TEXAS INSTRUMENTS

DAC8551-Q1, DAC6551-Q1

SLASEB8C – FEBRUARY 2016 – REVISED NOVEMBER 2016

DACx551-Q1 Automotive 16-, 12-Bit, Ultralow-Glitch, Voltage-Output DAC

1 Features

- Qualified for Automotive Applications
- AEC-Q100 Qualified With the Following Results:
  - Device Temperature Grade 1: –40°C to 125°C Ambient Operating Temperature Range
  - Device HBM ESD Classification Level 2
  - Device CDM ESD Classification Level C4B
- Relative Accuracy:
  - DAC8551-Q1 (16-Bit): 4 LSB INL
  - DAC6551-Q1 (12-Bit): 0.3 LSB INL
- Ultralow Glitch Impulse: 0.1 nV-s
- Settling Time: 8 μs to ±0.003% FSR
- Power Supply: 3 V to 5.5 V
- Power-On Reset to Zero Scale
- *Micro*Power Operation: 160 μA at 5 V
- Low-Power Serial Interface With Schmitt-Triggered Inputs
- On-Chip Output Buffer Amplifier With Rail-to-Rail Operation
- Power-Down Capability
- Binary Input
- $\overline{\text{SYNC}}$ Interrupt Facility
- Available in a Tiny VSSOP-8 Package

2 Applications

- Automotive Radar
- Automotive Sensors

3 Description

The DAC8551-Q1 and DAC6551-Q1 are small, low-power, voltage-output, 16- and 12-bit digital-to-analog converters (DACs) qualified for automotive applications. The DACx551-Q1 devices provide good linearity and minimize undesired code-to-code transient voltages. The devices use a versatile 3-wire serial interface that operates at clock rates to 30 MHz and is compatible with standard SPI, QSPI, Microwire, and digital signal-processor (DSP) interfaces.

The DACx551-Q1 devices require an external reference voltage to set the output range. The devices incorporate a power-on-reset circuit that ensures the DAC output powers up at 0 V and remains there until a valid write to the device takes place. The devices contain a power-down feature, accessed over the serial interface, that reduces the current consumption to 800 nA at 5 V.

The DACx551-Q1 devices power consumption is only 800 μW at 5 V, reducing to less than 4 μW in power-down mode. The DACx551-Q1 devices are available in a VSSOP-8 package.

Device Information[1]

PART NUMBER	PACKAGE	BODY SIZE (NOM)
DAC8551-Q1 DAC6551-Q1	VSSOP (8)	3.00 mm × 3.00 mm

(1) For all available packages, see the orderable addendum at the end of the data sheet.

Table of Contents

4 Revision History

Changes from Revision B (November 2016) to Revision C **Page**

- Added device DAC6551-Q1 to the data sheet ... 1
- Changed the data sheet Title From: DAC8551-Q1 Automotive 16-Bit... To: DACx551-Q1 Automotive 16-, 12-Bit... ... 1
- Changed Relative Accuracy in the *Features* section ... 1
- Updated the *Description* to include the DAC6551-Q1 device ... 1
- Added DAC6551-Q1 to the *Thermal Table* ... 5
- Added separate lines for the DAC6551-Q1 and DAC8551-Q1 devices for Resolution, Relative accuracy, and Differential nonlinearity in the *Electrical Characteristics* table ... 5
- Changed Note 1 of the *Electrical Characteristics* table ... 6
- Updated the *Overview* section to include the DAC6551-Q1 device ... 13
- Changed Equation 1 ... 13
- Changed the definitions of in the "where:" statement for Equation 1 ... 14
- Deleted a sentence from the *Resistor String* section: "Monotonicity is ennsured because of the string resistor archietecture." ... 14
- Added Figure 31 ... 16
- Updated the *Application Information* section to include the DAC6551-Q1 device ... 17
- Updated the *Using the REF02 As a Power Supply for the DACx551-Q1 Device* section to include the DAC6551-Q1 device ... 19
- Updated the *System Examples* section to include the DAC6551-Q1 device ... 20
- Updated the *Power Supply Recommendations* section to include the DAC6551-Q1 device ... 21
- Updated the *Layout Guidelines* section to include the DAC6551-Q1 device ... 21

Changes from Revision A (March 2016) to Revision B **Page**

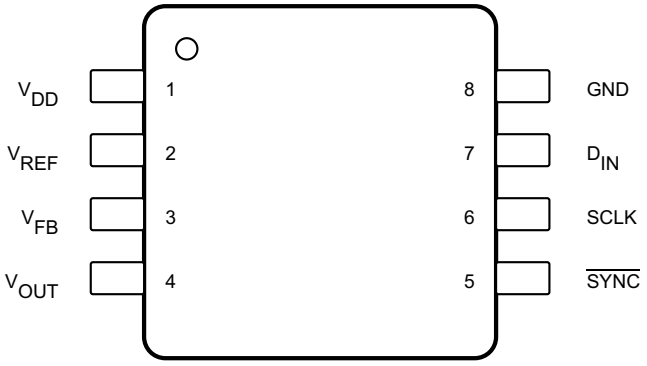
- Changed Relative Accuracy in the *Features* section ... 1
- Changed power supply voltage in the *Features* section ... 1
- Changed voltage for V_{DD} in the *Pin Functions* table ... 4
- Changed supply voltage in the *Recommended Operating Conditions* table ... 5
- Changed values in the *Thermal Information* table ... 5
- Changed supply voltage in the conditions statement of the *Electrical Characteristics* table ... 5
- Removed two rows and all test conditions in the *LOGIC INPUTS* section of the *Electrical Characteristics* table ... 6
- Changed supply voltage in the *POWER REQUIREMENTS* section of the *Electrical Characteristics* table ... 6
- Changed test conditions for supply current in the *POWER REQUIREMENTS* section of the *Electrical Characteristics* table ... 6
- Changed V_{DD} in the condition statement and test conditions of the *Timing Requirements*(1)(2) section ... 7
- Changed MIN value for SCLK low time in the *Timing Requirements*(1)(2) section ... 7
- Added text in the *Application Information* section ... 17
- Changed supply voltage in the *Power Supply Recommendations* section ... 21
- Added new *Receiving Notification of Documentation Updates* section ... 22

Changes from Original (February 2016) to Revision A **Page**

- Changed data sheet from PRODUCT PREVIEW to PRODUCTON DATA ... 1

5 Pin Configuration and Functions

DGK Package
8-Pin VSSOP
Top View



Pin Functions

PIN		TYPE	DESCRIPTION
NAME	NO.		
D_{IN}	7	I	Serial data input. Data is clocked into the 24-bit input shift register on each falling edge of the serial clock input. Schmitt-trigger logic input.
GND	8	GND	Ground reference point for all circuitry on the device
SCLK	6	I	Serial clock input. Data can be transferred at rates up to 30 MHz. Schmitt-trigger logic input.
$\overline{SYNC}$	5	I	Level-triggered control input (active-low). This is the frame synchronization signal for the input data. $\overline{SYNC}$ going low enables the input shift register, and data is transferred in on the falling edges of the following clocks. The DAC is updated following the 24th clock (unless $\overline{SYNC}$ is taken high before this edge, in which case the rising edge of $\overline{SYNC}$ acts as an interrupt, and the write sequence is ignored by the device). Schmitt-trigger logic input.
V_{DD}	1	PWR	Power supply input, 3 V to 5.5 V
V_{FB}	3	I	Feedback connection for the output amplifier. For voltage output operation, tie to V_{OUT} externally.
V_{OUT}	4	O	Analog output voltage from DAC. The output amplifier has rail-to-rail operation.
V_{REF}	2	I	Reference voltage input

6 Specifications

6.1 Absolute Maximum Ratings

over operating ambient temperature range (unless otherwise noted)(1)

		MIN	MAX	UNIT
V_{DD} to GND		–0.3	6	V
Digital input voltage to GND	D_{IN}, SCLK and $\overline{SYNC}$	–0.3	V_{DD} + 0.3	V
V_{OUT} to GND		–0.3	V_{DD} + 0.3	V
V_{REF} to GND		–0.3	V_{DD} + 0.3	V
V_{FB} to GND		–0.3	V_{DD} + 0.3	V
Junction temperature range, T_J max		–65	150	°C
Storage temperature, T_{stg}		–65	150	°C

(1) Stresses beyond those listed under *Absolute Maximum Ratings* may cause permanent damage to the device. These are stress ratings only, which do not imply functional operation of the device at these or any other conditions beyond those indicated under *Recommended Operating Conditions*. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.

6.2 ESD Ratings

			VALUE	UNIT
$V_{(ESD)}$	Electrostatic discharge	Human-body model (HBM), per AEC Q100-002 (1)	±2000	V
		Charged-device model (CDM), per AEC Q100-011 — All pins	±500	
		Charged-device model (CDM), per AEC Q100-011 — Corner pins (1, 4, 5, and 8)	±750	

(1) AEC Q100-002 indicates that HBM stressing shall be in accordance with the ANSI/ESDA/JEDEC JS-001 specification.

6.3 Recommended Operating Conditions

over operating ambient temperature range (unless otherwise noted)

		MIN	NOM	MAX	UNIT
POWER SUPPLY					
Supply voltage	V_{DD} to GND	3		5.5	V
DIGITAL INPUTS					
Digital input voltage	D_{IN}, SCLK and $\overline{SYNC}$	0		V_{DD}	V
REFERENCE INPUT					
V_{REF} Reference input voltage		0		V_{DD}	V
AMPLIFIER FEEDBACK INPUT					
V_{FB} Output amplifier feedback input			V_{OUT}		V
TEMPERATURE RANGE					
T_A Operating ambient temperature		–40		125	°C

6.4 Thermal Information

THERMAL METRIC (1)		DAC8551-Q1 DAC6551-Q1 DGK (VSSOP) 8 PINS	UNIT
$R_{\theta JA}$	Junction-to-ambient thermal resistance	173.7	°C/W
$R_{\theta JC(top)}$	Junction-to-case (top) thermal resistance	65.4	°C/W
$R_{\theta JB}$	Junction-to-board thermal resistance	94.2	°C/W
ψ_{JT}	Junction-to-top characterization parameter	10.2	°C/W
ψ_{JB}	Junction-to-board characterization parameter	92.7	°C/W

(1) For more information about traditional and new thermal metrics, see the *Semiconductor and IC Package Thermal Metrics* application report.

6.5 Electrical Characteristics

V_{DD} = 3 V to 5.5 V, V_{REF} = V_{DD} and T_A = –40°C to 125°C, unless otherwise noted.

PARAMETER	TEST CONDITIONS	MIN	TYP	MAX	UNIT
STATIC PERFORMANCE (1)					
Resolution	DAC8551-Q1	16			Bits
	DAC6551-Q1	12			
Relative accuracy	DAC8551-Q1		±4	±16	LSB
	DAC6551-Q1		±0.3	±1	
Differential nonlinearity	DAC8551-Q1		±0.35	±2	LSB
	DAC6551-Q1		±0.02	±1	
Offset error			±1	±15	mV
Full-scale error			±0.05	±0.5	% of FSR
Gain error			±0.02	±0.2	% of FSR
Offset error drift			±5		µV/°C
Gain temperature coefficient			±1		ppm of FSR/°C

(1) Linearity calculated using a reduced code range of 485 to 64,741 (16-bit); 30 to 4,046 (12-bit); output unloaded.

Electrical Characteristics (continued)

V_{DD} = 3 V to 5.5 V, V_{REF} = V_{DD} and T_A = –40°C to 125°C, unless otherwise noted.

PARAMETER		TEST CONDITIONS	MIN	TYP	MAX	UNIT
PSRR	Power-supply rejection ratio	R_L = 2 kΩ, C_L = 200 pF		0.75		mV/V
OUTPUT CHARACTERISTICS(2)						
	Output voltage range		0		V_{REF}	V

POWER REQUIREMENTS						
V_{DD}	Supply voltage		3		5.5	V
I_{DD}	Supply current	Normal mode, midscale code, no load, does not include reference current. V_{IH} = V_{DD} and V_{IL} = GND, V_{DD} = 3.6 V to 5.5 V		160	250	µA
		Normal mode, midscale code, no load, does not include reference current. V_{IH} = V_{DD} and V_{IL} = GND, V_{DD} = 3 V to 3.6 V		110	240	
		All power-down modes, V_{IH} = V_{DD} and V_{IL} = GND, V_{DD} = 3.6 V to 5.5 V		0.8	3	
		All power-down modes, V_{IH} = V_{DD} and V_{IL} = GND, V_{DD} = 3 V to 3.6 V		0.5	3	
POWER EFFICIENCY						
	I_{OUT} / I_{DD}	I_{LOAD} = 2 mA, V_{DD} = 5 V		89%		
TEMPERATURE RANGE						
T_A	Ambient temperature		–40		125	°C

(2) Specified by design and characterization; not production tested.

6.6 Timing Requirements(1)(2)

V_{DD} = 3 V to 5.5 V and T_A = –40°C to 125°C, unless otherwise noted.

PARAMETER		TEST CONDITIONS	MIN	NOM	MAX	UNIT
f_{SCLK}	Serial clock frequency	V_{DD} = 3 V to 3.6 V			25	MHz
		V_{DD} = 3.6 V to 5.5 V			30	
t_1	SCLK cycle time	V_{DD} = 3 V to 3.6 V	40			ns
		V_{DD} = 3.6 V to 5.5 V	34			
t_2	SCLK high time	V_{DD} = 3 V to 3.6 V	13			ns
		V_{DD} = 3.6 V to 5.5 V	13			
t_3	SCLK low time	V_{DD} = 3 V to 3.6 V	13			ns
		V_{DD} = 3.6 V to 5.5 V	13			
t_4	$\overline{SYNC}$ to SCLK rising edge setup time	V_{DD} = 3 V to 3.6 V	0			ns
		V_{DD} = 3.6 V to 5.5 V	0			
t_5	Data setup time	V_{DD} = 3 V to 3.6 V	5			ns
		V_{DD} = 3.6 V to 5.5 V	5			
t_6	Data hold time	V_{DD} = 3 V to 3.6 V	5			ns
		V_{DD} = 3.6 V to 5.5 V	5			
t_7	24th SCLK falling edge to $\overline{SYNC}$ rising edge	V_{DD} = 3 V to 3.6 V	0			ns
		V_{DD} = 3.6 V to 5.5 V	0			
t_8	Minimum $\overline{SYNC}$ high time	V_{DD} = 3 V to 3.6 V	50			ns
		V_{DD} = 3.6 V to 5.5 V	34			
t_9	24th SCLK falling edge to $\overline{SYNC}$ falling edge	V_{DD} = 3 V to 5.5 V	50			ns

(1) All input signals are specified with $t_R = t_F$ = 5 ns (10% to 90% of V_{DD}) and timed from a voltage level of (V_{IL} + V_{IH}) / 2.
(2) See the *Serial-Write-Operation Timing Diagram*.

6.7 Switching Characteristics

over operating ambient temperature range (unless otherwise noted)

7 Detailed Description

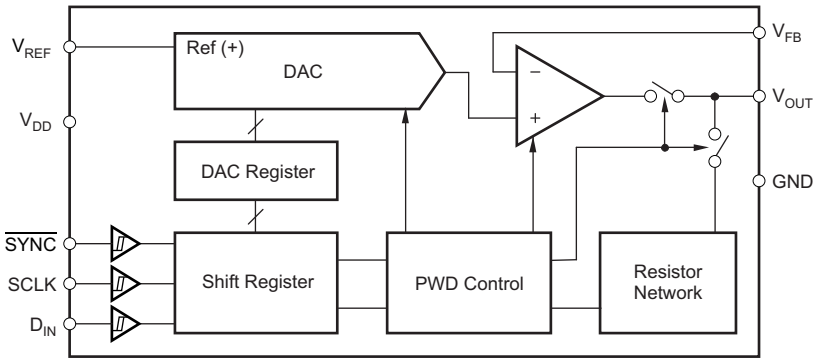
7.1 Overview

The DAC8551-Q1 and DAC6551-Q1 are small, low-power, voltage-output, 16- and 12-bit digital-to-analog converters (DACs) qualified for automotive applications. The DACx551-Q1 devices provide good linearity and minimize undesired code-to-code transient voltages. The devices use a versatile 3-wire serial interface that operates at clock rates to 30 MHz and is compatible with standard SPI, QSPI, Microwire, and digital signal processor (DSP) interfaces.

The DACx551-Q1 devices require an external reference voltage to set the output range. The devices incorporate a power-on-reset circuit that ensures the DAC output powers up at 0 V and remains there until a valid write to the device takes place. The devices contain a power-down feature, accessed over the serial interface, that reduces the current consumption to 800 nA at 5 V.

The DACx551-Q1 devices power consumption is only 800 μW at 5 V, reducing to less than 4 μW in power-down mode. The DACx551-Q1 devices are available in a VSSOP-8 package.

7.2 Functional Block Diagram



7.3 Feature Description

7.3.1 DAC Section

The DACx551-Q1 architecture consists of a string DAC followed by an output buffer amplifier. Figure 27 shows a block diagram of the DAC architecture.

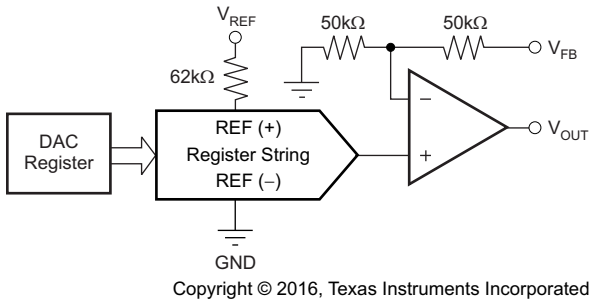


Figure 27. DACx551-Q1 Architecture

The input coding to the DACx551-Q1 is straight binary, so the ideal output voltage is given by:

$$V_{OUT} = \frac{D_{IN}}{2^{n-1}} \times V_{REF} \quad (1)$$

Feature Description (continued)

where:

- n = resolution in bits; 12 (DAC6551-Q1) or 16 (DAC8551-Q1)
- D_{IN} = decimal equivalent of the binary code that is loaded to the DAC register; it can range from 0 to 2^{n-1}.

7.3.1.1 Resistor String

The resistor string section is shown in Figure 28. It is simply a string of resistors, each of value R. The code loaded into the DAC register determines at which node on the string the voltage is tapped off to be fed into the output amplifier by closing one of the switches connecting the string to the amplifier.

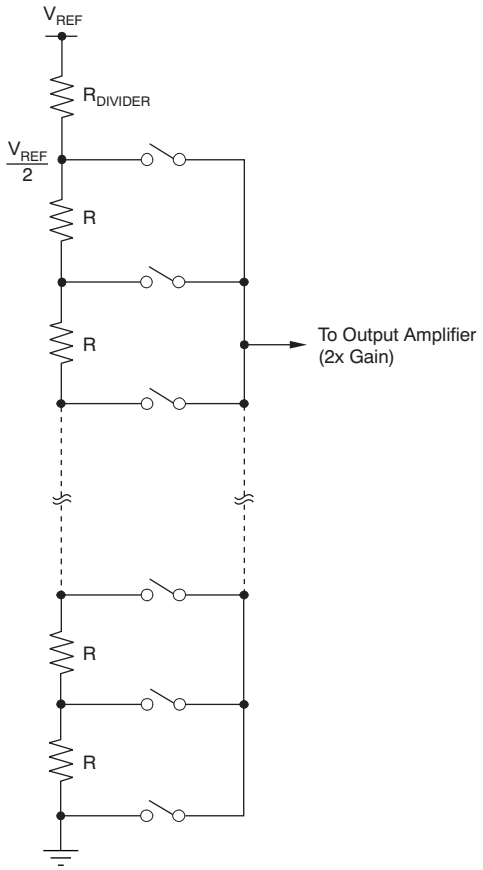

Figure 28. Resistor String

7.3.1.2 Output Amplifier

The output buffer amplifier is capable of generating rail-to-rail voltages on its output, giving an output range of 0 V to V_{DD}. It is capable of driving a load of 2 kΩ in parallel with 1000 pF to GND. The source and sink capabilities of the output amplifier can be seen in the *Typical Characteristics*. The slew rate is 1.4 V/μs with a full-scale setting time of 8 μs with the output unloaded.

The inverting input of the output amplifier is brought out to the V_{FB} pin. This configuration allows for better accuracy in critical applications by tying the V_{FB} point and the amplifier output together directly at the load. Other signal conditioning circuitry may also be connected between these points for specific applications.

7.3.2 Power-On Reset

The DACx551-Q1 contains a power-on-reset circuit that controls the output voltage during power up. On power up, the DAC registers are filled with zeros and the output voltages are 0 V; they remain that way until a valid write sequence is made to the DAC. The power-on reset is useful in applications where it is important to know the state of the output of the DAC while it is in the process of powering up.

7.4 Device Functional Modes

7.4.1 Power-Down Modes

The DACx551-Q1 supports four separate modes of operation. These modes are programmable by setting two bits (PD1 and PD0) in the control register. Table 1 shows how the state of the bits corresponds to the mode of operation of the device.

Table 1. Operating Modes

PD1 (DB17)	PD0 (DB16)	OPERATING MODE
0	0	Normal operation
—	—	Power-down modes
0	1	Output typically 1 kΩ to GND
1	0	Output typically 100 kΩ to GND
1	1	High-Z

When both bits are set to 0, the device works normally with its typical current consumption of 160 μA at 5 V. However, for the three power-down modes, the supply current falls to 800 nA at 5 V. Not only does the supply current fall, but the output stage is also internally switched from the output of the amplifier to a resistor network of known values. This configuration has the advantage that the output impedance of the device is known while it is in power-down mode. There are three different options. The output is connected internally to GND through a 1-kΩ resistor, a 100-kΩ resistor, or it is left open-circuited (High-Z). The output stage is illustrated in Figure 29.

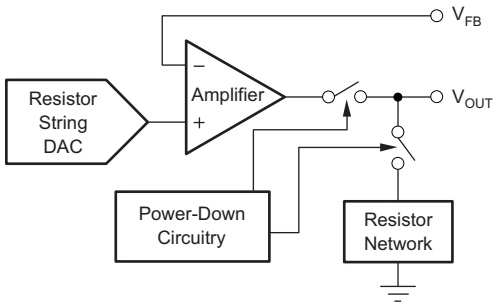

Figure 29. Output Stage During Power Down

All analog circuitry is shut down when the power-down mode is activated. However, the contents of the DAC register are unaffected when in power down. The time to exit power-down is typically 2.5 μs for V_{DD} = 5 V, and 5 μs for V_{DD} = 3 V. See the *Typical Characteristics* for more information.

7.5 Programming

The DAC8551-Q1 and DAC6551-Q1 devices have a 3-wire serial interface ($\overline{SYNC}$, SCLK, and D_{IN}), which is compatible with SPI, QSPI, and Microwire interface standards, as well as most DSPs. See the *Serial Write Operation Timing Diagram* section for an example of a typical write sequence.

The input shift register is 24 bits wide, as shown in Figure 30 and Figure 31. The first six bits are *don't care* bits. The next two bits (PD1 and PD0) are control bits that control which mode of operation the part is in (normal mode or any one of three power-down modes). A more complete description of the various modes is located in the *Power-Down Modes* section. The next 16 bits are the left aligned data bits. These bits are transferred to the DAC register on the 24th falling edge of SCLK.

DB23																							DB0

X	X	X	X	X	X	PD1	PD0	D11	D10	D9	D8	D7	D6	D5	D4	D3	D2	D1	D0	0	0	0	0

Figure 31. DAC6551-Q1 Data-Input Register Format

The write sequence begins by bringing the $\overline{SYNC}$ line low. Data from the D_{IN} line are clocked into the 24-bit shift register on each falling edge of SCLK. The serial clock frequency can be as high as 30 MHz, making the devices compatible with high-speed DSPs. On the 24th falling edge of the serial clock, the last data bit is clocked in and the programmed function is executed (that is, a change in DAC register contents and/or a change in the mode of operation).

At this point, the $\overline{SYNC}$ line may be kept low or brought high. In either case, it must be brought high for a minimum of 33 ns before the next write sequence so that a falling edge of $\overline{SYNC}$ can initiate the next write sequence. As previously mentioned, it must be brought high again just before the next write sequence.

7.5.1 $\overline{SYNC}$ Interrupt

In a normal write sequence, the $\overline{SYNC}$ line is kept low for at least 24 falling edges of SCLK, and the DAC is updated on the 24th falling edge. However, if $\overline{SYNC}$ is brought high before the 24th falling edge, it acts as an interrupt to the write sequence. The shift register is reset, and the write sequence is seen as invalid. Neither an update of the DAC register contents nor a change in the operating mode occurs, as shown in Figure 32.

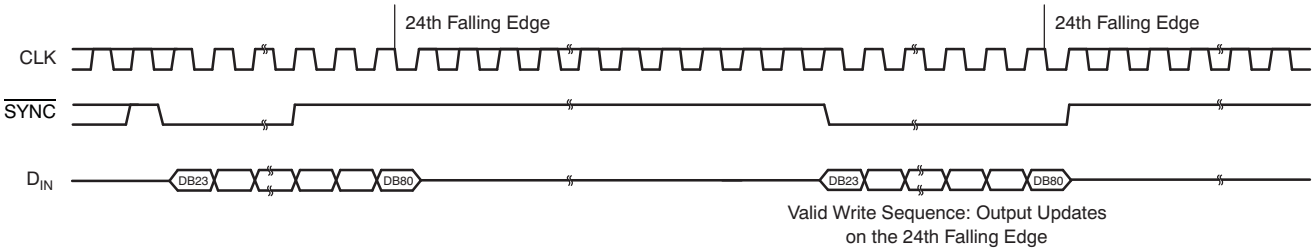

Figure 32. $\overline{SYNC}$ Interrupt Facility

8 Application and Implementation

NOTE

Information in the following applications sections is not part of the TI component specification, and TI does not warrant its accuracy or completeness. TI's customers are responsible for determining suitability of components for their purposes. Customers should validate and test their design implementation to confirm system functionality.

8.1 Application Information

The DAC8551-Q1 and DAC6551-Q1 devices are AEC-Q100 qualified, low-power, ultralow-glitch, 16-bit and 12-bit DACs, respectively. The wide temperature range, low-power consumption and very low glitch of the devices make them a great choice for automotive applications such as radar and sensor conditioning.

8.2 Typical Applications

8.2.1 Loop-Powered 2-Wire 4-mA to 20-mA Transmitter With XTR116

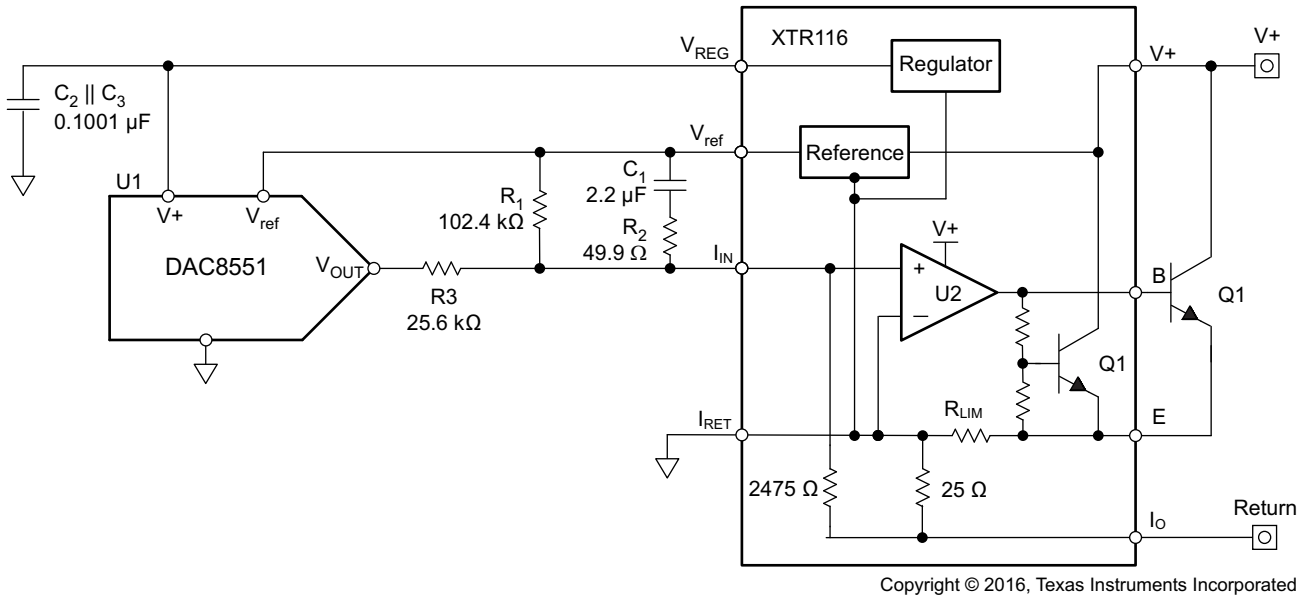

Figure 33. Loop-Powered Transmitter

8.2.1.1 Design Requirements

This design is commonly referred to as a loop-powered, or 2-wire, 4 mA to 20 mA transmitter. The transmitter has only two external input terminals: a supply connection and an output, or return, connection. The transmitter communicates back to its host, typically a PLC analog input module, by precisely controlling the magnitude of its return current. In order to conform to the 4 mA to 20 mA communication standard, the complete transmitter must consume less than 4 mA of current. The DAC8551-Q1 device enables the accurate control of the loop current from 4 mA to 20 mA in 16-bit steps.

8.2.1.2 Detailed Design Procedure

Although it is possible to recreate the loop-powered circuit using discrete components, the XTR116 provides simplicity and improved performance due to the matched internal resistors. The output current can be modified if necessary by looking using Equation 2.

$$I_{OUT}(Code) = \left(\frac{V_{ref} \times Code}{2^N \times R_3} + \frac{V_{REG}}{R_1} \right) \times \left(1 + \frac{2475\ \Omega}{25\ \Omega} \right) \quad (2)$$

Typical Applications (continued)

For more details of this application, see *2-wire, 4-20mA Transmitter, EMC/EMI Tested Reference Design* (TIDUAO7). It covers in detail the design of this circuit as well as how to protect it from EMC/EMI tests.

8.2.1.3 Application Curves

Total unadjusted error (TUE) is a good estimate for the performance of the output as shown in Figure 34. The linearity of the output or INL is in Figure 35.

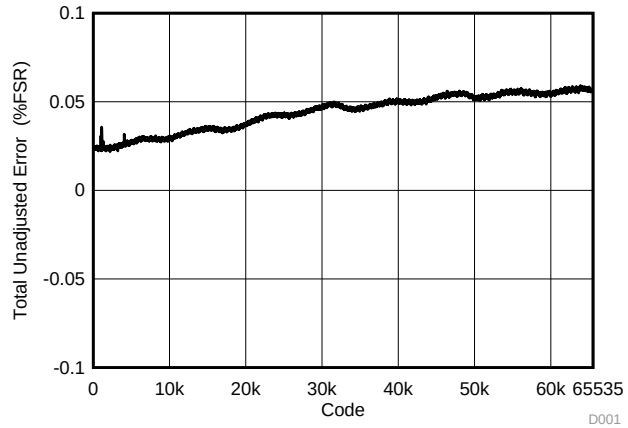

Figure 34. Total Unadjusted Error

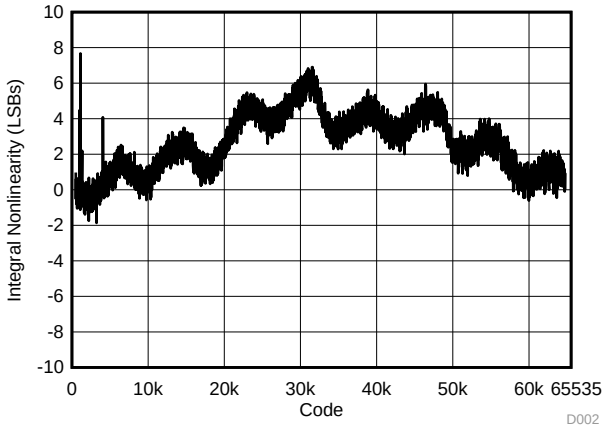

Figure 35. Integral Nonlineareity

8.2.2 Bipolar Operation Using the DAC8551-Q1 Device

The DAC8551-Q1 device has been designed for single-supply operation, but a bipolar output range is also possible using the circuit in Figure 36. The circuit shown gives an output voltage range of $\pm V_{REF}$. Rail-to-rail operation at the amplifier output is achievable using an OPA703 as the output amplifier.

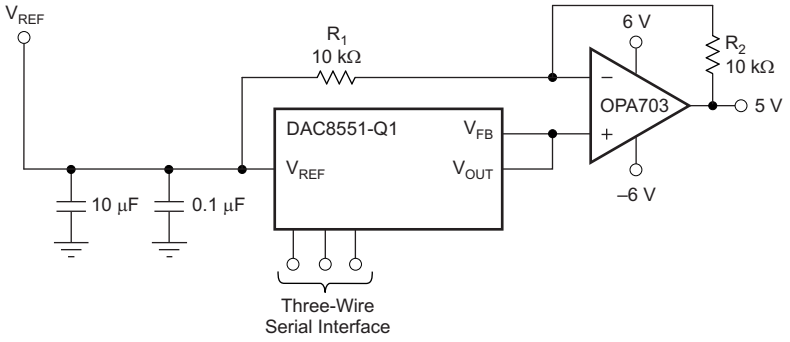

Figure 36. Bipolar Output Range

The output voltage for any input code can be calculated as follows:

$$V_O = \left[V_{REF} \times \left(\frac{D}{65536} \right) \times \left(\frac{R_1 + R_2}{R_1} \right) - V_{REF} \times \left(\frac{R_2}{R_1} \right) \right] \quad (3)$$

where D represents the input code in decimal (0–65,535)

with V_{REF} = 5V, R_1 = R_2 = 10 kΩ.

$$V_O = \left(\frac{10 \times D}{65536} \right) - 5\ V \quad (4)$$

Using this example, an output voltage range of ±5 V with 0000h corresponding to a –5 V output and FFFFh corresponding to a 5 V output can be achieved. Similarly, using V_{REF} = 2.5 V, a ±2.5 V output voltage range can be achieved.

8.2.3 Using the REF02 As a Power Supply for the DACx551-Q1

Due to the extremely low supply current required by the DACx551-Q1, an alternative option is to use a precision reference such as the REF02 device to supply the required voltage to the device, as illustrated in Figure 37.

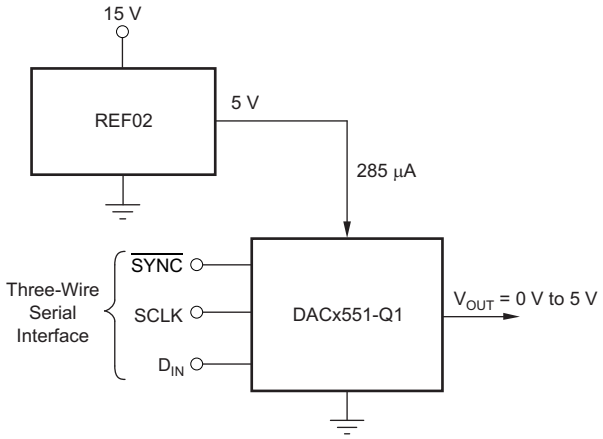

Figure 37. REF02 As a Power Supply to the DACx551-Q1

This configuration is especially useful if the power supply is quite noisy or if the system supply voltages are at some value other than 5 V. The REF02 device outputs a steady supply voltage for the device. If the REF02 device is used, the current it must supply to the device is 200 µA. This configuration is with no load on the output of the DAC. When a DAC output is loaded, the REF02 also must supply the current to the load.

The total current required (with a 5 kΩ load on the DAC output) is:

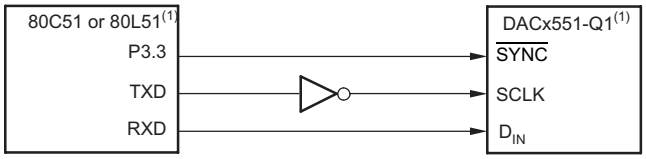
$$200\mu A + \frac{5V}{5k\Omega} = 1.2mA \quad (5)$$

The load regulation of the REF02 is typically 0.005%/mA, resulting in an error of 299 µV for the 1.2 mA current drawn from it. This value corresponds to a 3.9 LSB error.

8.3 System Examples

8.3.1 Interface From the DACx551-Q1 to 8051

See Figure 38 for a serial interface between the DACx551-Q1 and a typical 8051-type microcontroller. The setup for the interface is as follows: TXD of the 8051 drives SCLK of the DACx551-Q1, whereas RXD drives the serial data line of the device. The SYNC signal is derived from a bit-programmable pin on the port of the 8051. In this case, port line P3.3 is used. When data are to be transmitted to the DACx551-Q1, P3.3 is taken low. The 8051 transmits data in 8-bit bytes; thus, only eight falling clock edges occur in the transmit cycle. To load data to the DAC, P3.3 is left low after the first eight bits are transmitted, then a second write cycle is initiated to transmit the second byte of data. P3.3 is taken high following the completion of the third write cycle. The 8051 outputs the serial data in a format that has the LSB first. The DACx551-Q1 requires data with the MSB as the first bit received. Therefore, the 8051 transmit routine must take this into account, and *mirror* the data as needed.

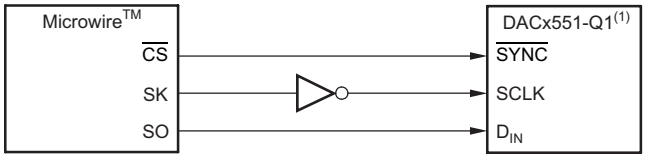


NOTE: (1) Additional pins omitted for clarity.

Figure 38. Interface From the DACx551-Q1 to 80C51 or 80L51

8.3.2 Interface From the DACx551-Q1 to Microwire

Figure 39 shows an interface between the DACx551-Q1 and any Microwire-compatible device. Serial data are shifted out on the falling edge of the serial clock and is clocked into the DACx551-Q1 on the rising edge of the SK signal.

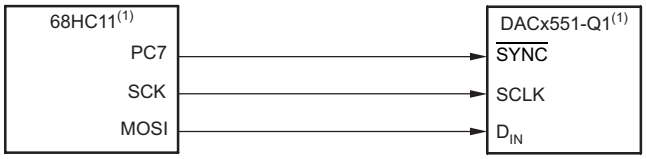


NOTE: (1) Additional pins omitted for clarity.

Figure 39. Interface From the DACx551-Q1 to Microwire

8.3.3 Interface From the DACx551-Q1 to 68HC11

Figure 40 shows a serial interface between the DACx551-Q1 and the 68HC11 microcontroller. SCK of the 68HC11 drives SCLK of the DACx551-Q1, whereas the MOSI output drives the serial data line of the DAC. The SYNC signal is derived from a port line (PC7), similar to the 8051 diagram.



NOTE: (1) Additional pins omitted for clarity.

Figure 40. Interface From the DACx551-Q1 to 68HC11

The 68HC11 should be configured so that its CPOL bit is 0 and its CPHA bit is 1. This configuration causes data appearing on the MOSI output to be valid on the falling edge of SCK. When data are being transmitted to the DAC, the SYNC line is held low (PC7). Serial data from the 68HC11 are transmitted in 8-bit bytes with only eight falling clock edges occurring in the transmit cycle. (Data are transmitted MSB first.) In order to load data to the DACx551-Q1, PC7 is left low after the first eight bits are transferred, then a second and third serial write operation are performed to the DAC. PC7 is taken high at the end of this procedure.

9 Power Supply Recommendations

The DACx551-Q1 can operate within the specified supply voltage range of 3 V to 5.5 V. The power applied to V_{DD} should be well-regulated and low-noise. Switching power supplies and dc/dc converters often have high-frequency glitches or spikes riding on the output voltage. In addition, digital components can create similar high-frequency spikes. This noise can easily couple into the DAC output voltage through various paths between the power connections and analog output. In order to further minimize noise from the power supply, a strong recommendation is to include a 1-μF to 10-μF capacitor and 0.1-μF bypass capacitor. The current consumption on the V_{DD} pin, the short-circuit current limit, and the load current for the device is listed in the Electrical Characteristics table. The power supply must meet the aforementioned current requirements.

10 Layout

10.1 Layout Guidelines

A precision analog component requires careful layout, adequate bypassing, and clean, well-regulated power supplies.

The DACx551-Q1 offers single-supply operation, and is often used in close proximity with digital logic, microcontrollers, microprocessors, and digital signal processors. The more digital logic present in the design and the higher the switching speed, the more difficult it is to keep digital noise from appearing at the output.

Due to the single ground pin of the DACx551-Q1, all return currents, including digital and analog return currents for the DAC, must flow through a single point. Ideally, GND would be connected directly to an analog ground plane. This plane would be separate from the ground connection for the digital components until they were connected at the power-entry point of the system.

As with the GND connection, V_{DD} should be connected to a power-supply plane or trace that is separate from the connection for digital logic until they are connected at the power-entry point. In addition, a 1 μF to 10 μF capacitor and 0.1 μF bypass capacitor are strongly recommended. In some situations, additional bypassing may be required, such as a 100 μF electrolytic capacitor or even a *Pi* filter made up of inductors and capacitors—all designed to essentially low-pass filter the 5 V supply, removing the high-frequency noise.

11 Device and Documentation Support

11.1 Documentation Support

11.1.1 Related Documentation

2-wire, 4-20mA Transmitter, EMC/EMI Tested Reference Design (TIDUAO7)

11.2 Receiving Notification of Documentation Updates

To receive notification of documentation updates, navigate to the device product folder on ti.com. In the upper right corner, click on *Alert me* to register and receive a weekly digest of any product information that has changed. For change details, review the revision history included in any revised document.

11.3 Community Resources

The following links connect to TI community resources. Linked contents are provided "AS IS" by the respective contributors. They do not constitute TI specifications and do not necessarily reflect TI's views; see TI's Terms of Use.

TI E2E™ Online Community ***TI's Engineer-to-Engineer (E2E) Community.*** Created to foster collaboration among engineers. At e2e.ti.com, you can ask questions, share knowledge, explore ideas and help solve problems with fellow engineers.

Design Support ***TI's Design Support*** Quickly find helpful E2E forums along with design support tools and contact information for technical support.

11.4 Trademarks

E2E is a trademark of Texas Instruments.
All other trademarks are the property of their respective owners.

11.5 Electrostatic Discharge Caution

These devices have limited built-in ESD protection. The leads should be shorted together or the device placed in conductive foam during storage or handling to prevent electrostatic damage to the MOS gates.

11.6 Glossary

SLYZ022 — *TI Glossary*.

This glossary lists and explains terms, acronyms, and definitions.

12 Mechanical, Packaging, and Orderable Information

The following pages include mechanical, packaging, and orderable information. This information is the most-current data available for the designated devices. This data is subject to change without notice and without revision of this document. For browser-based versions of this data sheet, see the left-hand navigation pane.

PACKAGING INFORMATION

Orderable part number	Status (1)	Material type (2)	Package | Pins	Package qty | Carrier	RoHS (3)	Lead finish/ Ball material (4)	MSL rating/ Peak reflow (5)	Op temp (°C)	Part marking (6)
DAC6551AQDGKRQ1	Active	Production	VSSOP (DGK) | 8	2500 | LARGE T&R	Yes	NIPDAUAG	Level-2-260C-1 YEAR	-40 to 125	D61Q
DAC6551AQDGKRQ1.Z	Active	Production	VSSOP (DGK) | 8	2500 | LARGE T&R	Yes	NIPDAUAG	Level-2-260C-1 YEAR	-40 to 125	D61Q
DAC8551AQDGKRQ1	Active	Production	VSSOP (DGK) | 8	2500 | LARGE T&R	Yes	NIPDAU | NIPDAUAG	Level-2-260C-1 YEAR	-40 to 125	D81Q
DAC8551AQDGKRQ1.Z	Active	Production	VSSOP (DGK) | 8	2500 | LARGE T&R	Yes	NIPDAUAG	Level-2-260C-1 YEAR	-40 to 125	D81Q

(1) Status: For more details on status, see our product life cycle.

(2) Material type: When designated, preproduction parts are prototypes/experimental devices, and are not yet approved or released for full production. Testing and final process, including without limitation quality assurance, reliability performance testing, and/or process qualification, may not yet be complete, and this item is subject to further changes or possible discontinuation. If available for ordering, purchases will be subject to an additional waiver at checkout, and are intended for early internal evaluation purposes only. These items are sold without warranties of any kind.

(3) RoHS values: Yes, No, RoHS Exempt. See the TI RoHS Statement for additional information and value definition.

(4) Lead finish/Ball material: Parts may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead finish/Ball material values may wrap to two lines if the finish value exceeds the maximum column width.

(5) MSL rating/Peak reflow: The moisture sensitivity level ratings and peak solder (reflow) temperatures. In the event that a part has multiple moisture sensitivity ratings, only the lowest level per JEDEC standards is shown. Refer to the shipping label for the actual reflow temperature that will be used to mount the part to the printed circuit board.

(6) Part marking: There may be an additional marking, which relates to the logo, the lot trace code information, or the environmental category of the part.

Multiple part markings will be inside parentheses. Only one part marking contained in parentheses and separated by a "~" will appear on a part. If a line is indented then it is a continuation of the previous line and the two combined represent the entire part marking for that device.
