4 Device Comparison Table

PARAMETER	AMC0211R ⁽¹⁾	AMC0311R
Isolation rating per VDE 0884-17	Basic	Reinforced
Package	Narrow-body SOIC (D)	Wide-body SOIC (DWV)

(1) Product Preview information (not Production Data).

5 Pin Configuration and Functions

Figure 5-1. DWV and D Packages, 8-Pin SOIC (Top View)

Table 5-1. Pin Functions

PIN		TYPE	DESCRIPTION
NO.	NAME		
1	VDD1	High-side power	High-side power supply ⁽¹⁾
2	INP	Analog input	Analog input
3	SNSN	Analog input	GND1 sense pin and inverting analog input to the amplifier. Connect to GND1.
4	GND1	High-side ground	High-side analog ground
5	GND2	Low-side ground	Low-side analog ground
6	REFIN	Analog input	The voltage applied to this pin sets the fullscale output of the device. Internally, a 90kΩ resistor is connected from REFIN to GND2.
7	OUT	Analog output	Analog output
8	VDD2	Low-side power	Low-side power supply ⁽¹⁾

(1) See the [Power Supply Recommendations](#) section for power-supply decoupling recommendations.

6 Specifications

6.1 Absolute Maximum Ratings

over operating free-air temperature range (unless otherwise noted)⁽¹⁾

		MIN	MAX	UNIT
Power-supply voltage	High-side VDD1 to GND1	−0.3	6.5	V
	Low-side VDD2 to GND2	−0.3	6.5	
Analog input voltage	INP, SNSN to GND1	GND1 − 3	VDD1 + 0.5	V
Reference input voltage	REFIN to GND2	GND2 − 0.5	VDD2 + 0.5	V
Analog output voltage	OUT to GND2	GND2 − 0.5	VDD2 + 0.5	V
Input current	Continuous, any pin except power-supply pins	−10	10	mA
Temperature	Junction, T _J		150	°C
	Storage, T _{stg}	−65	150	

- (1) Operation outside the *Absolute Maximum Ratings* may cause permanent device damage. *Absolute Maximum Ratings* do not imply functional operation of the device at these or any other conditions beyond those listed under *Recommended Operating Conditions*. If used outside the Recommended Operating Conditions but within the Absolute Maximum Ratings, the device may not be fully functional, and this may affect device reliability, functionality, performance, and shorten the device lifetime.

6.2 ESD Ratings

			VALUE	UNIT
V _(ESD)	Electrostatic discharge	Human-body model (HBM), per ANSI/ESDA/JEDEC JS-001 ⁽¹⁾	±2000	V
		Charged-device model (CDM), per ANSI/ESDA/JEDEC JS-002 ⁽²⁾	±1000	

- (1) JEDEC document JEP155 states that 500V HBM allows safe manufacturing with a standard ESD control process.

- (2) JEDEC document JEP157 states that 250V CDM allows safe manufacturing with a standard ESD control process.

6.3 Recommended Operating Conditions

over operating ambient temperature range (unless otherwise noted)

				MIN	NOM	MAX	UNIT
POWER SUPPLY							
VDD1	High-side power supply	VDD1 to GND1		3	5.0	5.5	V
VDD2	Low-side power supply	VDD2 to GND2		3	3.3	5.5	V
ANALOG INPUT							
V _{Clipping}	Nominal input voltage before clipping output	V _{IN} = V _{INP} − V _{SNSN}		0		2.56	V
V _{FSR}	Specified linear input voltage	V _{IN} = V _{INP} − V _{SNSN}		0.13 ⁽¹⁾		2.25	V
V _{REFIN}	Reference input voltage	REFIN to GND2		2.7		VDD2	V
ANALOG OUTPUT							
C _{LOAD}	Capacitive load	OUT to GND2				500	pF
R _{LOAD}	Resistive load	OUT to GND2			10	1	kΩ
TEMPERATURE RANGE							
T _A	Specified ambient temperature			−40		125	°C

- (1) See the *Analog Output* section for details.

6.4 Thermal Information (D Package)

THERMAL METRIC ⁽¹⁾		D (SOIC)	UNIT
		8 PINS	
$R_{\theta JA}$	Junction-to-ambient thermal resistance	116.5	°C/W
$R_{\theta JC(top)}$	Junction-to-case (top) thermal resistance	52.8	°C/W
$R_{\theta JB}$	Junction-to-board thermal resistance	58.9	°C/W
Ψ_{JT}	Junction-to-top characterization parameter	19.4	°C/W
Ψ_{JB}	Junction-to-board characterization parameter	58.0	°C/W
$R_{\theta JC(bot)}$	Junction-to-case (bottom) thermal resistance	N/A	°C/W

(1) For more information about traditional and new thermal metrics, see the [Semiconductor and IC Package Thermal Metrics](#) application note.

6.5 Thermal Information (DWV Package)

THERMAL METRIC ⁽¹⁾		DWV (SOIC)	UNIT
		8 PINS	
$R_{\theta JA}$	Junction-to-ambient thermal resistance	102.8	°C/W
$R_{\theta JC(top)}$	Junction-to-case (top) thermal resistance	45.1	°C/W
$R_{\theta JB}$	Junction-to-board thermal resistance	63.0	°C/W
Ψ_{JT}	Junction-to-top characterization parameter	14.3	°C/W
Ψ_{JB}	Junction-to-board characterization parameter	61.1	°C/W
$R_{\theta JC(bot)}$	Junction-to-case (bottom) thermal resistance	N/A	°C/W

(1) For more information about traditional and new thermal metrics, see the [Semiconductor and IC Package Thermal Metrics](#) application note.

6.6 Power Ratings

PARAMETER		TEST CONDITIONS	VALUE	UNIT
P_D	Maximum power dissipation (both sides)	VDD1 = VDD2 = 5.5V	72	mW
P_{D1}	Maximum power dissipation (high-side)	VDD1 = 5.5V	31	mW
P_{D2}	Maximum power dissipation (low-side)	VDD2 = 5.5V	41	mW

6.7 Insulation Specifications (Basic Isolation)

over operating ambient temperature range (unless otherwise noted)

PARAMETER		TEST CONDITIONS	VALUE	UNIT
GENERAL				
CLR	External clearance ⁽¹⁾	Shortest pin-to-pin distance through air	≥ 4	mm
CPG	External creepage ⁽¹⁾	Shortest pin-to-pin distance across the package surface	≥ 4	mm
DTI	Distance through insulation	Minimum internal gap (internal clearance) of the insulation	≥ 15.4	μm
CTI	Comparative tracking index	DIN EN 60112 (VDE 0303-11); IEC 60112	≥ 600	V
	Material group	According to IEC 60664-1	I	
	Overvoltage category per IEC 60664-1	Rated mains voltage ≤ 300V _{RMS}	I-IV	
		Rated mains voltage ≤ 600V _{RMS}	I-III	
DIN EN IEC 60747-17 (VDE 0884-17) ⁽²⁾				
V _{IORM}	Maximum repetitive peak isolation voltage	At AC voltage	1130	V _{PK}
V _{IOWM}	Maximum-rated isolation working voltage	At AC voltage (sine wave)	800	V _{RMS}
		At DC voltage	1130	V _{DC}
V _{IOTM}	Maximum transient isolation voltage	V _{TEST} = V _{IOTM} , t = 60s (qualification test), V _{TEST} = 1.2 × V _{IOTM} , t = 1s (100% production test)	4250	V _{PK}
V _{IMP}	Maximum impulse voltage ⁽³⁾	Tested in air, 1.2/50μs waveform per IEC 62368-1	5000	V _{PK}
V _{IOSM}	Maximum surge isolation voltage ⁽⁴⁾	Tested in oil (qualification test), 1.2/50μs waveform per IEC 62368-1	10000	V _{PK}
q _{pd}	Apparent charge ⁽⁵⁾	Method a, after input/output safety test subgroups 2 and 3, V _{pd(ini)} = V _{IOTM} , t _{ini} = 60s, V _{pd(m)} = 1.2 × V _{IORM} , t _m = 10s	≤ 5	pC
		Method a, after environmental tests subgroup 1, V _{pd(ini)} = V _{IOTM} , t _{ini} = 60s, V _{pd(m)} = 1.3 × V _{IORM} , t _m = 10s	≤ 5	
		Method b1, at preconditioning (type test) and routine test, V _{pd(ini)} = V _{IOTM} , t _{ini} = 1s, V _{pd(m)} = 1.5 × V _{IORM} , t _m = 1s	≤ 5	
		Method b2, at routine test (100% production) ⁽⁷⁾ , V _{pd(ini)} = V _{IOTM} = V _{pd(m)} , t _{ini} = t _m = 1s	≤ 5	
C _{IO}	Barrier capacitance, input to output ⁽⁶⁾	V _{IO} = 0.5V _{PP} at 1MHz	≈1.5	pF
R _{IO}	Insulation resistance, input to output ⁽⁶⁾	V _{IO} = 500V at T _A = 25°C	> 10 ¹²	Ω
		V _{IO} = 500V at 100°C ≤ T _A ≤ 125°C	> 10 ¹¹	
		V _{IO} = 500V at T _S = 150°C	> 10 ⁹	
	Pollution degree		2	
	Climatic category		55/125/21	
UL1577				
V _{ISO}	Withstand isolation voltage	V _{TEST} = V _{ISO} , t = 60s (qualification test), V _{TEST} = 1.2 × V _{ISO} , t = 1s (100% production test)	3000	V _{RMS}

- (1) Apply creepage and clearance requirements according to the specific equipment isolation standards of an application. Maintain the creepage and clearance distance of a board design to make sure that the mounting pads of the isolator on the printed circuit board (PCB) do not reduce this distance. Creepage and clearance on a PCB become equal in certain cases. Techniques such as inserting grooves, ribs, or both on a PCB are used to help increase these specifications.
- (2) This coupler is suitable for *safe electrical insulation* only within the safety ratings. Compliance with the safety ratings shall be ensured by means of suitable protective circuits.
- (3) Testing is carried out in air to determine the surge immunity of the package.
- (4) Testing is carried out in oil to determine the intrinsic surge immunity of the isolation barrier.
- (5) Apparent charge is electrical discharge caused by a partial discharge (pd).
- (6) All pins on each side of the barrier are tied together, creating a two-pin device.
- (7) Either method b1 or b2 is used in production.

6.8 Insulation Specifications (Reinforced Isolation)

over operating ambient temperature range (unless otherwise noted)

PARAMETER		TEST CONDITIONS	VALUE	UNIT
GENERAL				
CLR	External clearance ⁽¹⁾	Shortest pin-to-pin distance through air	≥ 8.5	mm
CPG	External creepage ⁽¹⁾	Shortest pin-to-pin distance across the package surface	≥ 8.5	mm
DTI	Distance through insulation	Minimum internal gap (internal clearance) of the double insulation	≥ 15.4	μm
CTI	Comparative tracking index	DIN EN 60112 (VDE 0303-11); IEC 60112	≥ 600	V
	Material group	According to IEC 60664-1	I	
	Overvoltage category per IEC 60664-1	Rated mains voltage ≤ 300V _{RMS}	I-IV	
		Rated mains voltage ≤ 6000V _{RMS}	I-III	
DIN EN IEC 60747-17 (VDE 0884-17) ⁽²⁾				
V _{IORM}	Maximum repetitive peak isolation voltage	At AC voltage	2120	V _{PK}
V _{IOWM}	Maximum-rated isolation working voltage	At AC voltage (sine wave)	1500	V _{RMS}
		At DC voltage	2120	V _{DC}
V _{IOTM}	Maximum transient isolation voltage	V _{TEST} = V _{IOTM} , t = 60s (qualification test), V _{TEST} = 1.2 × V _{IOTM} , t = 1s (100% production test)	7000	V _{PK}
V _{IMP}	Maximum impulse voltage ⁽³⁾	Tested in air, 1.2/50μs waveform per IEC 62368-1	7700	V _{PK}
V _{IOSM}	Maximum surge isolation voltage ⁽⁴⁾	Tested in oil (qualification test), 1.2/50μs waveform per IEC 62368-1	10000	V _{PK}
q _{pd}	Apparent charge ⁽⁵⁾	Method a, after input/output safety test subgroups 2 and 3, V _{pd(ini)} = V _{IOTM} , t _{ini} = 60s, V _{pd(m)} = 1.2 × V _{IORM} , t _m = 10s	≤ 5	pC
		Method a, after environmental tests subgroup 1, V _{pd(ini)} = V _{IOTM} , t _{ini} = 60s, V _{pd(m)} = 1.6 × V _{IORM} , t _m = 10s	≤ 5	
		Method b1, at preconditioning (type test) and routine test, V _{pd(ini)} = 1.2 × V _{IOTM} , t _{ini} = 1s, V _{pd(m)} = 1.875 × V _{IORM} , t _m = 1s	≤ 5	
		Method b2, at routine test (100% production) ⁽⁷⁾ V _{pd(ini)} = V _{pd(m)} = 1.2 × V _{IOTM} , t _{ini} = t _m = 1s	≤ 5	
C _{IO}	Barrier capacitance, input to output ⁽⁶⁾	V _{IO} = 0.5V _{PP} at 1MHz	≈1.5	pF
R _{IO}	Insulation resistance, input to output ⁽⁶⁾	V _{IO} = 500V at T _A = 25°C	> 10 ¹²	Ω
		V _{IO} = 500V at 100°C ≤ T _A ≤ 125°C	> 10 ¹¹	
		V _{IO} = 500V at T _S = 150°C	> 10 ⁹	
	Pollution degree		2	
	Climatic category		55/125/21	
UL1577				
V _{ISO}	Withstand isolation voltage	V _{TEST} = V _{ISO} , t = 60s (qualification test), V _{TEST} = 1.2 × V _{ISO} , t = 1s (100% production test)	5000	V _{RMS}

- (1) Apply creepage and clearance requirements according to the specific equipment isolation standards of an application. Maintain the creepage and clearance distance of a board design to make sure that the mounting pads of the isolator on the printed circuit board (PCB) do not reduce this distance. Creepage and clearance on a PCB become equal in certain cases. Techniques such as inserting grooves, ribs, or both on a PCB are used to help increase these specifications.
- (2) This coupler is suitable for *safe electrical insulation* only within the safety ratings. Compliance with the safety ratings shall be ensured by means of suitable protective circuits.
- (3) Testing is carried out in air to determine the surge immunity of the package.
- (4) Testing is carried in oil to determine the intrinsic surge immunity of the isolation barrier.
- (5) Apparent charge is electrical discharge caused by a partial discharge (pd).
- (6) All pins on each side of the barrier are tied together, creating a two-pin device.
- (7) Either method b1 or b2 is used in production.

6.9 Safety-Related Certifications (Basic Isolation)

VDE	UL
DIN EN IEC 60747-17 (VDE 0884-17), EN IEC 60747-17, DIN EN 61010-1 (VDE 0411-1) Clause : 6.4.3 ; 6.7.1.3 ; 6.7.2.1 ; 6.7.2.2 ; 6.7.3.4.2 ; 6.8.3.1	Recognized under 1577 component recognition and CSA component acceptance NO 5 programs
Basic insulation	Single protection
Certificate number: Pending	File number: Pending

6.10 Safety-Related Certifications (Reinforced Isolation)

VDE	UL
DIN EN IEC 60747-17 (VDE 0884-17), EN IEC 60747-17, DIN EN IEC 62368-1 (VDE 0868-1), EN IEC 62368-1, IEC 62368-1 Clause : 5.4.3 ; 5.4.4.4 ; 5.4.9	Recognized under 1577 component recognition and CSA component acceptance NO 5 programs
Reinforced insulation	Single protection
Certificate number: Pending	File number: Pending

6.11 Safety Limiting Values (D Package)

Safety limiting⁽¹⁾ intends to minimize potential damage to the isolation barrier upon failure of input or output circuitry. A failure of the I/O can allow low resistance to ground or the supply and, without current limiting, dissipate sufficient power to over-heat the die and damage the isolation barrier potentially leading to secondary system failures.

PARAMETER		TEST CONDITIONS	MIN	TYP	MAX	UNIT
I_S	Safety input, output, or supply current	$R_{\theta JA} = 116.5^{\circ}\text{C/W}$, $V_{DDx} = 5.5\text{V}$, $T_J = 150^{\circ}\text{C}$, $T_A = 25^{\circ}\text{C}$			195	mA
P_S	Safety input, output, or total power	$R_{\theta JA} = 116.5^{\circ}\text{C/W}$, $T_J = 150^{\circ}\text{C}$, $T_A = 25^{\circ}\text{C}$			1070	mW
T_S	Maximum safety temperature				150	$^{\circ}\text{C}$

- (1) The maximum safety temperature, T_S , has the same value as the maximum junction temperature, T_J , specified for the device. The I_S and P_S parameters represent the safety current and safety power, respectively. Do not exceed the maximum limits of I_S and P_S . These limits vary with the ambient temperature, T_A .

The junction-to-air thermal resistance, $R_{\theta JA}$, in the Thermal Information table is that of a device installed on a high-K test board for leaded surface-mount packages. Use these equations to calculate the value for each parameter:

$T_J = T_A + R_{\theta JA} \times P$, where P is the power dissipated in the device.

$T_{J(max)} = T_S = T_A + R_{\theta JA} \times P_S$, where $T_{J(max)}$ is the maximum junction temperature.

$P_S = I_S \times V_{DD_{max}}$, where $V_{DD_{max}}$ is the maximum supply voltage for high-side and low-side.

6.12 Safety Limiting Values (DWV Package)

Safety limiting⁽¹⁾ intends to minimize potential damage to the isolation barrier upon failure of input or output circuitry. A failure of the I/O can allow low resistance to ground or the supply and, without current limiting, dissipate sufficient power to over-heat the die and damage the isolation barrier potentially leading to secondary system failures.

PARAMETER		TEST CONDITIONS	MIN	TYP	MAX	UNIT
I_S	Safety input, output, or supply current	$R_{\theta JA} = 102.8^{\circ}\text{C/W}$, $V_{DDx} = 5.5\text{V}$, $T_J = 150^{\circ}\text{C}$, $T_A = 25^{\circ}\text{C}$			220	mA
P_S	Safety input, output, or total power	$R_{\theta JA} = 102.8^{\circ}\text{C/W}$, $T_J = 150^{\circ}\text{C}$, $T_A = 25^{\circ}\text{C}$			1210	mW
T_S	Maximum safety temperature				150	$^{\circ}\text{C}$

- (1) The maximum safety temperature, T_S , has the same value as the maximum junction temperature, T_J , specified for the device. The I_S and P_S parameters represent the safety current and safety power, respectively. Do not exceed the maximum limits of I_S and P_S . These limits vary with the ambient temperature, T_A .

The junction-to-air thermal resistance, $R_{\theta JA}$, in the Thermal Information table is that of a device installed on a high-K test board for leaded surface-mount packages. Use these equations to calculate the value for each parameter:

$T_J = T_A + R_{\theta JA} \times P$, where P is the power dissipated in the device.

$T_{J(max)} = T_S = T_A + R_{\theta JA} \times P_S$, where $T_{J(max)}$ is the maximum junction temperature.

$P_S = I_S \times V_{DD_{max}}$, where $V_{DD_{max}}$ is the maximum supply voltage for high-side and low-side.

6.13 Electrical Characteristics

minimum and maximum specifications apply from $T_A = -40^{\circ}\text{C}$ to $+125^{\circ}\text{C}$, $V_{DD1} = 3.0\text{V}$ to 5.5V , $V_{DD2} = 3.0\text{V}$ to 5.5V , $V_{REFIN} = 3.3\text{V}$, $SNSN = \text{GND1}$, $V_{INP} = 0.25\text{V}$ to 2.25V (unless otherwise noted); typical specifications are at $T_A = 25^{\circ}\text{C}$, $V_{DD1} = 5\text{V}$, and $V_{DD2} = 3.3\text{V}$

PARAMETER		TEST CONDITIONS	MIN	TYP	MAX	UNIT
ANALOG INPUT						
C _{IN}	Input capacitance			2		pF
R _{INP}	Input impedance	INP pin to GND1	0.05	2.4		GΩ
I _{IB, INP}	Input bias current ⁽¹⁾	INP pin, INP = GND1	−10	±3	10	nA
CMTI	Common-mode transient immunity		150			V/ns
ANALOG OUTPUT						
	Nominal gain			V _{REFIN} / V _{Clipping}		V/V
R _{OUT}	Output resistance	OUTP or OUTN		<0.2		Ω
	Output short-circuit current	sourcing or sinking, INP = GND1, output shorted to either GND2 or VDD2		11		mA
DC ACCURACY						
V _{OS}	Input offset voltage ^{(1) (2)}	V _{INP} = 250mV, V _{REFIN} = 3.3V, T _A = 25°C	−1.5	±0.15	1.5	mV
TCV _{OS}	Input offset thermal drift ^{(1) (2) (4)}		−30	±3	30	μV/°C
E _G	Gain error ⁽¹⁾	T _A = 25°C	−0.25%	±0.04%	0.25%	
TCE _G	Gain error drift ^{(1) (5)}		−40	±5	40	ppm/°C
	Nonlinearity ⁽¹⁾		−0.08%	±0.002%	0.08%	
	Output noise	V _{IN} = GND1, BW = 50kHz		260		μVrms
PSRR	Power-supply rejection ratio ⁽²⁾	VDD1 DC PSRR, V _{INP} = 250mV, VDD1 from 3V to 5.5V		−77		dB
		VDD1 AC PSRR, V _{INP} = 250mV, VDD1 with 10kHz / 100mV ripple		−58		
		VDD2 DC PSRR, V _{INP} = 250mV, VDD2 from 3V to 5.5V		−100		
		VDD2 AC PSRR, V _{INP} = 250mV, VDD2 with 10kHz / 100mV ripple		−69		
AC ACCURACY						
BW	Output bandwidth		120	145		kHz
THD	Total harmonic distortion ⁽³⁾	V _{INP} = 2V _{PP} , V _{INP} > 0V, f _{INP} = 10kHz, BW = 50kHz		−78	−68	dB
SNR	Signal-to-noise ratio	V _{INP} = 2.25V _{PP} , f _{INP} = 1kHz, BW = 10kHz	75	79		dB
		V _{INP} = 2.25V _{PP} , f _{INP} = 10kHz, BW = 50kHz		68		
POWER SUPPLY						
I _{DD1}	High-side supply current			4.4	5.6	mA
I _{DD2}	Low-side supply current			4.8	7.4	mA
VDD1 _{UV}	High-side undervoltage detection threshold	VDD1 rising	2.4	2.6	2.8	V
		VDD1 falling	1.9	2.05	2.2	
VDD2 _{UV}	Low-side undervoltage detection threshold	VDD2 rising	2.3	2.5	2.7	V
		VDD2 falling	1.9	2.05	2.2	

(1) The typical value includes one standard deviation (*sigma*) at nominal operating conditions.

(2) This parameter is input referred.

(3) THD is the ratio of the rms sum of the amplitudes of first five higher harmonics to the amplitude of the fundamental.

(4) Offset error temperature drift is calculated using the box method, as described by the following equation:

$$TCV_{OS} = (Value_{MAX} - Value_{MIN}) / TempRange$$

- (5) Gain error temperature drift is calculated using the box method, as described by the following equation:

$$TCE_G \text{ (ppm)} = (Value_{MAX} - Value_{MIN}) / (Value_{(T=25^\circ C)} \times TempRange) \times 10^6$$

6.14 Switching Characteristics

over operating ambient temperature range (unless otherwise noted)

PARAMETER		TEST CONDITIONS	MIN	TYP	MAX	UNIT
t_r	Output signal rise time	10% to 90%, unfiltered output		2.6		μs
t_f	Output signal fall time	10% to 90%, unfiltered output		2.6		μs
	V_{INP} to V_{OUT} signal delay (50% – 10%)	Unfiltered output		1.6		μs
	V_{INP} to V_{OUT} signal delay (50% – 50%)	Unfiltered output		2.9	3.2	μs
	V_{INP} to V_{OUT} signal delay (50% – 90%)	Unfiltered output		4.3		μs
t_{AS}	Analog settling time	VDD1 step to 3.0V with VDD2 $\geq$ 3.0V to V_{OUT} valid, 0.1% settling		20		μs

7 Detailed Description

7.1 Overview

The AMC0x11R is a precision, galvanically isolated amplifier with a 2.25V, high impedance input and single-ended ratiometric output. The input stage of the device drives a second-order, delta-sigma ($\Delta\Sigma$) modulator. The modulator converts the analog input signal into a digital bitstream that is transferred across the isolation barrier that separates the high-side from the low-side.

On the low-side, the received bitstream is processed by an analog filter that outputs a GND2-referenced, single-ended signal at the OUT pin. This single-ended output signal is proportional to the input signal. The full-scale output voltage of the isolated amplifier is equal to the voltage applied to the REFIN pin.

The SiO₂-based, capacitive isolation barrier supports a high level of magnetic field immunity, as described in the [ISO72x Digital Isolator Magnetic-Field Immunity application note](#). The digital modulation used in the AMC0x11R transmits data across the isolation barrier. This modulation, and the isolation barrier characteristics, result in high reliability and high common-mode transient immunity.

7.2 Functional Block Diagram

7.3 Feature Description

7.3.1 Analog Input

The high-impedance input buffer on the INP pin feeds a second-order, switched-capacitor, feed-forward $\Delta\Sigma$ modulator. The modulator converts the analog signal into a bitstream that is transferred across the isolation barrier, as described in the [Isolation Channel Signal Transmission](#) section.

There are two restrictions on the analog input signal. First, if the input voltage exceeds the value specified in the [Absolute Maximum Ratings](#) table, the input current must be limited to 10mA. This limitation is caused by the device input electrostatic discharge (ESD) diodes turning on. Second, linearity and noise performance are specified only when the input voltage is within the linear full-scale range (V_{FSR}). V_{FSR} is specified in the [Recommended Operating Conditions](#) table.

7.3.2 Isolation Channel Signal Transmission

As shown in [Figure 7-1](#), the AMC0x11R uses an on-off keying (OOK) modulation scheme to transmit the modulator output bitstream across the SiO₂-based isolation barrier. The transmit driver (TX) is illustrated in the [Functional Block Diagram](#). TX transmits an internally generated, high-frequency carrier across the isolation barrier to represent a digital one. However, TX does not send a signal to represent a digital zero. The nominal frequency of the carrier used inside the AMC0x11R is 480MHz.

The receiver (RX) on the other side of the isolation barrier recovers and demodulates the signal and provides the input to the analog filter. The AMC0x11R transmission channel is optimized to achieve the highest level of common-mode transient immunity (CMTI) and the lowest level of radiated emissions. The high-frequency carrier and RX/TX buffer switching cause these emissions.

Figure 7-1. OOK-Based Modulation Scheme

7.3.3 Analog Output

The AMC0x11R provides a single-ended analog output voltage proportional to the input voltage. The output is referred to GND2 and is galvanically isolated from the input of the device. The output is designed to connect directly to the input of an ADC.

The full-scale output voltage is set by the REFIN pin. For any input voltage within the specified linear input range, the device outputs a voltage equal to:

$$V_{OUT} = V_{IN} / V_{Clipping} \times V_{REFIN} = (V_{INP} - V_{SNSN}) / V_{Clipping} \times V_{REFIN} \quad (1)$$

Connect REFIN to the same reference voltage as the ADC to match the ADC dynamic input voltage range. With a shared reference voltage, the ADC outputs a positive full-scale code when the clipping voltage is applied to the input of the AMC0x11R. The output buffer requires a minimum headroom of 250mV against GND2 for linear operation. Therefore, the device shows non-linear behavior for input voltages near 0V.

Calculate the minimum input voltage for linear operation as follows:

$$V_{INP, MIN} = (250\text{mV} \times V_{Clipping}) / V_{REFIN} \quad (2)$$

For example, the minimum linear input voltage for the AMC0x11R device with a clipping voltage of 2.56V and $V_{REFIN} = 5\text{V}$, is 128mV.

The device is linear within the specified linear full-scale range. Beyond the linear full-scale range, the output continues to follow the input, but with reduced linearity performance. The output clips when the input voltage reaches the clipping voltage. [Figure 7-2](#) shows the input-to-output transfer characteristic.

Figure 7-2. Input to Output Transfer Curve of the AMC0x11R

7.3.4 Reference Input

The voltage applied to the REFIN pin determines the output voltage range of the OUT pin, as described in the [Analog Output](#) section.

The output buffer is linear in the range of $250\text{mV} < V_{\text{OUT}} < (V_{\text{DD2}} - 250\text{mV})$. With REFIN shorted to VDD2, the output becomes nonlinear for input voltages close to $V_{\text{Clipping, MAX}}$. Eventually the output voltage clips, because the output buffer requires a minimum headroom of 250mV to VDD2. The maximum linear, input-referred voltage that the output buffer supports is a function of V_{REFIN} and is calculated as follows:

$$V_{\text{IN, MAX}} = V_{\text{OUT, MAX}} \times V_{\text{Clipping, MAX}} / V_{\text{REFIN}} \quad (3)$$

For a worst-case calculation, set $V_{\text{OUT, MAX}} = V_{\text{DD2, MIN}} - 250\text{mV} = 2.75\text{V}$ and $V_{\text{REFIN}} \leq 3.0\text{V}$ (V_{REFIN} cannot exceed VDD2). Under these worst-case assumptions, the output buffer supports an input voltage range up to 2.35V. This range is larger than the specified linear input voltage range of the device. Therefore, the reference voltage is not a limiting item.

7.4 Device Functional Modes

The AMC0x11R operates in one of the following states:

- Off-state: The low-side supply (VDD2) is below the $VDD2_{UV}$ threshold. The device is not responsive. OUT is in Hi-Z state. Internally, OUT is clamped to VDD2 and GND2 by ESD protection diodes.
- Missing high-side supply: The low-side of the device (VDD2) is supplied and within recommended operating conditions. The high-side supply (VDD1) is below the $VDD1_{UV}$ threshold. The OUT pin is driven to GND2.
- Analog input overrange (positive full-scale input): VDD1 and VDD2 are within recommended operating conditions but the analog input voltage V_{IN} is above the maximum clipping voltage $V_{Clipping, MAX}$. The device outputs V_{REFIN} at the OUT pin.
- Analog input underrange (negative full-scale input): VDD1 and VDD2 are within recommended operating conditions but the analog input voltage V_{IN} is below the minimum clipping voltage $V_{Clipping, MIN}$. The OUT pin is driven to GND2.
- Normal operation: VDD1, VDD2, and V_{IN} are within the recommended operating conditions. The device outputs a voltage proportional to the input voltage.

Table 7-1 lists the operating modes.

Table 7-1. Device Operational Modes

OPERATING CONDITION	VDD1	VDD2	V_{IN}	DEVICE RESPONSE
Off	Don't care	$VDD2 < VDD2_{UV}$	Don't care	OUT is in Hi-Z state. Internally, OUT is clamped to VDD2 and GND2 by ESD protection diodes.
Missing high-side supply	$VDD1 < VDD1_{UV}$	Valid ⁽¹⁾	Don't care	The OUT pin is driven to GND2.
Input overrange	Valid ⁽¹⁾	Valid ⁽¹⁾	$V_{IN} > V_{Clipping, MAX}$	The device outputs V_{REFIN} at the OUT pin.
Input underrange	Valid ⁽¹⁾	Valid ⁽¹⁾	$V_{IN} < V_{Clipping, MIN}$	The OUT pin is driven to GND2.
Normal operation	Valid ⁽¹⁾	Valid ⁽¹⁾	Valid ⁽¹⁾	The device outputs a voltage proportional to the input voltage.

(1) *Valid* denotes operation within the recommended operating conditions.

8 Application and Implementation

Note

Information in the following applications sections is not part of the TI component specification, and TI does not warrant its accuracy or completeness. TI's customers are responsible for determining suitability of components for their purposes, as well as validating and testing their design implementation to confirm system functionality.

8.1 Application Information

Industrial power systems such as motor drives are divided into two or more voltage domains that are galvanically isolated from each other. For example, the high-voltage domain includes the AC grid, DC link, and power stage for driving the motor. The low-voltage includes the system controller and human interface. The controller measures the value of the DC link voltage while remaining galvanically isolated from the high-voltage side for safety reasons. With the high-impedance input and galvanically isolated output, the AMC0x11R enables this measurement.

8.2 Typical Application

Figure 8-1 illustrates a simplified schematic of an AC inverter for a three-phase motor drive. The AMC0x11R is used for DC link voltage sensing. In the power domain, the DC link voltage is divided down to a 2V level across the bottom resistor (RSNS) of a high-impedance resistive divider. The voltage across RSNS is sensed by the AMC0x11R. The low-side gate driver supply is regulated to a 5V level to power the high-voltage side of the AMC0x11R. In the signal domain, on the opposite side of the isolation barrier, the AMC0x11R outputs a voltage proportional to the DC link voltage.

Figure 8-1. Using the AMC0x11R in a Typical Application

8.2.1 Design Requirements

Table 8-1 lists the parameters for this typical application.

Table 8-1. Design Requirements

PARAMETER	VALUE
DC link voltage	450V (maximum)
High-side supply voltage	5V
Low-side supply voltage	3.3V
Maximum resistor operating voltage	125V
Voltage drop across the sense resistor (RSNS) for a linear response	2.25V (maximum)
Current through the resistive divider, I_{CROSS}	200 μ A (maximum)

8.2.2 Detailed Design Procedure

The 200 μ A cross-current requirement at the maximum DC link voltage (450V) determines that the total impedance of the resistive divider is 2.25M Ω . The impedance of the resistive divider is dominated by the top portion, shown exemplary as R1 and R2 in Figure 8-1. The maximum allowed voltage drop per unit resistor is specified as 125V. Therefore, the minimum number of unit resistors in the top portion of the resistive divider is $450V / 125V \approx 4$. The calculated unit value is $2.25M\Omega / 4 = 563k\Omega$ and the next closest value from the E96 series is 562k Ω . Size RSNS such that the voltage drop across the resistor at the maximum DC link voltage (450V) equals the V_{FSR} . V_{FSR} is the linear full-scale voltage and is specified as 2.25V. RSNS is calculated as $RSNS = V_{FSR} / (V_{DC-link, MAX} - V_{FSR}) \times R_{TOP}$. R_{TOP} is the total value of the top resistor string ($4 \times 562k\Omega = 2.248M\Omega$). RSNS results in a value of 11.3k Ω and matches a value from the E96 series.

Table 8-2 summarizes the design of the resistive divider.

Table 8-2. Resistor Value Examples

PARAMETER	VALUE
Unit resistor value, R_{TOP}	562k Ω
Number of unit resistors in R_{TOP}	4
Sense resistor value, RSNS	11.3k Ω
Total resistance value ($R_{TOP} + RSNS$)	2.251M Ω
Resulting current through resistive divider, I_{CROSS}	199.2 μ A
Resulting full-scale voltage drop across sense resistor RSNS	2.251V
Peak power dissipated in R_{TOP} unit resistor	22.3mW
Total peak power dissipated in resistive divider	89.6mW

8.2.2.1 Input Filter Design

Place an RC filter in front of the device to improve signal-to-noise performance of the signal path. Input noise with a frequency close to the $\Delta\Sigma$ modulator sampling frequency (typically 10MHz) is folded back into the low-frequency range by the modulator. The purpose of the RC filter is to attenuate high-frequency noise below the desired noise level of the measurement. In practice, a cutoff frequency that is two orders of magnitude lower than the modulator frequency yields good results.

Most voltage-sensing applications use high-impedance resistive dividers to scale down the input voltage. In this case, a single capacitor, as shown in Figure 8-2, is sufficient to filter the input signal. For $(R1 + R2) \gg RSNS$, the cutoff frequency of the input filter is $1 / (2 \times \pi \times RSNS \times C5)$. For example, $RSNS = 10k\Omega$ and $C5 = 100pF$ results in a cutoff frequency of 160kHz.

Figure 8-2. Input Filter

8.2.2.2 Connecting the REFIN Pin

The reference input has an internal, 90k Ω impedance connected to GND2. Consider this impedance when driving the REFIN pin from a high-impedance source. Connect a 100nF capacitor from REFIN to GND2 to filter out high-frequency noise at the reference input. Figure 8-3 shows different options for connecting the REFIN pin.

Figure 8-3. Connecting the REFIN Pin

In the first example, REFIN is shorted to VDD2. In the second example, V_{REFIN} is derived from VDD2 through a resistive divider consisting of R1 and the internal 90k Ω input impedance. In the third example, an external voltage source drives the reference input pin.

8.2.3 Application Curve

Figure 8-4 shows the typical full-scale step response of the AMC0x11R.

Figure 8-4. Step Response of the AMC0x11R

8.3 Best Design Practices

Do not leave the analog input (INP pin) of the AMC0x11R unconnected (floating) when the device is powered up. If the device input is left floating, the device output is not valid.

Do not connect protection diodes to the input (INP pin) of the AMC0x11R. Diode leakage current potentially introduces significant measurement error especially at high temperatures. The input pin is protected against high voltages by the ESD protection circuit and the high impedance of the external resistive divider.

8.4 Power Supply Recommendations

In a typical application, the high-side power supply (VDD1) for the AMC0x11R is generated from the low-side supply (VDD2) by an isolated DC/DC converter. A low-cost option is based on the push-pull driver [SN6501](#) and a transformer that supports the desired isolation voltage ratings.

The AMC0x11R does not require any specific power-up sequencing. The high-side power supply (VDD1) is decoupled with a low-ESR, 100nF capacitor (C1) parallel to a low-ESR, 1μF capacitor (C2). The low-side power supply (VDD2) is equally decoupled with a low-ESR, 100nF capacitor (C3) parallel to a low-ESR, 1μF capacitor (C4). Place all four capacitors (C1, C2, C3, and C4) as close to the device as possible. [Figure 8-5](#) shows a decoupling diagram for the AMC0x11R.

Figure 8-5. Decoupling of the AMC0x11R

Verify capacitors provide adequate *effective* capacitance under the applicable DC bias conditions experienced in the application. Multilayer ceramic capacitors (MLCC) typically exhibit only a fraction of the nominal capacitance under real-world conditions. Consider this factor when selecting these capacitors. This issue is especially acute in low-profile capacitors, where the dielectric field strength is higher than in taller components. Reputable capacitor manufacturers provide capacitance versus DC bias curves that greatly simplify component selection.

8.5 Layout

8.5.1 Layout Guidelines

The [Layout](#) section details a layout recommendation with the critical placement of the decoupling capacitors (as close as possible to the AMC0x11R supply pins). This example also depicts the placement of other components required by the device.

8.5.2 Layout Example

9.5 Electrostatic Discharge Caution

This integrated circuit can be damaged by ESD. Texas Instruments recommends that all integrated circuits be handled with appropriate precautions. Failure to observe proper handling and installation procedures can cause damage.

ESD damage can range from subtle performance degradation to complete device failure. Precision integrated circuits may be more susceptible to damage because very small parametric changes could cause the device not to meet its published specifications.

11 Mechanical, Packaging, and Orderable Information

The following pages include mechanical, packaging, and orderable information. This information is the most current data available for the designated devices. This data is subject to change without notice and revision of this document. For browser-based versions of this data sheet, refer to the left-hand navigation.

PACKAGING INFORMATION

Orderable part number	Status (1)	Material type (2)	Package Pins	Package qty Carrier	RoHS (3)	Lead finish/ Ball material (4)	MSL rating/ Peak reflow (5)	Op temp (°C)	Part marking (6)
AMC0311RDWVR	Active	Production	SOIC (DWV) 8	1000 LARGE T&R	Yes	NIPDAU	Level-2-260C-1 YEAR	-	C0311R

⁽¹⁾ **Status:** For more details on status, see our [product life cycle](#).

⁽²⁾ **Material type:** When designated, preproduction parts are prototypes/experimental devices, and are not yet approved or released for full production. Testing and final process, including without limitation quality assurance, reliability performance testing, and/or process qualification, may not yet be complete, and this item is subject to further changes or possible discontinuation. If available for ordering, purchases will be subject to an additional waiver at checkout, and are intended for early internal evaluation purposes only. These items are sold without warranties of any kind.

⁽³⁾ **RoHS values:** Yes, No, RoHS Exempt. See the [TI RoHS Statement](#) for additional information and value definition.

⁽⁴⁾ **Lead finish/Ball material:** Parts may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead finish/Ball material values may wrap to two lines if the finish value exceeds the maximum column width.

⁽⁵⁾ **MSL rating/Peak reflow:** The moisture sensitivity level ratings and peak solder (reflow) temperatures. In the event that a part has multiple moisture sensitivity ratings, only the lowest level per JEDEC standards is shown. Refer to the shipping label for the actual reflow temperature that will be used to mount the part to the printed circuit board.

⁽⁶⁾ **Part marking:** There may be an additional marking, which relates to the logo, the lot trace code information, or the environmental category of the part.

Multiple part markings will be inside parentheses. Only one part marking contained in parentheses and separated by a "-" will appear on a part. If a line is indented then it is a continuation of the previous line and the two combined represent the entire part marking for that device.
