

BQ25887 I2C Controlled 2-Cell, 2-A Boost-Mode Battery Charger With Cell Balancing For USB Input

1 Features

- High-efficiency 2-A, 1.5-MHz switch mode boost charger
 - 93.4% Charge efficiency at 5-V adapter, 7.6-V battery, 1-A charge
 - Optimized for USB input and 2-cell Li-Ion battery
 - Selectable low power PFM mode for light load operation
- Single input to support USB input adapters
 - Supports 3.9-V to 6.2-V input voltage range with 20-V absolute maximum input voltage rating
 - Input current limit (500 mA to 3.3 A with 100-mA resolution) to support USB2.0, USB3.0 standard adapters
 - Maximum power tracking by input voltage limit up-to 5.5 V
- Cell balancing and I²C control
 - Integrated FETs for balancing current up to 400 mA
 - Automatic cell balancing with default register setting
- Input current optimizer (ICO) to maximize input power without overloading adapters
- Integrated 16-bit ADC for system monitoring (BUS voltage and current, each cell voltage, charge current, and NTC and die temperature)
- High integration includes all MOSFETs, current sensing and loop compensation

- High accuracy
 - $\pm 0.5\%$ Charge voltage regulation
 - $\pm 5\%$ Charge current regulation
 - $\pm 7.5\%$ Input current regulation
- Safety
 - Battery temperature sensing in charge
 - Thermal regulation and thermal shutdown

2 Applications

- [Electronic and robotic toys](#)
- [Virtual reality headset](#)
- [IP network camera](#)
- [Drone payload control](#)

3 Description

The BQ25887 is a highly-integrated 2-A boost switch-mode battery charge management device for 2-cell (2s) Li-Ion and Li-polymer battery. The BQ25887 has I2C control with cell balancing for USB input.

Device Information⁽¹⁾

PART NUMBER	PACKAGE	BODY SIZE (NOM)
BQ25887	VQFN (24)	4.00 mm x 4.00 mm

(1) For all available packages, see the orderable addendum at the end of the data sheet.

4 Revision History

NOTE: Page numbers for previous revisions may differ from page numbers in the current version.

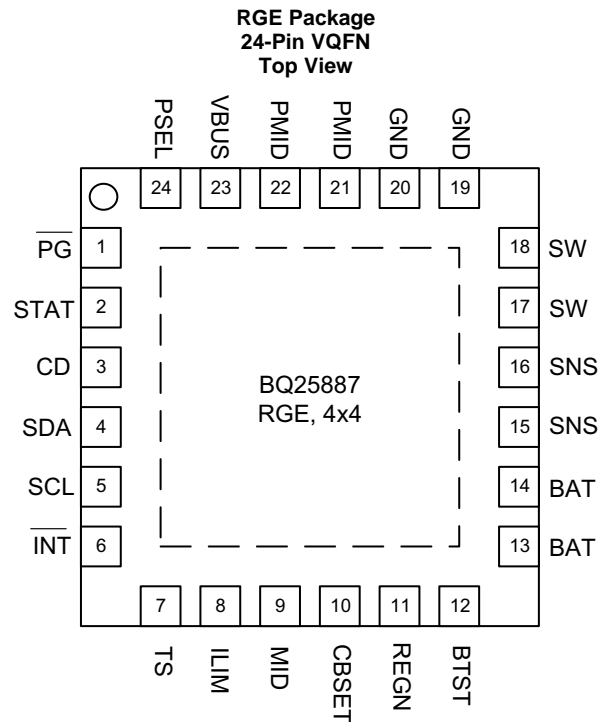

Changes from Revision A (May 2019) to Revision B	Page
• Changed Applications section	1
• Deleted no OTG and no power path from Description	1
• Added note to Absolute Maximum Ratings	7
• Added Figure 79	72
• Added Figure 80	72

Changes from Original (February 2019) to Revision A	Page
• Changed from Advance Information to Production Data.....	1

5 Device Comparison Table

PART NUMBER	BQ25882	BQ25883	BQ25886	BQ25887
VBUS Operating Range	3.9 to 6.2 V	3.9 to 6.2 V	4.3 to 6.2 V	3.9 to 6.2 V
USB Detection	D+/D-	D+/D-	D+/D-	PSEL
Power path	Yes	Yes	Yes	No
Cell Balancing	No	No	No	Yes
OTG	Up to 2 A	Up to 2 A	Up to 2 A	No OTG
16 bit ADC	Yes	Yes	No	Yes
Control Interface	I2C	I2C	Standalone	I2C
Status Pin	/PG	STAT, /PG	STAT, /PG	STAT, /PG
Package	2.1x2.1 WCSP-25	4x4 QFN-24	4x4 QFN-24	4x4 QFN-24

6 Pin Configuration and Functions

Pin Functions

PIN		I/O	DESCRIPTION
NAME	NO.		
$\overline{\text{PG}}$	1	DO	Open drain active low power good indicator – Connect to the pull up rail via 10-k Ω resistor. LOW indicates a good input source if the input voltage is within VVBUS_OP, and can provide more than IPOORSRC (30mA).
STAT	2	DO	Open drain charge status indicator – Connect to the pull-up rail via 10-k Ω resistor. LOW indicates charge in progress. HIGH indicates charge complete or charge disabled. When any fault occurs, the STAT pin blinks at 1Hz. The STAT function can be disabled when the STAT_DIS bit is set.
CD	3	DI	Active High Chip Disable Pin – Pull CD high to disable charge and place the device in HIZ mode. ADC operation and I2C is still allowed when CD is high. Converter is enabled when CD pin is LOW and EN_CHG bit is 1. CD pin is internally pulled low with 900-k Ω resistor.
SDA	4	DIO	I2C Interface Data – Connect SDA to the pull up rail through a 10-k Ω resistor.
SCL	5	DI	I2C Interface Clock – Connect SCL to the pull up rail through a 10-k Ω resistor.
$\overline{\text{INT}}$	6	DO	Open drain active Interrupt Output – Connect $\overline{\text{INT}}$ to the pull up rail via a 10-k Ω resistor. The $\overline{\text{INT}}$ pin sends active low, 256- μ s pulse to the host to report charger device status and fault.
TS	7	AI	Temperature Qualification Voltage – Connect a negative temperature coefficient thermistor. Program temperature window with a resistor divider from REGN to TS to GND. Charge suspends when TS pin is out of range. Recommend 103AT-2 thermistor.
ILIM	8	AI	Input Current Limit (IINDPM) – ILIM pin sets the maximum input current and can be used to monitor input current. IINDPM loop regulates ILIM pin voltage at 0.8V. When ILIM pin is less than 0.8V, the input current can be calculated by $\text{IIN} = \text{KILIM} \times \text{VILIM} / (\text{RILIM} \times 0.8\text{V})$. A resistor connected from ILIM pin to ground sets the input current limit as maximum ($\text{IINMAX} = \text{KILIM} / \text{RILIM}$). When ILIM pin is short to GND, the input current limit is set to maximum by ILIM. The actual input current limit is the lower limit set by ILIM pin (when EN_ILIM bit is HIGH) or IINDPM register bits. Input current limit less than 500mA is not supported on ILIM pin. The ILIM pin function can be disabled when EN_ILIM bit is 0. If ILIM pin is not used, pull this pin to GND. Do not float this pin.
MID	9	AI	Voltage Input for Mid Point Between Cells in 2S1P Configuration – Connect MID to the negative terminal of the top cell and the positive terminal of the bottom cell. This pin measures the voltage of the bottom cell for cell balancing and VMID ADC measurement. For protection of bottom cell reverse plug in, connect a 300 ohm resistor in series between MID pin and mid connection point of the two battery cell.

Pin Functions (continued)

PIN		I/O	DESCRIPTION
NAME	NO.		
CBSET	10	P	Power pin for Cell Balancing – Connect CBSET to the mid point between the two batteries in 2S configuration with a current limit resistor. The resistor value determines the cell balancing current as calculated in Cell Balancing Section. The resistor chosen should not exceed 400 mA for cell balancing.
REGN	11	P	Gate Drive Supply – Bias supply for internal MOSFETs driver and IC. Bypass REGN to GND with a 4.7- μ F ceramic capacitor. REGN current limit is 50 mA.
BTST	12	P	PWM High-side Driver Supply – Internally, BTST is connected to the cathode of the boot-strap diode. Connect a 47nF bootstrap capacitor from SW to BTST.
BAT	13, 14	P	Battery Power Connection – Connect minimum recommended 10- μ F capacitance after derating closely to the BAT pin and GND.
SNS	15, 16	AO	Sense Output – Charge current sense pin. Place a 44- μ F ceramic capacitor on this pin for stability of this output.
SW	17, 18	P	Inductor Connection – Connect to the switched side of the external inductor.
GND	19, 20	–	Ground Return
PMID	21, 22	P	Blocking MOSFET Connection – The minimum recommended total input low-ESR capacitance on VBUS and PMID, after applied derating, is 10 μ F. At least 1- μ F is recommended at VBUS with the remainder at PMID. Typical value for PMID is 10 μ F.
VBUS	23	P	Input Supply – VBUS is connected to the external DC supply. Bypass VBUS to GND with at least 1- μ F ceramic capacitor, placed as close to the IC as possible.
PSEL	24	DI	Power Source Selection – HIGH indicates USB host source (500mA) and LOW indicates adapter source (3.0A).

7 Specifications

7.1 Absolute Maximum Ratings

over operating free-air temperature range (unless otherwise noted) ⁽¹⁾

		MIN	MAX	UNIT
Voltage Range (with respect to GND unless otherwise specified)	V _{BUS} (converter not switching)	-0.3	20	V
	P _{MID} (converter not switching)	-0.3	8.5	V
	BAT, SNS, MID, CBSET (converter not switching)	-0.3	12	V
	SW	-0.3 ⁽²⁾	13	V
	BTST	-0.3	19	V
	REGN, STAT, /PG, TS	-0.3	6	V
	ILIM	-0.3	5	V
	BTST to SW	-0.3	6	V
	SDA, SCL, /INT, CD, PSEL,	-0.3	6	V
Voltage Range (with respect to GND unless otherwise specified)	BAT to CBSET	0	12	V
Output Sink Current	/INT, STAT, /PG		6	mA
Junction Temperature, T _J		-40	150	°C
Storage temperature, T _{stg}		-40	150	°C

- (1) Stresses beyond those listed under *Absolute Maximum Ratings* may cause permanent damage to the device. These are stress ratings only, which do not imply functional operation of the device at these or any other conditions beyond those indicated under *Recommended Operating Conditions*. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.
- (2) -2V for 50ns

7.2 ESD Ratings

			VALUE	UNIT
V _(ESD)	Electrostatic discharge	Human body model (HBM), per ANSI/ESDA/JEDEC JS-001 ⁽¹⁾	±2000	V
		Charged device model (CDM), per JEDEC specification JESD22-C101 ⁽²⁾	±250	

- (1) JEDEC document JEP155 states that 500-V HBM allows safe manufacturing with a standard ESD control process.
- (2) JEDEC document JEP157 states that 250-V CDM allows safe manufacturing with a standard ESD control process.

7.3 Recommended Operating Conditions

over operating free-air temperature range (unless otherwise noted)

		MIN	NOM	MAX	UNIT
V _{VBUS}	Input Voltage	3.9		6.2	V
I _{VBUS}	Average input current (VBUS)			3.3	A
I _{BAT}	Average charge current (IBAT)			2.2	A
I _{BAT_RMS}	RMS discharging current with internal MOSFET			5	A
I _{BAT_PK}	Peak discharging current with internal MOSFET			9 (up to 1us)	A
V _{BAT}	Battery Voltage			9.2 ⁽¹⁾	V
T _A	Operating free-air temperature range	-40		85	°C

- (1) The inherent switching noise voltage spikes should not exceed the absolute maximum rating on SW pin. A tight layout minimizes switching noise.

7.4 Thermal Information

over operating free-air temperature range (unless otherwise noted)

THERMAL METRIC ⁽¹⁾		bq25887	UNIT
		RGE (VQFN)	
		24-PIN	
$R_{\theta JA}$	Junction-to-ambient thermal resistance (JEDEC ⁽¹⁾)	32.4	°C/W
$R_{\theta JC(top)}$	Junction-to-case (top) thermal resistance	26.7	°C/W
$R_{\theta JB}$	Junction-to-board thermal resistance	10.7	°C/W
Ψ_{JT}	Junction-to-top characterization parameter	0.4	°C/W
Ψ_{JB}	Junction-to-board characterization parameter	10.6	°C/W
$R_{\theta JC(bot)}$	Junction-to-case (bottom) thermal resistance	3.7	°C/W

(1) For more information about traditional and new thermal metrics, see the Semiconductor and IC Package Thermal Metrics application report, [SPRA953](#).

7.5 Electrical Characteristics

$V_{VBUS_UVLO_RISING} < V_{VBUS} < V_{VBUS_OV}$, $T_J = -40^{\circ}\text{C}$ to $+125^{\circ}\text{C}$, and $T_J = 25^{\circ}\text{C}$ for typical values (unless otherwise noted)

PARAMETER		TEST CONDITIONS	MIN	TYP	MAX	UNIT
QUIESCENT CURRENTS						
I _{BAT}	Battery discharge current (BAT)	VBAT = 9 V, No VBUS, SCL, SDA = 0 V or 1.8 V, T _J =25C, ADC Disabled		12	14	μA
		VBAT = 9 V, No VBUS, SCL, SDA = 0 V or 1.8 V, T _J < 85C, ADC Disabled		12	20	μA
I _{VBUS_HIZ}	Input supply current (VBUS) in HIZ	VBUS = 5 V, High-Z Mode, no battery, ADC Disabled, 25°C		30	38	μA
		VBUS = 5 V, High-Z Mode, no battery, ADC Disabled, <85°C		30	48	μA
I _{VBUS}	Input supply current (VBUS)	VBUS = 5 V, V _{BAT} = 7.6 V, converter not switching		1.5	3	mA
		VBUS = 5 V, V _{BAT} = 7.6 V, converter switching		3		mA
VBUS/VBAT POWER UP						
V _{VBUS_OP}	VBUS operating range		3.9		6.2	V
V _{VBUS_UVLO_RISING}	VBUS rising for active I2C, no battery	VBUS rising		3.3	3.68	V
V _{VBUS_OV}	VBUS over-voltage rising threshold	VBUS rising	6.2		6.6	V
	VBUS over-voltage falling threshold	VBUS falling	5.9		6.4	V
V _{BAT_UVLO_RISING}	Battery for active I2C	VBAT rising	3.7	4	4.42	V
V _{POORSRC_FALLING}	Bad adapter detection threshold	VBUS falling below V _{POORSRC_FALLING}		3.7		V
I _{POORSRC}	Bad adapter detection current source			15		mA
BATTERY CHARGER						
V _{CELLREG_RANGE}	Typical charge voltage regulation range		3.4		4.6	V
V _{CELLREG_STEP}	Typical charge voltage step			5		mV
V _{CELLREG_ACC}	Charge voltage	VREG = 4.20 V, T _J = 0°C to 85°C,	4.179	4.2	4.221	V
V _{CELLREG_ACC}	Charge voltage	VREG = 4.35 V, T _J = 0°C to 85°C	4.328	4.35	4.372	V
I _{CHG_RANGE}	Charge current regulation range		100		2200	mA
I _{CHG_STEP}	Charge current regulation step			50		mA
I _{CHG_ACC}	Fast Charge current regulation accuracy	ICHG = 1000 mA, VBAT = 6.2 V or 7.6 V, T _J = 0°C to 85°C	-7.5		7.5	%
I _{CHG_ACC}	Fast Charge current regulation accuracy	ICHG = 500mA, VBAT = 6.2 V or 7.6 V, T _J = 0°C to 85°C	-15		15	%
I _{CHG_ACC}	Fast Charge current regulation accuracy	ICHG = 250 mA, VBAT = 6.2 V or 7.6 V, T _J = 0°C to 85°C	-25		25	%
I _{PRECHG_RANGE}	Precharge current range		50		800	mA

Electrical Characteristics (continued)

 $V_{BUS_UVLO_RISING} < V_{BUS} < V_{BUS_OV}$, $T_J = -40^{\circ}\text{C}$ to $+125^{\circ}\text{C}$, and $T_J = 25^{\circ}\text{C}$ for typical values (unless otherwise noted)

PARAMETER		TEST CONDITIONS	MIN	TYP	MAX	UNIT
I_{PRECHG_STEP}	Typical precharge current step			50		mA
I_{PRECHG_ACC}	Precharge current accuracy	$V_{BAT} = 5.2\text{ V}$, $I_{PRECHG} = 200\text{ mA}$, $T_J = 25^{\circ}\text{C}$	170		237	mA
		$V_{BAT} = 5.2\text{ V}$, $I_{PRECHG} = 200\text{ mA}$, $T_J = 0^{\circ}\text{C}$ to 85°C	150		245	mA
I_{TERM_RANGE}	Termination current range		50		800	mA
I_{TERM_STEP}	Typical termination current step			50		mA
I_{TERM_ACC}	Termination current accuracy	$ICHG = 1.5\text{ A}$, $I_{TERM} = 150\text{ mA}$, $T_J = 25^{\circ}\text{C}$	143		157	mA
		$ICHG = 1.5\text{ A}$, $I_{TERM} = 150\text{ mA}$, $T_J = 0^{\circ}\text{C}$ to 85°C	120		180	mA
		$ICHG = 1.5\text{ A}$, $I_{TERM} = 50\text{ mA}$, $T_J = 25^{\circ}\text{C}$	45		60	mA
		$ICHG = 1.5\text{ A}$, $I_{TERM} = 50\text{ mA}$, $T_J = 0^{\circ}\text{C}$ to 85°C	22		75	mA
$V_{CELL_SHORT_RISING}$	Short Battery Voltage rising threshold to start pre-charging	VCELL rising	2.05	2.2	2.35	V
$V_{CELL_SHORT_FALLING}$	Short Battery Voltage falling threshold to stop pre-charging	VCELL falling	1.85	2	2.15	V
I_{BAT_SHORT}	Low Battery Voltage trickle charging current	$V_{TOPCELL} < 2.2\text{ V}$, $V_{BOTCELL} < V_{REG} - V_{RCHG}$; Or $V_{BOTCELL} < 2.2\text{ V}$, $V_{TOPCELL} < V_{REG} - V_{RCHG}$		100		mA
$V_{CELL_LOWV_RISING}$	VCELL LOWV Rising threshold to start fast-charging	VCELL rising, $V_{BATLOW} = 2.8\text{ V}$	2.65	2.8	2.95	V
		VCELL rising, $V_{BATLOWV} = 3.0\text{ V}$	2.85	3	3.15	V
$V_{CELL_LOWV_FALLING}$	VCELL LOWV falling threshold to start fast-charging	VCELL falling, $V_{BATLOW} = 2.8\text{ V}$	2.45	2.6	2.75	V
		VCELL falling, $V_{BATLOWV} = 3.0\text{ V}$	2.65	2.8	2.95	V
V_{CELL_RECHG}	Recharge threshold below $V_{CELLREG}$	VCELL falling, $V_{CELL_RECHG}[1:0] = 01$		100		mV
$R_{ON_QHS} (Q2)$	High-side switching MOSFET on-resistance between SW and SNS (Q2)	$T_J = 25^{\circ}\text{C}$		32	35	m Ω
		$T_J = -40^{\circ}\text{C}$ to 125°C		32	47	m Ω
$R_{ON_QLS} (Q3)$	Low-side switching MOSFET on-resistance between SW and GND (Q3)	$T_J = 25^{\circ}\text{C}$		42	46	m Ω
		$T_J = -40^{\circ}\text{C}$ to 125°C		42	63	m Ω
I_{BAT_DISCHG}	BAT Discharge current source	$V_{BAT} = 8\text{ V}$, $EN_BAT_DISCHG = 1$	8	11.5	16	mA
INPUT VOLTAGE / CURRENT REGULATION						
V_{INDPM_RANGE}	Input voltage regulation range		3.9		5.5	V
V_{INDPM_STEP}	Input voltage regulation step			100		mV
V_{INDPM}	Input voltage limit	$V_{INDPM} = 3.9\text{ V}$	3.783	3.9	4.017	V
		$V_{INDPM} = 4.4\text{ V}$	4.268	4.4	4.532	V
I_{INDPM_RANGE}	Input current regulation range		500		3300	mA
I_{INDPM_STEP}	Input current regulation step			100		mA
I_{INDPM_ACC}	Input current regulation limit	$I_{INDPM} = 500\text{ mA}$	438	469	500	mA
		$I_{INDPM} = 900\text{ mA}$	765	832	900	mA
		$I_{INDPM} = 2500\text{ mA}$	2125	2312	2500	mA
		$I_{INDPM} = 3000\text{ mA}$	2550	2775	3000	mA
K_{ILIM}	$I_{INMAX} = K_{ILIM}/R_{ILIM}$	Input Current regulation by ILIM pin		1110		A x Ω
I_{INDPM}	Input current regulation limit, $I_{INMAX} = K_{ILIM}/R_{ILIM}$	Input Current regulation by ILIM pin = 0.5A	457	505	553	mA
		Input Current regulation by ILIM pin = 0.9A	839	909	980	mA
		Input Current regulation by ILIM pin = 1.5A	1413	1518	1624	mA
$R_{ON_QBLK} (Q1)$	Blocking MOSFET on-resistance between VBUS and PMID (QBLK)	$T_J = 25^{\circ}\text{C}$		33	37	m Ω
		$T_J = -40^{\circ}\text{C}$ to 125°C		33	51	m Ω

Electrical Characteristics (continued)

 $V_{VBUS_UVLO_RISING} < V_{VBUS} < V_{VBUS_OV}$, $T_J = -40^{\circ}\text{C}$ to $+125^{\circ}\text{C}$, and $T_J = 25^{\circ}\text{C}$ for typical values (unless otherwise noted)

PARAMETER		TEST CONDITIONS	MIN	TYP	MAX	UNIT
THERMAL REGULATION AND THERMAL SHUTDOWN						
T_{REG}	Junction temperature regulation accuracy	$T_{REG} = 120^{\circ}\text{C}$		120		$^{\circ}\text{C}$
T_{SHUT_RISING}	Thermal Shutdown Rising threshold	Temperature Increasing		150		$^{\circ}\text{C}$
	Thermal Shutdown Falling threshold	Temperature Decreasing		120		$^{\circ}\text{C}$
JEITA THERMISTOR COMPARATOR (BOOST MODE)						
V_{T1}	TS pin voltage rising. T1 (0°C) threshold, Charge suspended below this temperature.	As Percentage to REGN	72.75	73.25	73.75	%
V_{T1_HYS}	TS pin voltage falling. Charge re-enabled to ICHG/2 and VREG above this temperature	As Percentage to REGN		1.3		%
V_{T2}	TS pin voltage rising. T2 (10°C) threshold, charge set to ICHG/2 and VREG below this temperature	As Percentage to REGN	67.75	68.25	68.75	%
V_{T2_HYS}	TS pin voltage falling. Charge set to ICHG and VREG above this temperature	As Percentage to REGN		1.2		%
V_{T3}	TS pin voltage falling. T3 (45°C) threshold, charge set to ICHG and 8.1 V above this temperature.	As Percentage to REGN	44.25	44.75	45.25	%
V_{T3_HYS}	TS pin voltage rising. Charge set to ICHG and VREG below this temperature	As Percentage to REGN		1		%
V_{T5}	TS pin voltage falling. T5 (60°C) threshold, charge suspended above this temperature.	As Percentage to REGN	33.875	34.375	34.875	%
V_{T5_HYS}	TS pin voltage rising. Charge set to ICHG and 8.1 V below this temperature	As Percentage to REGN		1.35		%
BOOST MODE CONVERTER						
F_{SW}	PWM switching frequency	Oscillator frequency	1.35	1.5	1.65	MHz
CELL BALANCING						
I_{CB_MAX}	Maximum recommended cell balancing current	$V_{CELL} = 4.2\text{V}$, $RCBSET = 9.5\Omega$, $RDSON_QCBX = 1\Omega$			400	mA
$RDSON_QCBH$	MOSFET on resistance between BAT and MID	Cell balance enabled ($REG0x2A[0] = 1$); $V_{CELL_HS} > 3.7\text{V}$, $V_{CELL_HS} > V_{CELL_LS}$, $VBAT - VMID - VMID > 80\text{mV}$, $ICB \leq 400\text{mA}$		1	1.2	Ω
$RDSON_QCBL$	MOSFET on resistance between MID and GND	Cell balance enabled ($REG0x2A[0] = 1$); $V_{CELL_LS} > 3.7\text{V}$, $V_{CELL_LS} > V_{CELL_HS}$, $VMID - (VBAT - VMID) > 80\text{mV}$, $ICB \leq 400\text{mA}$		1	1.2	Ω
V_{CBEN_RISING}	Cell balance function qualification threshold	Cell balance enabled rising threshold	3.65	3.7	3.75	V
V_{CBEN_HYS}	Cell balance function qualification hysteresis	Cell balance enabled falling hysteresis		200		mV
$V_{QUAL_TH_RANGE}$	Cell balance pre-qualification mode to qualification mode threshold range	Cell balance enabled ($REG0x2A[0]=1$); V_{CELL_LS} or $V_{CELL_HS}>3.7\text{V}$, increase the voltage delta between the two cells	40		180	mV
$V_{QUAL_TH_STEP}$	Cell balance pre-qualification mode to qualification mode threshold step size	Cell balance enabled ($REG0x2A[0]=1$); V_{CELL_LS} or $V_{CELL_HS}>3.7\text{V}$, increase the voltage delta between the two cells		10		mV
V_{QUAL_TH}	Cell balance pre-qualification mode to qualification mode threshold.	Cell balance enabled ($REG0x2A[0]=1$); V_{CELL_LS} or $V_{CELL_HS}>3.7\text{V}$, increase the voltage delta between the two cells		80		mV

Electrical Characteristics (continued)

 $V_{VBUS_UVLO_RISING} < V_{VBUS} < V_{VBUS_OV}$, $T_J = -40^{\circ}\text{C}$ to $+125^{\circ}\text{C}$, and $T_J = 25^{\circ}\text{C}$ for typical values (unless otherwise noted)

PARAMETER		TEST CONDITIONS	MIN	TYP	MAX	UNIT
V _{DIFF_START_RANGE}	Balance discharge start cell voltage difference threshold range	Cell balance enabled (REG0x2A[0] = 1); Difference between the two cells to turn on cell balancing MOSFET	40		190	mV
V _{DIFF_START_STEP}	Balance discharge start cell voltage difference threshold step size	Cell balance enabled (REG0x2A[0] = 1); Difference between the two cells to turn on cell balancing MOSFET		10		mV
V _{DIFF_START}	Balance discharge start cell voltage difference threshold	Cell balance enabled (REG0x2A[0] = 1); Difference between the two cells to turn on cell balancing MOSFET set to 120mV (REG0x29[3:0] = 1000)		120		mV
V _{DIFF_START}	Balance discharge start cell voltage difference threshold	Cell balance enabled (REG0x2A[0] = 1); Difference between the two cells to turn on cell balancing MOSFET set to 80mV (REG0x29[3:0] = 0100)		80		mV
V _{DIFF_END_RANGE}	Balance discharge stop cell voltage difference threshold range	Cell balance enabled (REG0x2A[0] = 1); Difference between the two cells to turn off cell balancing MOSFET	30		100	mV

8 Detailed Description

8.1 Overview

The BQ25887 device is a highly integrated 2-A switch-mode battery charger for 2s Li-Ion and Li-Polymer battery. It integrates the input blocking FET (Q1, QBLK), high-side switching FET (Q2, QHS), and low-side switching FET (Q3, QLS). The device also integrates the boot-strap diode for high-side gate drive.

8.2 Functional Block Diagram

8.3 Feature Description

8.3.1 Device Power-On-Reset

The internal bias circuits are powered from either VBAT or VBUS when it rises above $V_{VBUS_UVLO_RISING}$ or $V_{BAT_UVLO_RISING}$. I2C interface is ready for communication and all the registers are reset to default value. The host can access all the registers after POR.

8.3.2 Device Power Up from Input Source

When an input source is plugged in, the device checks the input source voltage to turn on REGN LDO and all the bias circuits. It detects and sets the input current limit before the boost converter is started. The power up sequence from input source is as listed:

1. Poor Source Qualification
2. Input Source Type Detection based on PSEL to set default Input Current Limit (IINDPM) register and input source type
3. Power Up REGN LDO
4. Converter Power-up

8.3.2.1 Poor Source Qualification

After REGN LDO powers up, the device checks the current capability of the input source. The input source has to meet the following requirements in order to start the boost converter.

1. VBUS voltage below V_{VBUS_OVP}
2. VBUS voltage above $V_{POORSRC}$ when pulling $I_{POORSRC}$ (typical 15mA)

If V_{BUS_OVP} is detected (condition 1 above), the device automatically retries detection once the over-voltage fault goes away. If a poor source is detected (condition 2 above), the device repeats poor source qualification routine every 2 seconds. After 7 consecutive failures, the device sets $VBUS_STAT[2:0] = '0b100'$, $EN_HIZ = 1$, and goes to HIZ mode. On BQ25887 adapter re-plug-in and/or EN_HIZ bit toggle is required to restart device operation. The EN_HIZ bit is cleared automatically when the adapter is plugged in. If the fault is not removed, the part will enter HIZ mode again after the 7 consecutive failures.

8.3.2.2 Input Source Type Detection

After the PG_STAT bit is set and input source is qualified, the charger device runs input source type detection when $AUTO_INDET_EN$ bit is set.

The BQ25887 sets input current limit through PSEL pin. After input source type detection, the following registers and pins are changed:

1. Input Current Limit (IINDPM) register is changed to set current limit
2. Input Voltage Limit (VINDPM) register is changed to set default limit (if $EN_VINDPM_RST = 1$, otherwise VINDPM value remains unchanged)
3. $VBUS_STAT$ bits change to reflect the detected source
4. \overline{INT} pin pulses to notify the host
5. \overline{PG} pin is pulled LOW, and PG_STAT bit is set to '1'

After detection is completed, the host can over-write IINDPM or VINDPM registers to change the input current, or input voltage limit if needed. The charger input current is always limited by the lower of IINDPM register, ILIM pin, or Input Current Optimizer (ICO) setting when ICO is enabled.

When $AUTO_INDET_EN$ is disabled, the Input Source Type Detection is bypassed, and the Input Current Limit (IINDPM) register remains unchanged from previous value. When EN_VINDPM_RST is disabled, the Input Voltage Limit (VINDPM) register remains unchanged from previous value.

8.3.2.2.1 PSEL Sets Input Current Limit

The BQ25887 has PSEL pin for input current limit setting to interface with USB PHY. It directly takes the USB PHY device output to decide whether the input is USB host or charging port. PSEL HIGH sets the input current limit to 500 mA and PSEL LOW sets the input current limit to 3 A. Automatic start ICO is disabled when PSEL is HIGH. When no input source is connected, input current limit will not be updated by PSEL change.

Feature Description (continued)

During default mode, after input source type detection is completed with an input source already plugged in, the PSEL pin is monitored. When the pin status changes, the input current limit is changed based on the pin status.

During host mode, after input source type detection is completed with an input source already plugged in, the PSEL pin is NOT monitored. The host needs to set the FORCE_INDET bit to 1 in order to read the PSEL value. After the detection is completed, the input current limit (IINDPM), and the VBUS_STAT bits can be changed due to the detection result.

8.3.2.2.2 Force Input Current Limit Detection

In host mode, the host can force the device to run Input Current Limit Detection by setting FORCE_INDET bit. After the detection is completed, FORCE_INDET bit returns to 0 by itself and input result is updated.

8.3.2.3 Power Up REGN Regulator (LDO)

The REGN LDO supplies internal bias circuits as well as the QHS and QLS gate drive. The LDO also provides bias rail to TS external resistors. The pull-up rail of STAT and PG can be connected to REGN as well. The REGN is enabled when all the below conditions are valid.

1. VBUS above $V_{VBUS_UVLO_RISING}$ in boost mode or VBUS below $V_{VBUS_UVLO_RISING}$ in buck mode
2. Poor Source Qualification detects a valid input source
3. Input Source Type Detection completes and sets appropriate input current limit
4. After 220-ms delay is complete

If one of the above conditions is not valid, the device is in high impedance mode (HIZ) with REGN LDO off. The device draws less than I_{VBUS_HIZ} from VBUS during HIZ state. The battery powers up the system when the device is in HIZ.

8.3.2.4 Converter Power Up

After the input current limit is set, the \overline{PG} pin is pulled LOW, the PG_STAT and VBUS_STAT bits are changed, and the converter is enabled, allowing the QHS and QLS to start switching. Before charging begins, the battery discharge source (IBAT_DISCHG) is enabled automatically to detect the presence of battery. The host can enable IBAT_DISCHG via the EN_BAT_DISCHG bit at any point during operation, including in Battery Only or HIZ modes. The device provides soft-start when converter output voltage is ramped up.

As a battery charger, the device deploys a highly efficient 1.5-MHz boost switching regulator. The fixed frequency oscillator keeps tight control of the switching frequency under all conditions of input voltage, battery voltage, charge current and temperature, simplifying output filter design.

In order to improve light-load efficiency, the device switches to PFM (Pulse Frequency Modulation) control at light load when battery is below 6.4V or charging is disabled. During the PFM operation, the switching duty cycle is set by the ratio of SNS and VBUS.

8.3.3 Input Current Optimizer (ICO)

The device provides innovative Input Current Optimizer (ICO) to identify maximum power point without overloading the input source. The algorithm automatically identifies maximum input current limit of a power source without staying in VINDPM to avoid input source overload.

On BQ25887, this feature is enabled by default (EN_ICO = 1) and can be disabled by setting EN_ICO bit to 0. After DCP type input source is detected based on the procedures describe above (Input Source Type Detection). The algorithm runs automatically when EN_ICO bit is set. The algorithm can also be forced to execute by setting FORCE_ICO bit regardless of input source type detected .

Feature Description (continued)

Table 1. Input Current Optimizer Automatic Operation

DEVICE	INPUT SOURCE	INPUT CURRENT LIMIT (IINDPM)	AUTOMATIC START ICO ALGORITHM
BQ25887	PSEL = HI	500 mA	Disable
	PSEL = LOW	3.0 A	Enable

The actual input current limit used by the Dynamic Power Management is reported in ICO_ILIM register while Input Current Optimizer is enabled (EN_ICO = 1) or set by IINDPM register when the algorithm is disabled (EN_ICO = 0). In addition, the current limit is clamped by ILIM pin unless EN_ILIM bit is 0 to disable ILIM pin function.

When the algorithm is enabled, it runs continuously to adjust input current limit of Dynamic Power Management (IINDPM) using ICO_ILIM register until ICO_STAT[1:0] and ICO_FLAG bits are set (the ICO_FLAG bit indicates any change in ICO_STAT[1:0] bits). The algorithm operates depending on battery voltage:

1. When voltage at BAT pin is below 6.2 V, the algorithm starts ICO_ILIM register with IINDPM which is the maximum input current limit allowed by system
2. When voltage at BAT is above 6.2 V, the algorithm starts ICO_ILIM register with 500mA which is the minimum input current limit to minimize adapter overload

When optimal input current is identified, the ICO_STAT[1:0] and ICO_FLAG bits are set to indicate input current limit in ICO_ILIM register would not be changed until the algorithm is forced to run by the following event (these events also reset the ICO_STAT[1:0] bits to '01'):

1. A new input source is plugged-in, or EN_HIZ bit is toggled
2. IINDPM register is changed
3. VINDPM register is changed
4. FORCE_ICO bit is set to 1
5. VBUS_OVP event

8.3.4 Battery Charging Management

The BQ25887 charges 2-cell Li-Ion battery with up to 2.2-A charge current for high capacity battery.

8.3.4.1 Autonomous Charging Cycle

When battery charging is enabled (EN_CHG = 1 and CD pin is LOW;), the device autonomously completes a charging cycle without host involvement. The device default charging parameters are listed in [Table 2](#) below. On BQ25887, the host can always control the charging operation and optimize the charging parameters by writing to the corresponding registers through I²C.

Table 2. Charging Parameter Default Settings

DEFAULT MODE	BQ25887
Charging Voltage	4.2V/Cell
Charging Current	1.50 A
Pre-Charge Current	150 mA
Termination Current	150 mA
Temperature Profile	JEITA
Safety Timer	12 hours
Topoff Timer	Disabled

A new charge cycle starts when the following conditions are valid:

1. Converter starts
2. Battery charging is enabled by I²C register bit (EN_CHG = 1 and CD pin is LOW and ICHG register is not 0 mA)
3. No thermistor fault on TS
4. No safety timer fault

The charger automatically terminates the charging cycle when the charging current is below termination threshold, charge voltage is above recharge threshold, and device is not in DPM mode or thermal regulation. When a full battery voltage is discharged below recharge threshold (threshold selectable via VCELL_RECHG[1:0] bits on BQ25887), the device automatically starts a new charging cycle. After the charge is done, toggle CD pin or EN_CHG bit can initiate a new charging cycle.

The STAT output indicates the charging status of: charging (LOW), charging complete or charge disable (HIGH) or charging fault (Blinking). If no battery is connected, the STAT pin blinks as capacitance connected at BAT charges, discharges, then recharges. The STAT output can be disabled by setting STAT_DIS bit. In addition, the status register (CHRG_STAT) indicates the different charging phases as:

- 000 – Not Charging
- 001 – Trickle Charge ($V_{BAT} < V_{BAT_SHORT}$)
- 010 – Pre-charge ($V_{BAT_SHORT} < V_{BAT} < V_{BAT_LOWV}$)
- 011 – Fast-charge (CC mode)
- 100 – Taper Charge (CV mode)
- 101 – Top-off Timer Charging
- 110 – Charge Termination Done

When the charger transitions to any of these states, including when charge cycle is completed, an \overline{INT} is asserted to notify the host.

8.3.4.2 Battery Charging Profile

The device charges the battery in five phases: trickle charge, pre-charge, constant current, constant voltage, and top-off timer charging (optional). At the beginning of a charging cycle, the device checks the battery voltage and regulates current/voltage accordingly.

Table 3. Default Charging Current Setting

VBAT	CHARGING CURRENT	REGISTER DEFAULT SETTING	CHRG_STAT
$< V_{CELL_SHORT}$	I_{BAT_SHORT}	100 mA	001
$V_{CELL_SHORT} - V_{CELL_LOWV}$	I_{PRECHG}	150 mA	010
$> V_{CELL_LOWV}$	I_{CHG}	1500 mA	011

If the charger device is in DPM regulation or thermal regulation during charging, the actual charging current will be less than the programmed value. In this case, termination is temporarily disabled and the charging safety timer is counted at half the clock rate, as explained in the [Charging Safety Timer](#) section.

Figure 9. Battery Charging Profile

8.3.4.3 Cell Balancing During Charging

Some applications require cell balancing when the user can replace one or both of the cells in the 2S1P configuration. When charging two batteries with different voltages, cell balancing is required, as the cell with the higher voltage is at risk of being overcharged. For extremely unbalanced cells, charging the lower voltage cell as well as fast cell balancing is desired.

The BQ25887 implements a passive cell balancing scheme with a recommended maximum discharge current of 400 mA. Balancing current is limited by external resistors placed between the CBSET pin and the mid-point of the two cells. Low side cell voltage is sensed at MID pin. Cell balancing can be enabled in the I2C registers.

The Cell Balancing current limit resistor, R_{CBSET} , can be calculated as below.

$$I_{CB_LIM} = V_{CELLREG} / (R_{CBSET} + R_{DSON_QCBX})$$

For example, the maximum recommended cell balancing current is 400 mA. For 4.2-V battery cell, R_{CBSET} can be calculated as 9.5 Ω (typical).

Cell balancing status register, CB_STAT, HS_CV_STAT and LS_CV_STAT is active in both automatic cell balancing mode and manual cell balancing mode.

The default setting of the cell balancing parameters are below.

Table 4. Cell Balancing Default Setting

PARAMETER	REGISTER	DEFAULT VALUE
Enable Auto Cell Balancing Mode (CB_AUTO_EN)	REG0x2A [6]	1 = Enable

Table 4. Cell Balancing Default Setting (continued)

PARAMETER	REGISTER	DEFAULT VALUE
Disable Charge for Accurate Cell Balancing Measurement (CB_CHG_DIS)	REG0x2A [7]	1 = Charge Disable for Cell Balancing Voltage Measurement
Voltage Threshold Enter Cell Balancing Qualification Mode from Pre-Qualification Mode (VQUAL_TH)	REG0x29h [7:4]	1111 = Disable Pre-Qualification Mode
Voltage Threshold Enter Cell Balancing Active Mode from Qualification Mode (VDIFF_START)	REG0x29h [3:0]	0100 = 80 mV
Voltage Threshold Exit Cell Balancing Offset from VDIFF_START (VDIFF_END_OFFSET)	REG0x28 [7:5]	001 = 40 mV
Time Interval between Taking Measurements in Pre-Qualification Mode (TCB_QUAL_INTERVAL)	REG0x0x28 [4]	0 = 2 min
Time Interval between Taking Measurements in Cell Balancing Active Mode (TCB_ACTIVE)	REG0x28 [3:2]	10 = 2 min
Time Delay between Charge Disable and Cell Voltage Measurement (TSETTLE)	REG0x28 [1]	10 = 1 sec

Figure 10. Cell Balancing Timing Diagram

8.3.4.4 Charging Termination

The device terminates a charge cycle when the battery voltage is above recharge threshold, and the current is below termination current.

When termination occurs, the STAT pin goes HIGH (charge current will continue to taper if top-off timer is enabled), status register CHRГ_STAT is set to 110, and an INT pulse is asserted to the host. Termination is temporarily disabled when the charger device is in input current, voltage or thermal regulation. Termination can be permanently disabled by writing 0 to EN_TERM bit prior to charge termination.

At low termination currents (50 mA - 100 mA), due to the comparator offset, the actual termination current may be up to 20% higher than the termination target. In order to compensate for comparator offset, a programmable top-off timer (default disabled) can be applied after termination is detected. The top-off timer will follow safety timer constraints, such that if safety timer is suspended, so will the top-off timer. Similarly, if safety timer is doubled, so will the top-off timer. CHRГ_STAT reports whether the top off timer is active via the 101 code. Once the Top-Off timer expires, the CHRГ_STAT register is set to 110 and an INT pulse is asserted to the host.

Top-off timer gets reset (set to 0 and counting resumes when appropriate) for any of the following conditions:

1. Charge disable to enable

2. Termination status low to high
3. REG_RST register bit is set (disables top-off timer)

The top-off timer settings are read in once termination is detected by the charger. Programming a top-off timer value after termination will have no effect unless a recharge cycle is initiated. An $\overline{\text{INT}}$ is asserted to the host when entering top-off timer segment as well as when top-off timer expires. All charge cycle related $\overline{\text{INT}}$ pulses (including top-off timer $\overline{\text{INT}}$ pulses) can be masked by CHR $\overline{\text{G}}$ _MASK bit.

8.3.4.5 Thermistor Qualification

The charger device provides a single thermistor input for battery temperature monitor.

8.3.4.5.1 JEITA Guideline Compliance in Charge Mode

To improve the safety of charging Li-ion batteries, JEITA guideline was released on April 20, 2007. The guideline emphasized the importance of avoiding a high charge current and high charge voltage at certain low and high temperature ranges.

To initiate a charge cycle, the voltage on TS pin must be within the VT1 to VT5 thresholds. If TS voltage exceeds the T1-T5 range, the controller suspends charging and waits until the battery temperature is within the T1 to T5 range. At cool temperature (T1-T2), JEITA recommends the charge current to be reduced to half of the charge current or lower. At warm temperature (T3-T5), JEITA recommends charge voltage less than 4.1 V / cell.

On BQ25887, the charger provides flexible voltage/current settings beyond JEITA requirement. The Voltage setting at warm temperature (T3-T5) can be VCELLREG, 4.0 V, 4.15 V, or charge suspended (configured by JEITA_VSET [1:0]). The fast charge current setting at warm temperature (T3-T5) can be 100%, or 40% of fast charge current, ICHG (configured by JEITA_ISETH). The fast charge current setting at cool temperature (T1-T2) can be 100%, 40%, or 20% of fast charge current, ICHG, or charge suspend (configured by JEITA_ISETC[1:0]). Whenever the charger detects "warm" or "cool" temperature, termination is automatically disabled regardless of JEITA_VSET, JEITA_ISETH and JEITA_ISETC register bit settings.

Figure 11. TS Resistor Network

Figure 12. TS Charging Values

Assuming a 103AT NTC (Negative Temperature Coefficient) thermistor on the battery pack as shown above, the value of RT1 and RT2 can be determined by:

$$RT2 = \frac{R_{NTC,T1} \times R_{NTC,T5} \times \left(\frac{1}{V_{T5}} - \frac{1}{V_{T1}} \right)}{R_{NTC,T1} \times \left(\frac{1}{V_{T1}} - 1 \right) - R_{NTC,T5} \times \left(\frac{1}{V_{T5}} - 1 \right)} \quad (1)$$

$$RT1 = \frac{\frac{1}{V_{T1}} - 1}{\frac{1}{R_{T2}} + \frac{1}{R_{NTC,T1}}} \quad (2)$$

Select 0°C to 60°C range for Li-ion or Li-polymer battery:

$$R_{NTC,T1} = 27.28 \text{ k}\Omega$$

$$R_{NTC,T5} = 3.02 \text{ k}\Omega$$

$$RT1 = 5.24 \text{ k}\Omega$$

$$RT2 = 30.31 \text{ k}\Omega$$

8.3.4.6 Charging Safety Timer

The device has built-in safety timer to prevent extended charging cycle due to abnormal battery conditions. The user can program fast charge safety timer through I²C (CHG_TIMER bits). When safety timer expires, the fault register TMR_STAT bit is set to 1, and an INT pulse is asserted to the host. The safety timer feature can be disabled by clearing EN_TIMER bit.

During input voltage, current or thermal regulation or cell balancing active mode (cell balancing discharging), the safety timer counts at half clock rate as the actual charge current is likely to be below the register setting. For example, if the charger is in input current regulation (IINDPM_STAT=1) throughout the whole charging cycle, and the safety timer is set to 12 hours, then the timer will expire in 24 hours. This half clock rate feature can be disabled by setting TMR2X_EN = 0. Changing the TMR2X_EN bit while the device is running has no effect on the safety timer count, other than forcing the timer to count at half the rate under the conditions dictated above.

During faults which disable charging, or supplement mode, timer is suspended. Since the timer is not counting in this state, the TMR2X_EN bit has no effect. Once the fault goes away, safety timer resumes. If the charging cycle is stopped and started again, the timer gets reset.

The safety timer is reset for the following events:

1. Charging cycle stop and restart (toggle CD pin, EN_CHG bit, or charged battery falls below recharge threshold).
2. BAT voltage changes from pre-charge to fast-charge or vice versa (in host-mode or default mode).

The precharge safety timer (fixed 2hr counter that runs when VBAT < V_{BAT_LOWV}), follows the same rules as the fast-charge safety timer in terms of getting suspended, reset, and counting at half-rate when TMR2X_EN is set.

8.3.5 Integrated 16-Bit ADC for Monitoring

The device includes a 16-bit ADC to monitor critical system information based on the device's modes of operation. The control of the ADC is done through the [ADC Control Register \(Address = 15h\) \[reset = 30h\]](#). The ADC_EN bit provides the ability to enable and disable the ADC to conserve power. The ADC_RATE bit allows continuous conversion or one-shot behavior. After a one-shot conversion finishes, the ADC_EN bit is cleared, and must be re-asserted to start a new conversion.

To enable the ADC, the ADC_EN bit must be set to '1'. The ADC is allowed to operate if either the V_{VBUS} > V_{VBUS_UVLO_RISING} or V_{BAT} > V_{BAT_UVLO_RISING} is valid. If no adapter is present, and the VBAT is less than V_{BAT_UVLO_RISING}, the device will not perform an ADC measurement, nor update the ADC read-back values in REG17 through REG24. Additionally, the device will immediately reset ADC_EN bit without sending any interrupt. The same will happen if the ADC is enabled when all ADC channels are disabled. It is recommended to read

back ADC_EN after setting it to '1' to ensure ADC is running a conversion. If the charger changes mode (for example, if adapter is connected, EN_HIZ goes to '1', or CD goes high,) while an ADC conversion is running, the conversion is interrupted. Once the mode change is complete, the ADC resumes conversion, starting with the channel where it was interrupted. When device is in HIZ mode, ADC conversion can still be enabled through I²C. In HIZ mode, device power up internally to start ADC conversion and turn back down when ADC conversion is completed.

When TS_ADC conversion performs in battery only mode, the REGN is powered and extra battery current would be drawn. Battery current can be kept low by disabling the TS_ADC conversion in battery only mode.

The integrated ADC has two rate conversion options: a one-shot mode and a continuous conversion mode set by the ADC_RATE bit. By default, all ADC parameters will be converted in one-shot or continuous conversion mode unless disabled in the [ADC Function Disable Register \(Address = 16h\) \[reset = 00h\]](#). If an ADC parameter is disabled by setting the corresponding bit in REG16, then the read-back value in the corresponding register will be from the last valid ADC conversion or the default POR value (all zeros if no conversions have taken place). If an ADC parameter is disabled in the middle of an ADC measurement cycle, the device will finish the conversion of that parameter, but will not convert the parameter starting the next conversion cycle. Even though no conversion takes place when all ADC measurement parameters are disabled, the ADC circuitry is active and ready to begin conversion as soon as one of the bits in the ADC Function Disable register is set to '0'. If all channels are disabled in one-shot conversion mode, the ADC_EN bit is cleared.

The ADC_DONE_STAT and ADC_DONE_FLAG bits signal when a conversion is completed in one-shot mode only. This event produces an INT pulse, which can be masked with ADC_DONE_MASK. During continuous conversion mode, the ADC_DONE_STAT bit has no meaning and will be '0'. The ADC_DONE_FLAG bit will remain unchanged in continuous conversion mode.

ADC conversion operates independently of the faults present in the device. ADC conversion will continue even after a fault has occurred (such as one that causes the power stage to be disabled), and the host must set ADC_EN = '0' to disable the ADC. ADC conversion is interrupted upon adapter plug-in, and will only resume until after Input Source Type Detection is complete. ADC readings are only valid for DC states and not for transients. When host writes ADC_EN = 0, the ADC stops immediately, and ADC measurement values correspond to last valid ADC reading.

A recommended method to exit ADC conversion is described below:

1. Write ADC_RATE to one-shot, and the ADC will stop at the end of a complete cycle of conversions, or
2. Disable all ADC conversion channels, and the ADC will stop at the end of the current measurement.

8.3.6 Status Outputs

8.3.6.1 Power Good Indicator ($\overline{\text{PG}}$)

The PG_STAT bit goes HIGH and open drain $\overline{\text{PG}}$ pin goes low to indicate a good input source when:

1. VBUS above V_{VBUS_UVLO_RISING}
2. VBUS below V_{VBUS_OV} threshold
3. VBUS above V_{POORSRC} (typ. 3.7 V) when I_{POORSRC} (typ. 30 mA) current is applied (not a poor source)
4. Input Source Type Detection is completed
5. CD pin is LOW

8.3.6.2 Charging Status Indicator (STAT)

The device indicates charging state on the open drain STAT pin. The STAT pin can drive LED. The STAT pin function can be disabled via the STAT_DIS bit. When CD is high, the device is in HIZ mode and STAT will not reflect charging state.

Table 5. STAT Pin State

CHARGING STATE	STAT INDICATOR
Charging in progress (including trickle charge, pre-charge, fast-charge, recharge)	LOW
Charging complete (including top-off)	HIGH
Sleep mode, charge disable	HIGH

Table 5. STAT Pin State (continued)

CHARGING STATE	STAT INDICATOR
Charge suspend (Input over-voltage, TS fault, timer fault or battery over-voltage)	Blinking at 1Hz

8.3.6.3 Interrupt to Host

In some applications, the host does not always monitor the charger operation. The $\overline{\text{INT}}$ pin notifies the system host on the device operation. By default, the following events will generate an active-low, 256- μs $\overline{\text{INT}}$ pulse.

- Good input source detected
 - $V_{\text{VBUS}} < V_{\text{VBUS_OV}}$ threshold
 - $V_{\text{VBUS}} > V_{\text{POORSRC}}$ (typ. 3.7 V) when I_{POORSRC} (typ. 30 mA) current is applied (not a poor source)
- VBUS_STAT changes state (VBUS_STAT any bit change)
- Good input source removed
- Entering IINDPM regulation
- Entering VINDPM regulation
- Entering IC junction temperature regulation (TREG)
- I2C Watchdog timer expired
 - At initial power up, this $\overline{\text{INT}}$ gets asserted to signal I²C is ready for communication
- Charger status changes state (CHRG_STAT value change), including Charge Complete
- TS_STAT changes state (TS_STAT any bit change)
- VBUS over-voltage detected (VBUS_OVP)
- Junction temperature shutdown (TSHUT)
- Cell over-voltage detected (CELLOVP)
- Cell over-voltage detected (HS_OV or LS_OV)
- Charge safety timer expired
- A rising edge on any of the *_STAT bits

Each one of these $\overline{\text{INT}}$ sources can be masked off to prevent $\overline{\text{INT}}$ pulses from being sent out when they occur. Three bits exist for each one of these events:

- The STAT bit holds the *current status* of each $\overline{\text{INT}}$ source
- The FLAG bit holds information on which source produced an $\overline{\text{INT}}$, regardless of the current status
- The MASK bit is used to prevent the device from sending out $\overline{\text{INT}}$ for each particular event

When one of the above conditions occurs (a rising edge on any of the *_STAT bits), the device sends out an $\overline{\text{INT}}$ pulse and keeps track of which source generated the $\overline{\text{INT}}$ via the FLAG registers. The FLAG register bits are automatically reset to zero after the host reads them, and a new edge on STAT bit is required to re-assert the FLAG.

Figure 13. $\overline{\text{INT}}$ Generation Behavior Example

8.3.7 Input Current Limit on ILIM Pin

For safe operation, the BQ2588x has an additional hardware pin on ILIM to limit maximum input current. The maximum input current is set by a resistor from ILIM pin to ground as:

$$I_{\text{INMAX}} = \frac{K_{\text{ILIM}}}{R_{\text{ILIM}}} \quad (3)$$

The actual input current limit is the lower value between ILIM pin setting and register setting (IINDPM). For example, if the register setting is 3.3 A (0x1C), and ILIM has a 820-Ω resistor ($K_{\text{ILIM}} = 1276$ max) to ground for 1.55 A, the input current limit is 1.55 A. ILIM pin can be used to set the input current limit rather than the register settings when EN_ILIM bit is set. The device regulates ILIM pin at 0.8 V. If ILIM voltage exceeds 0.8 V, the device enters input current regulation (refer to section). Entering IINDPM through ILIM pin sets the IINDPM_STAT and FLAG bits, and produces an interrupt to host. The interrupt can be masked via the IINDPM_MASK bit.

The ILIM pin can also be used to monitor input current when EN_ILIM is set. The voltage on ILIM pin is proportional to the input current. ILIM can be used to monitor input current with the following relationship:

$$I_{\text{IN}} = \frac{K_{\text{ILIM}} \times V_{\text{ILIM}}}{R_{\text{ILIM}} \times 0.8\text{V}} \quad (4)$$

For example, if ILIM pin is set with 820-Ω resistor, and the ILIM voltage 0.5V, the actual input current is 0.795 A to 0.973 A. If ILIM pin is open, the input current is limited to zero since ILIM voltage floats above 0.8 V. If ILIM pin is shorted, the input current limit is set by the register.

The ILIM pin function can be disabled by setting the EN_ILIM bit to 0. When the pin is disabled, both input current limit function and monitoring function are not available.

8.3.8 Voltage and Current Monitoring

The device closely monitors the input voltage, as well as internal FET currents for safe boost and buck mode operation.

8.3.8.1 Voltage and Current Monitoring in Boost Mode

8.3.8.1.1 Input Over-Voltage Protection

The valid input voltage range for boost mode operation is V_{VBUS_OP} . If VBUS voltage exceeds V_{VBUS_OV} , the device stops switching immediately to protect the power FETs. During input over-voltage, an \overline{INT} pulse is asserted to signal the host, and the $VBUS_OVP_STAT$ and $VBUS_OVP_FLAG$ fault registers get set. The device automatically starts switching again when the over-voltage condition goes away.

8.3.8.1.2 Input Under-Voltage Protection

The valid input voltage range for boost mode operation is V_{VBUS_OP} . If VBUS voltage falls below V_{POOR_SRC} during operation, the device stops switching. During input under-voltage, an \overline{INT} pulse is asserted to signal the host, and the PG_STAT bit gets cleared. The PG_FLAG bit will get set to signal this event. The device automatically attempts to restart switching when the under-voltage condition goes away.

8.3.9 Thermal Regulation and Thermal Shutdown

8.3.9.1 Thermal Protection in Boost Mode

The device monitors internal junction temperature, T_J , to avoid overheating and limits the IC surface temperature in boost mode. When the internal junction temperature exceeds the preset thermal regulation limit (TREG bits), the device reduces charge current. A wide thermal regulation range from 60°C to 120°C allows optimization for the system thermal performance.

During thermal regulation, the actual charging current is usually below the programmed value in ICHG registers. Therefore, termination is disabled, the safety timer runs at half the clock rate, the status register TREG_STAT bit goes high, and an \overline{INT} is asserted to the host.

Additionally, the device has thermal shutdown to turn off the converter when IC surface temperature exceeds T_{SHUT} . The fault register bits TSHUT_STAT and TSHUT_FLAG are set and an \overline{INT} pulse is asserted to the host. The converter turns back on when IC temperature is below T_{SHUT_HYS} .

8.3.10 Battery Protection

8.3.11 Serial Interface

The device uses I²C compatible interface for flexible charging parameter programming and instantaneous device status reporting. I²C is a bi-directional 2-wire serial interface. Only two open-drain bus lines are required: a serial data line (SDA), and a serial clock line (SCL). Devices can be considered as masters or slaves when performing data transfers. A master is a device which initiates a data transfer on the bus and generates the clock signals to permit that transfer. At that time, any device addressed is considered a slave.

The device operates as a slave device with address 0x6A, receiving control inputs from the master device like micro-controller or digital signal processor through REG00 – REG2C. Register read beyond REG2C (0x2C), returns 0xFF. The I²C interface supports both standard mode (up to 100kbts/s), and fast mode (up to 400 kbts/s). When the bus is free, both lines are HIGH. The SDA and SCL pins are open drain and must be connected to the positive supply voltage via a current source or pull-up resistor.

8.3.11.1 Data Validity

The data on the SDA line must be stable during the HIGH period of the clock. The HIGH or LOW state of the data line can only change when the clock signal on SCL line is LOW. One clock pulse is generated for each data bit transferred.

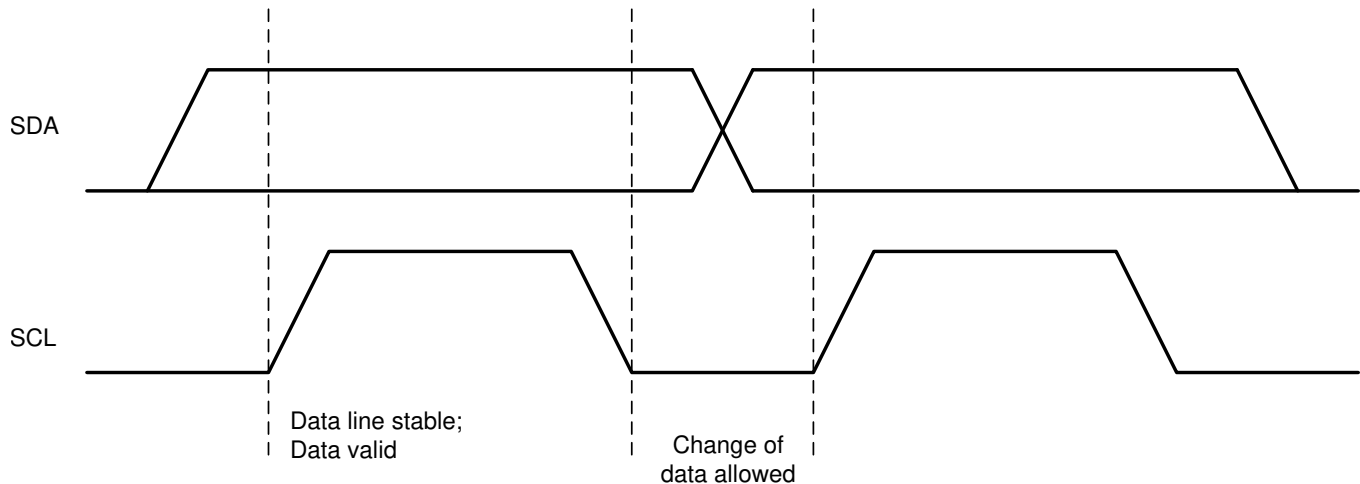

Figure 14. Bit Transfers on the I2C bus

8.3.11.2 START and STOP Conditions

All transactions begin with a START (S) and are terminated with a STOP (P). A HIGH to LOW transition on the SDA line while SCL is HIGH defines a START condition. A LOW to HIGH transition on the SDA line when the SCL is HIGH defines a STOP condition.

START and STOP conditions are always generated by the master. The bus is considered busy after the START condition, and free after the STOP condition.

Figure 15. START and STOP conditions on the I2C bus

8.3.11.3 Byte Format

Every byte on the SDA line must be 8 bits long. The number of bytes to be transmitted per transfer is unrestricted. Each byte has to be followed by an ACKNOWLEDGE (ACK) bit. Data is transferred with the Most Significant Bit (MSB) first. If a slave cannot receive or transmit another complete byte of data until it has performed some other function, it can hold the SCL line low to force the master into a wait state (clock stretching). Data transfer then continues when the slave is ready for another byte of data and releases the SCL line.

Figure 16. Data Transfer on the I2C Bus

8.3.11.4 Acknowledge (ACK) and Not Acknowledge (NACK)

The ACK signaling takes place after byte. The ACK bit allows the receiver to signal the transmitter that the byte was successfully received and another byte may be sent. All clock pulses, including the acknowledge 9th clock pulse, are generated by the master.

The transmitter releases the SDA line during the acknowledge clock pulse so the receiver can pull the SDA line LOW and it remains stable LOW during the HIGH period of this 9th clock pulse.

A NACK is signaled when the SDA line remains HIGH during the 9th clock pulse. The master can then generate either a STOP to abort the transfer or a repeated START to start a new transfer.

8.3.11.5 Slave Address and Data Direction Bit

After the START signal, a slave address is sent. This address is 7 bits long, followed by the 8 bit as a data direction bit (bit R/W). A zero indicates a transmission (WRITE) and a one indicates a request for data (READ). The device 7-bit address is defined as 1101 011' (0x6B) by default. The address bit arrangement is shown below.

Figure 17. 7-Bit Addressing (0x6B)

Figure 18. Complete Data Transfer on the I2C Bus

8.3.11.6 Single Write and Read

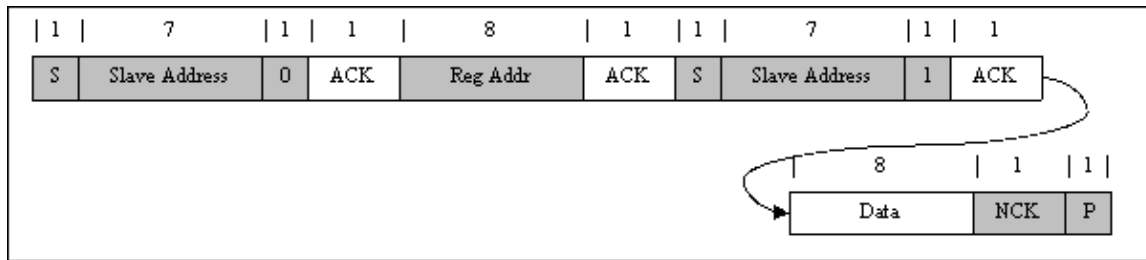

Figure 19. Single Write

Figure 20. Single Read

If the register address is not defined, the charger IC sends back NACK and returns to the idle state.

8.3.11.7 Multi-Write and Multi-Read

The charger device supports multi-read and multi-write of all registers.

Figure 21. Multi-Write

Figure 22. Multi-Read

8.4 Device Functional Modes

8.4.1 Host Mode and Default Mode

The BQ2588x is a host controlled charger, but it can operate in default mode without host management. In default mode, the device can be used as an autonomous charger with no host or while host is in sleep mode. When the charger is in default mode, WD_STAT bit is HIGH. When the charger is in host mode, WD_STAT bit is LOW.

After power-on-reset, the device starts in default mode with watchdog timer expired, or default mode. All the registers are in the default settings. During default mode, any change on PSEL pin will make real time internal reference change.

In default mode, the device keeps charging the battery with default 12-hour fast charging safety timer.

A I2C write to the registers transitions the charger from default mode to host mode and watchdog timer is reset. All the device parameters can be programmed by the host. To keep the device in host mode, the host has to reset the watchdog timer by writing 1 to WD_RST bit before the watchdog timer expires (WD_STAT bit is set), or disable watchdog timer by setting WATCHDOG bits = 00.

Device Functional Modes (continued)

When the watchdog timer (WD_STAT bit = 1) is expired, the device returns to default mode and all registers are reset to default values except as detailed in the [Register Maps](#) section. The Watchdog timer will be reset on any write if the watchdog timer has expired.

5	CB_MASK	R/W	Yes	No	When set, the device will not send an interrupt on the $\overline{\text{INT}}$ pin when the device enters or exits cell balance mode.
4	HS_CV_MASK	R/W	Yes	No	When set, the device will not send an interrupt on the $\overline{\text{INT}}$ pin when the high side cell balancing FET is in CV mode.
3	LS_CV_MASK	R/W	Yes	No	When set, the device will not send an interrupt on the $\overline{\text{INT}}$ pin when the low side cell balancing FET is in CV mode.
2	HS_OV_MASK	R/W	Yes	No	When set, the device will not send an interrupt on the $\overline{\text{INT}}$ pin when the high side cell is in over-voltage.
1	LS_OV_MASK	R/W	Yes	No	When set, the device will not send an interrupt on the $\overline{\text{INT}}$ pin when the low side cell is in over-voltage.
0	CB_OC_MASK	R/W	Yes	No	When set, the device will not send an interrupt on the $\overline{\text{INT}}$ pin when the Cell Balance Over-Current Protections is active.

9 Application and Implementation

NOTE

Information in the following applications sections is not part of the TI component specification, and TI does not warrant its accuracy or completeness. TI's customers are responsible for determining suitability of components for their purposes. Customers should validate and test their design implementation to confirm system functionality.

9.1 Application Information

A typical application consists of the BQ25887 configured as an I²C controlled device and a 2s battery charger with cell balancing for Li-Ion and Li-polymer batteries used in a wide range of E-cig and other portable devices. It integrates an input blocking FET (QBLK, Q1), high-side switching FET (QHS, Q2), and low-side switching FET (QLS, Q3). The device also integrates a bootstrap diode for the high-side gate drive.

9.2 Typical Application

*Note: 300Ω resistor on MID pin is used to limit the current in the case where the bottom cell is plugged in reversly

Figure 69. BQ25887 (Cell Balancing and I²C) Typical Application Diagram

Typical Application (continued)

9.2.1 Design Requirements

For this design example, use the parameters shown in [Table 53](#) below.

Table 53. Design Parameters

PARAMETER	VALUE
V _{BUS} voltage range	3.9 V to 6.2 V
Input current limit (I _{INDPM} [4:0])	2.4 A
Fast charge current limit (I _{CHG} [5:0])	1.5 A
Battery Regulation Voltage (V _{CELLREG} [7:0])	4.2 V

9.2.2 Detailed Design Procedure

9.2.2.1 Inductor Selection

The device has 1.5-MHz switching frequency to allow the use of small inductor and capacitor values. The inductor saturation current should be higher than the input current (I_{IN}) plus half the ripple current (I_{RIPPLE}):

$$I_{SAT} \geq I_{IN} + \frac{I_{RIPPLE}}{2} \quad (5)$$

The inductor ripple current (I_{RIPPLE}) depends on input voltage (V_{BUS}), duty cycle (D = V_{BAT}/V_{BUS}), switching frequency (f_{SW}) and inductance (L):

$$I_{RIPPLE} = \frac{V_{BUS} \times (V_{SYS} - V_{BUS})}{V_{SYS} \times f_{SW} \times L} \quad (6)$$

The maximum inductor ripple current happens in the vicinity of D = 0.5. Usually inductor ripple is designed in the range of (20 – 40%) maximum charging current as a trade-off between inductor size and efficiency for a practical design.

9.2.2.2 Input (V_{BUS} / P_{MID}) Capacitor

The input capacitor should have enough ripple current rating to absorb input switching ripple current. The worst case RMS ripple current occurs when duty cycle is 0.5. If the converter does not operate at 50% duty cycle, then the worst case capacitor RMS current I_{PMID} occurs where the duty cycle is closest to 50% and can be estimated by

$$I_{PMID} = \frac{I_{RIPPLE}}{2 \times \sqrt{3}} \approx 0.29 \times I_{RIPPLE} \quad (7)$$

A low ESR ceramic capacitor such as X7R or X5R is preferred for input decoupling capacitor and should be placed close to the P_{MID} and GND pins of the IC. Voltage rating of the capacitor must be higher than normal input voltage level. 25-V rating or higher capacitor is preferred for up to 5-V input voltage. A minimum 10-μF capacitor is suggested for up to 3.3-A input current. Keep in mind, long impedance cable would cause significant voltage drop with higher inrush current. For optimal performance, 44-μF cap on P_{MID} is recommended. In addition, a minimum 1-μF capacitor is suggested at V_{BUS} pin.

9.2.2.3 Output (V_{SNS}) Capacitor

The SYS capacitor is the boost converter output capacitor and should also have enough ripple current rating to absorb output switching ripple current. The output capacitor RMS current I_{COUT} is given:

$$I_{CSYS, rms} = I_{OUT} \times \sqrt{\frac{D}{1-D}} \quad (8)$$

The output capacitor voltage ripple is a function of the boost output current (I_{OUT}), and can be calculated as follows:

$$\Delta V_{SYS} = \frac{I_{OUT} \times D}{f_{SW} \times C_{SYS}} \quad (9)$$

A low ESR ceramic capacitor such as X7R or X5R is preferred for SNS decoupling capacitor and should be placed close to the SNS and GND pins of the IC. Voltage rating of the capacitor must be higher than normal output voltage level. 16-V rating or higher capacitor is preferred. Minimum 44-μF capacitor is suggested for up to 2.2-A boost converter output current.

9.2.3 Application Curves

$C_{VBUS} = 1 \mu\text{F}$, $C_{PMID} = 10 \mu\text{F}$, $C_{BAT} = 10 \mu\text{F}$, $C_{SNS} = 44 \mu\text{F}$, $L = \text{DFE252012F-1R0}$ (1 μH) (unless otherwise specified)

Figure 78. IINDPM Transient Response

Figure 79. Charge Cycle with the Bottom Cell Voltage Higher Than the Top Cell Voltage

Figure 80. Charge Cycle with the Top Cell Voltage Higher Than the Bottom Cell Voltage

10 Power Supply Recommendations

In order to provide an output voltage, the device requires a power supply between 3.9-V and 6.2-V input with at least 500-mA current rating connected to VBUS or a 2-cell Li-Ion battery with voltage > VBAT_UVLO connected to BAT..

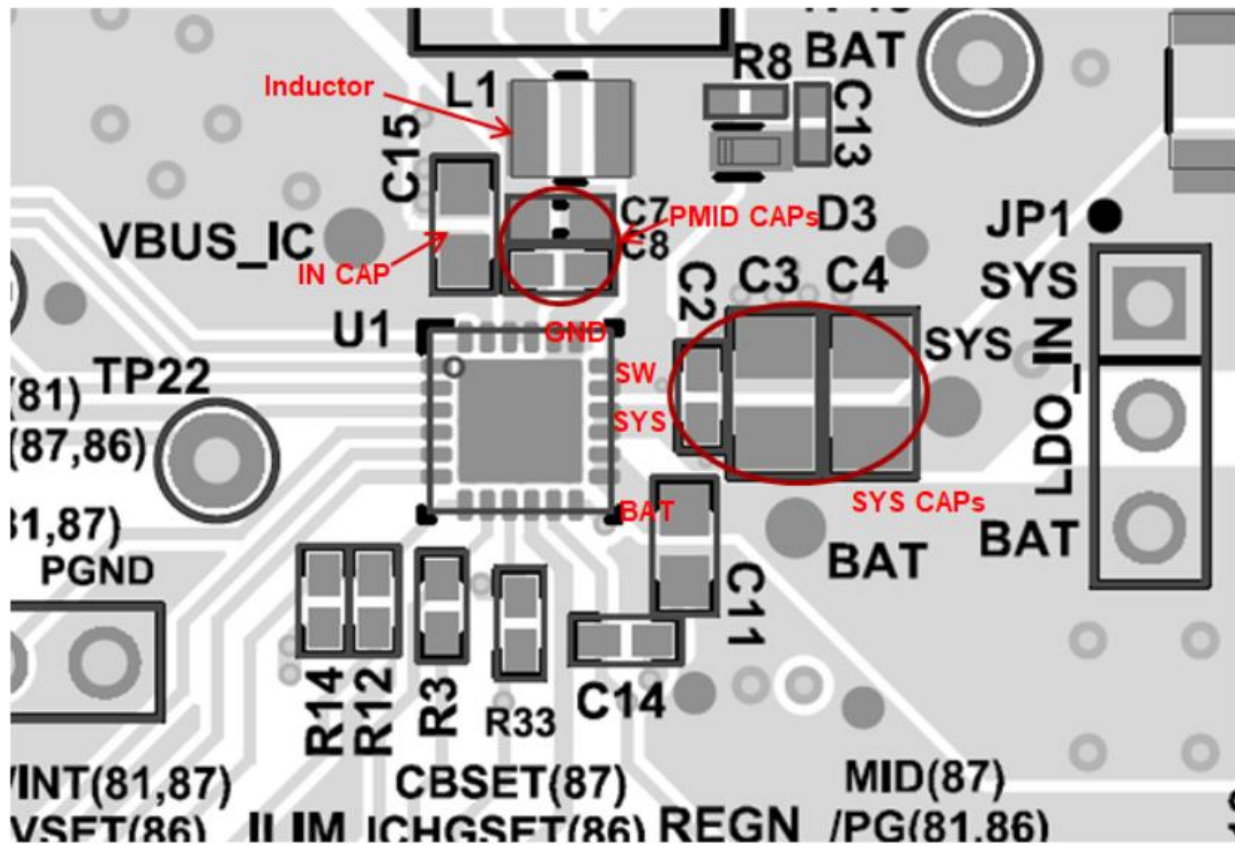

11 Layout

11.1 Layout Guidelines

The switching node rise and fall times should be minimized for minimum switching loss. Proper layout of the components to minimize high frequency current path loops is important to prevent electrical and magnetic field radiation and high frequency resonant problems. Here is a PCB layout priority list for proper layout. Layout PCB according to this specific order is essential.

1. Put SNS output capacitor as close to SNS and GND pins as possible. Ground connections need to be tied to the IC ground with a short copper trace connection or GND plane.
2. Place PMID input capacitor as close as possible to PMID pins and PGND pins and use shortest copper trace connection or GND plane.
3. Place inductor input terminal to SW pins as close as possible. Minimize the copper area of this trace to lower electrical and magnetic field radiation but make the trace wide enough to carry the input current. Minimize parasitic capacitance from this area to any other trace or plane.
4. Decoupling capacitors should be placed on the same side of and next to the IC and make trace connection as short as possible.
5. Route analog ground separately from power ground. Connect analog ground and connect power ground separately. Connect analog ground and power ground together using thermal pad as the single ground connection point. Or using a 0-Ω resistor to tie analog ground to power ground.
6. It is critical that the exposed thermal pad on the backside of the device package be soldered to the PCB ground. Ensure that there are sufficient thermal vias directly under the IC, connecting to the ground plane on the other layers.
7. Via size and number should be enough for a given current path.
8. Route MID as sensing trace away from switching nodes such as SW.

Refer to the EVM design and the [Layout Example](#) below for the recommended component placement with trace and via locations.

12 Device and Documentation Support

12.1 Device Support

12.1.1 Third-Party Products Disclaimer

TI'S PUBLICATION OF INFORMATION REGARDING THIRD-PARTY PRODUCTS OR SERVICES DOES NOT CONSTITUTE AN ENDORSEMENT REGARDING THE SUITABILITY OF SUCH PRODUCTS OR SERVICES OR A WARRANTY, REPRESENTATION OR ENDORSEMENT OF SUCH PRODUCTS OR SERVICES, EITHER ALONE OR IN COMBINATION WITH ANY TI PRODUCT OR SERVICE.

12.2 Documentation Support

12.2.1 Related Documentation

For related documentation see the following:

- [BQ2588x Boosting Battery Chargers Evaluation Module User's Guide](#)

12.3 Receiving Notification of Documentation Updates

To receive notification of documentation updates, navigate to the device product folder on ti.com. In the upper right corner, click on *Alert me* to register and receive a weekly digest of any product information that has changed. For change details, review the revision history included in any revised document.

12.4 Support Resources

TI E2E™ support forums are an engineer's go-to source for fast, verified answers and design help — straight from the experts. Search existing answers or ask your own question to get the quick design help you need.

Linked content is provided "AS IS" by the respective contributors. They do not constitute TI specifications and do not necessarily reflect TI's views; see TI's [Terms of Use](#).

12.5 Trademarks

E2E is a trademark of Texas Instruments.

All other trademarks are the property of their respective owners.

12.6 Electrostatic Discharge Caution

This integrated circuit can be damaged by ESD. Texas Instruments recommends that all integrated circuits be handled with appropriate precautions. Failure to observe proper handling and installation procedures can cause damage.

ESD damage can range from subtle performance degradation to complete device failure. Precision integrated circuits may be more susceptible to damage because very small parametric changes could cause the device not to meet its published specifications.

12.7 Glossary

[SLYZ022](#) — TI Glossary.

This glossary lists and explains terms, acronyms, and definitions.

13 Mechanical, Packaging, and Orderable Information

The following pages include mechanical, packaging, and orderable information. This information is the most current data available for the designated devices. This data is subject to change without notice and revision of this document. For browser-based versions of this data sheet, refer to the left-hand navigation.

PACKAGING INFORMATION

Orderable part number	Status (1)	Material type (2)	Package Pins	Package qty Carrier	RoHS (3)	Lead finish/ Ball material (4)	MSL rating/ Peak reflow (5)	Op temp (°C)	Part marking (6)
BQ25887RGER	Active	Production	VQFN (RGE) 24	3000 LARGE T&R	Yes	NIPDAU	Level-1-260C-UNLIM	-40 to 85	BQ25887

BQ25887RGET	Active	Production	VQFN (RGE) 24	250 SMALL T&R	Yes	NIPDAU	Level-1-260C-UNLIM	-40 to 85	BQ25887
BQ25887RGET.A	Active	Production	VQFN (RGE) 24	250 SMALL T&R	Yes	NIPDAU	Level-1-260C-UNLIM	-40 to 85	BQ25887

⁽¹⁾ **Status:** For more details on status, see our [product life cycle](#).

⁽²⁾ **Material type:** When designated, preproduction parts are prototypes/experimental devices, and are not yet approved or released for full production. Testing and final process, including without limitation quality assurance, reliability performance testing, and/or process qualification, may not yet be complete, and this item is subject to further changes or possible discontinuation. If available for ordering, purchases will be subject to an additional waiver at checkout, and are intended for early internal evaluation purposes only. These items are sold without warranties of any kind.

⁽³⁾ **RoHS values:** Yes, No, RoHS Exempt. See the [TI RoHS Statement](#) for additional information and value definition.

⁽⁴⁾ **Lead finish/Ball material:** Parts may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead finish/Ball material values may wrap to two lines if the finish value exceeds the maximum column width.

⁽⁵⁾ **MSL rating/Peak reflow:** The moisture sensitivity level ratings and peak solder (reflow) temperatures. In the event that a part has multiple moisture sensitivity ratings, only the lowest level per JEDEC standards is shown. Refer to the shipping label for the actual reflow temperature that will be used to mount the part to the printed circuit board.

⁽⁶⁾ **Part marking:** There may be an additional marking, which relates to the logo, the lot trace code information, or the environmental category of the part.

Multiple part markings will be inside parentheses. Only one part marking contained in parentheses and separated by a "~" will appear on a part. If a line is indented then it is a continuation of the previous line and the two combined represent the entire part marking for that device.
