# DRV5013 Digital-Latch Hall Effect Sensor

1 Features

- Digital bipolar-latch Hall sensor
- Superior temperature stability
  - B_{OP} ±10% over temperature
- Multiple sensitivity options (B_{OP} / B_{RP})
  - ±1.3mT (FA, FD, see *Device Nomenclature*)
  - ±2.7mT (AD, ND, see *Device Nomenclature*)
  - ±6mT (AG, see *Device Nomenclature*)
  - ±12mT (BC, see *Device Nomenclature*)
- Supports a wide voltage range
  - 2.5V to 38V
  - No external regulator required
- Wide operating temperature range
  - T_A = –40 to +125°C (Q, see *Device Nomenclature*)
  - T_A = –40 to +150°C (E, see *Device Nomenclature*)
- Open-drain output (30mA sink)
- Fast 35µs power-on time
- Small package and footprint
  - Surface mount 3-pin SOT-23 (DBZ)
    - 2.92mm × 2.37mm
  - Through-hole 3-pin TO-92 (LPG, LPE)
    - 4mm × 3.15mm
- **Protection features:**
  - Reverse supply protection (up to –22V)
  - Supports up to 40V load dump
  - Output short-circuit protection
  - Output current limitation
Output State (FA, AD, AG, BC Versions)
Inverted Output State (ND, FD Version)

2 Applications

- Power tools
- Flow meters
- Valve and solenoid status
- Brushless dc motors
- Proximity sensing
- Tachometers

3 Description

The DRV5013 device is a chopper-stabilized Hall effect sensor that offers a magnetic sensing solution with superior sensitivity stability over temperature and integrated protection features.
The magnetic field is indicated through a digital bipolar latch output. The IC has an open-drain output stage with 30-mA current sink capability. A wide operating voltage range from 2.5V to 38 V with reverse polarity protection up to –22 V makes the device suitable for a wide range of industrial applications.

Internal protection functions are provided for reverse supply conditions, load dump, and output short circuit or overcurrent.

Package Information [(1)]

PART NUMBER	PACKAGE	BODY SIZE (NOM) [(2)]
DRV5013	DBZ (SOT-23, 3)	2.92mm × 2.37mm
	LPE (TO-92, 3)	4mm × 3.15mm
	LPG (TO-92, 3)	4mm × 3.15mm

(1) For all available packages, see the package option addendum at the end of the data sheet.
(2) The package size (length × width) is a nominal value and includes pins, where applicable.

5 Specifications

5.1 Absolute Maximum Ratings

over operating free-air temperature range (unless otherwise noted) [1]

		MIN	MAX	UNIT
Power supply voltage	V_{CC}	−22 [2]	40	V
	Voltage ramp rate (V_{CC}), V_{CC} < 5V	Unlimited		V/µs
	Voltage ramp rate (V_{CC}), V_{CC} > 5V	0	2	
Output pin voltage		−0.5	40	V
Output pin reverse current during reverse supply condition		0	100	mA
Magnetic flux density, B_{MAX}		Unlimited		
Operating junction temperature, T_J	Q, see Figure 8-1	−40	150	°C
	E, see Figure 8-1	−40	175	
Storage temperature, T_{stg}		−65	150	°C

(1)   Operation outside the *Absolute Maximum Ratings* may cause permanent device damage. *Absolute Maximum Ratings* do not imply functional operation of the device at these or any other conditions beyond those listed under *Recommended Operating Conditions*. If used outside the *Recommended Operating Conditions* but within the *Absolute Maximum Ratings*, the device may not be fully functional, and this may affect device reliability, functionality, performance, and shorten the device lifetime.

(2)   Specified by design. Only tested to –20 V.

5.2 ESD Ratings

			VALUE	UNIT
$V_{(ESD)}$	Electrostatic discharge	Human body model (HBM), per ANSI/ESDA/JEDEC JS-001, all pins[1]	±2500	V
		Charged device model (CDM), per JEDEC specification JESD22-C101, all pins[2]	±500	

(1)   JEDEC document JEP155 states that 500-V HBM allows safe manufacturing with a standard ESD control process.
(2)   JEDEC document JEP157 states that 250-V CDM allows safe manufacturing with a standard ESD control process.

5.3 Recommended Operating Conditions

over operating free-air temperature range (unless otherwise noted)

		MIN	MAX	UNIT
V_{CC}	Power supply voltage	2.5	38	V
V_O	Output pin voltage (OUT)	0	38	V
I_{SINK}	Output pin current sink (OUT)[1]	0	30	mA
T_A	Operating ambient temperature	Q, see Figure 8-1	−40	125	°C
		E, see Figure 8-1	−40	150	

(1)   Power dissipation and thermal limits must be observed.

5.4 Thermal Information

THERMAL METRIC[1]		DRV5013		UNIT
		DBZ (SOT-23)	LPG, LPE (TO-92)	
		3 PINS	3 PINS	
$R_{\theta JA}$	Junction-to-ambient thermal resistance	333.2	180	°C/W
$R_{\theta JC(top)}$	Junction-to-case (top) thermal resistance	99.9	98.6	°C/W
$R_{\theta JB}$	Junction-to-board thermal resistance	66.9	154.9	°C/W
ψ_{JT}	Junction-to-top characterization parameter	4.9	40	°C/W
ψ_{JB}	Junction-to-board characterization parameter	65.2	154.9	°C/W

(1)   For more information about traditional and new thermal metrics, see the *Semiconductor and IC Package Thermal Metrics* application report.

5.5 Electrical Characteristics

over operating free-air temperature range (unless otherwise noted)

PARAMETER		TEST CONDITIONS	MIN	TYP	MAX	UNIT
POWER SUPPLIES (V_CC)						
V_{CC}	V_{CC} operating voltage		2.5		38	V
I_{CC}	Operating supply current	ND, FD Versions V_{CC} = 2.5V to 38V, T_A = 25°C		1.5		mA
		ND, FD Versions V_{CC} = 2.5V to 38V, T_A = $T_{A, MAX}$ [1]		1.5	3.2	
		AD, AG, BC, FA Versions V_{CC} = 2.5V to 38V, T_A = 25°C		2.7		
		AD, AG, BC, FA Versions V_{CC} = 2.5V to 38V, T_A = $T_{A, MAX}$ [1]		3	3.5	
t_{on}	Power-on time	AD, AG, BC, ND versions		35	50	µs
		FA, FD version		35	70	
OPEN DRAIN OUTPUT (OUT)						
$r_{DS(on)}$	FET on-resistance	V_{CC} = 3.3V, I_O = 10mA, T_A = 25°C		22		Ω
		V_{CC} = 3.3V, I_O = 10mA, T_A = $T_{A,MAX}$ [1]		36	50	
$I_{lkg(off)}$	Off-state leakage current	Output Hi-Z			1	µA
PROTECTION CIRCUITS						
V_{CCR}	Reverse supply voltage		−22			V
I_{OCP}	Overcurrent protection level	OUT shorted V_{CC}	15	30	45	mA

(1) $T_{A, MAX}$ is 125°C for Q devices and 150°C for E devices (see Figure 8-1).

5.6 Switching Characteristics

over operating free-air temperature range (unless otherwise noted)

PARAMETER		TEST CONDITIONS	MIN	TYP	MAX	UNIT
OPEN-DRAIN OUTPUT (OUT)						
t_d	Output delay time	B = B_{RP} – 10mT to B_{OP} + 10mT in 1µs		13	25	µs
t_r	Output rise time (10% to 90%)	R1 = 1kΩ, C_O = 50pF, V_{CC} = 3.3V		200		ns
t_f	Output fall time (90% to 10%)	R1 = 1kΩ, C_O = 50pF, V_{CC} = 3.3V		31		ns

5.7 Magnetic Characteristics

over operating free-air temperature range (unless otherwise noted)

| PARAMETER		TEST CONDITIONS	MIN	TYP	MAX	UNIT[1]

6 Detailed Description

6.1 Overview

The DRV5013 device is a chopper-stabilized Hall sensor with a digital latched output for magnetic sensing applications. The DRV5013 device can be powered with a supply voltage ranging from 2.5 V to 38 V, and continuously withstand –22 V reverse-battery conditions. The DRV5013 device does not operate when –22 V to 2.4 V is applied to the V_{CC} pin (with respect to the GND pin). In addition, the device can withstand voltages up to 40 V for transient durations.

The field polarity is defined as follows: a south pole near the marked side of the package induces a positive magnetic flux density on the sensor, while a north pole near the marked side of the package induces a negative magnetic flux density on the sensor.

The output state is dependent on the magnetic flux density perpendicular to the package. A positive magnetic flux density greater than the operate point threshold, B_{OP}, causes the output to pull low for the AD, AG, BC and FA device versions (release high for the inverted ND and FD device versions). A negative magnetic flux density less than the release point threshold, B_{RP}, causes the output to release high for the AD, AG, BC and FA device versions (pull low for the inverted ND and FD device versions). Hysteresis is included in between the operate point and the release point to help prevent magnetic noise from accidentally tripping the output.

An external pullup resistor is required on the OUT pin. The OUT pin can be pulled up to V_{CC}, or to a different voltage supply. This allows for easier interfacing with controller circuits.

6.2 Functional Block Diagram
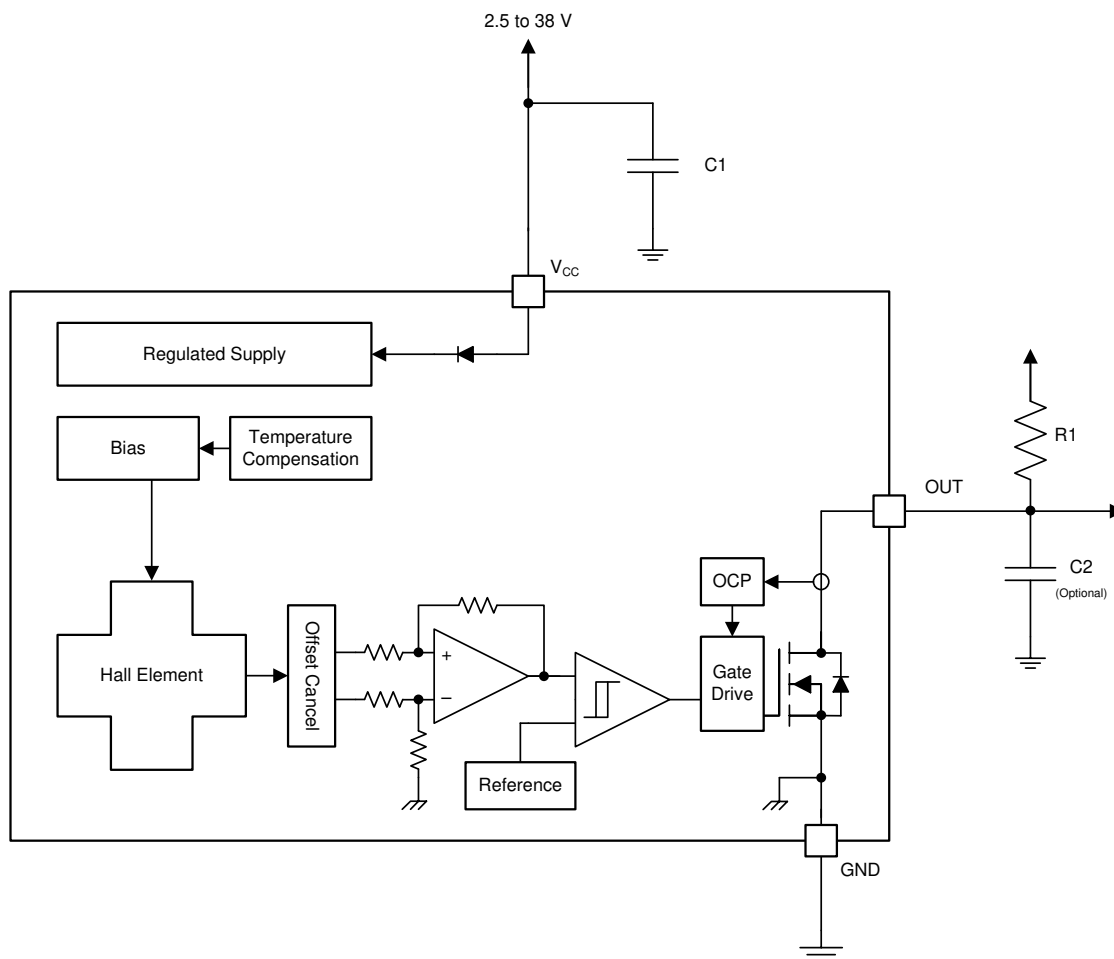

6.3 Feature Description

6.3.1 Field Direction Definition

Figure 6-1 illustrates that a positive magnetic flux density is defined as the presence of a south pole near the marked side of the package.

Figure 6-1. Field Direction Definition

6.3.2 Device Output

If the device is powered on with a magnetic flux density between B_{RP} and B_{OP}, then the device output is indeterminate and can either be Hi-Z or Low. If the magnetic flux density is greater than B_{OP}, then the output is pulled low (released high for the inverted ND and FD versions). If the magnetic flux density is less than B_{RP}, then the output is released high according to the output reference voltage and pullup resistor (pulled low for the inverted ND and FD versions).

**Figure 6-2. Output State (FA, AD, AG, BC Versions)**

Figure 6-3. Inverted Output State (ND, FD Versions)

6.3.3 Power-On Time

After applying V_{CC} to the DRV5013 device, t_{on} must elapse before the OUT pin is valid. During the power-up sequence, the output is Hi-Z. A pulse as shown in Figure 6-4 and Figure 6-5 occurs at the end of t_{on}. This pulse can allow the host processor to determine when the DRV5013 output is valid after start-up. The power-up sequence, including the pulse, is the same for all device output versions (AD, AG, BC, FA, FD, ND). Case 1, 2, 3 and 4 below show examples of valid outputs for the non-inverted output versions (AD, AG, BC, FA). In Case 1 (Figure 6-4) and Case 2 (Figure 6-5), the output is defined assuming a constant magnetic flux density $B > B_{OP}$ and $B < B_{RP}$.

Figure 6-4. Case 1: Power On When $B > B_{OP}$

Figure 6-5. Case 2: Power On When $B < B_{RP}$

Product Folder Links: *DRV5013*

If the device is powered on with the magnetic flux density $B_{RP} < B < B_{OP}$, then the device output is indeterminate and can either be Hi-Z or pulled low. During the power-up sequence, the output is held Hi-Z until t_{on} has elapsed. At the end of t_{on}, a pulse is given on the OUT pin to indicate that t_{on} has elapsed. After t_{on}, if the magnetic flux density changes such that $B_{OP} < B$, the output is released. Case 3 (Figure 6-6) and Case 4 (Figure 6-7) show examples of this behavior.

Figure 6-6. Case 3: Power On When $B_{RP} < B < B_{OP}$, Followed by B > B_{OP}

Figure 6-7. Case 4: Power On When $B_{RP} < B < B_{OP}$, Followed by B < B_{RP}

6.3.4 Output Stage

Figure 6-8 shows the DRV5013 open-drain NMOS output structure, rated to sink up to 30 mA of current. For proper operation, use Equation 1 to calculate the value of pullup resistor R1.

$$\frac{V_{ref}\ max}{30\ mA} \leq R1 \leq \frac{V_{ref}\ min}{100\ \mu A} \tag{1}$$

The size of R1 is a tradeoff between the OUT rise time and the current when OUT is pulled low. A lower current is generally better, however faster transitions and bandwidth require a smaller resistor for faster switching.

In addition, make sure that the value of R1 > 500 Ω so that the output driver can pull the OUT pin close to GND.

Note

V_{ref} is not restricted to V_{CC}. The allowable voltage range of this pin is specified in the *Absolute Maximum Ratings*.

Figure 6-8. NMOS Open-Drain Output

Select a value for C2 based on the system bandwidth specifications as shown in Equation 2.

$$2 \times f_{BW}\ (Hz) < \frac{1}{2\pi \times R1 \times C2} \tag{2}$$

Most applications do not require this C2 filtering capacitor.

6.3.5 Protection Circuits

The DRV5013 device is fully protected against overcurrent and reverse-supply conditions. Table 6-1 lists a summary of the protection circuits.

Table 6-1. Protection Circuit Summary

FAULT	CONDITION	DEVICE	DESCRIPTION	RECOVERY
FET overload (OCP)	$I_{SINK} \geq I_{OCP}$	Operating	Output current is clamped to I_{OCP}	$I_O < I_{OCP}$
Load dump	38 V < V_{CC} < 40 V	Operating	Device will operate for a transient duration	$V_{CC} \leq 38$ V
Reverse supply	−22 V < V_{CC} < 0 V	Disabled	Device will survive this condition	$V_{CC} \geq 2.5$ V

6.3.5.1 Overcurrent Protection (OCP)

An analog current-limit circuit limits the current through the FET. The driver current is clamped to I_{OCP}. During this clamping, the $r_{DS(on)}$ of the output FET is increased from the nominal value.

6.3.5.2 Load Dump Protection

The DRV5013 device operates at DC V_{CC} conditions up to 38 V nominally, and can additionally withstand V_{CC} = 40 V. No current-limiting series resistor is required for this protection.

6.3.5.3 Reverse Supply Protection

The DRV5013 device is protected in the event that the V_{CC} pin and the GND pin are reversed (up to −22 V).

Note

In a reverse supply condition, the OUT pin reverse-current must not exceed the ratings specified in the *Absolute Maximum Ratings*.

6.4 Device Functional Modes

The DRV5013 device is active only when V_{CC} is between 2.5 V and 38 V.

When a reverse supply condition exists, the device is inactive.

7 Application and Implementation

> **Note**
>
> Information in the following applications sections is not part of the TI component specification, and TI does not warrant its accuracy or completeness. TI's customers are responsible for determining suitability of components for their purposes, as well as validating and testing their design implementation to confirm system functionality.

7.1 Application Information

The DRV5013 device is used in magnetic-field sensing applications.

7.2 Typical Applications

7.2.1 Standard Circuit
Figure 7-1. Typical Application Circuit

7.2.1.1 Design Requirements

For this design example, use the parameters listed in Table 7-1 as the input parameters.

Table 7-1. Design Parameters

DESIGN PARAMETER	REFERENCE	EXAMPLE VALUE
Supply voltage	V_{CC}	3.2 to 3.4 V
System bandwidth	f_{BW}	10 kHz

7.2.1.2 Detailed Design Procedure

Table 7-2. External Components

COMPONENT	PIN 1	PIN 2	RECOMMENDED
C1	V_{CC}	GND	A 0.01-µF (minimum) ceramic capacitor rated for V_{CC}
C2	OUT	GND	**Optional**: Place a ceramic capacitor to GND
R1	OUT	REF[1]	Requires a resistor pullup

(1) REF is not a pin on the DRV5013 device, but a REF supply-voltage pullup is required for the OUT pin; the OUT pin may be pulled up to V_{CC}.

Product Folder Links: *DRV5013*

7.2.1.2.1 Configuration Example

In a 3.3-V system, 3.2 V ≤ V_{ref} ≤ 3.4 V. Use Equation 3 to calculate the allowable range for R1.

$$\frac{V_{ref}\ max}{30\ mA} \le R1 \le \frac{V_{ref}\ min}{100\ \mu A} \tag{3}$$

For this design example, use Equation 4 to calculate the allowable range of R1.

$$\frac{3.4\ V}{30\ mA} \le R1 \le \frac{3.2\ V}{100\ \mu A} \tag{4}$$

Therefore:

$$113\ \Omega \le R1 \le 32\ k\Omega \tag{5}$$

After finding the allowable range of R1 (Equation 5), select a value between 500 Ω and 32 kΩ for R1.

Assuming a system bandwidth of 10 kHz, use Equation 6 to calculate the value of C2.

$$2 \times f_{BW}\ (Hz) < \frac{1}{2\pi \times R1 \times C2} \tag{6}$$

For this design example, use Equation 7 to calculate the value of C2.

$$2 \times 10\ kHz < \frac{1}{2\pi \times R1 \times C2} \tag{7}$$

An R1 value of 10 kΩ and a C2 value less than 820 pF satisfy the requirement for a 10-kHz system bandwidth.

A selection of R1 = 10 kΩ and C2 = 680 pF would cause a low-pass filter with a corner frequency of 23.4 kHz.

7.2.1.3 Application Curves

R1 = 10 kΩ pull-up   No C2

Figure 7-2. 10-kHz Switching Magnetic Field

R1 = 10-kΩ pull-up   C2 = 680 pF

Figure 7-3. 10-kHz Switching Magnetic Field

Product Folder Links: DRV5013
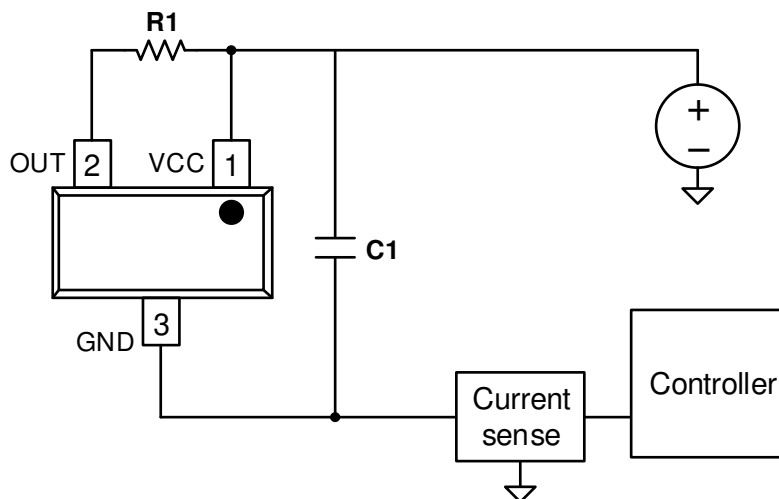

R1 = 10-kΩ pull-up   C2 = 680 pF
Figure 7-4. Low-Pass Filtering

7.2.2 Alternative Two-Wire Application

For systems that require minimal wire count, the device output can be connected to V_{CC} through a resistor, and the total supplied current can be sensed near the controller.

Figure 7-5. 2-Wire Application

Current can be sensed using a shunt resistor or other circuitry.

7.2.2.1 Design Requirements

Table 7-3 lists the related design parameters.

Table 7-3. Design Parameters

DESIGN PARAMETER	REFERENCE	EXAMPLE VALUE
Supply voltage	V_{CC}	12 V
OUT resistor	R1	1 kΩ
Bypass capacitor	C1	0.1 µF
Current when B < B_{RP}	$I_{RELEASE}$	About 3 mA
Current when B > B_{OP}	$I_{OPERATE}$	About 15 mA

Product Folder Links: *DRV5013*

7.2.2.2 Detailed Design Procedure

When the open-drain output of the device is high-impedance, current through the path equals the I_{CC} of the device (approximately 3 mA).

When the output pulls low, a parallel current path is added, equal to V_{CC} / (R1 + $r_{DS(on)}$). Using 12 V and 1 kΩ, the parallel current is approximately 12 mA, making the total current approximately 15 mA.

The local bypass capacitor C1 should be at least 0.1 µF, and a larger value if there is high inductance in the power line interconnect.

7.3 Power Supply Recommendations

The DRV5013 device is designed to operate from an input voltage supply (VM) range between 2.5 V and 38 V. A 0.01-µF (minimum) ceramic capacitor rated for V_{CC} must be placed as close to the DRV5013 device as possible. Larger values of the bypass capacitor may be needed to attenuate any significant high-frequency ripple and noise components generated by the power source. TI recommends limiting the supply voltage variation to less than 50 mV_{PP}.

7.4 Layout

7.4.1 Layout Guidelines

The bypass capacitor should be placed near the DRV5013 device for efficient power delivery with minimal inductance. The external pullup resistor should be placed near the microcontroller input to provide the most stable voltage at the input; alternatively, an integrated pullup resistor within the GPIO of the microcontroller can be used.

Generally, using PCB copper planes underneath the DRV5013 device has no effect on magnetic flux, and does not interfere with device performance. This is because copper is not a ferromagnetic material. However, If nearby system components contain iron or nickel, they may redirect magnetic flux in unpredictable ways.
7.4.2 Layout Example

Figure 7-6. DRV5013 Layout Example

8.2 Receiving Notification of Documentation Updates

To receive notification of documentation updates, navigate to the device product folder on ti.com. Click on *Notifications* to register and receive a weekly digest of any product information that has changed. For change details, review the revision history included in any revised document.

8.3 Support Resources

TI E2E™ support forums are an engineer's go-to source for fast, verified answers and design help — straight from the experts. Search existing answers or ask your own question to get the quick design help you need.

Linked content is provided "AS IS" by the respective contributors. They do not constitute TI specifications and do not necessarily reflect TI's views; see TI's Terms of Use.

8.4 Trademarks

TI E2E™ is a trademark of Texas Instruments.
All trademarks are the property of their respective owners.

8.5 Electrostatic Discharge Caution

This integrated circuit can be damaged by ESD. Texas Instruments recommends that all integrated circuits be handled with appropriate precautions. Failure to observe proper handling and installation procedures can cause damage.

ESD damage can range from subtle performance degradation to complete device failure. Precision integrated circuits may be more susceptible to damage because very small parametric changes could cause the device not to meet its published specifications.

8.6 Glossary

TI Glossary   This glossary lists and explains terms, acronyms, and definitions.

9 Revision History

NOTE: Page numbers for previous revisions may differ from page numbers in the current version.

10 Mechanical, Packaging, and Orderable Information

The following pages include mechanical, packaging, and orderable information. This information is the most current data available for the designated devices. This data is subject to change without notice and revision of this document. For browser-based versions of this data sheet, refer to the left-hand navigation.

PACKAGING INFORMATION

(1) Status: For more details on status, see our product life cycle.

(2) Material type: When designated, preproduction parts are prototypes/experimental devices, and are not yet approved or released for full production. Testing and final process, including without limitation quality assurance, reliability performance testing, and/or process qualification, may not yet be complete, and this item is subject to further changes or possible discontinuation. If available for ordering, purchases will be subject to an additional waiver at checkout, and are intended for early internal evaluation purposes only. These items are sold without warranties of any kind.

(3) RoHS values: Yes, No, RoHS Exempt. See the TI RoHS Statement for additional information and value definition.

(4) Lead finish/Ball material: Parts may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead finish/Ball material values may wrap to two lines if the finish value exceeds the maximum column width.

(5) MSL rating/Peak reflow: The moisture sensitivity level ratings and peak solder (reflow) temperatures. In the event that a part has multiple moisture sensitivity ratings, only the lowest level per JEDEC standards is shown. Refer to the shipping label for the actual reflow temperature that will be used to mount the part to the printed circuit board.

(6) Part marking: There may be an additional marking, which relates to the logo, the lot trace code information, or the environmental category of the part.

Multiple part markings will be inside parentheses. Only one part marking contained in parentheses and separated by a "~" will appear on a part. If a line is indented then it is a continuation of the previous line and the two combined represent the entire part marking for that device.

Important Information and Disclaimer: The information provided on this page represents TI's knowledge and belief as of the date that it is provided. TI bases its knowledge and belief on information provided by third parties, and makes no representation or warranty as to the accuracy of such information. Efforts are underway to better integrate information from third parties. TI has taken and continues to take reasonable steps to provide representative and accurate information but may not have conducted destructive testing or chemical analysis on incoming materials and chemicals. TI and TI suppliers consider certain information to be proprietary, and thus CAS numbers and other limited information may not be available for release.

In no event shall TI's liability arising out of such information exceed the total purchase price of the TI part(s) at issue in this document sold by TI to Customer on an annual basis.
