

AMC0x02R Precision, ± 50 -mV Input, Basic and Reinforced Isolated Amplifiers With Single-Ended, Ratiometric Output

1 Features

- Linear input voltage range: ± 50 mV
- Supply voltage range:
 - High-side (VDD1): 3.0V to 5.5V
 - Low-side (VDD2): 3.0V to 5.5V
- Single-ended, ratiometric output
 - Reference Input: 2.7V to 5.5V
- Low DC errors:
 - Offset error: ± 50 μ V (maximum)
 - Offset drift: ± 1 μ V/ $^{\circ}$ C (maximum)
 - Gain error: $\pm 0.2\%$ (maximum)
 - Gain drift: ± 45 ppm/ $^{\circ}$ C (maximum)
 - Nonlinearity: 0.04% (maximum)
- High CMTI: 150V/ns (minimum)
- Low EMI: Meets CISPR-11 and CISPR-25 standards
- Isolation ratings:
 - AMC0202R: Basic isolation
 - AMC0302R: Reinforced Isolation
- Safety-related certifications:
 - DIN EN IEC 60747-17 (VDE 0884-17)
 - UL1577
- Fully specified over the extended industrial temperature range: -40° C to $+125^{\circ}$ C

2 Applications

- [Industrial motor drives](#)
- [Frequency inverters](#)
- [Server Power Supply Units \(PSU\)](#)
- [Power Factor Correction \(PFC\)](#)

3 Description

The AMC0x02R is a precision, galvanically isolated amplifier with a ± 50 mV, differential input and single-ended, ratiometric output. The input is optimized for direct connection to a shunt resistor or other low-impedance signal source.

The isolation barrier separates parts of the system that operate on different common-mode voltage levels. The isolation barrier is highly resistant to magnetic interference. This barrier is certified to provide reinforced isolation up to 5kV_{RMS} (DWV package) and basic isolation up to 3kV_{RMS} (D package) (60s).

The AMC0x02R outputs a single-ended signal proportional to the input voltage. The full-scale output is set by the voltage applied to the REFIN pin. The output of the AMC0x02R is designed to connect directly to the input of an ADC. Connect REFIN to the same reference voltage as the ADC to match the dynamic input voltage range of the ADC.

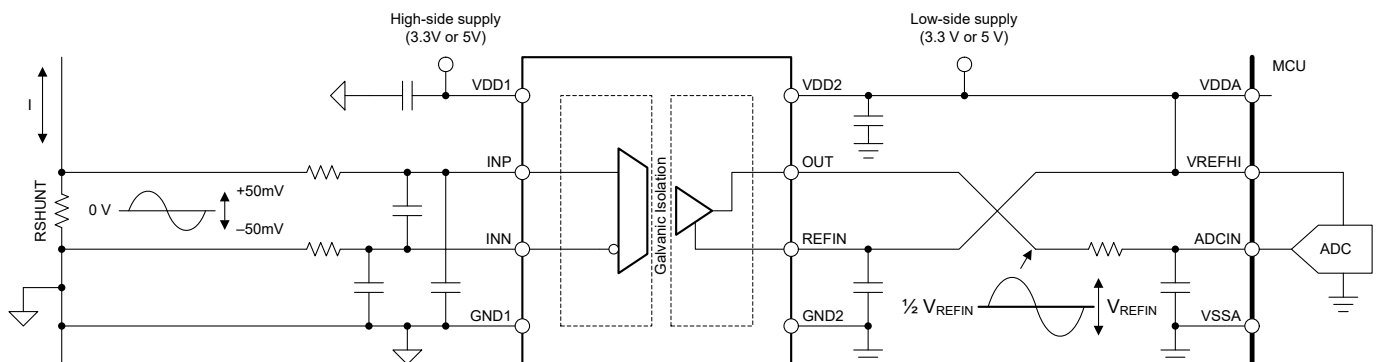

The AMC0x02R comes in 8-pin, wide- and narrow-body SOIC packages, and is fully specified over the temperature range from -40° C to $+125^{\circ}$ C.

Package Information

PART NUMBER	PACKAGE ⁽¹⁾	PACKAGE SIZE ⁽²⁾
AMC0202R	D (SOIC, 8)	4.9mm × 6mm
AMC0302R	DWV (SOIC, 8)	5.85mm × 11.5mm

(1) For more information, see the *Mechanical, Packaging, and Orderable Information*.

(2) The package size (length × width) is a nominal value and includes pins, where applicable.

(2) See the [Input Filter Design](#) section for input filter design recommendations.

6 Specifications

6.1 Absolute Maximum Ratings

over operating free-air temperature range (unless otherwise noted)⁽¹⁾

		MIN	MAX	UNIT
Power-supply voltage	High-side VDD1 to GND1	-0.3	6.5	V
	Low-side VDD2 to GND2	-0.3	6.5	
Analog input voltage	INP, INN to GND1	GND1 - 4	VDD1 + 0.5	V
Reference input voltage	REFIN to GND2	GND2 - 0.5	VDD2 + 0.5	V
Analog output voltage	OUT to GND2	GND2 - 0.5	VDD2 + 0.5	V
Input current	Continuous, any pin except power-supply pins	-10	10	mA
Temperature	Junction, T _J		150	°C
	Storage, T _{stg}	-65	150	

- (1) Operation outside the *Absolute Maximum Ratings* may cause permanent device damage. *Absolute Maximum Ratings* do not imply functional operation of the device at these or any other conditions beyond those listed under *Recommended Operating Conditions*. If used outside the *Recommended Operating Conditions* but within the *Absolute Maximum Ratings*, the device may not be fully functional, and this may affect device reliability, functionality, performance, and shorten the device lifetime.

6.2 ESD Ratings

			VALUE	UNIT
V _(ESD)	Electrostatic discharge	Human-body model (HBM), per ANSI/ESDA/JEDEC JS-001 ⁽¹⁾	±2000	V
		Charged-device model (CDM), per ANSI/ESDA/JEDEC JS-002 ⁽²⁾	±1000	

- (1) JEDEC document JEP155 states that 500V HBM allows safe manufacturing with a standard ESD control process.
 (2) JEDEC document JEP157 states that 250V CDM allows safe manufacturing with a standard ESD control process.

6.3 Recommended Operating Conditions

over operating ambient temperature range (unless otherwise noted)

				MIN	NOM	MAX	UNIT
POWER SUPPLY							
VDD1	High-side power supply	VDD1 to GND1		3	5.0	5.5	V
VDD2	Low-side power supply	VDD2 to GND2		3	3.3	5.5	V
ANALOG INPUT							
V _{Clipping}	Nominal differential input voltage before clipping output	V _{IN} = V _{INP} - V _{INN}		-64		64	mV
V _{FSR}	Specified linear differential input voltage	V _{IN} = V _{INP} - V _{INN}		-50		50	mV
V _{CM}	Operating common-mode input voltage	(V _{INP} + V _{INN}) / 2 to GND1		-0.032		1	V
C _{IN, EXT}	Minimum external capacitance connected to the input	from INP to INN			10		nF
REFERENCE INPUT							
V _{REFIN}	Reference input voltage	REFIN to GND2		2.7		VDD2	V
ANALOG OUTPUT							
C _{LOAD}	Capacitive load	OUT to GND2				500	pF
R _{LOAD}	Resistive load	OUT to GND2			10	1	kΩ
TEMPERATURE RANGE							
T _A	Specified ambient temperature			-40		125	°C

6.4 Thermal Information (D Package)

THERMAL METRIC ⁽¹⁾		D (SOIC)	UNIT
		8 PINS	
$R_{\theta JA}$	Junction-to-ambient thermal resistance	116.5	°C/W
$R_{\theta JC(top)}$	Junction-to-case (top) thermal resistance	52.8	°C/W
$R_{\theta JB}$	Junction-to-board thermal resistance	58.9	°C/W
Ψ_{JT}	Junction-to-top characterization parameter	19.4	°C/W
Ψ_{JB}	Junction-to-board characterization parameter	58.0	°C/W
$R_{\theta JC(bot)}$	Junction-to-case (bottom) thermal resistance	N/A	°C/W

- (1) For more information about traditional and new thermal metrics, see the [Semiconductor and IC Package Thermal Metrics](#) application note.

6.5 Thermal Information (DWV Package)

THERMAL METRIC ⁽¹⁾		DWV (SOIC)	UNIT
		8 PINS	
$R_{\theta JA}$	Junction-to-ambient thermal resistance	102.8	°C/W
$R_{\theta JC(top)}$	Junction-to-case (top) thermal resistance	45.1	°C/W
$R_{\theta JB}$	Junction-to-board thermal resistance	63.0	°C/W
Ψ_{JT}	Junction-to-top characterization parameter	14.3	°C/W
Ψ_{JB}	Junction-to-board characterization parameter	61.1	°C/W
$R_{\theta JC(bot)}$	Junction-to-case (bottom) thermal resistance	N/A	°C/W

(1) For more information about traditional and new thermal metrics, see the [Semiconductor and IC Package Thermal Metrics](#) application note.

6.6 Power Ratings

PARAMETER	TEST CONDITIONS	VALUE	UNIT
P_D	Maximum power dissipation (both sides)	VDD1 = VDD2 = 5.5V	80 mW
P_{D1}	Maximum power dissipation (high-side)	VDD1 = 5.5V	38 mW
P_{D2}	Maximum power dissipation (low-side)	VDD2 = 5.5V	42 mW

6.7 Insulation Specifications (Basic Isolation)

over operating ambient temperature range (unless otherwise noted)

PARAMETER		TEST CONDITIONS	VALUE	UNIT
GENERAL				
CLR	External clearance ⁽¹⁾	Shortest pin-to-pin distance through air	≥ 4	mm
CPG	External creepage ⁽¹⁾	Shortest pin-to-pin distance across the package surface	≥ 4	mm
DTI	Distance through insulation	Minimum internal gap (internal clearance) of the insulation	≥ 15.4	µm
CTI	Comparative tracking index	DIN EN 60112 (VDE 0303-11); IEC 60112	≥ 600	V
	Material group	According to IEC 60664-1	I	
	Overvoltage category per IEC 60664-1	Rated mains voltage ≤ 300V _{RMS}	I-IV	
		Rated mains voltage ≤ 600V _{RMS}	I-III	
DIN EN IEC 60747-17 (VDE 0884-17)⁽²⁾				
V _{IORM}	Maximum repetitive peak isolation voltage	At AC voltage	1130	V _{PK}
V _{IOWM}	Maximum-rated isolation working voltage	At AC voltage (sine wave)	800	V _{RMS}
		At DC voltage	1130	V _{DC}
V _{IOTM}	Maximum transient isolation voltage	V _{TEST} = V _{IOTM} , t = 60s (qualification test), V _{TEST} = 1.2 × V _{IOTM} , t = 1s (100% production test)	4250	V _{PK}
V _{IMP}	Maximum impulse voltage ⁽³⁾	Tested in air, 1.2/50µs waveform per IEC 62368-1	5000	V _{PK}
V _{IOSM}	Maximum surge isolation voltage ⁽⁴⁾	Tested in oil (qualification test), 1.2/50µs waveform per IEC 62368-1	10000	V _{PK}
q _{pd}	Apparent charge ⁽⁵⁾	Method a, after input/output safety test subgroups 2 and 3, V _{pd(ini)} = V _{IOTM} , t _{ini} = 60s, V _{pd(m)} = 1.2 × V _{IORM} , t _m = 10s	≤ 5	pC
		Method a, after environmental tests subgroup 1, V _{pd(ini)} = V _{IOTM} , t _{ini} = 60s, V _{pd(m)} = 1.3 × V _{IORM} , t _m = 10s	≤ 5	
		Method b1, at preconditioning (type test) and routine test, V _{pd(ini)} = V _{IOTM} , t _{ini} = 1s, V _{pd(m)} = 1.5 × V _{IORM} , t _m = 1s	≤ 5	
		Method b2, at routine test (100% production) ⁽⁷⁾ , V _{pd(ini)} = V _{IOTM} = V _{pd(m)} , t _{ini} = t _m = 1s	≤ 5	
C _{IO}	Barrier capacitance, input to output ⁽⁶⁾	V _{IO} = 0.5V _{PP} at 1MHz	≈ 1.5	pF
R _{IO}	Insulation resistance, input to output ⁽⁶⁾	V _{IO} = 500V at T _A = 25°C	> 10 ¹²	Ω
		V _{IO} = 500V at 100°C ≤ T _A ≤ 125°C	> 10 ¹¹	
		V _{IO} = 500V at T _S = 150°C	> 10 ⁹	
	Pollution degree		2	
	Climatic category		55/125/21	
UL1577				
V _{ISO}	Withstand isolation voltage	V _{TEST} = V _{ISO} , t = 60s (qualification test), V _{TEST} = 1.2 × V _{ISO} , t = 1s (100% production test)	3000	V _{RMS}

- (1) Apply creepage and clearance requirements according to the specific equipment isolation standards of an application. Maintain the creepage and clearance distance of a board design to make sure that the mounting pads of the isolator on the printed circuit board (PCB) do not reduce this distance. Creepage and clearance on a PCB become equal in certain cases. Techniques such as inserting grooves, ribs, or both on a PCB are used to help increase these specifications.
- (2) This coupler is suitable for *safe electrical insulation* only within the safety ratings. Compliance with the safety ratings shall be ensured by means of suitable protective circuits.
- (3) Testing is carried out in air to determine the surge immunity of the package.
- (4) Testing is carried out in oil to determine the intrinsic surge immunity of the isolation barrier.
- (5) Apparent charge is electrical discharge caused by a partial discharge (pd).
- (6) All pins on each side of the barrier are tied together, creating a two-pin device.
- (7) Either method b1 or b2 is used in production.

6.8 Insulation Specifications (Reinforced Isolation)

over operating ambient temperature range (unless otherwise noted)

PARAMETER		TEST CONDITIONS	VALUE	UNIT
GENERAL				
CLR	External clearance ⁽¹⁾	Shortest pin-to-pin distance through air	≥ 8.5	mm
CPG	External creepage ⁽¹⁾	Shortest pin-to-pin distance across the package surface	≥ 8.5	mm
DTI	Distance through insulation	Minimum internal gap (internal clearance) of the double insulation	≥ 15.4	μm
CTI	Comparative tracking index	DIN EN 60112 (VDE 0303-11); IEC 60112	≥ 600	V
	Material group	According to IEC 60664-1	I	
	Overvoltage category per IEC 60664-1	Rated mains voltage ≤ 300V _{RMS}	I-IV	
		Rated mains voltage ≤ 6000V _{RMS}	I-III	
DIN EN IEC 60747-17 (VDE 0884-17)⁽²⁾

V _{IOTM}	Maximum transient isolation voltage	V _{TEST} = V _{IOTM} , t = 60s (qualification test), V _{TEST} = 1.2 × V _{IOTM} , t = 1s (100% production test)	7000	V _{PK}
V _{IMP}	Maximum impulse voltage ⁽³⁾	Tested in air, 1.2/50μs waveform per IEC 62368-1	7700	V _{PK}
V _{IOSM}	Maximum surge isolation voltage ⁽⁴⁾	Tested in oil (qualification test), 1.2/50μs waveform per IEC 62368-1	10000	V _{PK}
q _{pd}	Apparent charge ⁽⁵⁾	Method a, after input/output safety test subgroups 2 and 3, V _{pd(ini)} = V _{IOTM} , t _{ini} = 60s, V _{pd(m)} = 1.2 × V _{IORM} , t _m = 10s	≤ 5	pC
		Method a, after environmental tests subgroup 1, V _{pd(ini)} = V _{IOTM} , t _{ini} = 60s, V _{pd(m)} = 1.6 × V _{IORM} , t _m = 10s	≤ 5	
		Method b1, at preconditioning (type test) and routine test, V _{pd(ini)} = 1.2 × V _{IOTM} , t _{ini} = 1s, V _{pd(m)} = 1.875 × V _{IORM} , t _m = 1s	≤ 5	
		Method b2, at routine test (100% production) ⁽⁷⁾ V _{pd(ini)} = V _{pd(m)} = 1.2 × V _{IOTM} , t _{ini} = t _m = 1s	≤ 5	
C _{IO}	Barrier capacitance, input to output ⁽⁶⁾	V _{IO} = 0.5V _{PP} at 1MHz	≈ 1.5	pF
R _{IO}	Insulation resistance, input to output ⁽⁶⁾	V _{IO} = 500V at T _A = 25°C	> 10 ¹²	Ω
		V _{IO} = 500V at 100°C ≤ T _A ≤ 125°C	> 10 ¹¹	
		V _{IO} = 500V at T _S = 150°C	> 10 ⁹	
	Pollution degree		2	
	Climatic category		55/125/21	
UL1577				
V _{ISO}	Withstand isolation voltage	V _{TEST} = V _{ISO} , t = 60s (qualification test), V _{TEST} = 1.2 × V _{ISO} , t = 1s (100% production test)	5000	V _{RMS}

- (1) Apply creepage and clearance requirements according to the specific equipment isolation standards of an application. Maintain the creepage and clearance distance of a board design to make sure that the mounting pads of the isolator on the printed circuit board (PCB) do not reduce this distance. Creepage and clearance on a PCB become equal in certain cases. Techniques such as inserting grooves, ribs, or both on a PCB are used to help increase these specifications.
- (2) This coupler is suitable for *safe electrical insulation* only within the safety ratings. Compliance with the safety ratings shall be ensured by means of suitable protective circuits.
- (3) Testing is carried out in air to determine the surge immunity of the package.
- (4) Testing is carried in oil to determine the intrinsic surge immunity of the isolation barrier.
- (5) Apparent charge is electrical discharge caused by a partial discharge (pd).
- (6) All pins on each side of the barrier are tied together, creating a two-pin device.
- (7) Either method b1 or b2 is used in production.

6.9 Safety-Related Certifications (Basic Isolation)

VDE	UL
DIN EN IEC 60747-17 (VDE 0884-17), EN IEC 60747-17, DIN EN 61010-1 (VDE 0411-1) Clause : 6.4.3 ; 6.7.1.3 ; 6.7.2.1 ; 6.7.2.2 ; 6.7.3.4.2 ; 6.8.3.1	Recognized under 1577 component recognition and CSA component acceptance NO 5 programs
Basic insulation	Single protection
Certificate number: 40040142	File number: E181974

6.10 Safety-Related Certifications (Reinforced Isolation)

VDE	UL
DIN EN IEC 60747-17 (VDE 0884-17), EN IEC 60747-17, DIN EN IEC 62368-1 (VDE 0868-1), EN IEC 62368-1, IEC 62368-1 Clause : 5.4.3 ; 5.4.4.4 ; 5.4.9	Recognized under 1577 component recognition and CSA component acceptance NO 5 programs
Reinforced insulation	Single protection
Certificate number: 40040142	File number: E181974

6.11 Safety Limiting Values (D Package)

Safety limiting⁽¹⁾ intends to minimize potential damage to the isolation barrier upon failure of input or output circuitry. A failure of the I/O can allow low resistance to ground or the supply and, without current limiting, dissipate sufficient power to over-heat the die and damage the isolation barrier potentially leading to secondary system failures.

PARAMETER		TEST CONDITIONS	MIN	TYP	MAX	UNIT
I_S	Safety input, output, or supply current	$R_{\theta JA} = 116.5^\circ\text{C/W}$, $V_{DDX} = 5.5\text{V}$, $T_J = 150^\circ\text{C}$, $T_A = 25^\circ\text{C}$			195	mA
P_S	Safety input, output, or total power	$R_{\theta JA} = 116.5^\circ\text{C/W}$, $T_J = 150^\circ\text{C}$, $T_A = 25^\circ\text{C}$			1070	mW
T_S	Maximum safety temperature				150	$^\circ\text{C}$

- (1) The maximum safety temperature, T_S , has the same value as the maximum junction temperature, T_J , specified for the device. The I_S and P_S parameters represent the safety current and safety power, respectively. Do not exceed the maximum limits of I_S and P_S . These limits vary with the ambient temperature, T_A .

The junction-to-air thermal resistance, $R_{\theta JA}$, in the Thermal Information table is that of a device installed on a high-K test board for leaded surface-mount packages. Use these equations to calculate the value for each parameter:

$T_J = T_A + R_{\theta JA} \times P$, where P is the power dissipated in the device.

$T_{J(\max)} = T_S = T_A + R_{\theta JA} \times P_S$, where $T_{J(\max)}$ is the maximum junction temperature.

$P_S = I_S \times V_{DD_{\max}}$, where $V_{DD_{\max}}$ is the maximum supply voltage for high-side and low-side.

6.12 Safety Limiting Values (DWV Package)

Safety limiting⁽¹⁾ intends to minimize potential damage to the isolation barrier upon failure of input or output circuitry. A failure of the I/O can allow low resistance to ground or the supply and, without current limiting, dissipate sufficient power to over-heat the die and damage the isolation barrier potentially leading to secondary system failures.

PARAMETER		TEST CONDITIONS	MIN	TYP	MAX	UNIT
I_S	Safety input, output, or supply current	$R_{\theta JA} = 102.8^\circ\text{C}/\text{W}$, $V_{DDx} = 5.5\text{V}$, $T_J = 150^\circ\text{C}$, $T_A = 25^\circ\text{C}$			220	mA
P_S	Safety input, output, or total power	$R_{\theta JA} = 102.8^\circ\text{C}/\text{W}$, $T_J = 150^\circ\text{C}$, $T_A = 25^\circ\text{C}$			1210	mW
T_S	Maximum safety temperature				150	$^\circ\text{C}$

- (1) The maximum safety temperature, T_S , has the same value as the maximum junction temperature, T_J , specified for the device. The I_S and P_S parameters represent the safety current and safety power, respectively. Do not exceed the maximum limits of I_S and P_S . These limits vary with the ambient temperature, T_A .

The junction-to-air thermal resistance, $R_{\theta JA}$, in the Thermal Information table is that of a device installed on a high-K test board for leaded surface-mount packages. Use these equations to calculate the value for each parameter:

$T_J = T_A + R_{\theta JA} \times P$, where P is the power dissipated in the device.

$T_{J(\max)} = T_S = T_A + R_{\theta JA} \times P_S$, where $T_{J(\max)}$ is the maximum junction temperature.

$P_S = I_S \times V_{DD_{\max}}$, where $V_{DD_{\max}}$ is the maximum supply voltage for high-side and low-side.

6.13 Electrical Characteristics

minimum and maximum specifications apply from $T_A = -40^\circ\text{C}$ to $+125^\circ\text{C}$, $V_{DD1} = 3.0\text{V}$ to 5.5V , $V_{DD2} = 3.0\text{V}$ to 5.5V , $V_{REFIN} = 3.3\text{V}$, $V_{INP} = -50\text{mV}$ to $+50\text{mV}$, and $V_{INN} = 0\text{V}$; typical specifications are at $T_A = 25^\circ\text{C}$, $V_{DD1} = 5\text{V}$, $V_{DD2} = 3.3\text{V}$, and $V_{REFIN} = 1.65\text{V}$ (unless otherwise noted)

PARAMETER		TEST CONDITIONS	MIN	TYP	MAX	UNIT
ANALOG INPUT						
C_{IN}	Effective input sampling capacitance			8		pF
R_{IN}	Input impedance		5.3	6.3	7.3	k Ω
I_{INP}	Input current	$V_{IN} = (V_{INP} - V_{INN}) = V_{FSR, MAX}$		8		μA
I_{INN}	Input current	$V_{IN} = (V_{INP} - V_{INN}) = V_{FSR, MAX}$		-8		μA
CMTI	Common-mode transient immunity	$ GND1 - GND2 = 1\text{kV}$	150			V/ns
REFERENCE INPUT						
R_{REFIN}	Input Impedance	REFIN to GND2, $V_{REFIN} = 3.3\text{V}$, $T_A = 25^\circ\text{C}$	65.3	76.8	88.3	k Ω
		REFIN to GND2, $V_{REFIN} = 5\text{V}$, $T_A = 25^\circ\text{C}$	62	72.9	83.9

7 Detailed Description

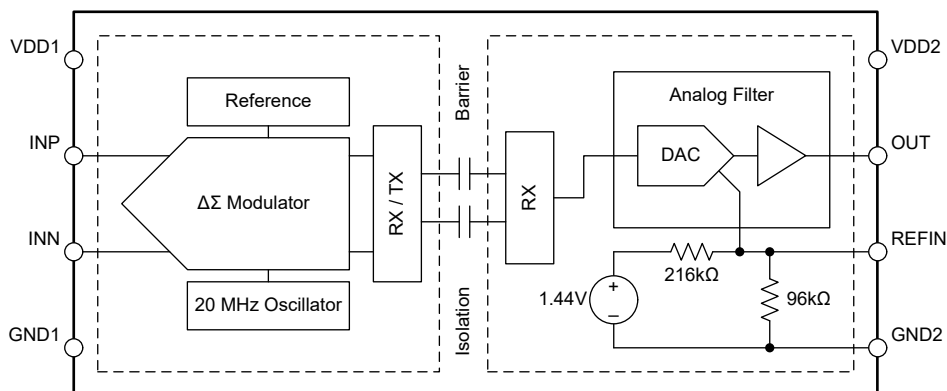

7.1 Overview

The AMC0x02R is a precision, galvanically isolated amplifier with a $\pm 50\text{mV}$, differential input and single-ended, ratiometric output. The input stage of the device drives a second-order, delta-sigma ($\Delta\Sigma$) modulator. The modulator converts the analog input signal into a digital bitstream that is transferred across the isolation barrier that separates the high-side from the low-side.

On the low-side, the received bitstream is processed by an analog filter that outputs a GND2-referenced, single-ended signal at the OUT pin. This single-ended output signal is proportional to the input signal. The full-scale output voltage of the isolated amplifier is equal to the voltage applied to the REFIN pin.

The SiO_2 -based, capacitive isolation barrier supports a high level of magnetic field immunity, as described in the [ISO72x Digital Isolator Magnetic-Field Immunity application note](#). The digital modulation used in the AMC0x02R transmits data across the isolation barrier. This modulation, and the isolation barrier characteristics, result in high reliability and high common-mode transient immunity.

7.2 Functional Block Diagram

7.3 Feature Description

7.3.1 Analog Input

As shown in [Figure 7-1](#), input of the AMC0x02R has a fully differential, switched-capacitor circuit with a dynamic input impedance of $6.3\text{k}\Omega$.

The sampling capacitor is continuously charged and discharged with a frequency of 20MHz. With the S1 switches closed, C_{IND} charges to the voltage difference across V_{INP} and V_{INN} . For the discharge phase, both S1 switches open first and then both S2 switches close. C_{IND} discharges to approximately $\text{AGND} + 0.8\text{V}$ during this phase.

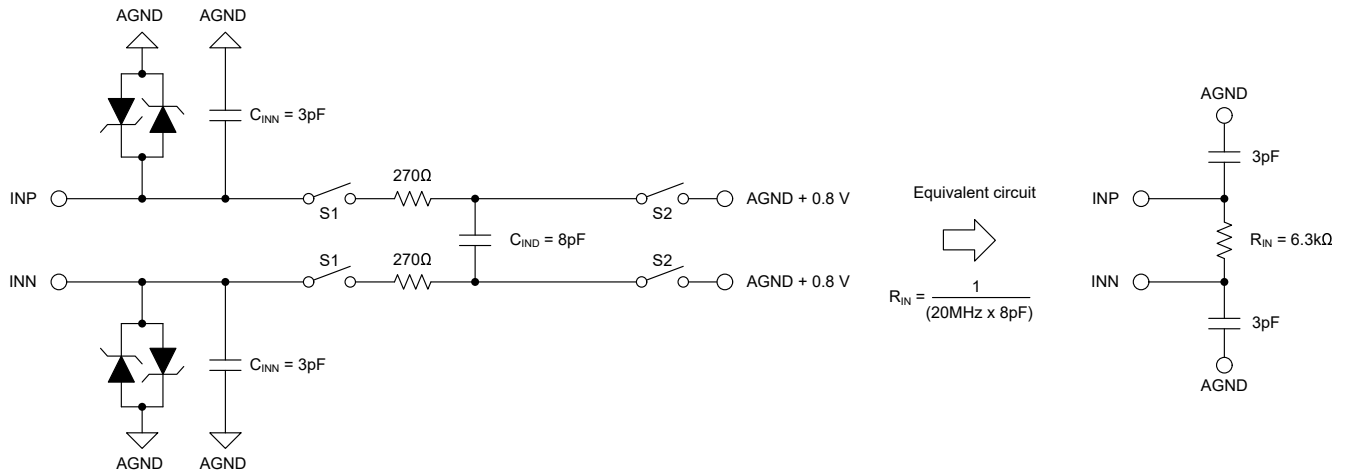

Figure 7-1. Equivalent Input Circuit

The analog input range is tailored to directly accommodate a voltage drop across a shunt resistor used for current sensing. There are two restrictions on the analog input signals (INP and INN).

- First, if the input voltage exceeds the input range specified in the [Absolute Maximum Ratings](#) table, limit the input current to the absolute maximum value. This is to prevent device input electrostatic discharge (ESD) diode damage due to high current.
- Second, keep the differential analog input voltage within the specified full-scale range (V_{FSR}) and input common-mode voltage range (V_{CM}) ranges. V_{FSR} and V_{CM} are specified in the [Recommended Operating Conditions](#) table. The device noise and linearity performance is specified only in this range.

7.3.2 Isolation Channel Signal Transmission

As shown in [OOK-Based Modulation Scheme](#), the AMC0x02R uses an on-off keying (OOK) modulation scheme to transmit the modulator output bitstream across the SiO₂-based isolation barrier. The transmit driver (TX) is illustrated in the [Functional Block Diagram](#). TX transmits an internally generated, high-frequency carrier across the isolation barrier to represent a digital *one*. However, TX does not send a signal to represent a digital *zero*. The nominal frequency of the carrier used inside the AMC0x02R is 480MHz.

The receiver (RX) on the other side of the isolation barrier recovers and demodulates the signal and provides the input to the analog filter. The AMC0x02R transmission channel is optimized to achieve the highest level of common-mode transient immunity (CMTI) and the lowest level of radiated emissions. The high-frequency carrier and RX/TX buffer switching cause these emissions.

Figure 7-2. OOK-Based Modulation Scheme

7.3.3 Analog Output

The AMC0x02R provides a single-ended analog output voltage proportional to the input voltage. The output is referred to GND2 and is galvanically isolated from the input of the device. The output is designed to connect directly to the input of an ADC.

The full-scale output voltage is set by the REFIN pin. For any input voltage within the specified linear input range, the device outputs a voltage equal to:

$$V_{OUT} = V_{IN} / V_{Clipping} \times V_{REFIN} / 2 + V_{REFIN} / 2 = (V_{INP} - V_{INN}) / V_{Clipping} \times V_{REFIN} / 2 + V_{REFIN} / 2 \quad (1)$$

Connect REFIN to the same reference voltage as a downstream ADC to match the ADC dynamic input voltage range. With a shared reference voltage, the ADC outputs a negative full-scale code when the negative clipping voltage is applied to the input of the AMC0x02R. The ADC outputs the mid-range code when 0V is applied to the input of the AMC0x02R. The ADC outputs a positive full-scale code when the positive clipping voltage is applied to the input of the AMC0x02R.

The device is linear within the specified linear full-scale range. Beyond the linear full-scale range, the output continues to follow the input, but with reduced linearity performance. The output clips when the input voltage reaches the clipping voltage. Figure 7-3 shows the input-to-output transfer characteristic.

Figure 7-3. Input-to-Output Transfer Curve of the AMC0x02R

7.4 Device Functional Modes

The AMC0x02R operates in one of the following states:

- Off-state: The low-side supply (VDD2) is below the VDD2_{UV} threshold. The device is not responsive. OUT is in Hi-Z state. Internally, OUT is clamped to VDD2 and GND2 by ESD protection diodes.
- Missing high-side supply: The low-side of the device (VDD2) is supplied and within recommended operating conditions. The high-side supply (VDD1) is below the VDD1_{UV} threshold. The OUT pin is driven to V_{REFIN} / 2.
- Analog input overrange (positive full-scale input): VDD1 and VDD2 are within recommended operating conditions but the analog input voltage V_{IN} is above the maximum clipping voltage V_{Clipping, MAX}. The device outputs V_{REFIN} at the OUT pin.
- Analog input underrange (negative full-scale input): VDD1 and VDD2 are within recommended operating conditions but the analog input voltage V_{IN} is below the minimum clipping voltage V_{Clipping, MIN}. The OUT pin is driven to GND2.
- Normal operation: VDD1, VDD2, and V_{IN} are within the recommended operating conditions. The device outputs a voltage that is proportional to the input voltage.

Table 7-1 lists the operating modes.

Table 7-1. Device Operational Modes

OPERATING CONDITION	VDD1	VDD2	V _{IN}	DEVICE RESPONSE
Off	Don't care	VDD2 < VDD2 _{UV}	Don't care	OUT is in Hi-Z state. Internally, OUT is clamped to VDD2 and GND2 by ESD protection diodes.
Missing high-side supply	VDD1 < VDD1 _{UV}	Valid ⁽¹⁾	Don't care	The OUT pin is driven to V _{REFIN} / 2.
Input overrange	Valid ⁽¹⁾	Valid ⁽¹⁾	V _{IN} > V _{Clipping, MAX}	The device outputs V _{REFIN} at the OUT pin.
Input underrange	Valid ⁽¹⁾	Valid ⁽¹⁾	V _{IN} < V _{Clipping, MIN}	The OUT pin is driven to GND2.
Normal operation	Valid ⁽¹⁾	Valid ⁽¹⁾	Valid ⁽¹⁾	The device outputs a voltage that is proportional to the input voltage.

(1) *Valid* denotes operation within the recommended operating conditions.

8 Application and Implementation

Note

Information in the following applications sections is not part of the TI component specification, and TI does not warrant its accuracy or completeness. TI's customers are responsible for determining suitability of components for their purposes, as well as validating and testing their design implementation to confirm system functionality.

8.1 Application Information

The AMC0x02R has low analog input voltage range, high accuracy, low temperature drift, and high common-mode transient immunity. The AMC0x02R is primarily designed for shunt-based current-sensing applications where accurate current monitoring is required in the presence of high common-mode voltages. The AMC0x02R is preferred for isolated current sensing in motor drives, frequency inverters, and uninterruptible power-supply applications.

8.2 Typical Application

The following image shows the AMC0x02R in a typical application. The load current flowing through an external shunt resistor RSHUNT produces a voltage drop. The AMC0x02R high-side circuitry senses the voltage drop across the shunt resistor, then digitizes and transfers data across the isolation barrier to the low side. Low-side circuitry reconstructs the digitized data into an analog signal and provides the signal as single-ended ratiometric voltage on the output pin.

The differential input, single-ended ratiometric output, and high common-mode transient immunity (CMTI) of the AMC0x02R provide reliable and accurate operation even in high-noise environments.

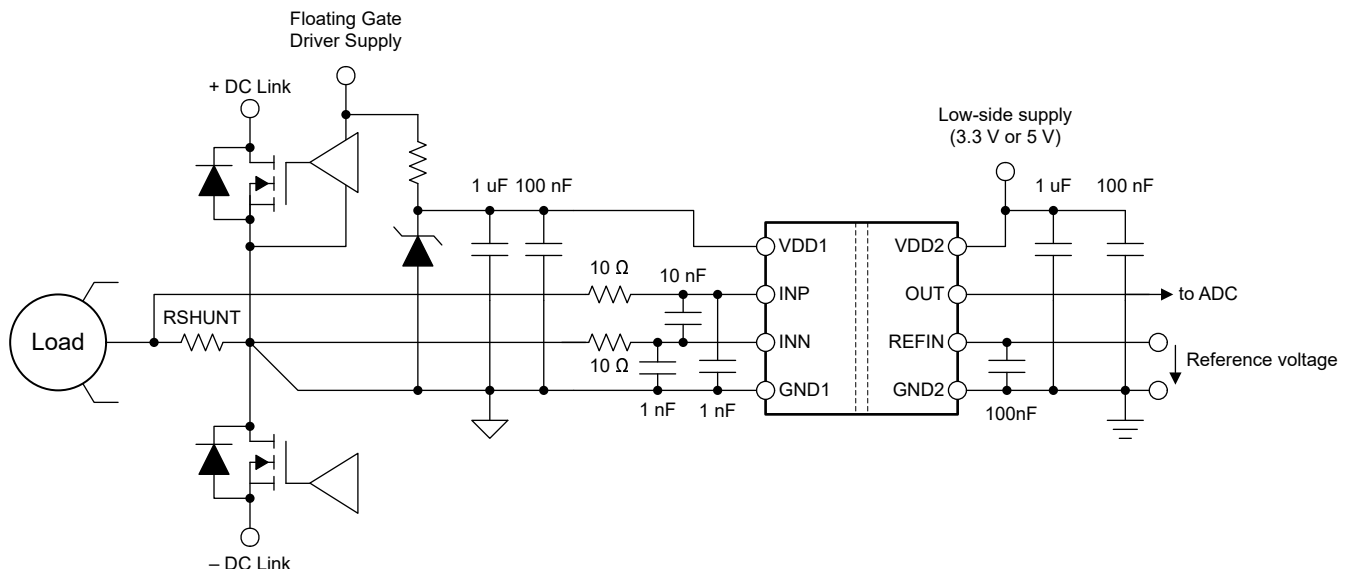

Figure 8-1. Using the AMC0x02R for Current Sensing in a Typical Application

8.2.1 Design Requirements

Table 8-1 lists the parameters for this typical application.

Table 8-1. Design Requirements

PARAMETER	VALUE
High-side supply voltage	3.3V or 5V
Low-side supply voltage	3.3V or 5V
Voltage drop across RSHUNT for a linear response	±50mV(maximum)

8.2.2 Detailed Design Procedure

In the [Typical Application](#) figure, the high-side power supply (VDD1) for the AMC0x02R is derived from the floating power supply of the upper gate driver.

The floating ground reference (GND1) is derived from the end of the shunt resistor that is connected to the negative input of the AMC0x02R (INN). If a four-pin shunt is used, the inputs of the AMC0x02R are connected to the inner leads. GND1 is then connected to the outer lead on the INN-side of the shunt. To minimize offset and improve accuracy, route the ground connection as a separate trace that connects directly to the shunt resistor. Do not short GND1 to INN directly at the device input; see the [Layout Example](#) section for more details.

Use Ohm's Law to calculate the voltage drop across the shunt resistor (V_{SHUNT}) for the desired measured current:

$$V_{SHUNT} = I \times RSHUNT \quad (2)$$

Select a RSHUNT value to satisfy the following two conditions:

- First, the voltage drop caused by the nominal current range does not exceed the recommended differential input voltage range of $V_{SHUNT} \leq \pm 50\text{mV}$.
- Secondly, the voltage drop caused by the maximum allowed overcurrent does not exceed the input voltage that causes a clipping output. Keep $V_{SHUNT} \leq V_{Clipping}$.

8.2.2.1 Input Filter Design

Place a differential RC filter (R1, R2, C5) in front of the isolated amplifier to improve signal-to-noise performance of the signal path. Design the input filter such that:

- The cutoff frequency of the filter is at least one order of magnitude lower than the sampling frequency (20MHz) of the $\Delta\Sigma$ modulator
- The input bias current does not generate significant voltage drop across the DC impedance of the input filter
- The impedances measured from the analog inputs are equal

Place capacitors C6 and C7 to improve common-mode rejection at high frequencies (>1MHz) and to improve offset voltage performance. For best performance, verify C6 matches the value of C7 and that both capacitors are 10 to 20 times lower in value than C5. NP0-type capacitors offer low temperature drift and low voltage coefficients, and are preferred for common-mode filtering.

For most applications, the structure shown in [Figure 8-2](#) achieves excellent performance.

Figure 8-2. Input Filter

8.2.2.2 Connecting the REFIN Pin

The reference input has a finite input impedance as shown in the [Functional Block Diagram](#). Consider this impedance when driving the REFIN pin from a high-impedance source. Connect a 100nF capacitor from REFIN to GND2 to filter out high-frequency noise at the reference input. [Figure 8-3](#) shows different options for connecting the REFIN pin.

Figure 8-3. Connecting the REFIN Pin

In the first example, REFIN is shorted to VDD2. In the second example, V_{REFIN} is derived from VDD2 through a buffered resistive divider. In the third example, an external voltage source drives the reference input pin.

8.2.3 Application Curves

One important aspect of power-stage design is the effective detection of an overcurrent condition to protect the switching devices and passive components from damage. To power off the system quickly in the event of an overcurrent condition, a low delay caused by the isolated amplifier is required. Figure 8-4 shows the typical full-scale step response of the AMC0x02R.

Figure 8-4. Output Step Response of the AMC0x02R

Figure 8-5 shows the typical step response of the AMC0x02R when a transient step is applied on its reference input pin with INP and INN connected to GND1.

Figure 8-5. Reference Input Step Response of the AMC0x02R

8.3 Best Design Practices

Place a minimum 10nF capacitor at the device input (from INP to INN). This capacitor helps avoid voltage droop at the input during the sampling period of the switched-capacitor input stage.

Do not short GND1 to INN directly at the device input. For best accuracy, route the ground connection as a separate trace that connects directly to the shunt resistor. See the [Layout Example](#) section for more details.

Do not leave the inputs of the AMC0x02R unconnected (floating) when the device is powered up. If the device inputs are left floating, the input bias current potentially drives the inputs to a positive value that exceeds the operating common-mode input voltage. This condition causes the device to output the fail-safe voltage described in the [Analog Output](#) section.

Connect the high-side ground (GND1) to INN, either by a hard short or through a resistive path. A DC current path between INN and GND1 is required to define the input common-mode voltage. Do not exceed the input common-mode range specified in the [Recommended Operating Conditions](#) table.

8.4 Power Supply Recommendations

In a typical application, the high-side power supply (VDD1) for the AMC0x02R is generated from the low-side supply (VDD2) by an isolated DC/DC converter. A low-cost option is based on the push-pull driver [SN6501](#) and a transformer that supports the desired isolation voltage ratings.

The AMC0x02R does not require any specific power-up sequencing. The high-side power supply (VDD1) is decoupled with a low-ESR, 100nF capacitor (C1) parallel to a low-ESR, 1μF capacitor (C2). The low-side power supply (VDD2) is equally decoupled with a low-ESR, 100nF capacitor (C3) parallel to a low-ESR, 1μF capacitor (C4). Place all four capacitors (C1, C2, C3, and C4) as close to the device as possible. [Figure 8-6](#) shows a decoupling diagram for the AMC0x02R.

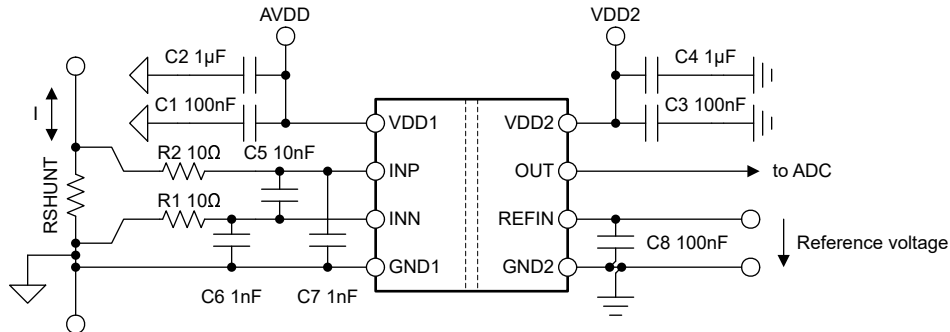

Figure 8-6. Decoupling of the AMC0x02R

Verify capacitors provide adequate *effective* capacitance under the applicable DC bias conditions experienced in the application. Multilayer ceramic capacitors (MLCC) typically exhibit only a fraction of the nominal capacitance under real-world conditions. Consider this factor when selecting these capacitors. This issue is especially acute in low-profile capacitors, where the dielectric field strength is higher than in taller components. Reputable capacitor manufacturers provide capacitance versus DC bias curves that greatly simplify component selection.

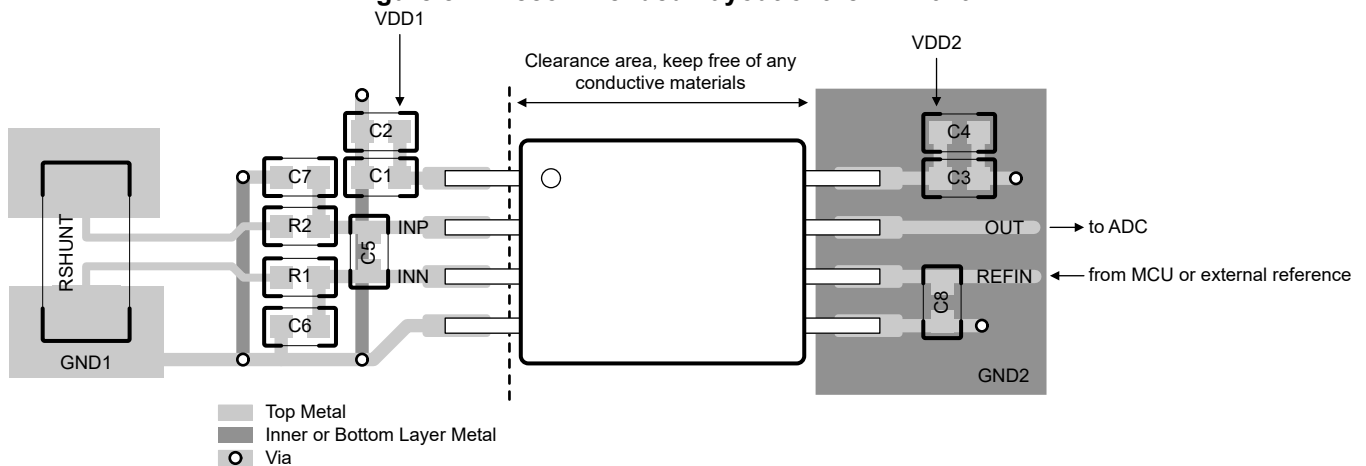

8.5 Layout

8.5.1 Layout Guidelines

The [Layout Example](#) section details a layout recommendation with the critical placement of the decoupling capacitors (as close as possible to the AMC0x02R supply pins). This example also depicts the placement of other components required by the device.

8.5.2 Layout Example

9.5 Electrostatic Discharge Caution

This integrated circuit can be damaged by ESD. Texas Instruments recommends that all integrated circuits be handled with appropriate precautions. Failure to observe proper handling and installation procedures can cause damage.

ESD damage can range from subtle performance degradation to complete device failure. Precision integrated circuits may be more susceptible to damage because very small parametric changes could cause the device not to meet its published specifications.

11 Mechanical, Packaging, and Orderable Information

The following pages include mechanical, packaging, and orderable information. This information is the most current data available for the designated devices. This data is subject to change without notice and revision of this document. For browser-based versions of this data sheet, refer to the left-hand navigation.

PACKAGING INFORMATION

Orderable part number	Status (1)	Material type (2)	Package Pins	Package qty Carrier	RoHS (3)	Lead finish/ Ball material (4)	MSL rating/ Peak reflow (5)	Op temp (°C)	Part marking (6)
AMC0302RDWVR	Active	Production	null (null)	1000 LARGE T&R	Yes	NIPDAU	Level-2-260C-1 YEAR	-40 to 125	C0302R

(1) **Status:** For more details on status, see our [product life cycle](#).

(2) **Material type:** When designated, preproduction parts are prototypes/experimental devices, and are not yet approved or released for full production. Testing and final process, including without limitation quality assurance, reliability performance testing, and/or process qualification, may not yet be complete, and this item is subject to further changes or possible discontinuation. If available for ordering, purchases will be subject to an additional waiver at checkout, and are intended for early internal evaluation purposes only. These items are sold without warranties of any kind.

(3) **RoHS values:** Yes, No, RoHS Exempt. See the [TI RoHS Statement](#) for additional information and value definition.

(4) **Lead finish/Ball material:** Parts may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead finish/Ball material values may wrap to two lines if the finish value exceeds the maximum column width.

(5) **MSL rating/Peak reflow:** The moisture sensitivity level ratings and peak solder (reflow) temperatures. In the event that a part has multiple moisture sensitivity ratings, only the lowest level per JEDEC standards is shown. Refer to the shipping label for the actual reflow temperature that will be used to mount the part to the printed circuit board.

(6) **Part marking:** There may be an additional marking, which relates to the logo, the lot trace code information, or the environmental category of the part.

Multiple part markings will be inside parentheses. Only one part marking contained in parentheses and separated by a "-" will appear on a part. If a line is indented then it is a continuation of the previous line and the two combined represent the entire part marking for that device.

These resources are intended for skilled developers designing with TI products. You are solely responsible for (1) selecting the appropriate TI products for your application, (2) designing, validating and testing your application, and (3) ensuring your application meets applicable standards, and any other safety, security, regulatory or other requirements.

These resources are subject to change without notice. TI grants you permission to use these resources only for development of an application that uses the TI products described in the resource. Other reproduction and display of these resources is prohibited. No license is granted to any other TI intellectual property right or to any third party intellectual property right. TI disclaims responsibility for, and you fully indemnify TI and its representatives against any claims, damages, costs, losses, and liabilities arising out of your use of these resources.

TI's products are provided subject to [TI's Terms of Sale](#), [TI's General Quality Guidelines](#), or other applicable terms available either on ti.com or provided in conjunction with such TI products. TI's provision of these resources does not expand or otherwise alter TI's applicable warranties or warranty disclaimers for TI products. Unless TI explicitly designates a product as custom or customer-specified, TI products are standard, catalog, general purpose devices.

TI objects to and rejects any additional or different terms you may propose.
