

DLP651LE DLPS153 - OCTOBER 2023

DLP651LE 0.65 WXGA Digital Micromirror Device

1 Features

- · 0.65-inch diagonal micromirror array
 - WXGA (1280 × 800) display resolution
 - 10.8 µm micromirror pitch
 - ±12° micromirror tilt angle (relative to a flat
 - Corner illumination
- 2×LVDS input data bus
- The DLP651LE chipset includes:
 - DLP651LE DMD
 - DLPC4430 controller
 - DLPA100 controller power management and motor driver IC
 - DLPA200 DMD power management IC

2 Applications

- **Smart lighting**
- Business projector
- Education projector

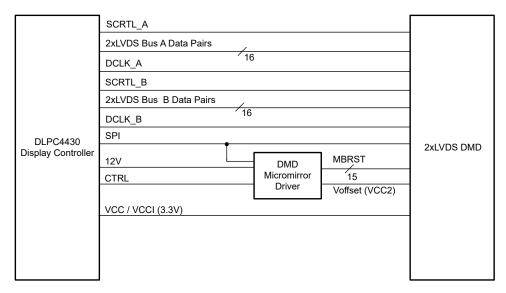

3 Description

The DLP651LE digital micromirror device (DMD) is a digitally controlled micro-electro-mechanical system (MEMS) spatial light modulator (SLM) that enables affordable WXGA display solutions. The DLP651LE DMD, the DLPC4430 display controller, the DLPA100 power and motor driver, and the DLPA200 micromirror driver comprise the chipset. This chipset is a cost-optimized version of DLP650LE, offered in performance-enhancing hermetic packaging, designed to enable applications requiring a 16:10 aspect ratio with excellent brightness.

Device Information

PART NUMBER	PACKAGE ⁽¹⁾	PACKAGE SIZE (NOM)
DLP651LE	FYM (149)	22.30 mm × 32.20 mm

For all available packages, see the orderable addendum at the end of the data sheet.

Table 5-1. Pin Functions (continued)

	,						
PIN		NET LENGTH SIGN		TYPE ⁽¹⁾	DESCRIPTION		
NAME	NO.			BEOOKII HON			
RESERVED_VB	E3, F3, K3, L3			NC	Do not connect on the DLP system board.		
RESERVED_VR	B2, B3, P2, P3			NC	Do not connect on the DLP system board.		

- I = Input, O = Output, G = Ground, A = Analog, P = Power, NC = No Connect.
- Power supply pins required for all DMD operating modes are V_{SS} , V_{BIAS} , V_{CC} , V_{CCI} , V_{OFFSET} , and V_{RESET} .
- V_{SS} must be connected for proper DMD operation.

6 Specifications

6.1 Absolute Maximum Ratings

Over operating free-air temperature range (unless otherwise noted). (1)

		MIN	MAX	UNIT
SUPPLY VOLTAG	BES			
V _{CC}	Supply voltage for LVCMOS core logic ⁽²⁾	-0.5	4	V
V _{CCI}	Supply voltage for LVDS interface ⁽²⁾	-0.5	4	V
V _{OFFSET}	Micromirror electrode and HVCMOS voltage ^{(2) (3)}	-0.5	9	V
V _{MBRST}	Input voltage for MBRST(15:0) ⁽²⁾	-28	28	V
V _{CCI} – V _{CC}	Supply voltage delta (absolute value) ⁽⁴⁾		0.3	V
INPUT VOLTAGE	S			•
	Input voltage for all other input pins ⁽²⁾	-0.5	V _{CC} + 0.3	V
V _{ID}	Input differential voltage (absolute value) ⁽⁵⁾		700	mV
CLOCKS		,		
f _{CLOCK}	Clock frequency for LVDS interface, DCLK_A		400	MHz
f _{CLOCK}	Clock frequency for LVDS interface, DCLK_B		400	MHz
ENVIRONMENTA	L			
т	Temperature, operating ⁽⁶⁾	0	90	°C
T _{ARRAY}	Temperature, non-operating ⁽⁶⁾	-40	90	°C
T _{DP}	Dew point temperature, operating and non-operating (noncondensing)		81	°C

- Operation outside the Absolute Maximum Ratings may cause permanent device damage. Absolute Maximum Ratings do not imply functional operation of the device at these or any other conditions beyond those listed under Recommended Operating Conditions. If outside the Recommended Operating Conditions but within the Absolute Maximum Ratings, the device may not be fully functional, and this may affect device reliability, functionality, performance, and shorten the device lifetime.
- All voltages are referenced to common ground VSS. VBIAS, VCC, VCCI, VOFFSET, and VRESET power supplies are all required for all DMD operating modes.
- V_{OFFSET} supply transients must fall within specified voltages.
- Exceeding the recommended allowable voltage difference between V_{CC} and V_{CCI} may result in excessive current draw.
- The maximum LVDS input voltage rating applies when each input of a differential pair is at the same voltage potential. (5)
- The array temperature cannot be measured directly and must be computed analytically from the temperature measured at test point 1 (TP1), shown in the figure in Section 7.5.
- V_{OFFSET} supply transients must fall within specified voltages.
- Excludes micromirror bias reset inputs MBRST(15:0).

6.2 Storage Conditions

Applicable for the DMD as a component or non-operating in a system.

		MIN	MAX	UNIT
T _{DMD}	DMD storage temperature	-40	80	°C
T _{DP-AVG}	Average dew point temperature (non-condensing) (1)		28	°C
T _{DP-ELR}	Elevated dew point temperature range (non-condensing) (2)	28	36	°C
CT _{ELR}	Cumulative time in elevated dew point temperature range		24	Months

- (1) The average over time (including storage and operating) that the device is not in the elevated dew point temperature range.
- (2) Exposure to dew point temperatures in the elevated range during storage and operation should be limited to less than a total cumulative time of CT_{ELR}.

6.3 ESD Ratings

SYMBOL	PARAMETER	DESCRIPTION	VALUE	UNIT
V	Electrostatic	±1000	V	
V _(ESD) discharge	discharge	Charged device model (CDM), per ANSI/ESDA/JEDEC JS-002 ⁽²⁾	±500	V
V _(ESD)	Electrostatic discharge (MBRST PINS)	Human body model (HBM), per ANSI/ESDA/JEDEC JS-001	±150	V

- (1) JEDEC document JEP155 states that 500-V HBM allows safe manufacturing with a standard ESD control process.
- (2) JEDEC document JEP157 states that 250-V CDM allows safe manufacturing with a standard ESD control process.

6.4 Recommended Operating Conditions

Over operating free-air temperature range (unless otherwise noted). The functional performance of the device specified in this data sheet is achieved when operating the device within the limits defined by this table. No level of performance is implied when operating the device above or below these limits.

		MIN	NOM	MAX	UNIT
VOLTAGE SUPPLY					
V _{CC}	Supply voltage for LVCMOS core logic ⁽¹⁾	3.0	3.3	3.6	V
V _{CCI}	Supply voltage for LVDS Interface ⁽¹⁾	3.0	3.3	3.6	V
V _{OFFSET}	Micromirror Electrode and HVCMOS voltage ^{(1) (2)}	8.25	8.5	8.75	V
V _{MBRST}	Micromirror Bias / Reset Voltage ⁽¹⁾	-27		26.5	V
V _{CC} - V _{CCI}	Supply voltage delta (absolute value) ⁽³⁾		0	0.3	V
LVCMOS INTERFACE					
V _{IH}	Input High Voltage	1.7	2.5	V _{CC} + 0.3	V
V _{IL}	Input Low Voltage	-0.3		0.7	V
Гон	High Level Output Current			-20	mA
I _{OL}	Low Level Output Current			15	mA
t _{PWRDNZ}	PWRDNZ pulse width ⁽⁴⁾	10			ns
SCP INTERFACE					
$f_{\sf SCPCLK}$	SCP clock frequency ⁽⁵⁾	50		500	kHz
t _{SCP_PD}	Propagation delay, clock to Q, from rising-edge of SCPCLK to valid SCPDO ⁽⁶⁾	0	-	900	ns
t _{SCP_DS}	SCPDI clock setup time (before SCPCLK falling-edge) ⁽⁶⁾	800			ns
t _{SCP_DH}	SCPDI hold time (after SCPCLK falling-edge) ⁽⁶⁾	900			ns
t _{SCP_NEG_ENZ}	Time between falling-edge of SCPENZ and the rising-edge of SCPCLK ⁽⁵⁾	1			us
SCP_POS_ENZ	Time between falling-edge of SCPCLK and the rising-edge of SCPENZ	1			us
t _{SCP_OUT_EN}	Time required for SCP output buffer to recover after SCPENZ (from tristate)			192/f _{DCLK}	s

6.4 Recommended Operating Conditions (continued)

Over operating free-air temperature range (unless otherwise noted). The functional performance of the device specified in this data sheet is achieved when operating the device within the limits defined by this table. No level of performance is implied when operating the device above or below these limits.

		MIN	NOM	MAX	UNIT
t _{SCP_PW_ENZ}	SCPENZ inactive pulse width (high level)	1			1/f _{scpclk}
t _r	Rise time (20% to 80%)			200	ns
t _f	Fall time (80% to 20%)			200	ns
LVDS INTERFACE				'	
f_{CLOCK}	Clock frequency for LVDS interface (all channels), DCLK ⁽⁷⁾		320	330	MHz
V _{ID}	Input differential voltage (absolute value) ⁽⁸⁾	100	400	600	mV
V _{CM}	Common mode voltage ⁽⁸⁾		1200		mV
V _{LVDS}	LVDS voltage ⁽⁸⁾	0		2000	mV
t _{LVDS_RSTZ}	Time required for LVDS receivers to recover from PWRDNZ			10	ns
Z _{IN}	Internal differential termination resistance	95		105	Ω
Z _{LINE}	Line differential impedance (PWB/trace)	90	100	110	Ω
ENVIRONMENTAL					
-	Array temperature, long-term operational ⁽⁹⁾ (10) (11)	10		40 to 70 ⁽¹²⁾	°C
T _{ARRAY}	Array temperature, short-term operational ⁽¹⁰⁾ (13)	0		10	°C
T _{DP -AVG}	Average dew point average temperature (non-condensing) ⁽¹⁴⁾			28	°C
T _{DP-ELR}	Elevated dew point temperature range (non-condensing) ⁽¹⁵⁾	28		36	°C
CT _{ELR}	Cumulative time in elevated dew point temperature range			24	Months
Q _{AP-ILL}	Window aperture illumination overfill (16)			17	W/cm ²
SOLID STATE ILLUMINA	TION			'	
ILL _{UV}	Illumination power at wavelengths < 410 nm ^{(9) (18)}			10	mW/cm ²
ILL _{VIS}	Illumination power at wavelengths ≥ 410 nm and ≤800 nm (17) (18)			33.5	W/cm ²
ILL _{IR}	Illumination power at wavelengths > 800 nm (18)			10	mW/cm ²
ILL _{BLU}	Illumination power at wavelengths ≥ 410 nm and ≤ 475 nm ⁽¹⁷⁾ (18)			10.6	W/cm ²
ILL _{BLU1}	Illumination power at wavelengths ≥ 410 nm and ≤ 440 nm ⁽¹⁷⁾ (18)			1.7	W/cm ²
LAMP ILLUMINATION					
ILL _{UV}	Illumination power at wavelengths < 395 nm ⁽⁹⁾ (18)			2	mW/cm ²
ILL _{VIS}	Illumination power at wavelengths ≥ 395 nm and ≤ 800 nm ⁽¹⁷⁾ ⁽¹⁸⁾			23.5	W/cm ²
ILL _{IR}	Illumination power at wavelengths > 800 nm (18)	-		10	mW/cm ²

- (1) All voltages are referenced to common ground V_{SS}. V_{BIAS}, V_{CC}, V_{CCI}, V_{OFFSET}, and V_{RESET} power supplies are all required for proper DMD operation. V_{SS} must also be connected.
- V_{OFFSET} supply transients must fall within specified max voltages. (2)
- To prevent excess current, the supply voltage delta |V_{CC|} V_{CC}| must be less than the specified limit. See Section 10 and Figure 10-1.
- PWRDNZ input pin resets the SCP and disables the LVDS receivers. PWRDNZ input pin overrides SCPENZ input pin and tristates the SCPDO output pin.
- (5) The SCP clock is a gated clock. Duty cycle must be 50% ± 10%. SCP parameter is related to the frequency of DCLK.
- See Figure 6-3. (6)
- (7) See LVDS Timing Requirements in Section 6.7 and Figure 6-7.
- See Figure 6-6 LVDS Waveform Requirements. (8)
- Simultaneous exposure of the DMD to the maximum Section 6.4 for temperature and UV illumination will reduce device lifetime.
- (10) The array temperature cannot be measured directly and must be computed analytically from the temperature measured at test point 1 (TP1) shown in Figure 7-1 and the package thermal resistance using Section 7.5.
- (11) Long-term is defined as the usable life of the device.
- (12) Per Figure 6-1, the maximum operational array temperature should be derated based on the micromirror landed duty cycle that the DMD experiences in the end application. See Section 7.8 for a definition of micromirror landed duty cycle.
- (13) Array temperatures beyond those specified as long-term are recommended for short-term conditions only (power-up). Short-term is defined as cumulative time over the usable life of the device and is less than 500 hours.
- (14) The average over time (including storage and operating) that the device is not in the "elevated dew point temperature range."

- (15) Exposure to dew point temperatures in the elevated range during storage and operation should be limited to less than a total cumulative time of CT_{ELR}.
- (16) Light illuminating the critical area on the window aperture shown in Figure 6-2 should be limited to a maximum of Q_{AP-ILL}.
- (17) The maximum allowable optical power incident on the DMD is limited by the maximum optical power density for each wavelength range specified and the micromirror array temperature (T_{ARRAY}).
- (18) To calculate, see Micromirror Power Density Calculation.

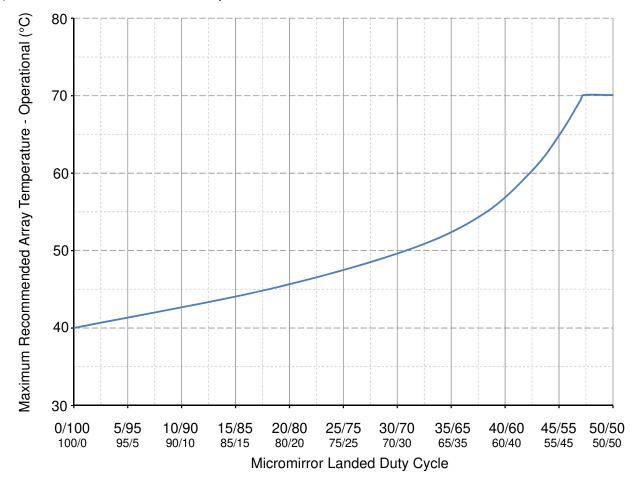

Figure 6-1. Maximum Recommended Array Temperature—Derating Curve

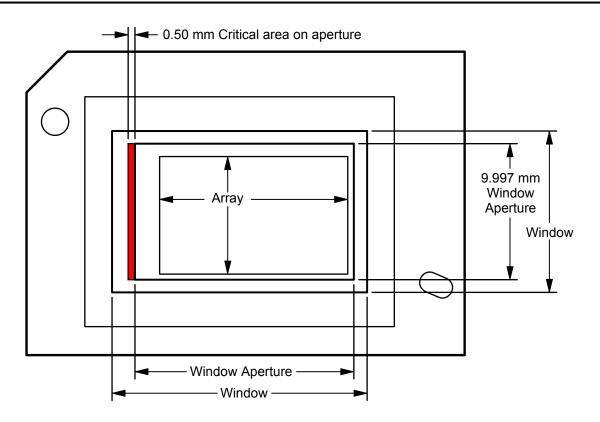

Figure 6-2. Illumination Overfill Diagram—Critical Area

6.5 Thermal Information

	DLP651LE	
THERMAL METRIC	FYM Package	UNIT
	149 PINS	

(1) The DMD is designed to conduct absorbed and dissipated heat to the back of the package. The cooling system must be capable of maintaining the package within the temperature range specified in the Section 6.4.

The total heat load on the DMD is largely driven by the incident light absorbed by the active area, although other contributions include light energy absorbed by the window aperture and electrical power dissipation of the array.

Optical systems should be designed to minimize the light energy falling outside the window clear aperture since any additional thermal load in this area can significantly degrade the reliability of the device.

6.6 Electrical Characteristics

Over operating free-air temperature range (unless otherwise noted).

	PARAMETER	TEST CONDITIONS	MIN	TYP	MAX	UNIT
V _{OH}	High level output voltage	V _{CC} = 3 V, I _{OH} = – 20 mA	2.4			V
V _{OL}	Low level output voltage	V _{CC} = 3.6 V, I _{OL} = 15 mA			0.4	V
I _{OZ}	High impedance output current	V _{CC} = 3.6 V			10	μA
I _{IL}	Low level input current	V _{CC} = 3.6 V, VI = 0			-60	μA
I _{IH}	High level input current (1)	V _{CC} = 3.6 V, VI = V _{CC}			200	μΑ
I _{CC}	Supply current VCC (2)	V _{CC} = 3.6 V			479	mA
I _{CCI}	Supply current VCCI (2)	V _{CCI} = 3.6 V			309	mA
I _{OFFSET}	Supply current VOFFSET (3)	V _{OFFSET} = 8.75 V			25	mA
Z _{IN}	Internal differential termination resistance		95		105	Ω
Z _{LINE}	Line differential impedance (PWB/trace)		90	100	110	Ω
Cı	Input capacitance ⁽¹⁾	f = 1 MHz			10	pF
Co	Output capacitance ⁽¹⁾	f = 1 MHz			10	pF
C _{IM}	Input capacitance for MBRST[0:15] pins	f = 1 MHz	200		330	pF

- (1) Applies to LVCMOS pins only. Excludes LVDS pins and test pad pins
- (2) To prevent excess current, the supply voltage delta |V_{CCI} V_{CC}| must be less than the specified limit in Section 6.4.
- (3) To prevent excess current, the supply voltage delta |V_{BIAS} V_{OFFSET}| must be less than the specified limit in Section 6.4.

6.7 Timing Requirements

Over Recommended Operating Conditions (unless otherwise noted).

	PARAMETER DESCRIPTION	SIGNAL	MIN	TYP	MAX	UNIT
LVDS (1)		'

	Bright pixel(s) in the POM (9) (11)	Gray 10 screen (12)			1	
Image performance	Dark pixel(s) in the active area (10)	White screen (13)			4	Micromirrors
	Adjacent pixel(s) (14)	Any screen			0	
	Unstable pixel(s) in active area (15)	Any screen			0	

- (1) Measured relative to the plane formed by the overall micromirror array.
- (2) Additional variation exists between the micromirror array and the package datums.
- (3) Represents the variation that can occur between any two individual micromirrors, located on the same device or located on different devices.
- (4) For some applications, it is critical to account for the micromirror tilt angle variation in the overall system optical design. With some system optical designs, the micromirror tilt angle variation within a device may result in perceivable non-uniformities in the light field reflected from the micromirror array. With some system optical designs, the micromirror tilt angle variation between devices may result in colorimetry variations, system efficiency variations or system contrast variations.
- (5) Refer to Figure 6-10.
- (6) The time required for a micromirror to nominally transition from one landed state to the opposite landed state.
- (7) The minimum time between successive transitions of a micromirror.
- (8) Efficiency numbers assume 24-degree illumination angle, F/2.4 illumination and collection cones, uniform source spectrum, and uniform pupil illumination. Efficiency numbers assume 100% electronic micromirror duty cycle and do not include optical overfill loss. The efficiency is measured photopically. Note that this number is specified under conditions described above and deviations from the specified conditions could result in decreased efficiency.
- (9) Bright pixel definition: a single pixel or mirror that is stuck in the ON position and is visibly brighter than the surrounding pixels
- (10) Dark pixel definition: a single pixel or mirror that is stuck in the OFF position and is visibly darker than the surrounding pixels
- (11) POM definition: rectangular border of off-state mirrors surrounding the active area
- (12) Gray 10 screen definition: a full screen with RGB values set to R = 10/255, G = 10/255, B = 10/255
- (13) White screen definition: a full screen with RGB values set to R=255/255, G = 255/255, B = 255/255
- (14) Adjacent pixel definition: Two or more stuck pixels sharing a common border or common point, also referred to as a cluster.
- (15) Unstable pixel definition: A single pixel or mirror that does not operate in sequence with parameters loaded into memory. The unstable pixel appears to be flickering asynchronously with the image.

6.12 Chipset Component Usage Specification

Reliable function and operation of the DLP651LE DMD requires that it be used in conjunction with the other components of the applicable DLP chipset, including those components that contain or implement TI DMD control technology. TI DMD control technology consists of the TI technology and devices used for operating or controlling a DLP DMD.

7 Detailed Description

7.1 Overview

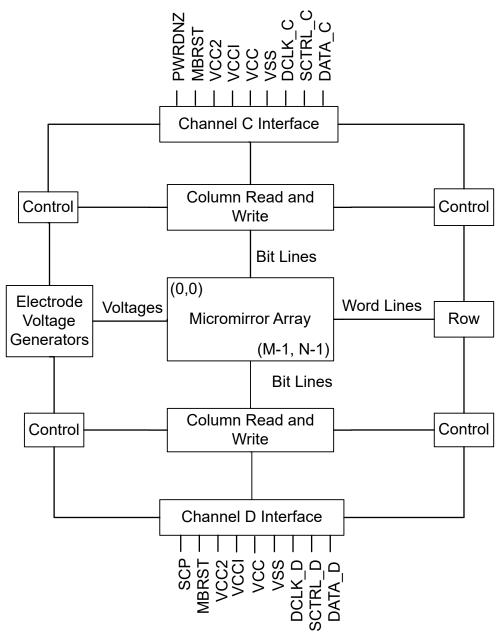

The DMD is a 0.65-inch diagonal spatial light modulator which consists of an array of highly reflective aluminum micromirrors. The DMD is an electrical input, optical output micro-electrical-mechanical system (MEMS). The electrical interface is Low Voltage Differential Signaling (LVDS). The DMD consists of a two-dimensional array of 1-bit CMOS memory cells. The array is organized in a grid of M memory cell columns by N memory cell rows. Refer to the Section 7.2. The positive or negative deflection angle of the micromirrors can be individually controlled by changing the address voltage of underlying CMOS addressing circuitry and micromirror reset signals (MBRST).

The DLP651LE DMD is part of the chipset comprising of the DLP651LE DMD, the DLPC4430 display controller, the DLPA100 power and motor driver and the DLPA200 micromirror driver. To ensure reliable operation, the DLP651LE DMD must always be used with the DLPC4430 display controller, the DLPA100 power and motor driver and the DLPA200 micromirror driver.

7.2 Functional Block Diagram

For pin details on Channels A, B refer to *Pin Configuration and Functions* and LVDS Interface section of *Timing Requirements*.

7.3 Feature Description

7.3.1 Power Interface

The DMD requires 3 DC voltages: DMD_P3P3V, V_{OFFSET} , and MBRST. DMD_P3P3V is created by the DLPA100 power and motor driver and the DLPA200 DMD micromirror driver. Both the DLPA100 and DLPA200 create the main DMD voltages, as well as powering various peripherals (TMP411, I^2C , and TI level translators). DMD_P3P3V provides the V_{CC} voltage required by the DMD. V_{OFFSET} (8.5V) and MBRST are made by the DLPA200 and are supplied to the DMD to control the micromirrors.

7.3.2 Timing

This data sheet provides timing at the device pin. For output timing analysis, the tester pin electronics and its transmission line effects must be considered. Figure 6-5 shows an equivalent test load circuit for the output under test. Timing reference loads are not intended as a precise representation of any particular system environment or depiction of the actual load presented by a production test. System designers should use IBIS or other simulation tools to correlate the timing reference load to a system environment. The load capacitance value stated is only for characterization and measurement of AC timing signals. This load capacitance value does not indicate the maximum load the device is capable of driving.

7.4 Optical Interface and System Image Quality Considerations

TI assumes no responsibility for end-equipment optical performance. Achieving the desired end-equipment optical performance involves making trade-offs between numerous component and system design parameters. System optical performance and image quality strongly relate to optical system design parameter trade offs. Although it is not possible to anticipate every conceivable application, projector image quality and optical performance is contingent on compliance to the optical system operating conditions described in the following sections.

7.4.1 Numerical Aperture and Stray Light Control

The angle defined by the numerical aperture of the illumination and projection optics at the DMD optical area should be the same. This angle should not exceed the nominal device micromirror tilt angle unless appropriate apertures are added in the illumination and/or projection pupils to block out flat-state and stray light from the projection lens. The micromirror tilt angle defines DMD capability to separate the "ON" optical path from any other light path, including undesirable flat-state specular reflections from the DMD window, DMD border structures, or other system surfaces near the DMD such as prism or lens surfaces. If the numerical aperture exceeds the micromirror tilt angle, or if the projection numerical aperture angle is more than two degrees larger than the illumination numerical aperture angle (and vice versa), contrast degradation, and objectionable artifacts in the display's border and/or active area could occur.

7.4.2 Pupil Match

TI's optical and image quality specifications assume that the exit pupil of the illumination optics is nominally centered within 2° of the entrance pupil of the projection optics. Misalignment of pupils can create objectionable artifacts in the display's border and/or active area, which may require additional system apertures to control, especially if the numerical aperture of the system exceeds the pixel tilt angle.

7.4.3 Illumination Overfill

The active area of the device is surrounded by an aperture on the inside DMD window surface that masks structures of the DMD chip assembly from normal view, and is sized to anticipate several optical operating conditions. Overfill light illuminating the window aperture can create artifacts from the edge of the window aperture opening and other surface anomalies that may be visible on the screen. Design the illumination optical system to limit light flux incident anywhere on the window aperture from exceeding approximately 10% of the average flux level in the active area. Depending on the particular system optical architecture, overfill light may have to be further reduced below the suggested 10% level in order to be acceptable.

7.5 Micromirror Array Temperature Calculation

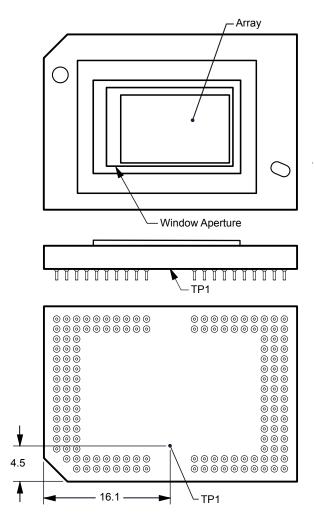

Figure 7-1. DMD Thermal Test Points

Micromirror array temperature cannot be measured directly, therefore it must be computed analytically from measurement points on the outside of the package, the package thermal resistance, the electrical power, and the illumination heat load. The relationship between array temperature and the reference ceramic temperature (thermal test TP1 in Figure 7-1) is provided by the following equations:

$$T_{ARRAY} = T_{CERAMIC} + (Q_{ARRAY} \times R_{ARRAY-TO-CERAMIC})$$
(1)

$$Q_{ARRAY} = Q_{ELECTRICAL} + Q_{ILLUMINATION}$$
(2)

where

- T_{ARRAY} = Computed array temperature (°C)
- T_{CFRAMIC} = Measured ceramic temperature (°C) (TP1 location)
- R_{ARRAY-TO-CERAMIC} = Thermal resistance of package specified in Section 6.5 from array to ceramic TP1 (°C/Watt)
- Q_{ARRAY} = Total DMD power on the array (W) (electrical + absorbed)
- Q_{ELECTRICAL} = Nominal Electrical Power (W)
- Q_{INCIDENT} = Incident illumination optical power (W)
- DMD average thermal absorptivity = 0.42

The electrical power dissipation of the DMD is variable and depends on the voltages, data rates, and operating frequencies. A nominal electrical power dissipation to use when calculating array temperature is 1.5 W. The absorbed power from the illumination source is variable and depends on the operating state of the micromirrors and the intensity of the light source. The equations shown above are valid for a single chip or multichip DMD system. It assumes an illumination distribution of 83.7% on the active array, and 16.3% on the array border.

The sample calculation for a typical projection application is as follows:

$$Q_{\text{INCIDENT}} = 45 \text{ W (measured)}$$

$$T_{\text{CERAMIC}} = 55.0^{\circ}\text{C}$$

$$Q_{\text{ELECTRICAL}} = 1.5 \text{ W}$$

$$Q_{\text{ARRAY}} = 1.5 \text{ W} + (0.42 \times 45 \text{ W}) = 20.4 \text{ W}$$

$$T_{\text{ARRAY}} = 55.0^{\circ}\text{C} + (20.4 \text{ W} \times 0.50^{\circ}\text{C/W}) = 65.2 ^{\circ}\text{C}$$

7.6 Micromirror Power Density Calculation

The calculation of the optical power density of the illumination on the DMD in the different wavelength bands uses the total measured optical power on the DMD, percent illumination overfill, area of the active array, and ratio of the spectrum in the wavelength band of interest to the total spectral optical power.

- ILL_{UV} = [OP_{UV-RATIO} × Q_{INCIDENT}] × 1000 ÷ A_{ILL} (mW/cm²)
- ILL_{VIS} = [OP_{VIS-RATIO} × Q_{INCIDENT}] ÷ A_{ILL} (W/cm²)
- ILL_{IR} = $[OP_{IR-RATIO} \times Q_{INCIDENT}] \times 1000 \div A_{ILL} (mW/cm^2)$
- ILL_{BLU} = [OP_{BLU-RATIO} × Q_{INCIDENT}] ÷ A_{ILL} (W/cm²)
- ILL_{BLU1} = [OP_{BLU1-RATIO} × Q_{INCIDENT}] ÷ A_{ILL} (W/cm²)
- $A_{ILL} = A_{ARRAY} \div (1 OV_{ILL}) (cm^2)$

where:

- ILL_{LIV} = UV illumination power density on the DMD (mW/cm²)
- ILL_{VIS} = VIS illumination power density on the DMD (W/cm²)

• ILL_{IR} = IR illumination power density on the DMD (mW/cm²)

- ILL_{BLU} = BLU illumination power density on the DMD (W/cm²)
- ILL_{BLU1} = BLU1 illumination power density on the DMD (W/cm²)
- A_{ILL} = illumination area on the DMD (cm²)
- Q_{INCIDENT} = total incident optical power on DMD (W) (measured)
- A_{ARRAY} = area of the array (cm²) (data sheet)
- OV_{ILL} = percent of total illumination on the DMD outside the array (%) (optical model)
- OP_{UV-RATIO} = ratio of the optical power for wavelengths <410 nm to the total optical power in the illumination spectrum (spectral measurement)
- OP_{VIS-RATIO} = ratio of the optical power for wavelengths ≥410 and ≤800 nm to the total optical power in the illumination spectrum (spectral measurement)
- OP_{IR-RATIO} = ratio of the optical power for wavelengths >800 nm to the total optical power in the illumination spectrum (spectral measurement)
- OP_{BLU-RATIO} = ratio of the optical power for wavelengths ≥410 and ≤475 nm to the total optical power in the illumination spectrum (spectral measurement)
- OP_{BLU1-RATIO} = ratio of the optical power for wavelengths ≥410 and ≤440 nm to the total optical power in the illumination spectrum (spectral measurement)

The illumination area varies and depends on the illumination overfill. The total illumination area on the DMD is the array area and overfill area around the array. The optical model is used to determine the percent of the total illumination on the DMD that is outside the array (OV_{ILL}) and the percent of the total illumination that is on the active array. From these values the illumination area (A_{ILL}) is calculated. The illumination is assumed to be uniform across the entire array.

From the measured illumination spectrum, the ratio of the optical power in the wavelength bands of interest to the total optical power is calculated.

Sample calculation:

$$Q_{INCIDENT} = 45 \text{ W (measured)}$$
 (4)

$$A_{ARRAY} = (13.824 \text{ mm} \times 8.640 \text{ mm}) \div 100 = 1.1944 \text{ cm}^2 \text{ (data sheet)}$$
 (5)

$$OV_{ILL} = 16.3\%$$
 (optical model) (6)

$$OP_{UV-RATIO} = 0.00017$$
 (spectral measurement) (7)

$$OP_{IR-RATIO} = 0.00006$$
 (spectral measurement) (9)

$$OP_{BLU-RATIO} = 0.28100$$
 (spectral measurement) (10)

$$A_{\parallel \perp} = 1.1944 \text{ cm}^2 \div (1 - 0.163) = 1.4270 \text{ cm}^2$$
 (12)

$$ILL_{UV} = [0.00017 \times 45 \text{ W}] \times 1000 \div 1.4270 \text{ cm}^2 = 5.361 \text{ mW/cm}^2$$
 (13)

$$ILL_{VIS} = [0.99977 \times 45 \text{ W}] \div 1.4270 \text{ cm}^2 = 31.53 \text{ W/cm}^2$$
 (14)

Copyright © 2023 Texas Instruments Incorporated

Submit Document Feedback

$ILL_{IR} = [0.00006 \times 45 \text{ W}] \times 1000 \div 1.4270 \text{ cm}^2 = 1.892 \text{ mW/cm}^2$	(15)
$ILL_{BLU} = [0.28100 \times 45 \text{ W}] \div 1.4270 \text{ cm}^2 = 8.86 \text{ W/cm}^2$	(16)
$ILL_{BLI11} = [0.03200 \times 45 \text{ W}] \div 1.4270 \text{ cm}^2 = 1.01 \text{ W/cm}^2$	(17)

7.7 Window Aperture Illumination Overfill Calculation

The amount of optical overfill on the critical area of the window aperture cannot be measured directly. For systems with uniform illumination on the array the amount is determined using the total measured incident optical power on the DMD, and the ratio of the total optical power on the DMD that is on the defined critical area. The optical model is used to determine the percent of optical power on the window aperture critical area and estimate the size of the area.

• Q_{AP-ILL} = [Q_{INCIDENT} × OP_{AP_ILL_RATIO}] ÷ A_{AP_ILL} (W/cm²)

where:

- Q_{AP-ILL} = window aperture illumination overfill (W/cm²)
- Q_{INCIDENT} = total incident optical power on the DMD (Watts) (measured)
- OP_{AP_ILL_RATIO} = ratio of the optical power on the critical area of the window aperture to the total optical power on the DMD (optical model)
- A_{AP-ILL} = size of the window aperture critical area (cm²) (datasheet)
- OP_{CA RATIO} = percent of the window aperture critical area with incident optical power (%) (optical model)

Sample calculation:

Product Folder Links: DLP651LE

Submit Document Feedback

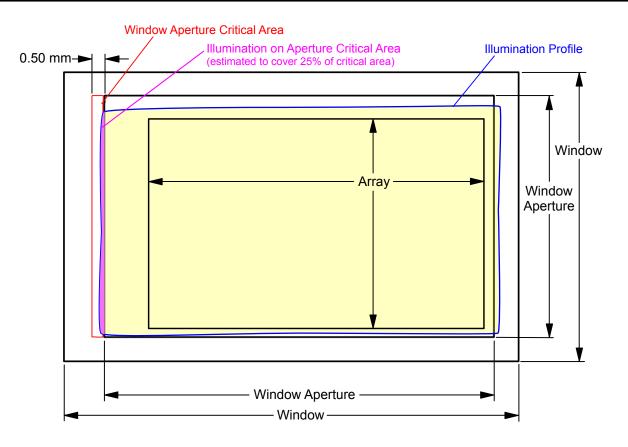

Figure 7-2. Window Aperture Overfill Example

See the figure for the length of the critical aperture.

$$Q_{INCIDENT} = 45 \text{ W (measured)}$$
 (18)

$$OP_{AP\ ILL\ RATIO} = 0.312\%$$
 (optical model) (19)

$$OV_{CA\ RATIO} = 25\%$$
 (optical model) (20)

$$A_{AP-II.I} = 0.99977 \text{ cm} \times 0.050 \text{ cm} = 0.049989 \text{ (cm}^2\text{)}$$
 (23)

$$Q_{AP-ILL} = (45 \times 0.00312) \div (0.049989 \times 0.25) = 11.2 \text{ (W/cm}^2)$$
(24)

7.8 Micromirror Landed-On/Landed-Off Duty Cycle

7.8.1 Definition of Micromirror Landed-On/Landed-Off Duty Cycle

The micromirror landed-on/landed-off duty cycle (landed duty cycle) denotes the amount of time (as a percentage) that an individual micromirror is landed in the On state versus the amount of time the same micromirror is landed in the Off state.

Copyright © 2023 Texas Instruments Incorporated

As an example, a landed duty cycle of 100/0 indicates that the referenced pixel is in the On state 100% of the time (and in the Off state 0% of the time); whereas 0/100 would indicate that the pixel is in the Off state 100% of the time. Likewise, 50/50 indicates that the pixel is On 50% of the time and Off 50% of the time.

Note that when assessing landed duty cycle, the time spent switching from one state (ON or OFF) to the other state (OFF or ON) is considered negligible and is thus ignored.

Since a micromirror can only be landed in one state or the other (On or Off), the two numbers (percentages) always add to 100.

7.8.2 Landed Duty Cycle and Useful Life of the DMD

Knowing the long-term average landed duty cycle (of the end product or application) is important because subjecting all (or a portion) of the DMD's micromirror array (also called the active array) to an asymmetric landed duty cycle for a prolonged period of time can reduce the DMD's usable life.

Note that it is the symmetry/asymmetry of the landed duty cycle that is of relevance. The symmetry of the landed duty cycle is determined by how close the two numbers (percentages) are to being equal. For example, a landed duty cycle of 50/50 is perfectly symmetrical whereas a landed duty cycle of 100/0 or 0/100 is perfectly asymmetrical.

7.8.3 Landed Duty Cycle and Operational DMD Temperature

Operational DMD Temperature and Landed Duty Cycle interact to affect the DMD's usable life, and this interaction can be exploited to reduce the impact that an asymmetrical Landed Duty Cycle has on the DMD's usable life. This is quantified in the de-rating curve shown in Figure 6-1. The importance of this curve is that:

- All points along this curve represent the same usable life.
- All points above this curve represent lower usable life (and the further away from the curve, the lower the usable life).
- All points below this curve represent higher usable life (and the further away from the curve, the higher the usable life).

In practice, this curve specifies the Maximum Operating DMD Temperature at a given long-term average Landed Duty Cycle.

7.8.4 Estimating the Long-Term Average Landed Duty Cycle of a Product or Application

During a given period of time, the Landed Duty Cycle of a given pixel follows from the image content being displayed by that pixel.

For example, in the simplest case, when displaying pure-white on a given pixel for a given time period, that pixel will experience a 100/0 Landed Duty Cycle during that time period. Likewise, when displaying pure-black, the pixel will experience a 0/100 Landed Duty Cycle.

Between the two extremes (ignoring for the moment color and any image processing that may be applied to an incoming image), the Landed Duty Cycle tracks one-to-one with the gray scale value, as shown in Table 7-1.

Table 7-1. Grayscale Value and Landed Duty Cycle

GRAYSCALE VALUE	LANDED DUTY CYCLE
0%	0/100
10%	10/90
20%	20/80
30%	30/70
40%	40/60
50%	50/50
60%	60/40
70%	70/30
80%	80/20

Table 7-1. Grayscale Value and Landed Duty Cycle (continued)

GRAYSCALE VALUE	LANDED DUTY CYCLE
90%	90/10
100%	100/0

Accounting for color rendition (but still ignoring image processing) requires knowing both the color intensity (from 0% to 100%) for each constituent primary color (red, green, and/or blue) for the given pixel as well as the color cycle time for each primary color, where "color cycle time" is the total percentage of the frame time that a given primary must be displayed in order to achieve the desired white point.

During a given period of time, the landed duty cycle of a given pixel can be calculated as follows:

Landed Duty Cycle = (Red_Cycle_% × Red_Scale_Value) + (Green_Cycle_% × Green_Scale_Value) + (Blue_Cycle_% × Blue_Scale_Value)

Where

• Red_Cycle_%, Green_Cycle_%, and Blue_Cycle_%, represent the percentage of the frame time that Red, Green, and Blue are displayed (respectively) to achieve the desired white point. (1)

For example, assume that the red, green and blue color cycle times are 50%, 20%, and 30% respectively (in order to achieve the desired white point), then the Landed Duty Cycle for various combinations of red, green, and blue color intensities would be as shown in Table 7-2 and Table 7-3.

Table 7-2. Example Landed Duty Cycle for Full-Color, Color Percentage

RED CYCLE	GREEN CYCLE	BLUE CYCLE
50%	20%	30%

Table 7-3. Example Landed Duty Cycle for Full-Color

RED SCALE	GREEN SCALE	BLUE SCALE	LANDED DUTY CYCLE
0%	0%	0%	0/100
100%	0%	0%	50/50
0%	100%	0%	20/80
0%	0%	100%	30/70
12%	0%	0%	6/94
0%	35%	0%	7/93
0%	0%	60%	18/82
100%	100%	0%	70/30
0%	100%	100%	50/50
100%	0%	100%	80/20
12%	35%	0%	13/87
0%	35%	60%	25/75
12%	0%	60%	24/76
100%	100%	100%	100/0

8 Application and Implementation

Note

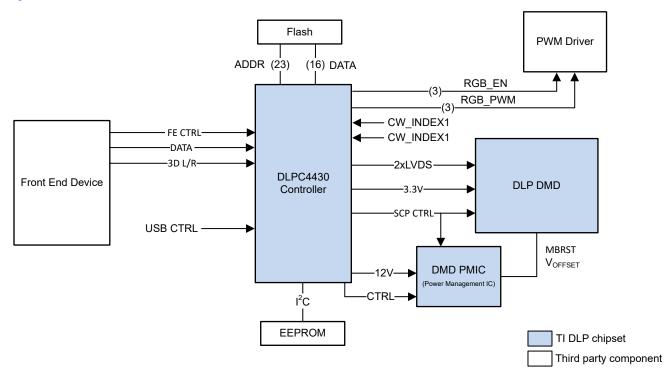

Information in the following applications sections is not part of the TI component specification, and TI does not warrant its accuracy or completeness. TI's customers are responsible for determining suitability of components for their purposes, as well as validating and testing their design implementation to confirm system functionality.

8.1 Application Information

Texas Instruments DLP technology is a micro-electro-mechanical systems (MEMS) technology that modulates light using a digital micromirror device (DMD). The DMD is a spatial light modulator, which reflects incoming light from an illumination source to one of two directions, either towards the projection optics, or the collection optics. The large micromirror array size and ceramic package provides great thermal performance for bright display applications. Typical applications using the DLP651LE include education projectors, and business projectors.

8.2 Typical Application

The DLP651LE digital micromirror device (DMD), combined with a DLPC4430 digital controller, DLPA100 power management device, and DLPA200 micromirror driver provides WXGA resolution for bright, colorful display applications. A typical display system that uses the DLP651LE and additional system components is shown in Figure 8-1.

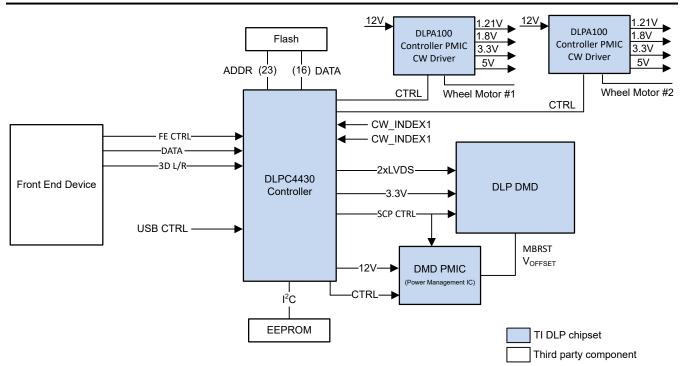

Figure 8-1. Typical DLPC4430 Application (LED, Top; LPCW, Bottom)

8.2.1 Design Requirements

The DLP 0.65 WXGA chipset can be used to create an efficient projection system. This chipset includes the DLP651LE, DLPC4430, DLPA100, and the DLPA200. The DLP651LE is used as the core imaging device in the display system and contains a 0.65-inch array of micromirrors. The DLPC4430 controller is the digital interface between the DMD and the rest of the system. The controller drives the DMD by taking the converted source data from the front end receiver and transmitting it to the DMD over a high speed interface. The DLPA100 power management device provides voltage regulators for the controller and colorwheel motor control. The DLPA200 provides the power and sequencing to drive the DLP651LE. To ensure reliable operation, the DLP651LE DMD must always be used with the DLPC4430 display controller, a DLPA100 PMIC driver, and a DLPA200 DMD micromirror driver.

Other core components of the display system include an illumination source, an optical engine for the illumination and projection optics, other electrical and mechanical components, and software. The illumination source options include lamp, LED, laser, or laser phosphor. The type of illumination used and desired brightness will have a major effect on the overall system design and size.

8.2.2 Detailed Design Procedure

For help connecting the DLPC4430 display controller and the DLP651LE DMD, see the reference design schematic. For a complete DLP system, an optical module or light engine is required that contains the DLP651LE DMD, associated illumination sources, optical elements, and necessary mechanical components. The optical module is typically supplied by an optical OMM (optical module manufacturer) who specializes in designing optics for DLP projectors.

8.2.3 Application Curves

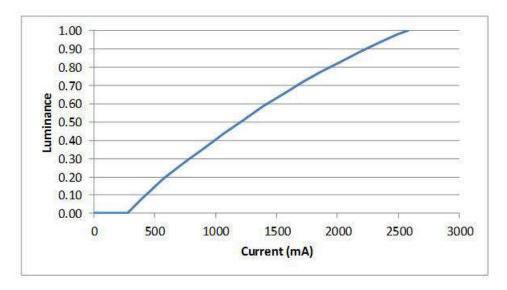

Figure 8-2. Luminance vs. Current

9 Layout

9.1 Layout Guidelines

The DLP651LE DMD is part of a chipset controlled by the DLPC4430 display controller in conjunction with the DLPA100 power and motor driver. These guidelines help to design a PCB board with the DLP651LE DMD. The DLP651LE DMD board is a high-speed multilayer PCB, with primarily high-speed digital logic with dual edge clock rates up to 400 MHz for DMD LVDS signals. The remaining traces comprise low-speed digital LVTTL signals. Use mini power planes for VOFFSET and MBRST[0:15]. Solid planes are required for DMD_P3P3V (3.3 V) and ground. The target impedance for the PCB is 50 Ω ±10% with the LVDS traces being 100 Ω ±10% differential. Use an 8-layer stack-up as described in Table 9-1.

9.2 Layout Example

9.2.1 Layers

Table 9-1 shows the layer stack-up and copper weight for each layer. Small subplanes are allowed on signal routing layers to connect components to major subplanes on top/bottom layers if necessary.

Table 9-1. Layer Stack-Up										
LAYER NO.	LAYER NAME	COPPER WT.	COMMENTS							
1	Side A—DMD only	1.5 oz	DMD, escapes, low frequency signals, power subplanes							
2	Ground	1 oz	Solid ground plane (net GND)							
3	Signal	0.5 oz	50- Ω and 100- Ω differential signals							
4	Ground	1 oz	Solid ground plane (net GND)							
5	DMD_P3P3V	1 oz	+3.3-V power plane (net DMD_P3P3V)							
6	Signal	0.5 oz	50 - Ω and 100 - Ω differential signals							
7	Ground	1 oz	Solid ground plane (net GND)							
8	8 Side B—all other components		Discrete components, low frequency signation power subplanes							

Table 9-1. Layer Stack-Up

9.2.2 Impedance Requirements

TI recommends the board have matched impedance of 50 Ω ±10% for all signals. The following table lists the exceptions.

Table 9-2. Special Impedance Requirements

SIGNAL TYPE	SIGNAL NAME	IMPEDANCE (Ω)			
A shannal IV/DC	D_AP(0:15), D_AN(0:15)				
A channel LVDS differential pairs	DCLK_AP, DCLK_AN 100 ±10% differential across each pai				
	SCTRL_AP, SCTRL_AN				
D	D_BP(0:15), D_BN(0:15)				
B channel LVDS differential pairs	DCLK_BP, DCLK_BN	100 ±10% differential across each pair			
	SCTRL_BP, SCTRL_BN				

9.2.3 Trace Width, Spacing

Unless otherwise specified, TI recommends all signals follow the 0.005-inch/0.005-inch design rule. Minimum trace clearance from the ground ring around the PWB has a 0.1-inch minimum. Actual trace widths and clearances will be determined based on an analysis of impedance and stack-up requirements.

10 Power Supply Recommendations

The following power supplies are all required to operate the DMD: V_{SS} , V_{BIAS} , V_{CC} , V_{CCI} , V_{OFFSET} , and V_{RESET} . DMD power-up and power-down sequencing is strictly controlled by the DLP display controller.

Note

CAUTION: For reliable operation of the DMD, the following power supply sequencing requirements must be followed. Failure to adhere to any of the prescribed power-up and power-down requirements may affect device reliability. See Figure 10-1—DMD Power Supply Sequencing Requirements.

 V_{BIAS} , V_{CCI} , V_{OFFSET} , and V_{RESET} power supplies must be coordinated during power-up and power-down operations. Failure to meet any of the below requirements will result in a significant reduction in the DMD's reliability and lifetime. Common ground V_{SS} must also be connected.

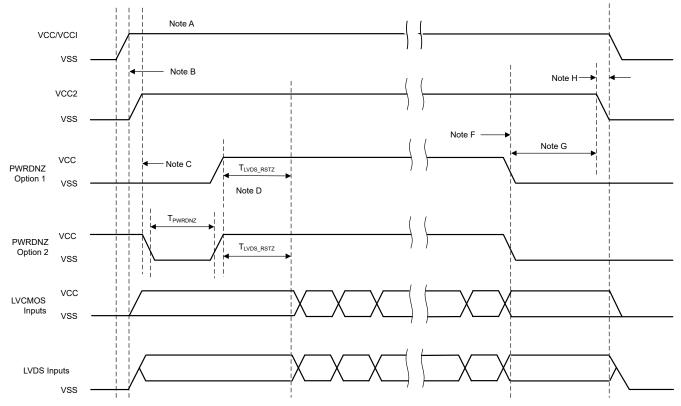

10.1 DMD Power Supply Power-Up Procedure

- During power-up, V_{CC} and V_{CCI} must always start and settle before V_{OFFSET} plus the first time delay period (t_{D1}). V_{BIAS} and V_{RESET} voltages are applied to the DMD.
- During power-up, it is a strict requirement that the voltage delta between V_{BIAS} and V_{OFFSET} must be within the specified limit shown in Section 6.4.
- During power-up, there is no requirement for the relative timing of V_{RESET} with respect to V_{BIAS}.
- Power supply slew rates during power-up are flexible, provided that the transient voltage levels follow the requirements specified in Section 6.1, in Section 6.4, and in Figure 10-1.
- During power-up, LVCMOS input pins must not be driven high until after V_{CC} and V_{CCI} have settled at operating voltages listed in Section 6.4.

10.2 DMD Power Supply Power-Down Procedure

- During power-down, V_{CC} and V_{CCI} must be supplied until after V_{CC2} is discharged to within the specified limit of ground. Refer to Section 6.4.
- Power supply slew rates during power-down are flexible, provided that the transient voltage levels follow the requirements specified in Section 6.1 and Section 6.4.
- During power-down, LVCMOS input pins must be less than specified in Section 6.4.

- See Pin Configuration and Functions for pin functions.
- V_{CC} must be up and stable prior to V_{CC2} powering up. В.
- PWRDNZ has two turn on options. Option 1: PWRDNZ does not go high until V_{CC} and V_{CC2} are up and stable, or Option 2: PWRDNZ must be pulsed low for a minimum of $T_{PWRDNZ},\, or\, 10$ ns after V_{CC} and V_{CC2} are up and stable.
- There is a minimum of T_{LVDS_ARSTZ}, or 2 µs, wait time from PWRDNZ going high for the LVDS receiver to recover.
- After the DMD micromirror park sequence is complete, the DLP controller software initiates a hardware power-down that activates the PWRDNZ and disables V_{CC2} .
- Under power-loss conditions, where emergency DMD micromirror park procedures are being enacted by the DLP controller hardware, PWRDNZ goes low.
- V_{CC} must remain high until after V_{CC2} goes low.
- To prevent excess current, the supply voltage delta $|V_{CCI} V_{CC}|$ must be less than specified limit in Section 6.4.

11 Device and Documentation Support

11.1 Device Support

11.1.1 Device Nomenclature

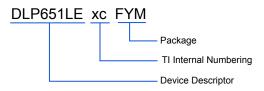

Figure 11-1. Device Number Description

11.1.2 Device Markings

The device marking will include both human-readable information and a two-dimensional matrix code. The human-readable information is described in Figure 11-2. The two-dimensional matrix code is an alpha-numeric string that contains the DMD part number, Part 1 and Part 2 of the serial number.

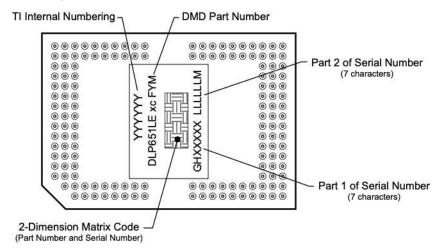

Figure 11-2. DMD Marking Locations

11.2 Documentation Support

11.2.1 Related Documentation

The following documents contain additional information related to the chipset components used with the DLP651LE:

- DLPC4430 Display Controller Data Sheet
- DLPA100 Power and Motor Driver Data Sheet
- DLPA200 Micromirror Driver Data Sheet

11.3 Receiving Notification of Documentation Updates

To receive notification of documentation updates, navigate to the device product folder on ti.com. In the upper right corner, click on *Alert me* to register and receive a weekly digest of any product information that has changed. For change details, review the revision history included in any revised document.

11.4 Support Resources

TI E2E[™] support forums are an engineer's go-to source for fast, verified answers and design help — straight from the experts. Search existing answers or ask your own question to get the guick design help you need.

Linked content is provided "AS IS" by the respective contributors. They do not constitute TI specifications and do not necessarily reflect TI's views; see TI's Terms of Use.

11.5 Trademarks

TI E2E[™] is a trademark of Texas Instruments.

All trademarks are the property of their respective owners.

11.6 Electrostatic Discharge Caution

This integrated circuit can be damaged by ESD. Texas Instruments recommends that all integrated circuits be handled with appropriate precautions. Failure to observe proper handling and installation procedures can cause damage.

ESD damage can range from subtle performance degradation to complete device failure. Precision integrated circuits may be more susceptible to damage because very small parametric changes could cause the device not to meet its published specifications.

11.7 Glossary

TI Glossary

This glossary lists and explains terms, acronyms, and definitions.

⁽¹⁾ Status: For more details on status, see our product life cycle.

Multiple part markings will be inside parentheses. Only one part marking contained in parentheses and separated by a "~" will appear on a part. If a line is indented then it is a continuation of the previous line and the two combined represent the entire part marking for that device.

Important Information and Disclaimer: The information provided on this page represents TI's knowledge and belief as of the date that it is provided. TI bases its knowledge and belief on information provided by third parties, and makes no representation or warranty as to the accuracy of such information. Efforts are underway to better integrate information from third parties. TI has taken and continues to take reasonable steps to provide representative and accurate information but may not have conducted destructive testing or chemical analysis on incoming materials and chemicals. TI and TI suppliers consider certain information to be proprietary, and thus CAS numbers and other limited information may not be available for release.

In no event shall TI's liability arising out of such information exceed the total purchase price of the TI part(s) at issue in this document sold by TI to Customer on an annual basis.

⁽²⁾ Material type: When designated, preproduction parts are prototypes/experimental devices, and are not yet approved or released for full production. Testing and final process, including without limitation quality assurance, reliability performance testing, and/or process qualification, may not yet be complete, and this item is subject to further changes or possible discontinuation. If available for ordering, purchases will be subject to an additional waiver at checkout, and are intended for early internal evaluation purposes only. These items are sold without warranties of any kind.

⁽³⁾ RoHS values: Yes, No, RoHS Exempt. See the TI RoHS Statement for additional information and value definition.

⁽⁴⁾ Lead finish/Ball material: Parts may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead finish/Ball material values may wrap to two lines if the finish value exceeds the maximum column width.

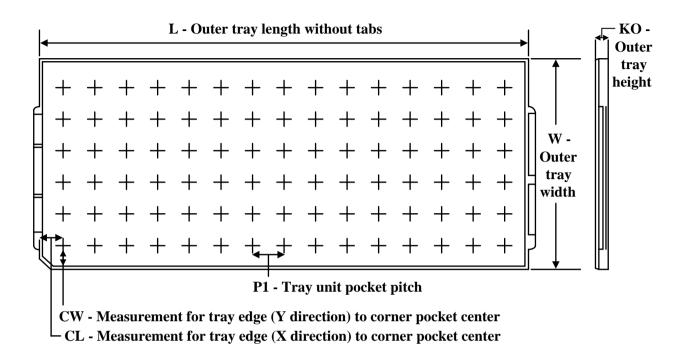

⁽⁵⁾ MSL rating/Peak reflow: The moisture sensitivity level ratings and peak solder (reflow) temperatures. In the event that a part has multiple moisture sensitivity ratings, only the lowest level per JEDEC standards is shown. Refer to the shipping label for the actual reflow temperature that will be used to mount the part to the printed circuit board.

⁽⁶⁾ Part marking: There may be an additional marking, which relates to the logo, the lot trace code information, or the environmental category of the part.
