

AMC3301 Precision, ±250mV Input, Reinforced Isolated Amplifier With Integrated DC/DC Converter

1 Features

- 3.3V or 5V single supply with integrated DC/DC
- ±250mV input voltage range optimized for current measurement using shunt resistors
- Fixed gain: 8.2 Low DC errors:
 - Offset voltage: ±150µV (max)
 - Offset drift: ±1µV/°C (max)
 - Gain error: ±0.2% (max)
 - Gain error drift: ±40ppm/°C (max)
 - Nonlinearity: ±0.04% (max)
- High CMTI: 85kV/µs (min)
- System-level diagnostic features
- Meets CISPR-11 and CISPR-25 EMI standards
- Safety-related certifications:
 - 6000V_{PK} reinforced isolation per DIN EN IEC 60747-17 (VDE 0884-17)
 - 4250V_{RMS} isolation for 1 minute per UL1577
- Fully specified over the extended industrial temperature range: -40°C to +125°C

2 Applications

- Isolated shunt-based current sensing in:
 - Protection relays
 - Motor drives
 - Power supplies
 - Photovoltaic inverters

3 Description

The AMC3301 is a precision, isolated amplifier optimized for shunt-based current measurements. The fully integrated, isolated DC/DC converter allows single-supply operation from the low-side of the device, which makes the device a unique solution for space-constrained applications. The reinforced capacitive isolation barrier is certified according to DIN EN IEC 60747-17 (VDE 0884-17) and UL1577 and supports a working voltage of up to 1.2kV_{RMS}.

The isolation barrier separates parts of the system that operate on different common-mode voltage levels and protects the low-voltage side from hazardous voltages and damage.

The input of the AMC3301 is optimized for direct connection to a low-impedance shunt resistor or other, low-impedance voltage source with low signal levels. The excellent DC accuracy and low temperature drift supports accurate current measurements over the extended industrial temperature range from -40°C to +125°C.

The integrated DC/DC converter fault-detection and diagnostic output pin of the AMC3301 simplify system-level design and diagnostics.

Package Information

PART NUMBER	PACKAGE ⁽¹⁾	PACKAGE SIZE ⁽²⁾
AMC3301	DWE (SOIC, 16)	10.3mm × 10.3mm

- For more information, see the Mechanical, Packaging, and Orderable Information.
- The package size (length × width) is a nominal value and includes pins, where applicable.

4 Pin Configuration and Functions

Figure 4-1. DWE Package, 16-Pin SOIC, Top View

Table 4-1. Pin Functions

	PIN	TYPE	DESCRIPTION		
NO.	NAME	ITPE	DESCRIPTION		
1	DCDC_OUT	Power	High-side output of the isolated DC/DC converter; connect this pin to the HLDO_IN pin. ⁽¹⁾		
2	DCDC_HGND	High-side power ground	High-side ground reference for the isolated DC/DC converter; connect this pin to the HGND pin.		
3	HLDO_IN	Power	Input of the high-side LDO; connect this pin to the DCDC_OUT pin.(1)		
4	NC	_	No internal connection; connect this pin to HGND or leave this pin unconnected.		
5	HLDO_OUT	Power	Output of the high-side LDO. ⁽¹⁾		
6	INP	Analog input	Noninverting analog input. Either INP or INN must have a DC current path to HGND t define the common-mode input voltage. (2)		
7	INN	Analog input	Inverting analog input. Either INP or INN must have a DC current path to HGND to define the common-mode input voltage. (2)		
8	HGND	High-side signal ground	High-side analog ground; connect this pin to the DCDC_HGND pin.		
9	GND	Low-side signal ground	Low-side analog ground; connect this pin to the DCDC_GND pin.		
10	OUTN	Analog output	Inverting analog output.		
11	OUTP	Analog output	Noninverting analog output.		
12	VDD	Low-side power	Low-side power supply. ⁽¹⁾		
13	LDO_OUT	Power	Output of the low-side LDO; connect this pin to the DCDC_IN pin. The output of the LDO must not be loaded by external circuitry. ⁽¹⁾		
14	DIAG	Digital output	Active-low, open-drain status indicator output; connect this pin to the pullup supply (for example, VDD) using a resistor or leave this pin floating if not used.		
15	DCDC_GND	Low-side power ground	Low-side ground reference for the isolated DC/DC converter; connect this pin to the GND pin.		
16	DCDC_IN	Power	Low-side input of the isolated DC/DC converter; connect this pin to the LDO_OUT pin.(1)		

⁽¹⁾ See the *Power Supply Recommendations* section for power-supply decoupling recommendations.

⁽²⁾ See the *Layout* section for details.

5 Specifications

5.1 Absolute Maximum Ratings

see (1)

		MIN	MAX	UNIT
Power-supply voltage	VDD to GND	-0.3	6.5	V
Analog input voltage	INP, INN	HGND – 6	V _{HLDO_OUT} + 0.5	V
Analog output voltage	OUTP, OUTN	GND – 0.5	VDD + 0.5	V
Digital output voltage	DIAG	GND – 0.5	6.5	V
Input current	Continuous, any pin except power-supply pins	-10	10	mA
Temperature	Junction, T _J		150	°C
Temperature	Storage, T _{stg}	-65	150	C

⁽¹⁾ Operation outside the Absolute Maximum Ratings may cause permanent device damage. Absolute Maximum Ratings do not imply functional operation of the device at these or any other conditions beyond those listed under Recommended Operating Conditions. If used outside the Recommended Operating Conditions but within the Absolute Maximum Ratings, the device may not be fully functional, and this may affect device reliability, functionality, performance, and shorten the device lifetime

5.2 ESD Ratings

			VALUE	UNIT
		Human body model (HBM), per ANSI/ESDA/JEDEC JS-001 ⁽¹⁾	±2000	
$V_{(ESD)}$	Electrostatic discharge	Charged-device model (CDM), per per ANSI/ESDA/JEDEC JS-002 ⁽²⁾	±1000	V

- (1) JEDEC document JEP155 states that 500-V HBM allows safe manufacturing with a standard ESD control process.
- (2) JEDEC document JEP157 states that 250-V CDM allows safe manufacturing with a standard ESD control process.

5.3 Recommended Operating Conditions

over operating ambient temperature range (unless otherwise noted)

			MIN	NOM	MAX	UNIT
POWER	SUPPLY			-		
VDD	Low-side power supply	VDD to GND	3	3.3	5.5	V
ANALO	G INPUT					
V _{Clipping}	Differential input voltage before clipping output	$V_{IN} = V_{INP} - V_{INN}$		±320		mV
V _{FSR}	Specified linear differential full-scale voltage	$V_{IN} = V_{INP} - V_{INN}$	-250	-	250	mV
	Absolute common-mode input voltage (1)	(V _{INP} + V _{INN}) / 2 to HGND	-2	V _{HL}	DO_OUT	V
V _{CM}	Operating common-mode input voltage	(V _{INP} + V _{INN}) / 2 to HGND	-0.16		1	V
ANALO	Э ОИТРИТ					
C _{LOAD}	Capacitive load	On OUTP or OUTN to GND2, Without any series resistance			500	pF
C _{LOAD}	Capacitive load	OUTP to OUTN, Without any series resistance			250	pF
R _{LOAD}	Resistive load	On OUTP or OUTN to GND2		10	1	kΩ
DIGITAL	OUTPUT					
	Pull-up supply-voltage for DIAG pin		0		VDD	V
TEMPER	RATURE RANGE	,				
T _A	Specified ambient temperature		-40		125	°C

⁽¹⁾ Steady-state voltage supported by the device in case of a system failure. See specified common-mode input voltage V_{CM} for normal operation. Observe analog input voltage range as specified in the Absolute Maximum Ratings table.

5.4 Thermal Information

		AMC3301	
	Junction-to-board thermal resistance Junction-to-top characterization parameter Junction-to-board characterization parameter	DWE (SOIC)	UNIT
		16 PINS	
R _{0JA}	Junction-to-ambient thermal resistance	73.5	°C/W
R _{0JC(top)}	Junction-to-case (top) thermal resistance	31	°C/W
R _{θJB}	Junction-to-board thermal resistance	44	°C/W
Ψ_{JT}	Junction-to-top characterization parameter	16.7	°C/W
Ψ_{JB}	Junction-to-board characterization parameter	42.8	°C/W
R _{0JC(bot)}	Junction-to-case (bottom) thermal resistance	n/a	°C/W

⁽¹⁾ For more information about traditional and new thermal metrics, see the Semiconductor and IC Package Thermal Metrics application report.

5.5 Power Ratings

	PARAMETER	TEST CONDITIONS	MIN	TYP	MAX	UNIT
P _D Maximum power dissipation	VDD = 5.5 V			231	mW	
FD	waximum power dissipation	VDD = 3.6 V			151	IIIVV

5.6 Insulation Specifications

over operating ambient temperature range (unless otherwise noted)

	PARAMETER	TEST CONDITIONS	VALUE	UNIT
GENERA	AL			
CLR	External clearance (1)	Shortest pin-to-pin distance through air	≥ 8	mm
CPG	External creepage (1)	Shortest pin-to-pin distance across the package surface	≥ 8	mm
DTI	D	Minimum internal gap (internal clearance - capacitive signal isolation)	≥ 21	
DTI	Distance through the insulation	Minimum internal gap (internal clearance - transformer power isolation)	≥ 120	— μm
СТІ	Comparative tracking index	DIN EN 60112 (VDE 0303-11); IEC 60112	≥ 600	V
	Material group	According to IEC 60664-1	1	
	Overvoltage category	Rated mains voltage ≤ 600 V _{RMS}	1-111	
	per IEC 60664-1	Rated mains voltage ≤ 1000 V _{RMS}	I-II	
DIN EN I	EC 60747-17 (VDE 0884-17) ⁽²⁾			
V _{IORM}	Maximum repetitive peak isolation voltage	At AC voltage	1700	V _{PK}

V _{IOWM}	working voltage	At DC voltage	1700	V_{DC}
V_{IOTM}	Maximum transient isolation voltage	V _{TEST} = V _{IOTM} , t = 60s (qualification test), V _{TEST} = 1.2 × V _{IOTM} , t = 1s (100% production test)	6000	V _{PK}
V _{IMP}	Maximum impulse voltage ⁽³⁾	Tested in air, 1.2/50µs waveform per IEC 62368-1	7700	V _{PK}
V _{IOSM}	Maximum surge isolation voltage ⁽⁴⁾	Tested in oil (qualification test), 1.2/50µs waveform per IEC 62368-1	10000	V _{PK}
		Method a, after input/output safety test subgroups 2 and 3, $V_{pd(ini)} = V_{IOTM}, t_{ini} = 60s, V_{pd(m)} = 1.2 \times V_{IORM}, t_m = 10s$	≤ 5	
a	Apparent charge ⁽⁵⁾	Method a, after environmental tests subgroup 1, $V_{pd(ini)} = V_{IOTM}, t_{ini} = 60s, V_{pd(m)} = 1.6 \times V_{IORM}, t_m = 10 \; s$	≤ 5	pC
q _{pd}	Apparent charge	Method b1, at preconditioning (type test) and routine test, $V_{pd(ini)} = 1.2 \text{ x } V_{IOTM}, t_{ini} = 1 \text{s}, V_{pd(m)} = 1.875 \times V_{IORM}, t_m = 1 \text{s}$	≤ 5	
		Method b2, at routine test (100% production) ⁽⁷⁾ , $V_{pd(ini)} = V_{pd(m)} = 1.2 \text{ x } V_{IOTM}, t_{ini} = t_m = 1s$	≤ 5	pC
C _{IO}	Barrier capacitance, input to output ⁽⁶⁾	V _{IO} = 0.5 V _{PP} at 1MHz	≅ 4.5	pF
		V _{IO} = 500 V at T _A = 25°C	> 10 ¹²	
R _{IO}	Insulation resistance, input to output ⁽⁶⁾	$V_{IO} = 500 \text{ V at } 100^{\circ}\text{C} \le T_{A} \le 125^{\circ}\text{C}$	> 10 ¹¹	Ω
		V _{IO} = 500 V at T _S = 150°C	> 10 ⁹	
	Pollution degree		2	
	Climatic category		40/125/21	
UL1577				
V _{ISO}	Withstand isolation voltage	V _{TEST} = V _{ISO} , t = 60 s (qualification test), V _{TEST} = 1.2 × V _{ISO} , t = 1 s (100% production test)	4250	V _{RMS}

- (1) Apply creepage and clearance requirements according to the specific equipment isolation standards of an application. Care must be taken to maintain the creepage and clearance distance of a board design to ensure that the mounting pads of the isolator on the printed circuit board (PCB) do not reduce this distance. Creepage and clearance on a PCB become equal in certain cases. Techniques such as inserting grooves, ribs, or both on a PCB are used to help increase these specifications.
- (2) This coupler is suitable for *safe electrical insulation* only within the safety ratings. Compliance with the safety ratings must be ensured by means of suitable protective circuits.
- (3) Testing is carried out in air to determine the surge immunity of the package.
- (4) Testing is carried in oil to determine the intrinsic surge immunity of the isolation barrier.
- (5) Apparent charge is electrical discharge caused by a partial discharge (pd).
- (6) All pins on each side of the barrier are tied together, creating a two-pin device.
- (7) Either method b1 or b2 is used in production.

5.8 Safety Limiting Values

Safety limiting ⁽¹⁾ intends to minimize potential damage to the isolation barrier upon failure of input or output circuitry. A failure ofthe I/O can allow low resistance to ground or the supply and, without current limiting, dissipate sufficient power to overheat the die and damage the isolation barrier potentially leading to secondary system failures.

	PARAMETER	TEST CONDITIONS	MIN	TYP	MAX	UNIT
I _S	Safaty input, output, or aupply ourrant	$R_{\theta,JA} = 73.5^{\circ}\text{C/W}, \text{VDD} = 5.5 \text{ V},$ $T_J = 150^{\circ}\text{C}, T_A = 25^{\circ}\text{C}$			309	mΛ
	Safety input, output, or supply current	R _{θJA} = 73.5°C/W, VDD = 3.6 V, T _J = 150°C, T _A = 25°C			472	mA mA
Ps	Safety input, output, or total power	R _{θ,JA} = 73.5°C/W, T _J = 150°C, T _A = 25°C			1700	mW
T _S	Maximum safety temperature				150	°C

(1) The maximum safety temperature, T_S, has the same value as the maximum junction temperature, T_J, specified for the device. The I_S and P_S parameters represent the safety current and safety power, respectively. Do not exceed the maximum limits of I_S and P_S. These limits vary with the ambient temperature, T_A.

The junction-to-air thermal resistance, R_{0JA}, in the *Thermal Information* table is that of a device installed on a high-K test board for leaded surface-mount packages. Use these equations to calculate the value for each parameter:

 $T_J = T_A + R_{\theta,JA} \times P$, where P is the power dissipated in the device.

 $T_{J(max)} = T_S = T_A + R_{\theta JA} \times P_S$, where $T_{J(max)}$ is the maximum junction temperature.

 $P_S = I_S \times VDD_{max}$, where VDD_{max} is the maximum low-side voltage.

5.9 Electrical Characteristics

minimum and maximum specifications apply from $T_A = -40^{\circ}\text{C}$ to +125°C, VDD = 3.0 V to 5.5 V, INP = -250 mV to +250 mV, INN = HGND = 0 V, and the external components listed in the *Typical Application* section; typical specifications are at $T_A = 25^{\circ}\text{C}$, and VDD = 3.3 V (unless otherwise noted)

	PARAMETER	TEST CONDITIONS	MIN	TYP	MAX	UNIT

6 Detailed Description

6.1 Overview

The AMC3301 is a fully differential, precision, isolated amplifier with a fully integrated DC/DC converter that can supply the device from a single 3.3-V or 5-V voltage supply on the low-side. The input stage of the device consists of a fully differential amplifier that drives a second-order, delta-sigma ($\Delta\Sigma$) modulator. The modulator uses an internal voltage reference and clock generator to convert the analog input signal to a digital bitstream. The drivers (termed TX in the Functional Block Diagram) transfer the output of the modulator across the isolation barrier that separates the high-side and low-side voltage domains. As shown in the Functional Block Diagram, the received bitstream and clock are synchronized and processed by a fourth-order analog filter on the low-side and presented as a differential output of the device

The signal path is isolated by a double capacitive silicon dioxide (SiO₂) insuation barrier, whereas power isolation uses an on-chip transformer separated by a thin-film polymer as the insulating material.

6.2 Functional Block Diagram

6.3 Feature Description

6.3.1 Analog Input

The differential amplifier input stage of the AMC3301 feeds a second-order, switched-capacitor, feed-forward $\Delta\Sigma$ modulator. The gain of the differential amplifier is set by internal precision resistors with a differential input impedance of R_{IND}. The modulator converts the analog signal into a bitstream that is transferred across the isolation barrier, as described in the *Data Isolation Channel Signal Transmission* section.

There are two restrictions on the analog input signals (INP and INN). First, if the input voltages V_{INP} or V_{INN} exceed the range specified in the *Absolute Maximum Ratings* table, the input current must be limited to the absolute maximum value, because the device input electrostatic discharge (ESD) diodes turns on. In addition, the linearity and parametric performance of the device are ensured only when the analog input voltage remains within linear full-scale range (V_{FSR}) and within the common-mode input voltage range (V_{CM}) as specified in the *Recommended Operating Conditions* table.

6.3.2 Data Isolation Channel Signal Transmission

The AMC3301 uses an on-off keying (OOK) modulation scheme, as shown in Figure 6-1, to transmit the modulator output bitstream across the capacitive SiO₂-based isolation barrier. The transmit driver (TX) shown in the *Functional Block Diagram* transmits an internally generated, high-frequency carrier across the isolation barrier to represent a digital *one* and does not send a signal to represent a digital *zero*. The nominal frequency of the carrier used inside the AMC3301 is 480 MHz.

The receiver (RX) on the other side of the isolation barrier recovers and demodulates the signal and produces the output. The AMC3301 transmission channel is optimized to achieve the highest level of common-mode transient immunity (CMTI) and lowest level of radiated emissions caused by the high-frequency carrier and RX/TX buffer switching.

Figure 6-1. OOK-Based Modulation Scheme

6.3.3 Analog Output

The AMC3301 offers a differential analog output comprised of the OUTP and OUTN pins. For differential input voltages ($V_{INP} - V_{INN}$) in the range from –250 mV to +250 mV, the device provides a linear response with a nominal gain of 8.2. For example, for a differential input voltage of 250 mV, the differential output voltage ($V_{OUTP} - V_{OUTN}$) is 2.05 V. At zero input (INP shorted to INN), both pins output the same common-mode output voltage V_{CMout} , as specified in the *Electrical Characteristics* table. For absolute differential input voltages greater than 250 mV but less than 320 mV, the differential output voltage continues to increase in magnitude but with reduced linearity performance. The outputs saturate at a differential output voltage of $V_{CLIPout}$ as shown in Figure 6-2 if the differential input voltage exceeds the $V_{Clipping}$ value.

Figure 6-2. Output Behavior of the AMC3301

The AMC3301 provides a fail-safe output that simplifies diagnostics on system level. Figure 6-2 shows the fail-safe mode, in which the AMC3301 outputs a negative differential output voltage that does not occur under normal operating conditions. The fail-safe output is active in two cases:

- The low-side does not receive data from the high-side (for example, because of a loss of power on the high side).
- The high-side DC/DC output voltage (DCDC_OUT) or the high-side LDO output voltage (HLDO_OUT) drop below their respective undervoltage detection thresholds (brown-out).

Use the maximum V_{FAILSAFE} voltage specified in the *Electrical Characteristics* table as a reference value for the fail-safe detection on the system level.

Copyright © 2025 Texas Instruments Incorporated Product Folder Links: *AMC3301*

6.3.4 Isolated DC/DC Converter

The AMC3301 offers a fully integrated isolated DC/DC converter that includes the following components as illustrated in the *Functional Block Diagram*:

- Low-dropout regulator (LDO) on the low-side to stabilize the supply voltage VDD that drives the low-side of the converter. This circuit does not output a constant voltage and is not intended for driving any external load.
- Low-side full-bridge inverter and drivers
- · Laminate-based, air-core transformer for high-immunity to magnetic fields
- · High-side full-bridge rectifier
- High-side LDO to stabilize the output voltage of the DC/DC converter for high analog performance of the signal path. The high-side LDO outputs a constant voltage and can provide a limited amount of current to power external circuitry.

The DC/DC converter uses a spread-spectrum clock generation technique to reduce the spectral density of the electromagnetic radiation. The resonator frequency is synchronized to the operation of the $\Delta\Sigma$ modulator to minimize the interference with data transmission and support the high analog performance of the device.

The architecture of the DC/DC converter is optimized to drive the high-side circuitry of the AMC3301 and can source up to I_H of additional DC current for an optional auxiliary circuit such as an active filter, preamplifier, or comparator. I_H is specified in the *Electrical Characteristics* table as a DC, non-switching current.

6.3.5 Diagnostic Output

The open-drain DIAG pin can be monitored to confirm the device is operational and the output voltage is valid. As shown in Figure 6-3, during power-up, the DIAG pin is actively held low until the high-side supply is in regulation and the device operates properly. During normal operation, the DIAG pin is in high-impedance (Hi-Z) state and is pulled high through an external pullup resistor. The DIAG pin is actively pulled low if:

- The low-side does not receive data from the high-side (for example, because of a loss of power on the high side). In this case, the amplifier outputs are driven to the V_{FAILSAFE} value that is shown in Figure 6-2.
- The high-side DC/DC output voltage (DCDC_OUT) or the high-side LDO output voltage (HLDO_OUT) drop below their respective undervoltage detection thresholds (brown-out). In this case, the low-side may still receive data from the high-side but the data may not be valid. The amplifier outputs are driven to the V_{FAILSAFE} value that is shown in Figure 6-2.

Figure 6-3. DIAG Output Under Different Operating Conditions

During normal operation, the DIAG pin is in a high-impedance state. Connect the DIAG pin to a pullup resistor or leave open if not used.

6.4 Device Functional Modes

The AMC3301 is operational when the power supply VDD is applied, as specified in the *Recommended Operating Conditions* table.

7 Application and Implementation

Note

Information in the following applications sections is not part of the TI component specification, and TI does not warrant its accuracy or completeness. TI's customers are responsible for determining suitability of components for their purposes. Customers should validate and test their design implementation to confirm system functionality.

7.1 Application Information

The low input voltage range, low nonlinearity, and low temperature drift make the AMC3301 a high-performance solution for industrial applications where shunt-based current sensing with high common-mode voltage levels is required.

7.2 Typical Application

The AMC3301 is ideally suited for shunt-based current sensing applications where accurate current monitoring is required in the presence of high common-mode voltages. The AMC3301 integrates an isolated power supply for the high-voltage side and therefore makes the device particularly easy to use in applications that do not have a high-side supply readily available or where a high-side supply is referenced to a different ground potential than the signal to be measured.

Figure 7-1 shows a simplified schematic of the AMC3301 in a solar inverter where the phase current is measured on the grid-side of an LCL filter. Although the system offers a supply for the high-side gate driver, there is a large common-mode voltage between the gate driver supply ground reference and the shunt resistor on the other side of the LCL filter. Therefore, the gate driver supply is not suitable for powering the high-side of an isolated amplifier that measures the voltage across the shunt. The integrated isolated power supply of the AMC3301 solves that problem and enables current sensing at locations that is optimal for the system.

The diagram also shows the AMC3330 being used for sensing the AC output voltage.

Figure 7-1. The AMC3301 in a Solar Inverter Application

7.2.1 Design Requirements

Table 7-1 lists the parameters for this typical application.

Table 7-1. Design Requirements

PARAMETER	VALUE
Supply voltage	3.3 V or 5 V
Voltage drop across the shunt for a linear response (V _{SHUNT})	±250 mV (maximum)

7.2.2 Detailed Design Procedure

The AMC3301 requires a single 3.3-V or 5-V supply on its low-side. The high-side supply is internally generated by an integrated DC/DC converter as explained in the *Isolated DC/DC Converter* section.

The ground reference (HGND) is derived from the terminal of the shunt resistor that is connected to the negative input of the AMC3301 (INN). If a four-pin shunt is used, the inputs of the AMC3301 are connected to the inner leads and HGND is connected to one of the outer shunt leads. To minimize offset and improve accuracy, set the ground connection to a separate trace that connects directly to the shunt resistor rather than shorting HGND to INN directly at the input to the device. See the *Layout* section for more details.

7.2.2.1 Shunt Resistor Sizing

Use Ohm's Law to calculate the voltage drop across the shunt resistor (V_{SHUNT}) for the desired measured current: $V_{SHUNT} = I \times R_{SHUNT}$.

Consider the following two restrictions to choose the proper value of the shunt resistor, R_{SHUNT}:

- The voltage drop caused by the nominal current range must not exceed the recommended differential input voltage range: |V_{SHUNT}| ≤ |V_{FSR}|
- The voltage drop caused by the maximum allowed overcurrent must not exceed the input voltage that causes
 a clipping output: |V_{SHUNT}| ≤ |V_{Clipping}|

7.2.2.2 Input Filter Design

TI recommends placing an RC filter in front of the isolated amplifier to improve signal-to-noise performance of the signal path. Design the input filter such that:

- The cutoff frequency of the filter is at least one order of magnitude lower than the sampling frequency (20 MHz) of the $\Delta\Sigma$ modulator
- The input bias current does not generate significant voltage drop across the DC impedance of the input filter
- The impedances measured from the analog inputs are equal

For most applications, the structure shown in Figure 7-2 achieves excellent performance.

Figure 7-2. Differential Input Filter

7.2.2.3 Differential to Single-Ended Output Conversion

Figure 7-3 shows an example of a TLV6001 based signal conversion and filter circuit for systems using single-ended-input ADCs to convert the analog output voltage into digital. With R1 = R2 = R3 = R4, the output voltage equals $(V_{OUTP} - V_{OUTN}) + V_{REF}$. Tailor the bandwidth of this filter stage to the bandwidth requirement of the system. For most applications, R1 = R2 = R3 = R4 = 3.3 k Ω and C1 = C2 = 330 pF yields good performance.

Figure 7-3. Connecting the AMC3301 Output to a Single-Ended Input ADC

For more information on the general procedure to design the filtering and driving stages of successive-approximation-register (SAR) ADCs, see the 18-Bit, 1MSPS Data Acquisition Block (DAQ) Optimized for Lowest Distortion and Noise reference guide and 18-Bit Data Acquisition Block (DAQ) Optimized for Lowest Power reference guide, available for download at www.ti.com.

7.2.3 Application Curve

In frequency inverter applications, the power switches must be protected in case of an overcurrent condition. To allow for fast powering off of the system, a low delay caused by the isolated amplifier is required. Figure 7-4 shows the typical full-scale step response of the AMC3301. Consider the delay of the required window comparator and the MCU to calculate the overall response time of the system.

Figure 7-4. Step Response of the AMC3301

7.3 Best Design Practices

Do not leave the analog inputs INP and INN of the AMC3301 unconnected (floating) when the device is powered up. If the device inputs are left floating, the input bias current may drive the inputs to a positive value that exceeds the operating common-mode input voltage and the output of the device is undetermined.

Connect the negative input (INN) to the high-side ground (HGND), either by a hard short or through a resistive path. A DC current path between INN and HGND is required to define the input common-mode voltage. Take care not to exceed the input common-mode range as specified in the *Recommended Operating Conditions* table. For best accuracy, route the ground connection as a separate trace that connects directly to the shunt resistor rather than shorting AGND to INN directly at the input to the device. See the *Layout* section for more details.

The high-side LDO can source a limited amount of current (I_H) to power external circuitry. Take care not to overload the high-side LDO.

The low-side LDO does not output a constant voltage and is not intended for powering any external circuitry. Do not connect any external load to the LDO OUT pin.

7.4 Power Supply Recommendations

The AMC3301 is powered from the low-side power supply (VDD) with a nominal value of 3.3 V or 5 V. TI recommends a low-ESR decoupling capacitor of 1 nF (C8 in Figure 7-5) placed as close as possible to the VDD pin, followed by a 1-µF capacitor (C9) to filter this power-supply path.

The low-side of the DC/DC converter is decoupled with a low-ESR 100-nF capacitor (C4) positioned close to the device between the DCDC_IN and DCDC_GND pins. Use a 1-µF capacitor (C2) to decouple the high side in addition to a low-ESR, 1-nF capacitor (C3) placed as close as possible to the device and connected to the DCDC OUT and DCDC HGND pins.

For the high-side LDO, use low-ESR capacitors of 1 nF (C6), placed as close as possible to the AMC3301, followed by a 100-nF decoupling capacitor (C5).

The ground reference for the high-side (HGND) is derived from the terminal of the shunt resistor which is connected to the negative input (INN) of the device. For best DC accuracy, use a separate trace to make this connection instead of shorting HGND to INN directly at the device input. The high-side DC/DC ground terminal (DCDC HGND) is shorted to HGND directly at the device pins.

Figure 7-5. Decoupling the AMC3301

Capacitors must provide adequate *effective* capacitance under the applicable DC bias conditions they experience in the application. Multilayer ceramic capacitors (MLCC) typically exhibit only a fraction of their nominal capacitance under real-world conditions and this factor must be taken into consideration when selecting these capacitors. This problem is especially acute in low-profile capacitors, in which the dielectric field strength is

Copyright © 2025 Texas Instruments Incorporated

higher than in taller components. Reputable capacitor manufacturers provide capacitance versus DC bias curves that greatly simplify component selection.

The Best Practices to Attenuate AMC3301 Family Radiated Emissions EMI application note is available for download at www.ti.com.

Table 7-2 lists components suitable for use with the AMC3301. This list is not exhaustive. Other components may exist that are equally suitable (or better), however these listed components have been validated during the development of the AMC3301.

7.5 Layout

7.5.1 Layout Guidelines

Figure 7-6 shows a layout recommendation with the critical placement of the decoupling capacitors. The same component reference designators are used as in the *Power Supply Recommendations* section. Decoupling capacitors are placed as close as possible to the AMC3301 supply pins. For best performance, place the shunt resistor close to the INP and INN inputs of the AMC3301 and keep the layout of both connections symmetrical.

To avoid causing errors in the measurement by the input bias currents of the AMC3301, connect the high-side ground pin (HGND) to the INN-side of the shunt resistor. Use a separate trace in the layout to make this connection to maintain equal currents in the INN and INP traces.

8.6 Electrostatic Discharge Caution

This integrated circuit can be damaged by ESD. Texas Instruments recommends that all integrated circuits be handled with appropriate precautions. Failure to observe proper handling and installation procedures can cause damage.

ESD damage can range from subtle performance degradation to complete device failure. Precision integrated circuits may be more susceptible to damage because very small parametric changes could cause the device not to meet its published specifications.

NOTES:

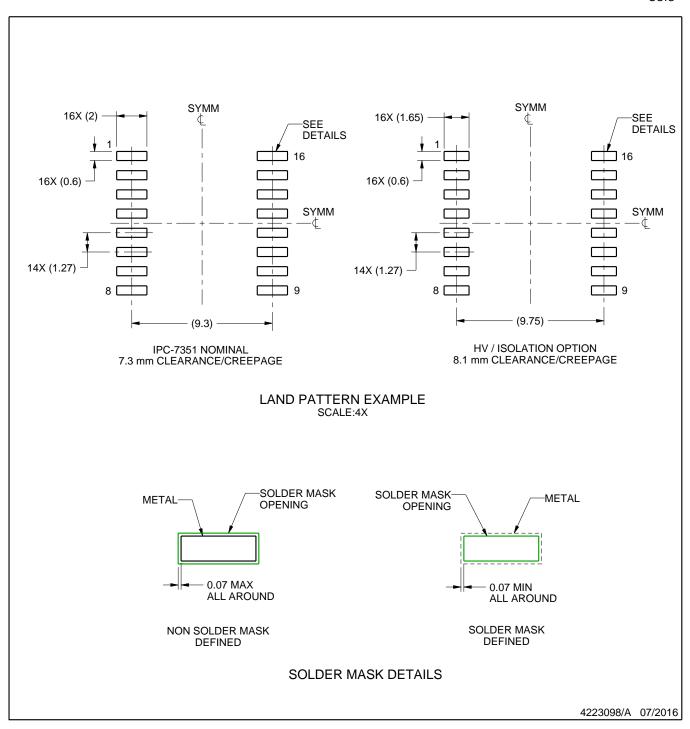

- 1. All linear dimensions are in millimeters. Any dimensions in parenthesis are for reference only. Dimensioning and tolerancing
- per ASME Y14.5M.

 2. This drawing is subject to change without notice.

 3. This dimension does not include mold flash, protrusions, or gate burrs. Mold flash, protrusions, or gate burrs shall not exceed 0.15 mm, per side.
- 4. This dimension does not include interlead flash. Interlead flash shall not exceed 0.25 mm, per side.
- 5. Reference JEDEC registration MS-013.

SOIC

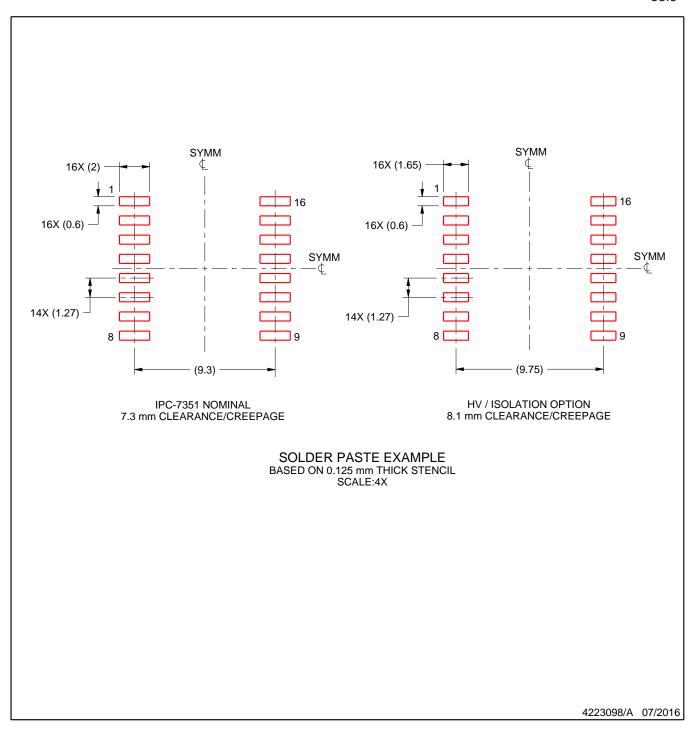

NOTES: (continued)

6. Publication IPC-7351 may have alternate designs.

7. Solder mask tolerances between and around signal pads can vary based on board fabrication site.

SOIC

NOTES: (continued)

- 8. Laser cutting apertures with trapezoidal walls and rounded corners may offer better paste release. IPC-7525 may have alternate design recommendations.
- 9. Board assembly site may have different recommendations for stencil design.

IMPORTANT NOTICE AND DISCLAIMER

TI PROVIDES TECHNICAL AND RELIABILITY DATA (INCLUDING DATASHEETS), DESIGN RESOURCES (INCLUDING REFERENCE DESIGNS), APPLICATION OR OTHER DESIGN ADVICE, WEB TOOLS, SAFETY INFORMATION, AND OTHER RESOURCES "AS IS" AND WITH ALL FAULTS, AND DISCLAIMS ALL WARRANTIES, EXPRESS AND IMPLIED, INCLUDING WITHOUT LIMITATION ANY IMPLIED WARRANTIES OF MERCHANTABILITY, FITNESS FOR A PARTICULAR PURPOSE OR NON-INFRINGEMENT OF THIRD PARTY INTELLECTUAL PROPERTY RIGHTS.

These resources are intended for skilled developers designing with TI products. You are solely responsible for (1) selecting the appropriate TI products for your application, (2) designing, validating and testing your application, and (3) ensuring your application meets applicable standards, and any other safety, security, regulatory or other requirements.

These resources are subject to change without notice. TI grants you permission to use these resources only for development of an application that uses the TI products described in the resource. Other reproduction and display of these resources is prohibited. No license is granted to any other TI intellectual property right or to any third party intellectual property right. TI disclaims responsibility for, and you fully indemnify TI and its representatives against any claims, damages, costs, losses, and liabilities arising out of your use of these resources.

TI's products are provided subject to TI's Terms of Sale, TI's General Quality Guidelines, or other applicable terms available either on ti.com or provided in conjunction with such TI products. TI's provision of these resources does not expand or otherwise alter TI's applicable warranties or warranty disclaimers for TI products. Unless TI explicitly designates a product as custom or customer-specified, TI products are standard, catalog, general purpose devices.

TI objects to and rejects any additional or different terms you may propose.
