pulse for the parallel output.						
4	$\overline{\text{CS}}$	I	Chip select.						
DEVICE POWER SUPPLIES									
22	VEE		Negative supply for OPA (OP1, OP2)						
23, 24	VCC		Positive supply for OPA (OP1, OP2, BUF-REF)						
5, 7, 13, 38, 40	+VA		Analog power supply.						
6, 12, 26, 39, 41	AGND		Analog ground.						
50, 63	+VBD		Digital power supply for ADC bus.						
51	BGND		Digital ground for ADC bus interface digital supply.						
NOT CONNECTED PINS									
16, 28	NC		No connection.						

## 6 Specifications

### 6.1 Absolute Maximum Ratings<sup>(1)</sup>

over operating free-air temperature range (unless otherwise noted)

	MIN	MAX	UNIT
CH(i) to AGND (both P and M inputs)	VEE–0.3	VCC + 0.3	V
VCC to VEE	–0.3	18	V
+VA to AGND	–0.3	7	V
+VBD to BDGND	–0.3	7	V
ADC control digital input voltage to GND	–0.3	(+VBD + 0.3)	V
ADC control digital output to GND	–0.3	(+VBD + 0.3)	V
Multiplexer control digital input voltage to GND	–0.3	(+VA + 0.3)	V
Power control digital input voltage to GND	–0.3	(+VCC + 0.3)	V
Operating temperature range	–40	85	°C
Junction temperature (T <sub>Jmax</sub> )		150	°C

- (1) Stresses beyond those listed under *absolute maximum ratings* may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated under *recommended operating conditions* is not implied. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.

### 6.2 Handling Ratings

			MIN	MAX	UNIT
T <sub>stg</sub>	Storage temperature range		−65	150	°C
V <sub>(ESD)</sub>	Electrostatic discharge	Human body model (HBM), per ANSI/ESDA/JEDEC JS-001, all pins <sup>(1)</sup>	−2	2	kV
		Charged device model (CDM), per JEDEC specification JESD22-C101, all pins <sup>(2)</sup>	−500	500	V

- (1) JEDEC document JEP155 states that 500-V HBM allows safe manufacturing with a standard ESD control process.

- (2) JEDEC document JEP157 states that 250-V CDM allows safe manufacturing with a standard ESD control process.

### 6.3 Recommended Operating Conditions

over operating free-air temperature range (unless otherwise noted)

		MIN	NOM	MAX	UNIT
Analog Input at Multiplexer Inputs	CHxP, CHxM	0		V <sub>REF</sub>	V
Digital Supply Voltage	+VBD	2.7	3.3	5.25	V
Analog Supply Voltage	+VA	4.75	5	5.25	V
Positive Supply Voltage for OPA	VCC	4.75	5	7.5	V
Negative Supply Voltage for OPA	VEE	–7.5	–5	–3	V

### 6.4 Thermal Information

THERMAL METRIC <sup>(1)</sup>		RCG	UNIT
		64 PINS	
R <sub>θJA</sub>	Junction-to-ambient thermal resistance	24.0	°C/W
R <sub>θJC(top)</sub>	Junction-to-case(top) thermal resistance	7.8	
R <sub>θJB</sub>	Junction-to-board thermal resistance	3.2	
ψ <sub>JT</sub>	Junction-to-top characterization parameter	0.1	
ψ <sub>JB</sub>	Junction-to-board characterization parameter	3.2	
R <sub>θJC(bottom)</sub>	Junction-to-case(bottom) thermal resistance	n/a	

- (1) For more information about traditional and new thermal metrics, see the *IC Package Thermal Metrics* application report, [SPRA953](#).

## 6.5 Electrical Characteristics

$T_A = -40^{\circ}\text{C}$  to  $85^{\circ}\text{C}$ ,  $V_{CC} = 5\text{ V}$ ,  $V_{EE} = -5\text{ V}$ ,  $+V_A = 5\text{ V}$ ,  $+V_{BD} = 5\text{ V}$  or  $3.3\text{ V}$ ,  $V_{ref} = 4\text{ V}$ ,  $f_{SAMPLE} = 1\text{ MSPS}$  (unless otherwise noted)

PARAMETER		TEST CONDITIONS	MIN	TYP	MAX	UNIT

	ADS8284I		$-4.5$	$\pm 1.5$	4.5	
Differential linearity	ADS8284IB	At 18-bit level	$-1$	$\pm 0.6$	1.5	LSB <sup>(3)</sup>
	ADS8284I		$-1$	$\pm 0.6$	1.5	
Offset error	ADS8284IB		$-0.5$	$\pm 0.05$	0.5	mV
	ADS8284I		$-0.5$	$\pm 0.05$	0.5	
Gain error <sup>(4)</sup>	ADS8284IB	External reference	$-0.1$	$\pm 0.025$	0.1	%FS
	ADS8284I		$-0.1$	$\pm 0.025$	0.1	
DC power supply rejection ratio		At 3FFF <sub>0H</sub> output code. For $+V_A$ or $V_{CC}$ , $V_{EE}$ variation of $0.5\text{ V}$ individually		80		dB
<b>SAMPLING DYNAMICS</b>						
Conversion time		$+V_{BD} = 5\text{ V}$		625	650	ns
		$+V_{DB} = 3\text{ V}$		625	650	
Acquisition time		$+V_{BD} = 5\text{ V}$	320	350		ns
		$+V_{DB} = 3\text{ V}$	320	350		
Maximum throughput rate					1.0	MHz
Aperture delay				4		ns
Aperture jitter				5		ps
Settling time to 0.5 LSB		For ADC only		150		ns
		For OPA (OP1, OP2) + mux		700		
Over voltage recovery		For ADC only		150		ns
<b>DYNAMIC CHARACTERISTICS</b>						
Total harmonic distortion (THD) <sup>(5)</sup>	ADS8284I	$V_{IN} = 4\text{ V}_{pp}$ at 2 kHz		$-119$		dB
	ADS8284IB			$-119$		
	ADS8284I	$V_{IN} = 4\text{ V}_{pp}$ at 10 kHz		$-105$		dB
	ADS8284IB			$-105$		
	ADS8284I	$V_{IN} = 4\text{ V}_{pp}$ at 100 kHz, LoPWR = 0		$-100$		dB
	ADS8284IB			$-100$		
Signal-to-noise ratio (SNR)	ADS8284I	$V_{IN} = 4\text{ V}_{pp}$ at 2 kHz		98.4		dB
	ADS8284IB		97.5	98.4		
	ADS8284I	$V_{IN} = 4\text{ V}_{pp}$ at 10 kHz		98		dB
	ADS8284IB			98		
	ADS8284I	$V_{IN} = 4\text{ V}_{pp}$ at 100 kHz, LoPWR = 0		95		dB
	ADS8284IB			97		

- (1) Ideal input span, does not include gain or offset error.
- (2) This is endpoint INL, not best fit.
- (3) LSB means least significant bit.
- (4) Calculated on the first nine harmonics of the input frequency.
- (5) Measured relative to actual measured reference.

	MIN	TYP	MAX	UNIT
t <sub>su6</sub>	Setup time C1, C2 or C3 to MXCLK rising edge		600	ns
t <sub>d8</sub>	Multiplexer and driver settle time ( from MXCLK rising edge to $\overline{\text{CONVST}}$ falling edge)	600		ns

## 6.9 Timing Diagrams

The ADS8284 is analog system-on-chip (SoC) device. The device includes a multiplexer, a differential input/differential output ADC driver and differential input high-performance ADC, an additional internal reference, a buffered reference output, and a REF/2 output.

Figure 1 shows the basic operation of the device (including all elements). Subsequent sections describe the detailed timings of the individual blocks of the device (primarily the multiplexer and ADC).

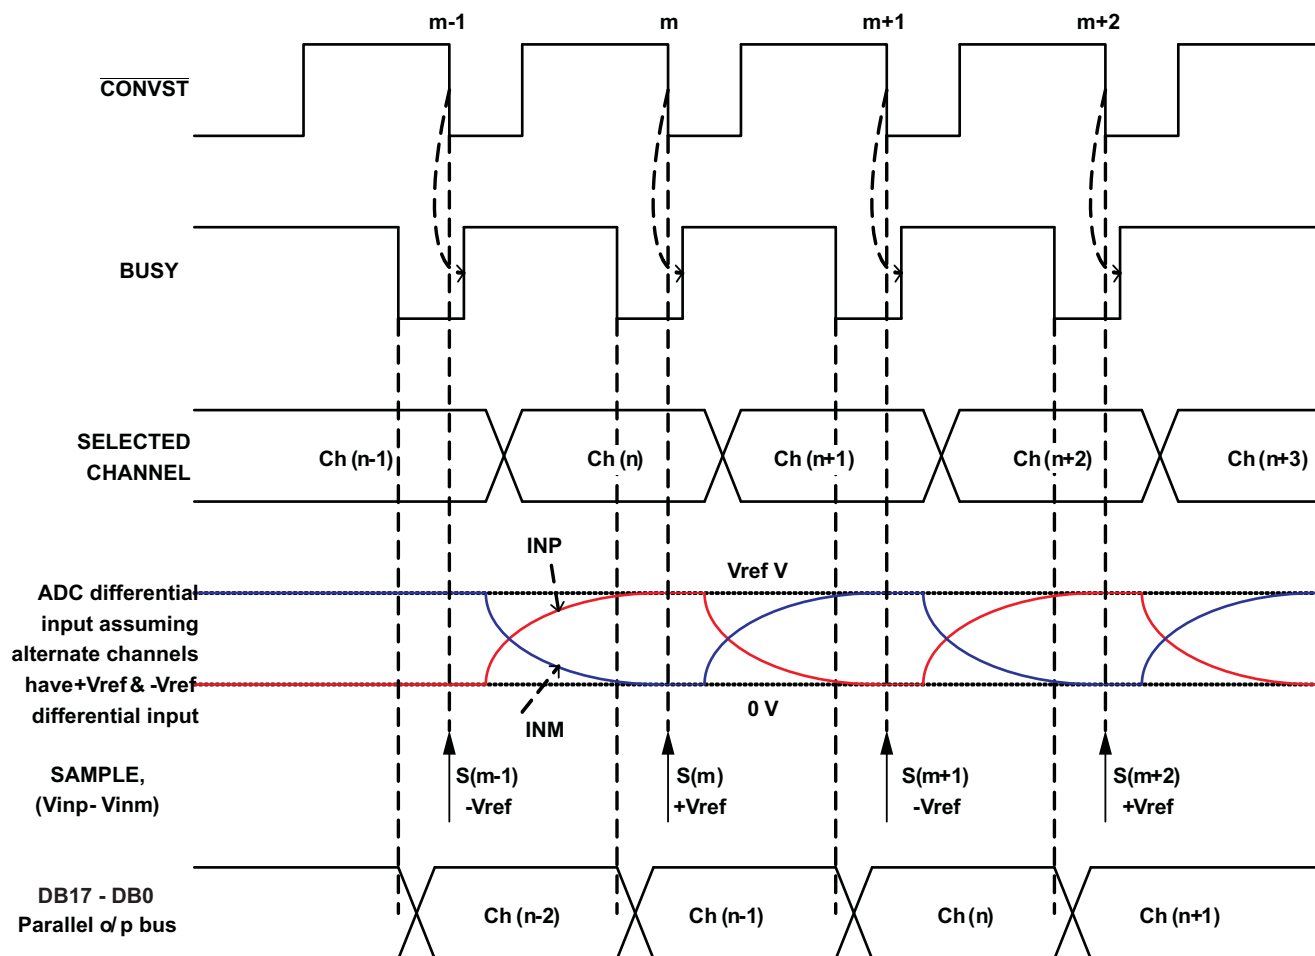

Figure 1. Device Operation

As shown in the diagram, the device can be controlled with only one ( $\overline{\text{CONVST}}$ ) digital input. On the falling edge of  $\overline{\text{CONVST}}$ , the  $\text{BUSY}$  output of the device goes high. A high level on  $\text{BUSY}$  indicates the device has sampled the signal and it is converting the sample into its digital equivalent. After the conversion is complete, the  $\text{BUSY}$  output falls to a logic low level and the device output data corresponding to the recently converted sample is available for reading.

It is recommended (not mandatory) to short the  $\text{BUSY}$  output of the device to the  $\text{MXCLK}$  input. The device selects a new channel at every rising edge of  $\text{MXCLK}$ . The multiplexer is differential. The multiplexer and ADC driver are designed to settle to the 18-bit level before sampling; even at the maximum conversion speed.

**ADC control and timing:** The timing diagrams in this section describe ADC operation; multiplexer operation is described in a later section.

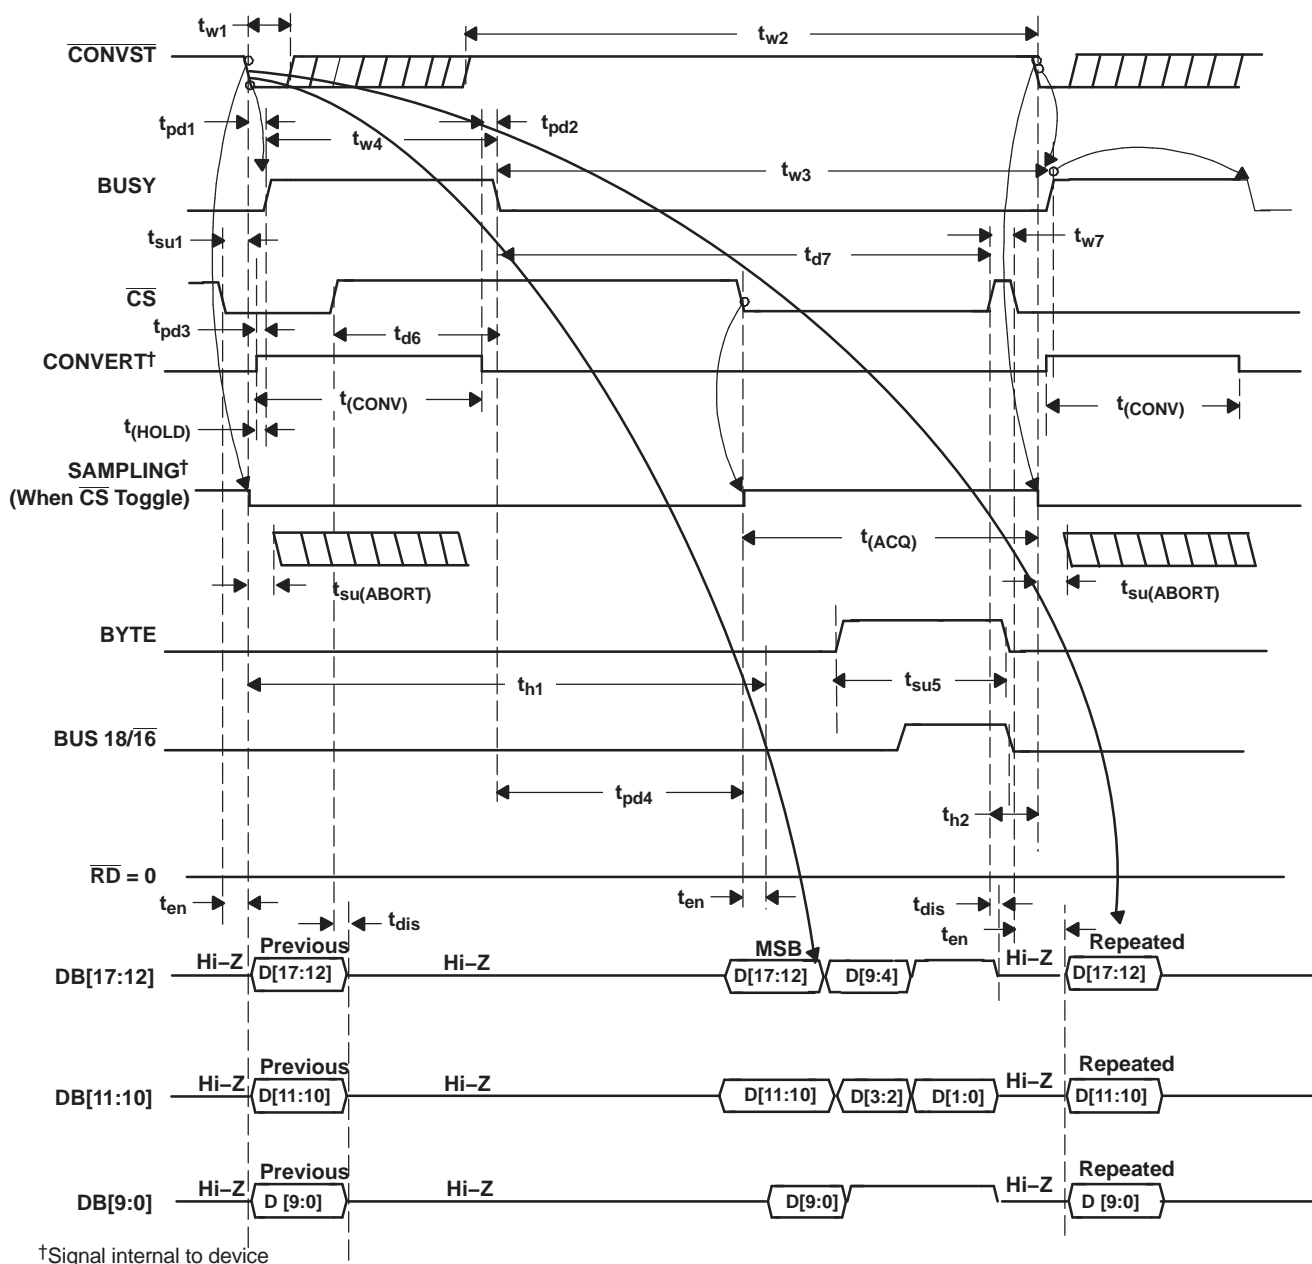

## Timing Diagrams (continued)

**Figure 6. Detailed Timing for Read Cycles**

**Multiplexer:** The multiplexer has two modes of sequencing namely auto sequencing and manual sequencing. Multiplexer mode selection and operation is controlled with the AUTO, C1, C2, C3, and MXCLK pin.

**Auto sequencing:** A logic one level on the AUTO pin selects auto sequencing mode. It is possible to select the number of channels to be scanned (always starting from channel zero) in auto sequencing mode. Pins C1 and C2 select the channel count (last channel in the auto sequence).

On every rising edge of MXCLK while C3 is at the logic zero level, the next higher channel (in ascending order) is selected. Channel selection rolls over to channel zero on the rising edge of MXCLK after channel selection reaches the *channel count* (last channel in the auto sequence selected by pins C1 and C2).

Any time during the sequence the channel sequence can be reset to channel zero. A rising edge on MXCLK while C3 is at the logic one level resets channel selection to channel zero.

**Table 1. Channel Selection in Auto Mode**

CHANNEL COUNT PINS			CLOCK PIN	LAST CHANNEL IN SEQUENCE	CHANNEL SEQUENCE
C3	C2	C1	MXCLK		
0	0	0	↑	0	0,0,0,0..
0	0	1	↑	1	0,1,0,1,..
0	1	0	↑	2	0,1,2,0,1,2,0...
0	1	1	↑	3	0,1,2,3,0,1,2,3,0...
1	X	X	↑	X	n → 0 (channel reset to zero)

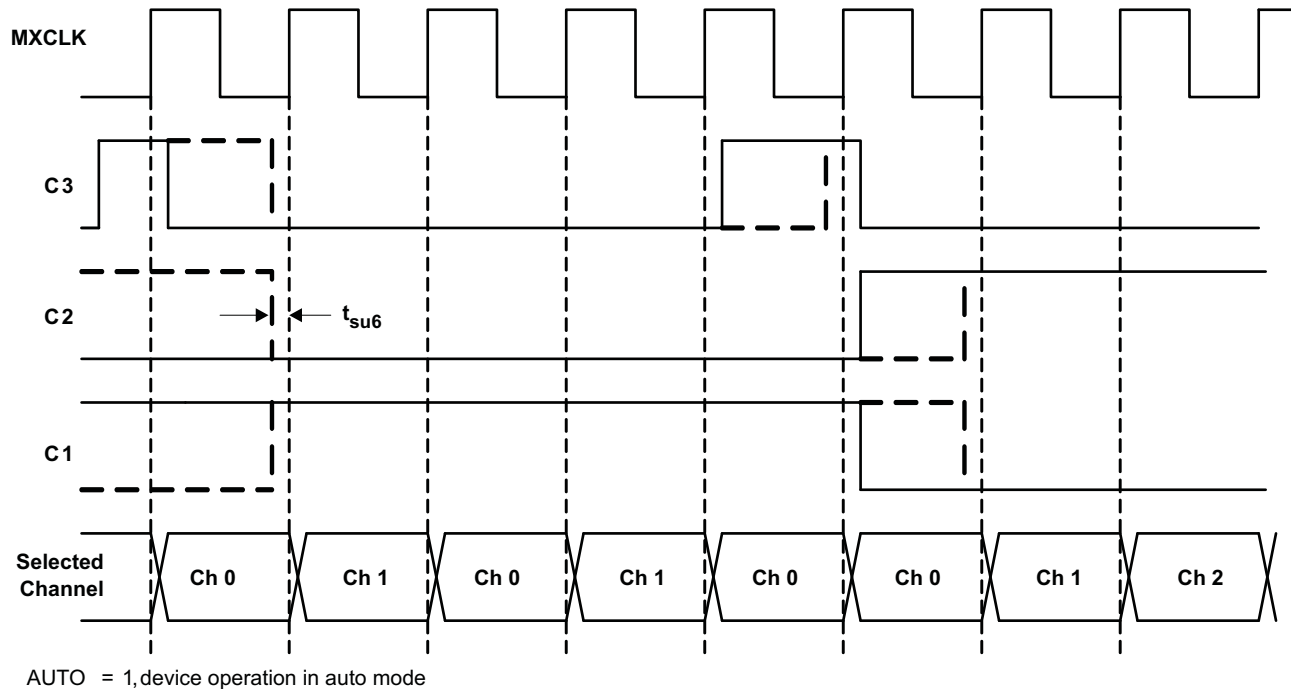

Figure 7. Multiplexer Auto Mode Timing Diagram

**Manual sequencing:** A logic zero level on the AUTO pin selects manual sequencing mode. Pins C1 and C2 set the channel address. On the rising edge of MXCLK, the addressed channel is connected to the ADC driver input.

Table 2. Channel Selection in Manual Mode

MODE	CHANNEL ADDRESS PINS			CLOCK PIN	CHANNEL
AUTO	C3	C2	C1	MXCLK	
0	X	0	0	↑	0
0	X	0	1	↑	1
0	X	1	0	↑	2
0	X	1	1	↑	3

## 7 Device Description

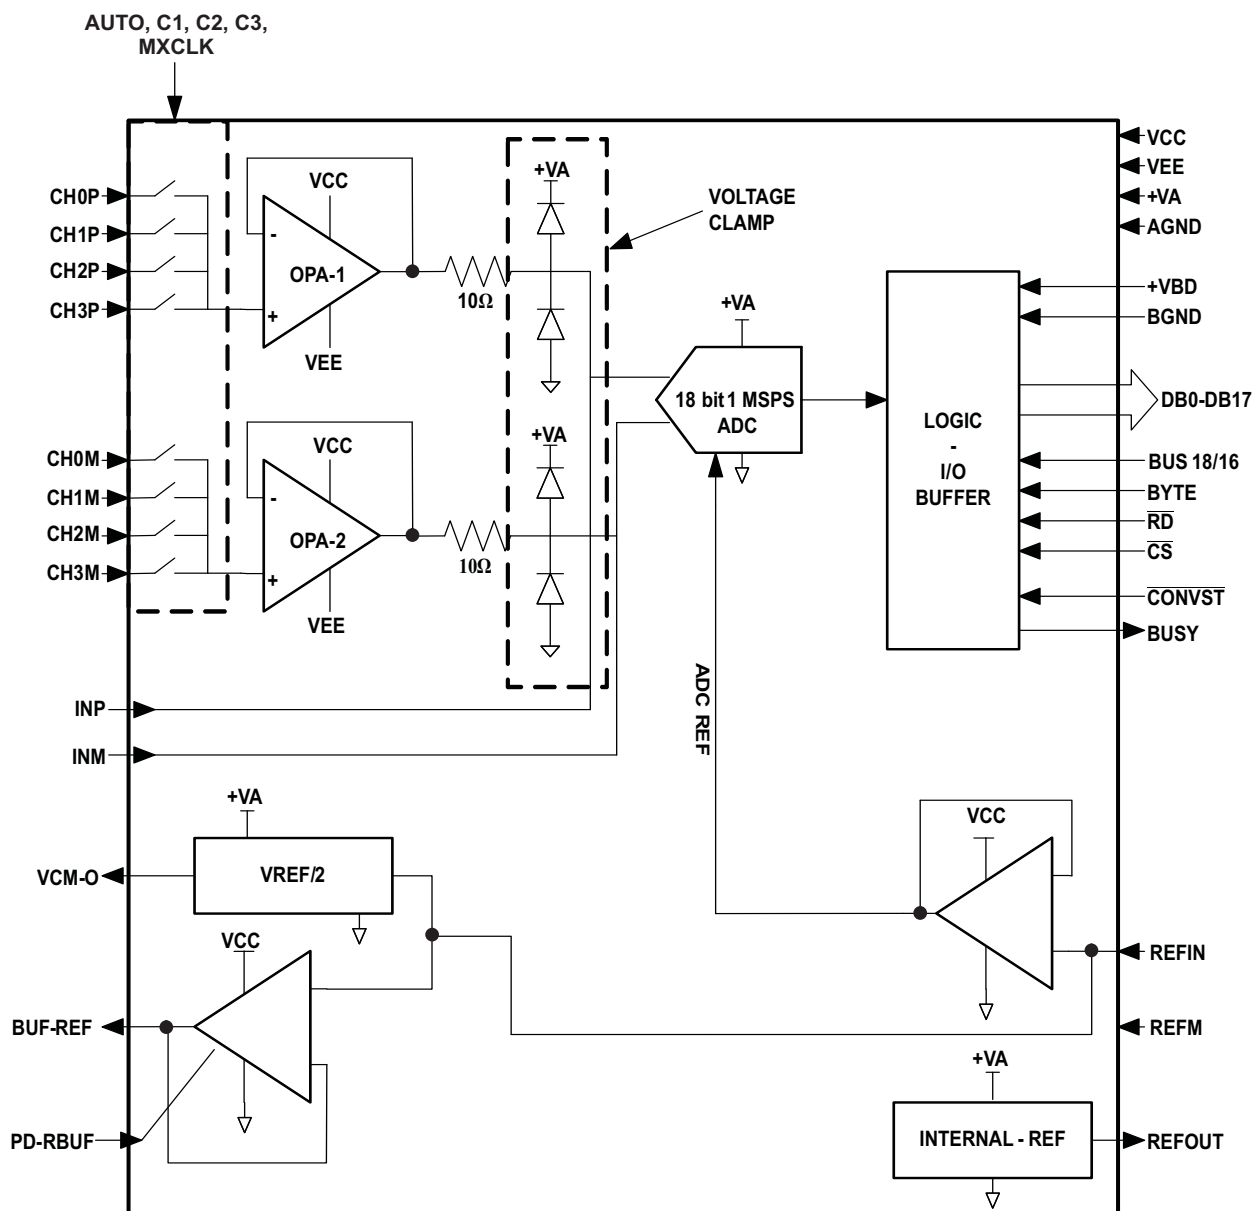

### 7.1 Overview

The ADS8284 features a high-speed successive approximation register (SAR) analog-to-digital converter (ADC). The architecture is based on charge redistribution which inherently includes a sample/hold function. See [Figure 73](#) for the application circuit for the ADS8284.

The conversion clock is generated internally. The conversion time of 650 ns is capable of sustaining a 1 MHz throughput.

The analog input voltage to ADC is provided to two input pins AINP and AINM. When a conversion is initiated, the differential input on these pins is sampled on the internal capacitor array. While a conversion is in progress, both inputs are disconnected from any internal function.

### 7.2 Functional Block Diagram

## 7.3 Feature Description

### 7.3.1 Analog Input

The device features an analog multiplexer, a differential, high input impedance, unity gain ADC driver, and a high performance ADC. Typically a lot of care is required for driving circuit component selection and board layout for high resolution ADC driving. However an on-board ADC driver simplifies the job for the user. All that is required is to decouple AINP and AINM with a 1-nF decoupling capacitor across these two pins as close to the device as possible. The multiplexer inputs tolerate source impedance of up to 50  $\Omega$  for specified device performance at an operating speed of 1-MSPS. This relaxes constraints on the signal conditioning circuit. In the case of true bipolar input signals, it is possible to condition them with a resistor divider as shown in Figure 72. The device permits use of 1.2-k $\Omega$  resistors for the divider with effective source impedance of 600  $\Omega$  for signal bandwidth less than 10 kHz. A suitable capacitor value used to limit signal bandwidth limits noise coming from the resistor divider network. Care must be taken concerning absolute analog voltage at the multiplexer input pins. This voltage should not exceed VCC and VEE. The clamp at the driver OPA limits the voltage applied to the ADC input.

### 7.3.2 Reference

The ADS8284 can operate with an external reference with a range from 3.0 V to 4.2 V. The reference voltage on the input pin 10 (REFIN) of the converter is internally buffered. A clean, low noise, well-decoupled reference voltage on this pin is required to ensure good performance of the converter. A low noise band-gap reference like the REF5040 can be used to drive this pin. A 0.1- $\mu$ F decoupling capacitor is required between REFIN and REFM pins (pin 10 and pin 9) of the converter. This capacitor should be placed as close as possible to the pins of the device. Designers should strive to minimize the routing length of the traces that connect the pins of the capacitor to the pins of the converter. An RC network can also be used to filter the reference voltage. A 100- $\Omega$  series resistor and a 0.1- $\mu$ F capacitor, which can also serve as the decoupling capacitor can be used to filter the reference voltage.

Figure 69. ADS8284 Using External Reference

The ADS8284 also has limited low pass filtering capability built into the converter. The equivalent circuitry on the REFIN input is as shown in Figure 70.

Figure 70. Simplified Reference Input Circuit

## Feature Description (continued)

The REFM input of the ADS8284 should always be shorted to AGND. A 4.096-V internal reference is included. When the internal reference is used, pin 11 (REFOUT) is connected to pin 10 (REFIN) with an 0.1- $\mu$ F decoupling capacitor and 1- $\mu$ F storage capacitor between pin 11 (REFOUT) and pin 9 (REFM) (see Figure 74). The internal reference of the converter is double buffered. If an external reference is used, the second buffer provides isolation between the external reference and the CDAC. This buffer is also used to recharge all of the capacitors of the CDAC during conversion (see Figure 70). pin 11 (REFOUT) can be left unconnected (floating) if external reference is used.

## 7.4 Device Functional Modes

### 7.4.1 Reading Data

The ADS8284 outputs full parallel data in straight binary format as shown in Table 3. The parallel output is active when  $\overline{\text{CS}}$  and  $\overline{\text{RD}}$  are both low. There is a minimal quiet zone requirement around the falling edge of  $\overline{\text{CONVST}}$ . This is 50 ns prior to the falling edge of  $\overline{\text{CONVST}}$  and 40 ns after the falling edge. No data read should attempted within this zone. Any other combination of  $\overline{\text{CS}}$  and  $\overline{\text{RD}}$  sets the parallel output to 3-state. BYTE and BUS18/16 are used for multiword read operations. BYTE is used whenever lower bits on the bus are output on the higher byte of the bus. BUS18/16 is used whenever the last two bits on the 18-bit bus is output on either bytes of the higher 16-bit bus. Refer to Table 3 for ideal output codes.

**Table 3. Ideal Input Voltages and Output Codes**

DESCRIPTION	ANALOG VALUE	DIGITAL OUTPUT STRAIGHT BINARY	
		BINARY CODY	HEX CODE
Full scale range	$2 \times (+V_{\text{ref}})$		
Least significant bit (LSB)	$2 \times (+V_{\text{ref}})/262144$		
+Full scale	$(+V_{\text{ref}}) - 1 \text{ LSB}$	01 1111 1111 1111 1111	1FFFF
Midscale	0 V	00 0000 0000 0000 0000	00000
Midscale – 1 LSB	0 V – 1 LSB	11 1111 1111 1111 1111	3FFFF
Zero	$-V_{\text{ref}}$	10 0000 0000 0000 0000	20000

The output data is a full 18-bit word (D17–D0) on DB17–DB0 pins (MSB–LSB) if both BUS18/16 and BYTE are low.

The result may also be read on an 16-bit bus by using only pins DB17–DB2. In this case two reads are necessary: the first as before, leaving both BUS18/16 and BYTE low and reading the 16 most significant bits (D17–D2) on pins DB17–DB2, then bringing BUS18/16 high while holding BYTE low. When BUS18/16 is high, the lower two bits (D1–D0) appear on pins DB3–DB2.

The result may also be read on an 8-bit bus for convenience. This is done by using only pins DB17–DB10. In this case three reads are necessary: the first as before, leaving both BUS18/16 and BYTE low and reading the 8 most significant bits on pins DB17–DB10, then bringing BYTE high while holding BUS18/16 low. When BYTE is high, the medium bits (D9–D2) appear on pins DB17–DB10. The last read is done by bringing BUS18/16 high while holding BYTE high. When BUS18/16 is high, the lower two bits (D1–D0) appear on pins DB11–DB10. The last read cycle is not necessary if only the first 16 most significant bits are of interest.

All of these multiword read operations can be performed with multiple active  $\overline{\text{RD}}$  (toggling) or with  $\overline{\text{RD}}$  held low for simplicity. This is referred to as the AUTO READ operation.

**Table 4. Conversion Data Read Out**

BYTE	BUS18/16	DATA READ OUT				
		TERMINAS DB17–DB12	TERMINAS DB11–DB10	TERMINAS DB9–DB4	TERMINAS DB3–DB2	TERMINAS DB1–DB0
High	High	All One's	D1–D0	All One's	All One's	All One's
Low	High	All One's	All One's	All One's	D1–D0	All One's
High	Low	D9–D4	D3–D2	All One's	All One's	All One's
Low	Low	D17–D12	D11–D10	D9–D4	D3–D2	D1–D0

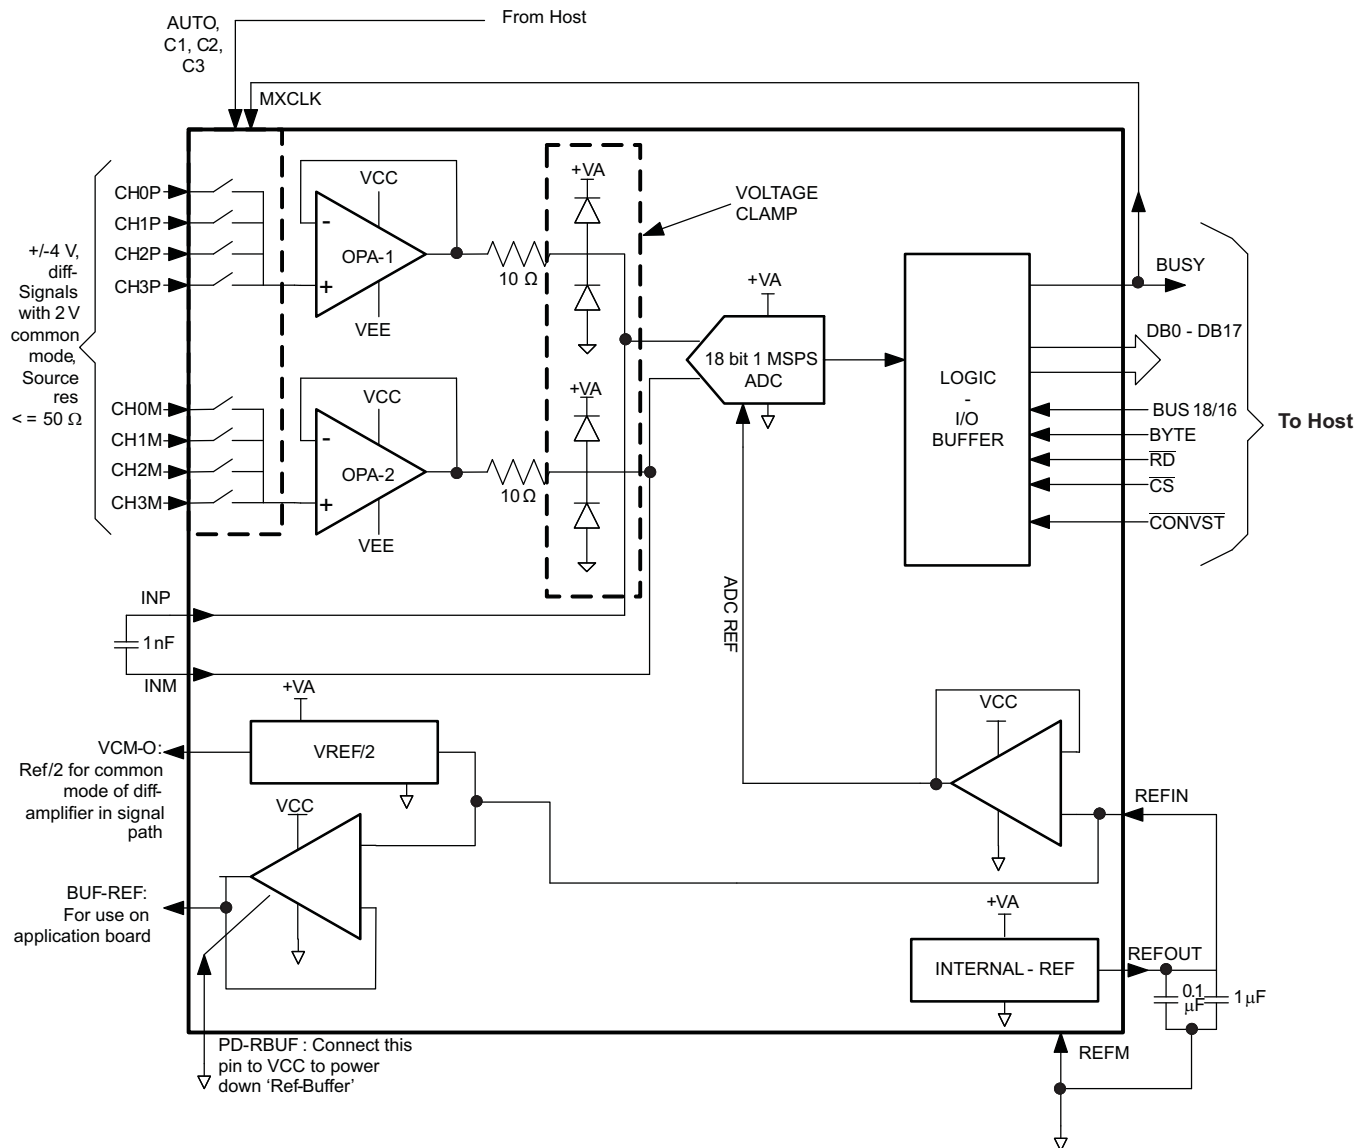

## 8 Application and Implementation

### 8.1 Application Information

As discussed before, the ADS8284 is 18-bit analog SoC that includes various blocks like a multiplexer, ADC driver, internal reference, internal reference buffer, buffered reference output, and Ref/2 output on-board. The following diagram shows the recommended analog and digital interfacing of the ADS8284.

### 8.2 Typical Applications

**Figure 71. Analog and Digital Interface Diagram**

## Typical Applications (continued)

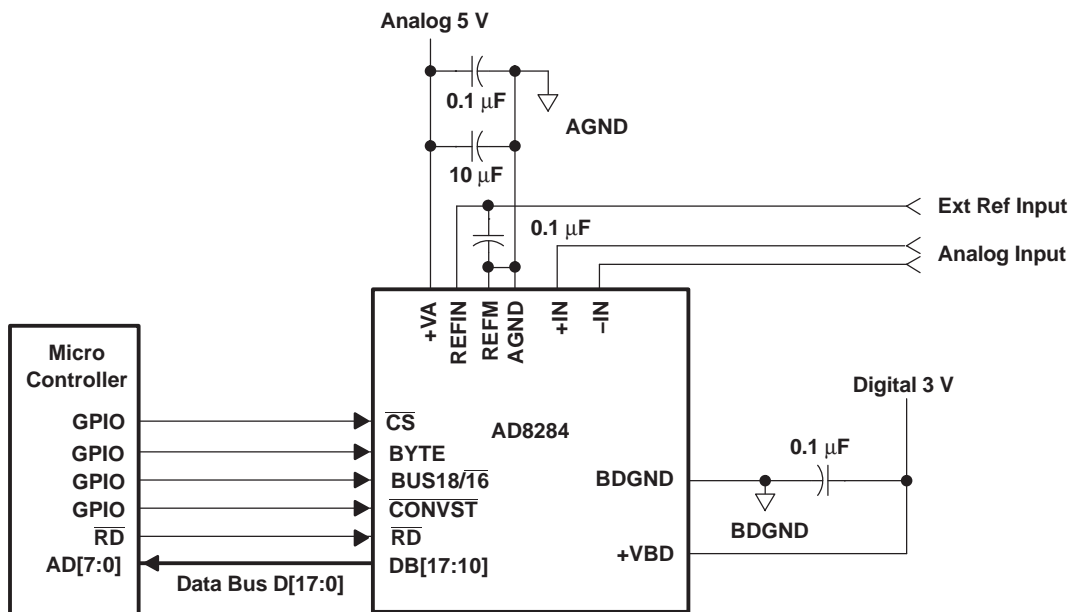

As shown in Figure 71, the ADS8284 accepts unipolar differential analog inputs in the range of  $\pm V_{\text{ref}}$  with a common-mode voltage of  $V_{\text{ref}}/2$  (0 to  $V_{\text{ref}}$  at positive input and  $V_{\text{ref}}$  to 0 at negative input). An application may require the interfacing of true bipolar input signals. Figure 72 shows the conversion of bipolar input signals to unipolar differential signals.

**Figure 72. Conversion of Bipolar Input Signals to Unipolar Differential Signals**

## Typical Applications (continued)

Figure 73 shows a parallel interface between the ADS8284 and a typical microcontroller using an 8-bit data bus.

**Figure 73. ADS8284 Application Circuitry**

The BUSY signal is used as a falling edge interrupt to the microcontroller.

**Figure 74. ADS8284 Using Internal Reference**

## 9 Power Supply Recommendations

**Table 5. Power Recommendations**

Voltage Supply	MIN	TYP	MAX
VBD	2.7 V	3.3 V	5.25 V
VA	4.75 V	5 V	5.25 V
VCC	4.75 V	5 V	7.5 V
VEE	–7.5 V	–5 V	–3 V

## 10 Device and Documentation Support

### 10.1 Trademarks

All trademarks are the property of their respective owners.

### 10.2 Electrostatic Discharge Caution

These devices have limited built-in ESD protection. The leads should be shorted together or the device placed in conductive foam during storage or handling to prevent electrostatic damage to the MOS gates.

### 10.3 Glossary

[SLYZ022](#) — *TI Glossary*.

This glossary lists and explains terms, acronyms and definitions.

## 11 Mechanical, Packaging, and Orderable Information

The following pages include mechanical packaging and orderable information. This information is the most current data available for the designated devices. This data is subject to change without notice and revision of this document. For browser-based versions of this data sheet, refer to the left-hand navigation.

ADS8284IBRGCT.B	NRND	Production	VQFN (RGC)   64	250   SMALL T&R	-	Call TI	Call TI	-40 to 85	

(1) **Status:** For more details on status, see our [product life cycle](#).

(2) **Material type:** When designated, preproduction parts are prototypes/experimental devices, and are not yet approved or released for full production. Testing and final process, including without limitation quality assurance, reliability performance testing, and/or process qualification, may not yet be complete, and this item is subject to further changes or possible discontinuation. If available for ordering, purchases will be subject to an additional waiver at checkout, and are intended for early internal evaluation purposes only. These items are sold without warranties of any kind.

(3) **RoHS values:** Yes, No, RoHS Exempt. See the [TI RoHS Statement](#) for additional information and value definition.

(4) **Lead finish/Ball material:** Parts may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead finish/Ball material values may wrap to two lines if the finish value exceeds the maximum column width.

(5) **MSL rating/Peak reflow:** The moisture sensitivity level ratings and peak solder (reflow) temperatures. In the event that a part has multiple moisture sensitivity ratings, only the lowest level per JEDEC standards is shown. Refer to the shipping label for the actual reflow temperature that will be used to mount the part to the printed circuit board.

(6) **Part marking:** There may be an additional marking, which relates to the logo, the lot trace code information, or the environmental category of the part.

Multiple part markings will be inside parentheses. Only one part marking contained in parentheses and separated by a "~" will appear on a part. If a line is indented then it is a continuation of the previous line and the two combined represent the entire part marking for that device.

**Important Information and Disclaimer:** The information provided on this page represents TI's knowledge and belief as of the date that it is provided. TI bases its knowledge and belief on information provided by third parties, and makes no representation or warranty as to the accuracy of such information. Efforts are underway to better integrate information from third parties. TI has taken and continues to take reasonable steps to provide representative and accurate information but may not have conducted destructive testing or chemical analysis on incoming materials and chemicals. TI and TI suppliers consider certain information to be proprietary, and thus CAS numbers and other limited information may not be available for release.

In no event shall TI's liability arising out of such information exceed the total purchase price of the TI part(s) at issue in this document sold by TI to Customer on an annual basis.

## GENERIC PACKAGE VIEW

- 2X 7.5 (width of the thermal pad)
- PIN1 ID (OPTIONAL) (indicated by a dashed line)
- 64 (width of the thermal pad)
- 65 (width of the thermal pad)
- SYMM (symmetry symbol)
- 64X<sup>0.3</sup><sub>0.18</sub> (width of the thermal pad)
- 48 (width of the thermal pad)
- 49 (width of the thermal pad)
- 64X<sup>0.5</sup><sub>0.3</sub> (width of the thermal pad)
- SEE DETAIL 'A' (indicated by a dashed line)

1. All linear dimensions are in millimeters. Any dimensions in parenthesis are for reference only. Dimensioning and tolerancing per ASME Y14.5M.
2. This drawing is subject to change without notice.
3. The package thermal pad must be soldered to the printed circuit board for optimal thermal and mechanical performance.

## VQFN - 1 mm max height

This drawing shows the bottom view of the PCB with the following dimensions and features:
 

- Overall Dimensions:**
  - Width:  $2X(8.8)$
  - Height:  $2X(8.8)$
- Internal Dimensions and Spacing:**
  - Top edge spacing:  $2X(8.8)$  (total),  $2X(7.5)$  (between pads),  $64X(0.6)$  (from left edge to first column).
  - Bottom edge spacing:  $2X(7.5)$  (between pads),  $45X(\varnothing 0.2)$  (TYP) VIA (from bottom edge to first row),  $4X(1.14)$  (between columns).
  - Left edge spacing:  $64X(0.24)$  (between rows),  $60X(0.5)$  (from top edge to first row).
  - Right edge spacing:  $4X(1.14)$  (between columns),  $2X(1.1)$  (from right edge to last column).
- Features and Callouts:**
  - SEE SOLDER MASK DETAIL:** Points to the top edge of the board.
  - SYMM  $\phi$ :** Indicated at the bottom center and left center.
  - 0.05 (TYP):** Points to the thickness of the solder mask.
  - 48, 49, 33, 32, 17, 16:** Pad numbers for the bottom edge.
  - 64, 65:** Pad numbers for the top edge.
  - 64X(0.6):** Dimension for the top edge pad spacing.
  - 64X(0.24):** Dimension for the top edge pad spacing.
  - 60X(0.5):** Dimension for the top edge pad spacing.
  - 45X( $\varnothing 0.2$ ) (TYP) VIA:** Dimension for the bottom edge pad spacing.
  - 4X(1.14):** Dimension for the bottom edge pad spacing.
  - 2X(1.1):** Dimension for the bottom edge pad spacing.

The diagram illustrates two types of solder mask openings on a PCB:

- Non Solder Mask Defined (Preferred):** This type shows a solder mask opening (blue outline) with a metal pad (green outline) inside it. The metal pad is defined by the metal layer, and the solder mask opening is defined by the solder mask. The dimensions are specified as 0.07 MAX ALL AROUND.
- Solder Mask Defined:** This type shows a solder mask opening (blue outline) with a metal pad (green outline) inside it. The metal pad is defined by the metal layer, and the solder mask opening is defined by the solder mask. The dimensions are specified as 0.07 MIN ALL AROUND.

4219009/A 10/2018

4. This package is designed to be soldered to a thermal pad on the board. For more information, see Texas Instruments literature number SLUA271 ([www.ti.com/lit/slue271](http://www.ti.com/lit/slue271)).
5. Vias are optional depending on application, refer to device data sheet. If any vias are implemented, refer to their locations shown on this view. It is recommended that vias under paste be filled, plugged or tented.

### VQFN - 1 mm max height

The diagram illustrates a solder paste stencil layout for a 6x6 grid of pads. The central grid is defined by a blue border. The pads are represented by red rectangles. The layout includes the following dimensions and labels:

- Grid Dimensions:**
  - Overall width:  $2X(8.8)$
  - Overall height:  $2X(8.8)$
  - Grid width:  $2X(7.5)$
  - Grid height:  $2X(7.5)$
- Pad Dimensions:**
  - Pad width:  $36X(0.94)$
  - Pad height:  $4X(1.14)$
  - Pad spacing (horizontal):  $2X(0.57)$
  - Pad spacing (vertical):  $2X(0.57)$
- Other Dimensions:**
  - Distance from top edge to first row of pads:  $64X(0.6)$
  - Distance from left edge to first column of pads:  $64X(0.24)$
  - Distance from bottom edge to last row of pads:  $60X(0.5)$
  - Distance from right edge to last column of pads:  $49$
- Labels and Notes:**
  - SYMM:** Symmetry lines are indicated across the grid.
  - EXPOSED METAL:** A label pointing to the bottom edge of the grid.
  - (R0.05) TYP:** A note indicating a typical radius for the corners of the pads.
  - 65:** A label for the top-left corner of the grid.
  - 48:** A label for the top-right corner of the grid.
  - 33:** A label for the bottom-right corner of the grid.
  - 17:** A label for the bottom-left corner of the grid.

**SOLDER PASTE EXAMPLE**  
 BASED ON 0.125 mm THICK STENCIL

EXPOSED PAD  
 60% PRINTED COVERAGE BY AREA  
 SCALE: 12X

6. Laser cutting apertures with trapezoidal walls and rounded corners may offer better paste release. IPC-7525 may have alternate design recommendations.
