

DRV8411 Dual H-Bridge Motor Driver with Current Regulation

1 Features

- Dual H-bridge motor driver, can drive -
 - One bipolar stepper motor
 - One or two brushed DC motors
 - Solenoids and other inductive loads
- Low ON-resistance: HS + LS = 400mΩ (Typical, 25°C)
- Wide Power Supply Voltage Range
 - 1.65 to 11V
- Pin-to-pin compatible with -
 - [DRV8833](#): 360mΩ/bridge
 - [DRV8833C](#): 1735mΩ/bridge
 - [DRV8847](#): 1000mΩ/bridge
 - [DRV8410](#): 800mΩ/bridge
 - [DRV8411A](#): 400mΩ/bridge
- High output current capability: 4A Peak
- PWM control interface
- Supports 1.8V, 3.3V, and 5V logic inputs
- Integrated current regulation
- Low-power sleep mode
 - $\leq 40\text{nA}$ at $V_{VM} = 5\text{V}$, $T_J = 25^\circ\text{C}$
- Small package and footprint
 - 16-pin HTSSOP with PowerPAD™, 5.0×4.4mm
 - 16-Pin WQFN with PowerPAD™, 3.0×3.0mm
- Integrated protection features
 - VM undervoltage lockout (UVLO)
 - Auto-retry overcurrent protection (OCP)
 - Thermal shutdown (TSD)
 - Fault Indication Pin (nFAULT)

2 Applications

- [Battery-Powered Toys](#)
- [POS Printers](#)
- [Video Security Cameras](#)
- Office Automation Machines
- [Gaming Machines](#)
- [Robotics](#)
- [Electronic Smart Locks](#)
- General purpose solenoid loads

3 Description

The DRV8411 is a dual H-bridge motor driver that can drive one or two DC brush motors, one stepper motor, solenoids, or other inductive loads. The tripler charge pump allows the device to operate down to 1.65V to accommodate 1.8V supply rails and low-battery conditions. The charge pump integrates all capacitors and allows for 100% duty cycle operation. The inputs and outputs can be paralleled to drive high current brush DC motors with half the $R_{DS(on)}$.

The device implements current regulation by comparing an internal reference voltage to the voltage on the xISEN pins, which is proportional to motor current through an external sense resistor. The ability to limit current can significantly reduce large currents during motor startup and stall conditions.

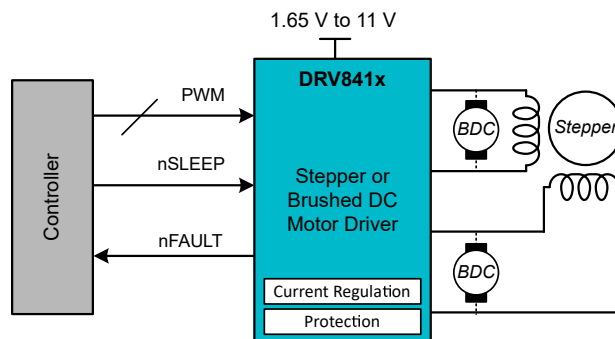

A low-power sleep mode achieves ultra-low quiescent current draw by shutting down most of the internal circuitry. Internal protection features include undervoltage, overcurrent, and overtemperature.

The DRV8411 is part of a family of devices which come in pin-to-pin, scalable $R_{DS(ON)}$ options to support various loads with minimal design changes. See [Section 4](#) for information on the devices in this family. View our full portfolio of [brushed motor drivers](#) on ti.com.

8 Detailed Description

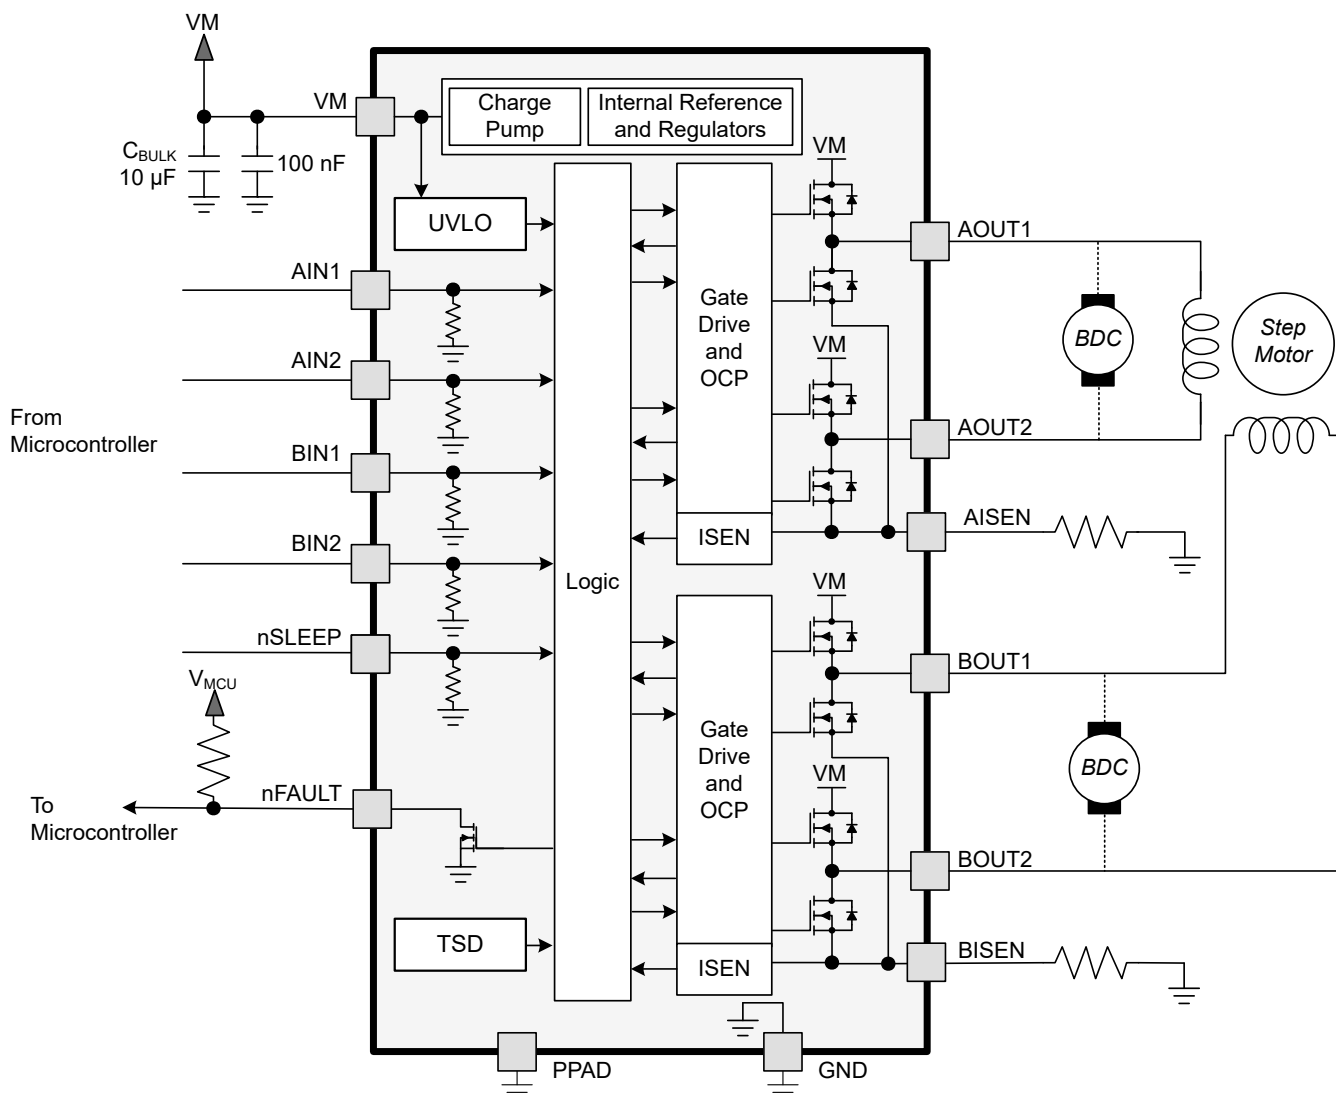

8.1 Overview

The DRV8411 is a dual H-bridge motor driver for driving two brushed DC motors or one stepper motor from a 1.65V to 11V supply rail. The integrated current regulation feature limits motor current to a predefined maximum based on xISEN resistors.

Two logic inputs control each H-bridge, which consists of four N-channel MOSFETs that have a typical $R_{DS(ON)}$ of 400m Ω (including one high-side and one low-side FET). A single power input, VM, serves as both device power and the motor winding bias voltage. The integrated charge pump of the device boosts VM internally and fully enhances the high-side FETs. Motor speed can be controlled with pulse-width modulation, at frequencies between 0 to 100kHz. The device enters a low-power sleep mode by bringing the nSLEEP pin low.

A variety of integrated protection features protect the device in the case of a system fault. These include undervoltage lockout (UVLO), overcurrent protection (OCP), and overtemperature shutdown (TSD).

8.2 Functional Block Diagram

8.3 External Components

Table 8-1 lists the recommended values of the external components for the driver.

Table 8-1. DRV8411 External Components

COMPONENT	PIN 1	PIN 2	RECOMMENDED
C _{VM1}	VM	GND	VM-rated capacitor, 10 μ F minimum
C _{VM2}	VM	GND	0.1- μ F, VM rated ceramic capacitor
R _{nFAULT}	VEXT ⁽¹⁾	nFAULT	Pullup resistor, I _{OD} \leq 5 mA
R _{AISEN}	AISEN	GND	Sense resistor, see the Section 8.4.2 for sizing
R _{BISEN}	BISEN	GND	Sense resistor, see the Section 8.4.2 for sizing

(1) VEXT is not a pin on the DRV8411, but a pullup resistor on the VEXT external supply voltage is required for the open-drain output, nFAULT.

8.4 Feature Description

8.4.1 Bridge Control

The DRV8411 has two identical H-bridge motor drivers. The input pins, AINx and BINx, control the corresponding outputs, AOUTx and BOUTx, respectively. Table 8-2 shows how the inputs control the H-bridge outputs.

Table 8-2. H-Bridge Control

nSLEEP	xIN1	xIN2	xOUT1	xOUT2	DESCRIPTION
0	X	X	High-Z	High-Z	Low-power sleep mode
1	0	0	High-Z	High-Z	Coast/ fast decay; H-bridge disabled to High-Z
1	0	1	L	H	Reverse (Current OUT2 \rightarrow OUT1)
1	1	0	H	L	Forward (Current OUT1 \rightarrow OUT2)
1	1	1	L	L	Brake; low-side slow decay

The inputs can be set to constant voltages for 100% duty cycle drive, or they can be pulse-width modulated (PWM) for variable motor speed. When using PWM, switching between driving (forward or reverse) and slow-decay states typically works best. For example, to drive a motor forward with 50% of the maximum RPM, IN1 = 1 and IN2 = 0 during the driving period or PWM "on" time, and IN1 = 1 and IN2 = 1 during the PWM "off" time.

Alternatively, the coast mode (IN1 = 0, IN2 = 0) for fast current decay is also available. To PWM using fast decay, the PWM signal is applied to one xIN pin while the other is held low, as shown below.

Table 8-3. PWM Control of Motor Speed

xIN1	xIN2	DESCRIPTION
PWM	0	Forward PWM, fast decay
1	PWM	Forward PWM, slow decay
0	PWM	Reverse PWM, fast decay
PWM	1	Reverse PWM, slow decay

Figure 8-1 shows how the motor current flows through the H-bridge. The input pins can be powered before VM is applied.

Figure 8-1. H-Bridge Current Paths

When an output changes from driving high to driving low, or driving low to driving high, dead time is automatically inserted to prevent shoot-through. The t_{DEAD} time is the time in the middle when the output is High-Z. If the output pin is measured during t_{DEAD} , the voltage depends on the direction of current. If the current is leaving the pin, the voltage is a diode drop below ground. If the current is entering the pin, the voltage is a diode drop above VM. This diode is the body diode of the high-side or low-side FET.

The propagation delay time (t_{PD}) is measured as the time between an input edge to output change. This time accounts for input deglitch time and other internal logic propagation delays. The input deglitch time prevents noise on the input pins from affecting the output state. Additional output slew delay timing accounts for FET turn on or turn off times (t_{RISE} and t_{FALL}).

Figure 8-2 below shows the timing of the inputs and outputs of the motor driver.

Figure 8-2. H-Bridge Timing Diagram

8.4.1.1 Parallel Bridge Interface

In the parallel bridge interface, the DRV8411 is configured to drive a higher current brushed-DC (BDC) motor by connecting the driver outputs in parallel to reduce the $R_{DS(ON)}$ by a factor of two. Figure 8-3 shows an example of how to connect the pins on the device. To use parallel bridge interface operation, connect AIN1 and BIN1 to the same control signal, IN1, and connect AIN2 and BIN2 to the same control signal, IN2. Similarly, connect AOUT1 and BOUT1 to the same output node, OUT1, and connect AOUT2 and BOUT2 to the same output node, OUT2. AISEN and BISEN must be connected to the same ground plane.

Note

Current regulation must not be used with parallel mode. AISEN and BISEN must be connected directly to the ground plane to disable current regulation.

Figure 8-3. Parallel Mode Connections

This mode can deliver the full functionality of the BDC motor control with all four modes (forward, reverse, coast, and brake mode). Table 8-4 shows the control interface states in parallel mode.

Table 8-4. Parallel H-Bridge Control

nSLEEP	IN1 (AIN1 & BIN1)	IN2 (AIN2 & BIN2)	OUT1 (AOUT1 & BOUT1)	OUT2 (AOUT2 & BOUT2)	DESCRIPTION
0	X	X	High-Z	High-Z	Low-power sleep mode
1	0	0	High-Z	High-Z	Coast; H-bridge disabled to High-Z
1	0	1	L	H	Reverse (Current OUT2 → OUT1)
1	1	0	H	L	Forward (Current OUT1 → OUT2)
1	1	1	L	L	Brake; low-side slow decay

8.4.2 Current Regulation

The current through the motor windings may be limited, by the current regulation feature of the DRV8411. For DC motors, current control is used to limit the start-up and stall current of the motor. For stepper motors, current control is often used when the supply rail rating is higher than the motor voltage rating so the winding current remains within the motor specification.

The current regulation feature is implemented with a current chopping scheme. The PWM chopping current, I_{TRIP} , is set by a comparator which compares the voltage across a current sense resistor connected to the xISEN pins with a reference voltage of 200 mV. Figure 8-4 shows the relevant circuitry for current regulation of a single H-bridge in DRV8411.

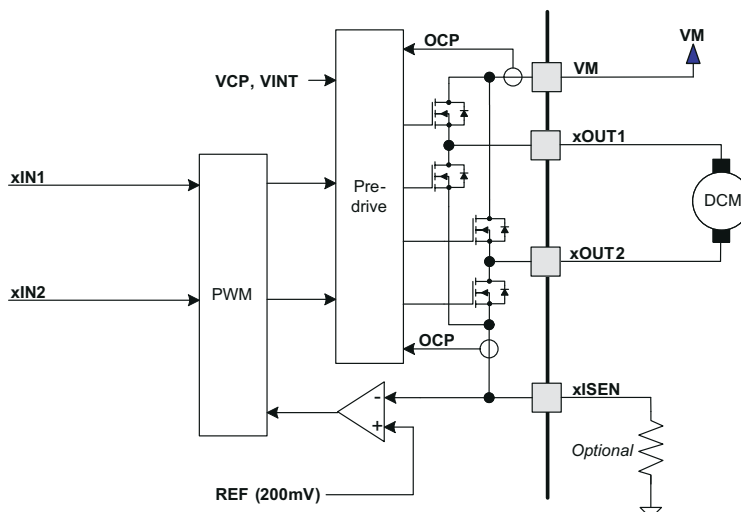

Figure 8-4. Current Regulation Circuit

When the motor current reaches the I_{TRIP} level, the device enforces slow current decay by enabling both low-side FETs for a duration of t_{OFF} as shown in Figure 8-5.

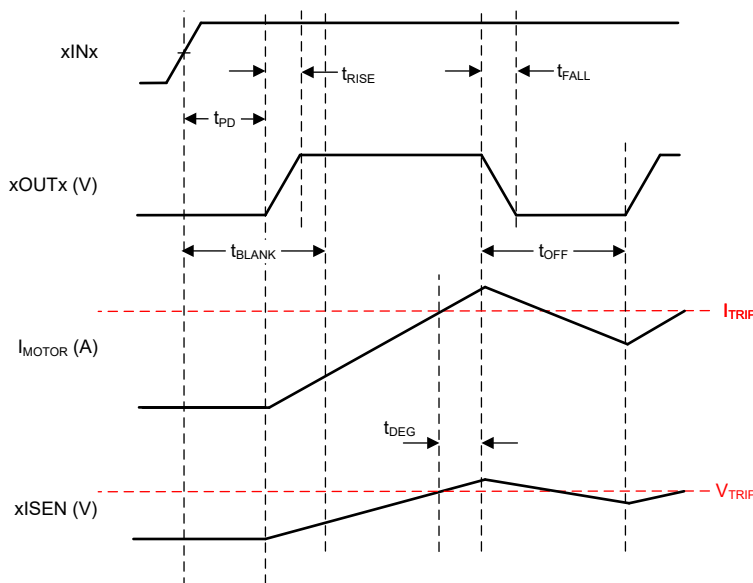

Figure 8-5. Current-Regulation Time Periods

After t_{OFF} elapses, the output is re-enabled according to the two inputs for that bridge, $xINx$. The device drives current until the motor current reaches the I_{TRIP} level again. The amount of time spent in the drive state depends on the VM voltage, the back-EMF of the motor, and the inductance of the motor. If the state of the INx control pins changes during the t_{OFF} time, the remainder of the t_{OFF} time is ignored, and the outputs will again follow the inputs.

After t_{OFF} elapses, if I_{OUT} is still greater than I_{TRIP} , the H-bridge enters another period of brake/low-side slow decay for t_{OFF} after a drive time of t_{BLANK} .

The chopping current is calculated in Equation 1.

$$R_{SENSE} = 0.2 \text{ V} / I_{TRIP} \quad (1)$$

Example: If a 1- Ω sense resistor is used, the chopping current will be $200 \text{ mV} / 1 \Omega = 200 \text{ mA}$.

If current regulation is not required, the xISEN pins should be directly connected to the PCB ground plane.

8.4.3 Protection Circuits

The DRV8411 is fully protected against undervoltage, overcurrent and overtemperature events.

8.4.3.1 Overcurrent Protection (OCP)

An analog current limit circuit on each FET limits the current through the FET by limiting the gate drive internally. If this current limit persists for longer than the OCP deglitch time (t_{OCP}), all FETs in the H-bridge will disable and the nFAULT pin will assert low. The driver re-enables after the OCP retry period (t_{RETRY}) has passed. nFAULT becomes high again at this time and normal operation resumes. If the fault condition is still present, the cycle repeats as shown in Figure 8-6. Please note that only the H-bridge where an overcurrent condition is detected will be disabled while the other bridge will function normally.

Figure 8-6. OCP Operation

Overcurrent conditions are detected independently on both high- and low-side FETs. This means that a short to ground, supply, or across the motor winding will all result in an overcurrent shutdown. The xISEN pins also integrate a separate overcurrent trip threshold specified by V_{OCP_ISEN} for additional protection when the VM voltage is low or the R_{SENSE} resistance on the xISEN pin is high.

8.4.3.2 Thermal Shutdown (TSD)

If the die temperature exceeds safe limits, all FETs in the H-bridge will be disabled and the nFAULT pin asserts low. Once the die temperature has fallen to a safe level, operation will automatically resume.

Any tendency of the device to enter TSD is an indication of either excessive power dissipation, insufficient heatsinking, or an ambient temperature outside of the Recommended Operating Conditions.

8.4.3.3 Undervoltage Lockout (UVLO)

Whenever the voltage on the VM pin falls below the UVLO falling threshold voltage, V_{UVLO} , all circuitry in the device is disabled, the output FETs are disabled, and all internal logic is reset. Normal operation resumes when the V_{VM} voltage rises above the UVLO rising threshold as shown in Figure 8-7. The nFAULT pin is driven low during an undervoltage condition and is released after operation starts again.

When V_{VM} is close to 0 V, the internal circuitry may not bias properly, and the open-drain pull-down on the nFAULT pin may release.

Figure 8-7. VM UVLO Operation

8.5 Device Functional Modes

Table 8-5 summarizes the DRV8411 functional modes described in this section.

Table 8-5. Modes of Operation

MODE	CONDITION	H-BRIDGE	INTERNAL CIRCUITS
Active Mode	nSLEEP pin high	Operating	Operating
Low-Power Sleep Mode	nSLEEP pin low	Disabled	Disabled
Fault Mode	Any fault condition met	Disabled	See Table 8-6

8.5.1 Active Mode

After the supply voltage on the VM pin has crossed the undervoltage threshold V_{UVLO} , the nSLEEP pin is high, and t_{WAKE} has elapsed, the device enters active mode. In this mode, the H-bridge, charge pump, and internal logic are active and the device is ready to receive inputs.

8.5.2 Low-Power Sleep Mode

The DRV8411 device supports a low power mode to reduce current consumption from the VM pin when the driver is not active. This mode is entered by setting nSLEEP = logic low and waiting for t_{SLEEP} to elapse.

In sleep mode, the H-bridge, charge pump, internal regulator, and internal logic are disabled and the device draws minimal current from the supply pin (I_{VMQ}). The device relies on a weak pulldown to ensure all of the internal MOSFETs remain disabled. If the device is powered up while the nSLEEP pin is low, it immediately enters sleep mode. After the nSLEEP pin is high for longer than the duration of t_{WAKE} , the device becomes fully operational.

The following timing diagram shows an example of entering and leaving sleep mode.

Figure 8-8. Sleep Mode Entry and Wakeup Timing Diagram

8.5.3 Fault Mode

The DRV8411 device enters a fault mode when a fault is encountered. This protects the device and the load on the outputs. The device behavior in the fault mode is described in [Table 8-6](#) and depends on the fault condition. The device will leave the fault mode and re-enter the active mode when the recovery condition is met.

Table 8-6. Fault Conditions Summary

FAULT	CONDITION	ERROR REPORT	H-BRIDGE	INTERNAL CIRCUITS	RECOVERY
VM undervoltage (UVLO)	$V_M < V_{UVLO, falling}$	nFAULT	Disabled	Disabled	$V_M > V_{UVLO, rising}$
Overcurrent (OCP)	$I_{OUT} > I_{OCP}$	nFAULT	Disabled	Operating	Automatic retry: t_{RETRY}
Thermal Shutdown (TSD)	$T_J > T_{TSD}$	nFAULT	Disabled	Operating	Automatic: $T_J < T_{TSD} - T_{HYS}$

8.6 Pin Diagrams

8.6.1 Logic-Level Inputs

[Figure 8-9](#) shows the input structure for the logic-level input pins AIN1, AIN2, BIN1, BIN2, and nSLEEP.

9 Application and Implementation

Note

Information in the following applications sections is not part of the TI component specification, and TI does not warrant its accuracy or completeness. TI's customers are responsible for determining suitability of components for their purposes, as well as validating and testing their design implementation to confirm system functionality.

9.1 Application Information

The DRV8411 is used in brushed-DC or stepper motor control as shown in the following applications examples.

9.1.1 Typical Application

The user can configure the DRV8411 for stepper motor, dual BDC, or single BDC motor applications as described in this section.

9.1.1.1 Stepper Motor Application

Figure 9-1 shows the typical application of the DRV8411 device to drive a stepper motor.

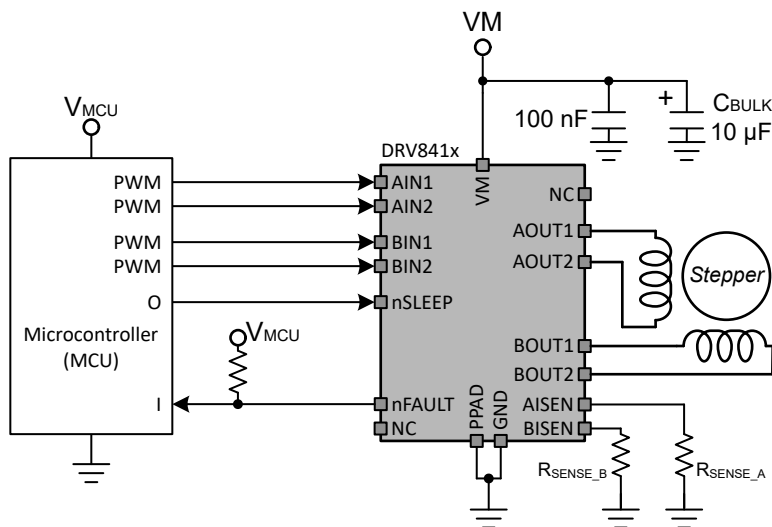

Figure 9-1. Typical Application Schematic of DRV8411 Driving Stepper Motor

9.1.1.1.1 Design Requirements

Table 9-1 lists design input parameters for system design.

Table 9-1. Design Parameters

DESIGN PARAMETER	REFERENCE	EXAMPLE VALUE
Motor supply voltage	V_M	11 V
Motor winding resistance	R_L	34 Ω /phase
Motor winding inductance	L_L	33 mH/phase
Target trip current	I_{TRIP}	500 mA

9.1.1.1.2 Detailed Design Procedure

9.1.1.1.2.1 Stepper Motor Speed

The first step in configuring the DRV8411 requires the desired motor speed and stepping level. The device can support full- and half-stepping modes using the PWM interface.

If the target motor speed is too high, the motor does not spin. Ensure that the motor can support the target speed.

For a desired motor speed (v), microstepping level (n_m), and motor full step angle (θ_{step}),

$$f_{\text{step}} (\text{steps} / \text{s}) = \frac{v(\text{rpm}) \times n_m (\text{steps}) \times 360^\circ / \text{rot}}{\theta_{\text{step}} (^\circ / \text{step}) \times 60 \text{ s} / \text{min}} \quad (2)$$

9.1.1.1.2.2 Current Regulation

The trip current (I_{TRIP}) is the maximum current driven through either winding. This setting determines the amount of torque the stepper motor will produce when operating in full stepping or half stepping control schemes. For an I_{TRIP} value of 500 mA, the value of the sense resistor (R_{SENSE_x}) is calculated as shown in [Equation 3](#).

$$R_{\text{SENSE}_A} = R_{\text{SENSE}_B} = 0.2 \text{ V} / I_{\text{TRIP}} = 0.2 \text{ V} / 0.5 \text{ A} = 400 \text{ m}\Omega \quad (3)$$

Select the closest available value of 400 m Ω for the sense resistors.

9.1.1.1.2.3 Stepping Modes

The DRV8411 is used to drive a stepper motor in full-stepping mode or non-circulating half-stepping mode using the following bridge configurations:

- Full-stepping mode
- Half-stepping mode with slow decay
- Half-stepping mode with fast decay

9.1.1.1.2.3.1 Full-Stepping Operation

In full-stepping mode, the full-bridge operates in either of two modes (forward or reverse mode) with a phase shift of 90° between the two windings. Full stepping is simplest stepper control mode to implement in firmware and offers the best performance at high speeds.

The controller applies the PWM input to the AIN1, AIN2, BIN1, and BIN2 pins as shown in [Figure 9-2](#) and the driver operates only in forward (FRW) and reverse (REV) mode.

Figure 9-2. Timing Diagram for Full-Stepping

9.1.1.1.2.3.2 Half-Stepping Operation with Fast Decay

In half-stepping mode, the full-bridge operates in one of the three modes (forward, reverse, or coast mode) to position the rotor half-way between two full-step positions. The coast state allows the current in the motor winding to decay quickly to 0 A. This mode is best-used when half-stepping at high speeds.

The controller applies the PWM input to the AIN1, AIN2, BIN1, and BIN2 pins as shown in [Figure 9-3](#), and the driver operates in forward, reverse, and coast mode.

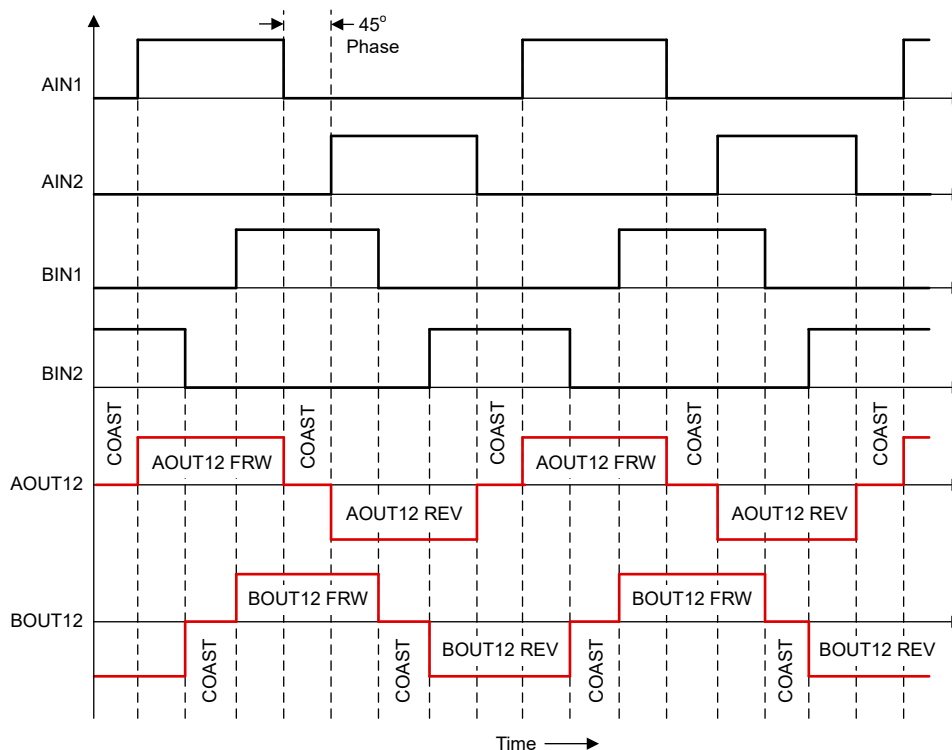

Figure 9-3. Timing Diagram for Half-Stepping with Fast Decay

9.1.1.1.2.3.3 Half-Stepping Operation with Slow Decay

In this half-stepping mode, the driver achieves the 0-A state using the slow decay control state (known as "brake mode" for BDC driving). Therefore, the full-bridge operates in one of the three modes (forward, reverse, or brake/slow-decay mode) to position the rotor half-way between two full-step positions. The slow decay state allows the current in the motor winding to decay slowly to 0 A. This mode is best-used when half-stepping at slow speeds and may help to reduce stepper noise and vibration.

The controller applies the PWM input to the AIN1, AIN2, BIN1, and BIN2 pins as shown in [Figure 9-4](#), and the driver operates in forward, reverse, and brake mode.

Figure 9-4. Timing Diagram for Half-Stepping with Slow Decay

9.1.1.2 Dual BDC Motor Application

Figure 9-8 shows the typical application of DRV8411 to drive two BDC motors.

Figure 9-8. Typical Application Schematic of Device Driving Two BDC Motors

9.1.1.2.1 Design Requirements

Table 9-2 lists the design input parameters for system design.

Table 9-2. Design Parameters

DESIGN PARAMETER	REFERENCE	EXAMPLE VALUE
Motor supply voltage	V_M	7 V
Motor winding resistance	R_L	7.8 Ω
Motor winding inductance	L_L	500 μ H
Motor RMS current	I_{RMS}	600 mA
Motor start-up current	I_{START}	900 mA
Target trip current	I_{TRIP}	1 A
Trip current reference voltage (internal voltage)	V_{TRIP}	200 mV

9.1.1.2.2 Detailed Design Procedure

9.1.1.2.2.1 Motor Voltage

The motor voltage used in an application depends on the rating of the selected motor and the desired revolutions per minute (RPM). A higher voltage spins a brushed DC motor faster with the same PWM duty cycle applied to the power FETs. A higher voltage also increases the rate of current change through the inductive motor windings.

9.1.1.2.2.2 Current Regulation

The trip current (I_{TRIP}) is the maximum current driven through either winding. Because the peak current (start current) of the motor is 900 mA, the I_{TRIP} current level is selected to be just greater than the peak current. The selected I_{TRIP} value for this example is 1 A. Therefore, use Equation 4 to select the value of the sense resistors (R_{SENSE_A} and R_{SENSE_B}) connected to the AISEN and BISEN pins.

$$R_{SENSE_A} = R_{SENSE_B} = 0.2 \text{ V} / I_{TRIP} = 0.2 \text{ V} / 1 \text{ A} = 200 \text{ m}\Omega \quad (4)$$

9.1.1.2.2.3 Sense Resistor

For optimal performance, the sense resistor must:

- Be a surface mount component

- Have low inductance
- Be rated for high enough power
- Be placed closely to the motor driver

The power dissipated by the sense resistor equals $I_{RMS}^2 \times R$. In this example, the peak current is 900 mA, the RMS motor current is 600 mA, and the sense resistor value is 200 mΩ. Therefore, the sense resistors ($R_{SENSE12}$ and $R_{SENSE34}$) dissipate 72 mW ($600 \text{ mA}^2 \times 200 \text{ m}\Omega = 72 \text{ mW}$). The power quickly increases with higher current levels.

Resistors typically have a rated power within some ambient temperature range, along with a derated power curve for high ambient temperatures. When a printed circuit board (PCB) is shared with other components generating heat, margin should be added. For best practice, measure the actual sense resistor temperature in a final system, along with the power MOSFETs, because those components are often the hottest.

Because power resistors are larger and more expensive than standard resistors, the common practice is to use multiple standard resistors in parallel, between the sense node and ground. This practice distributes the current and heat dissipation.

9.1.1.2.3 Application Curves

Ch 1 = AOUT2, Ch 2 = BIN2, Ch 3 = AIN1, Ch 4 = BOUT1, Ch 6 = AIN2, Ch 7 = AOUT12 current, Ch M7 = BOUT12 current

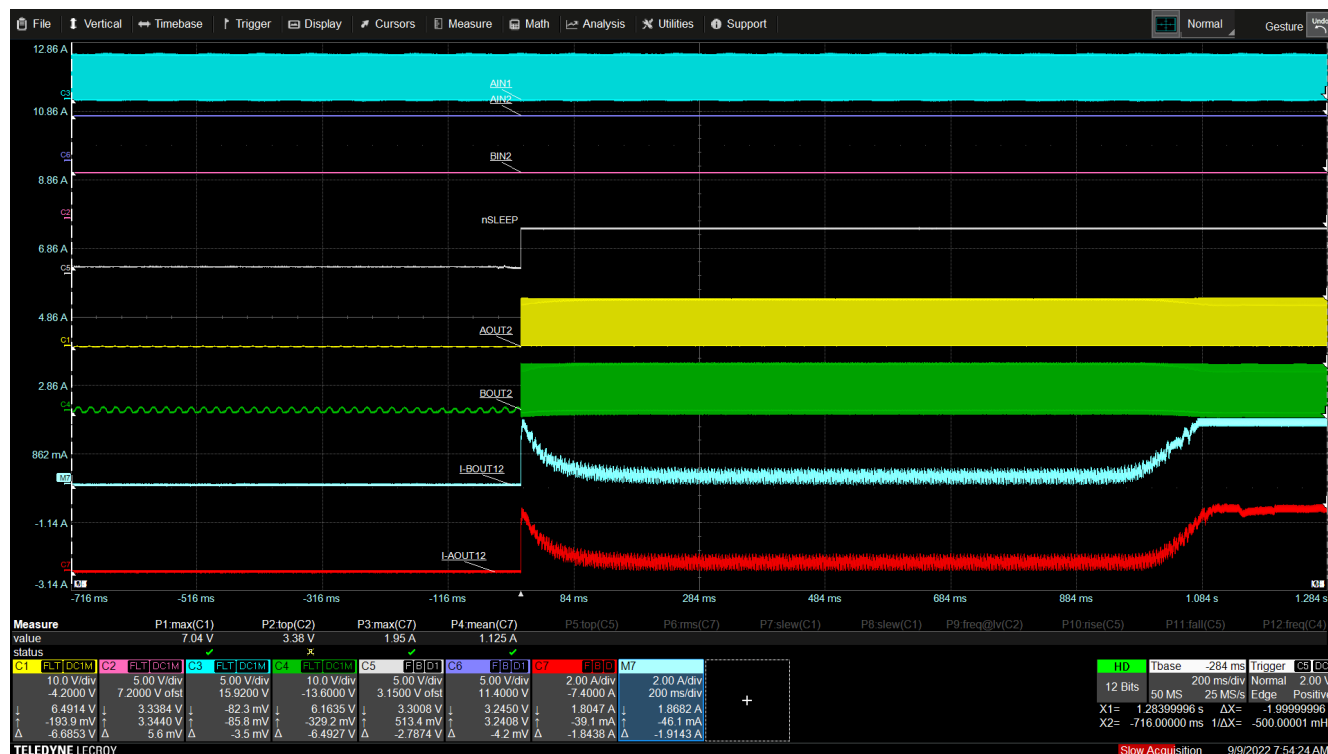

Figure 9-9. No Current Regulation

Figure 9-10. Current Regulation

9.1.1.3 Thermal Considerations

9.1.1.3.1 Maximum Output Current

In actual operation, the maximum output current achievable with a motor driver is a function of die temperature. This, in turn, is greatly affected by ambient temperature and PCB design. Basically, the maximum motor current will be the amount of current that results in a power dissipation level that, along with the thermal resistance of the package and PCB, keeps the die at a low enough temperature to stay out of thermal shutdown.

The dissipation ratings given in the data sheet can be used as a guide to calculate the approximate maximum power dissipation that can be expected to be possible without entering thermal shutdown for several different PCB constructions. However, for accurate data, the actual PCB design must be analyzed through measurement or thermal simulation.

9.1.1.3.2 Power Dissipation

Power dissipation in the device is dominated by the DC power dissipated in the output FET resistance, or $R_{DS(ON)}$. There is additional power dissipated due to PWM switching losses, which are dependent on PWM frequency, rise and fall times, and VM supply voltages.

The DC power dissipation of one H-bridge can be roughly estimated by Equation 5.

$$P_{TOT} = (HS - R_{DS(ON)} \times I_{OUT(RMS)}^2) + (LS - R_{DS(ON)} \times I_{OUT(RMS)}^2) \quad (5)$$

where

- P_{TOT} is the total power dissipation
- $HS - R_{DS(ON)}$ is the resistance of the high-side FET
- $LS - R_{DS(ON)}$ is the resistance of the low-side FET
- $I_{OUT(RMS)}$ is the RMS output current being applied to the motor

$R_{DS(ON)}$ increases with temperature, so as the device heats, the power dissipation increases. This must be taken into consideration when estimating the maximum output current.

9.1.1.3.3 Thermal Performance

The datasheet-specified junction-to-ambient thermal resistance, $R_{\theta JA}$, is primarily useful for comparing various drivers or approximating thermal performance. However, the actual system performance may be better or worse than this value depending on PCB stackup, routing, number of vias, and copper area around the thermal pad. The length of time the driver drives a particular current will also impact power dissipation and thermal performance. This section considers how to design for steady-state and transient thermal conditions.

The data in this section was simulated using the following criteria:

HTSSOP (PWP package)

- 2-layer PCB (size 114.3 x 76.2 x 1.6 mm), standard FR4, 1-oz (35 μ m copper thickness) or 2-oz copper thickness. Thermal vias are only present under the thermal pad (12 vias in 4 x 3 array, 1 mm pitch, 0.2 mm diameter, 0.025 mm Cu plating).
 - Top layer: HTSSOP package footprint and copper plane heatsink. Top layer copper area is varied in simulation.
 - Bottom layer: ground plane thermally connected through vias under the thermal pad for the driver. Bottom layer copper area varies with top copper area.
- 4-layer PCB (size 114.3 x 76.2 x 1.6 mm), standard FR4. Outer planes are 1-oz (35 μ m copper thickness) or 2-oz copper thickness. Inner planes are kept at 1-oz. Thermal vias are only present under the thermal pad (12 vias in 4 x 3 array, 1 mm pitch, 0.2 mm diameter, 0.025 mm Cu plating).
 - Top layer: HTSSOP package footprint and copper plane heatsink. Top layer copper area is varied in simulation.
 - Mid layer 1: GND plane thermally connected to thermal pad through vias. The area of the ground plane is 74.2 mm x 74.2 mm.
 - Mid layer 2: power plane, no thermal connection. The area of the power plane is 74.2 mm x 74.2 mm.
 - Bottom layer: signal layer with small copper pad underneath the driver and thermally connected through via stitching from the TOP and internal GND plane. Bottom layer thermal pad is the same size as the package (5 mm x 4.4 mm). Bottom pad size remains constant as top copper plane is varied.

Figure 9-11 shows an example of the simulated board for the HTSSOP package. Table 9-3 shows the dimensions of the board that were varied for each simulation.

Figure 9-11. HTSSOP PCB model top layer

Table 9-3. Dimension A for 16-pin PWP package

Cu area (cm ²)	Dimension A (mm)
2	16.43
4	22.23
8	30.59
16	42.37

WQFN (RTE package)

- 2-layer PCB (size 114.3 x 76.2 x 1.6 mm), standard FR4, 1-oz (35 mm copper thickness) or 2-oz copper thickness. Thermal vias are only present under the package footprint (5 vias, 1 mm pitch, 0.2 mm diameter, 0.025 mm Cu plating).
 - Top layer: WQFN package footprint and traces.
 - Bottom layer: ground plane thermally connected through vias under the package footprint. Bottom layer copper area is varied in simulation.
- 4-layer PCB (size 114.3 x 76.2 x 1.6 mm), standard FR4. Outer planes are 1-oz (35 mm copper thickness) or 2-oz copper thickness. Inner planes are kept at 1-oz. Thermal vias are only present under the package footprint (5 vias, 1 mm pitch, 0.2 mm diameter, 0.025 mm Cu plating).
 - Top layer: WQFN package footprint and traces.
 - Mid layer 1: GND plane thermally connected under package footprint through vias. The area of the ground plane is 74.2 mm x 74.2 mm.
 - Mid layer 2: power plane, no thermal connection. The area of the power plane is 74.2 mm x 74.2 mm.
 - Bottom layer: signal layer with small copper pad underneath the driver and thermally connected through via stitching from the TOP and internal GND plane. Bottom layer thermal pad is 1.55 mm x 1.55 mm. Bottom layer thermal pad is the same size as the package (3 mm x 3 mm). Bottom pad size remains constant.

Figure 9-12 shows an example of the simulated board for the HTSSOP package. Table 9-4 shows the dimensions of the board that were varied for each simulation.

16	40.00

9.1.1.3.3.1 Steady-State Thermal Performance

"Steady-state" conditions assume that the motor driver operates with a constant RMS current over a long period of time. The figures in this section show how $R_{\theta JA}$ and Ψ_{JB} (junction-to-board characterization parameter) change depending on copper area, copper thickness, and number of layers of the PCB. More copper area, more layers, and thicker copper planes decrease $R_{\theta JA}$ and Ψ_{JB} , which indicate better thermal performance from the PCB layout.

**Figure 9-13. HTSSOP, PCB junction-to-ambient thermal resistance vs copper area****Figure 9-14. HTSSOP, junction-to-board characterization parameter vs copper area**

Figure 9-15. WQFN, PCB junction-to-ambient thermal resistance vs copper area

Figure 9-16. WQFN, junction-to-board characterization parameter vs copper area

9.1.1.3.3.2 Transient Thermal Performance

The motor driver may experience different transient driving conditions that cause large currents to flow for a short duration of time. These may include -

- Motor start-up when the rotor is initially stationary.
- Fault conditions when there is a supply or ground short to one of the motor outputs, and the overcurrent protection triggers.
- Briefly energizing a motor or solenoid for a limited time, then de-energizing.

For these transient cases, the duration of drive time is another factor that impacts thermal performance in addition to copper area and thickness. In transient cases, the thermal impedance parameter $Z_{\theta JA}$ denotes the junction-to-ambient thermal performance. The figures in this section show the simulated thermal impedances for 1-oz and 2-oz copper layouts for the HTSSOP and WQFN packages. These graphs indicate better thermal performance with short current pulses. For short periods of drive time, the device die size and package dominates the thermal performance. For longer drive pulses, board layout has a more significant impact on thermal performance. Both graphs show the curves for thermal impedance split due to number of layers and copper area as the duration of the drive pulse duration increases. Long pulses can be considered steady-state performance.

Figure 9-18. HTSSOP package junction-to-ambient thermal impedance for 2-oz copper layouts

Figure 9-19. WQFN package junction-to-ambient thermal impedance for 1-oz copper layouts

Figure 9-20. WQFN package junction-to-ambient thermal impedance for 2-oz copper layouts

9.1.1.4 Multi-Sourcing with Standard Motor Driver Pinout

The devices come in industry standard package footprints in the PWP and RTE packages.

As shown in [Section 4](#), the DRV8410/11/11A devices are pin-to-pin compatible with the DRV8833 and DRV8833C. Many drivers from other suppliers have footprints similar to DRV8833 and DRV8833C.

- When replacing a device similar to DRV8833, user should remove the capacitors for the internal regulator (VINT) and the charge pump (VCP) by setting them as DNP (do not place) in the design files.
- The internal voltage reference for current regulation is 200 mV, just like the DRV8833 and DRV8833C. Because the voltage reference is the same, the system can still use the same xISEN resistor values designed for DRV8833 or other second source drivers with the same pinout.
- DRV841xPWP can use the same footprint as DRV8833 and DRV8833C in the HTSSOP package as shown in [Figure 9-21](#) and [Figure 9-22](#).
- DRV841xRTE are only footprint compatible with DRV8833C and other suppliers in the 3 mm x 3 mm QFN package.

Figure 9-21. DRV8833 Layout Example

Figure 9-22. DRV8410/1 Footprint Compatible Layout Example

9.2 Power Supply Recommendations

9.2.1 Bulk Capacitance

Having an appropriate local bulk capacitance is an important factor in motor drive system design. It is generally beneficial to have more bulk capacitance, while the disadvantages are increased cost and physical size.

The amount of local capacitance needed depends on a variety of factors, including:

- The highest current required by the motor system
- The capacitance and ability to source current
- The amount of parasitic inductance between the power supply and motor system
- The acceptable voltage ripple
- The type of motor used (brushed DC, brushless DC, stepper)
- The motor braking method

The inductance between the power supply and the motor drive system limits the rate current can change from the power supply. If the local bulk capacitance is too small, the system responds to excessive current demands or dumps from the motor with a change in voltage. When adequate bulk capacitance is used, the motor voltage remains stable and high current can be quickly supplied.

The data sheet generally provides a recommended value, but system-level testing is required to determine the appropriate sized bulk capacitor.

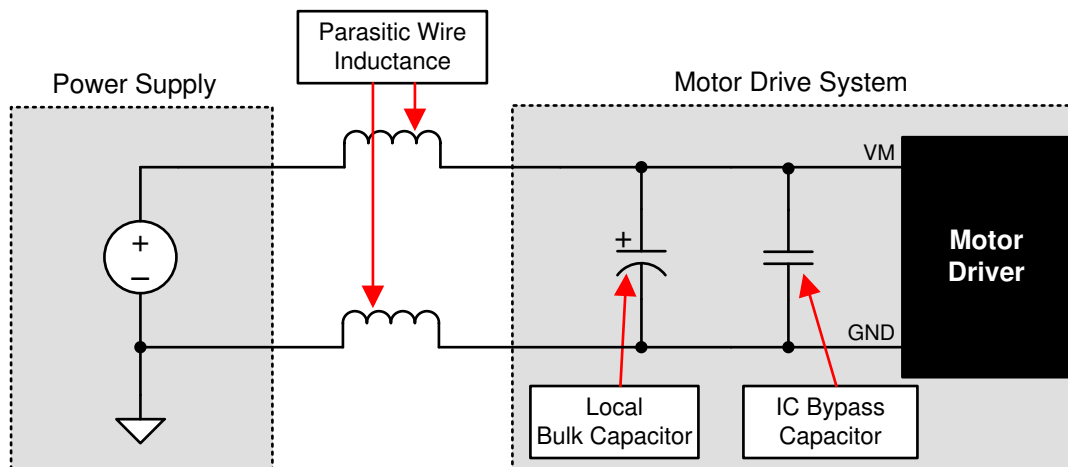

Figure 9-23. Example Setup of Motor Drive System With External Power Supply

The voltage rating for bulk capacitors should be higher than the operating voltage, to provide margin for cases when the motor transfers energy to the supply.

9.2.2 Power Supply and Logic Sequencing

There is no specific sequence for powering up the DRV8411. The presence of digital input signals is acceptable before VM is applied. After VM is applied to the DRV8411, the device begins operation based on the status of the control pins.

9.3 Layout

9.3.1 Layout Guidelines

Since the DRV8411 device has integrated power MOSFETs capable of driving high current, careful attention should be paid to the layout design and external component placement. Some design and layout guidelines are provided below. For more information on layout recommendations, please see the application note [Best Practices for Board Layout of Motor Drivers](#).

- Low ESR ceramic capacitors should be utilized for the VM-to-GND. X5R and X7R types are recommended.
- The VM power supply capacitor should be placed as close to the device as possible to minimize the loop inductance.
- The VM power supply bulk capacitor can be of ceramic or electrolytic type, but should also be placed as close as possible to the device to minimize the loop inductance.
- VM, xOUTx, and GND pins carry the high current from the power supply to the outputs and back to ground. Thick metal routing should be utilized for these traces as is feasible.
- GND should connect directly on the PCB ground plane.
- The device thermal pad should be attached to the PCB top layer ground plane and internal ground plane (when available) through thermal vias to maximize the PCB heat sinking.
- The copper plane area attached to the thermal pad should be maximized to ensure optimal heat sinking.

9.3.2 Layout Example

⁽¹⁾ **Status:** For more details on status, see our [product life cycle](#).

⁽²⁾ **Material type:** When designated, preproduction parts are prototypes/experimental devices, and are not yet approved or released for full production. Testing and final process, including without limitation quality assurance, reliability performance testing, and/or process qualification, may not yet be complete, and this item is subject to further changes or possible discontinuation. If available for ordering, purchases will be subject to an additional waiver at checkout, and are intended for early internal evaluation purposes only. These items are sold without warranties of any kind.

⁽³⁾ **RoHS values:** Yes, No, RoHS Exempt. See the [TI RoHS Statement](#) for additional information and value definition.

⁽⁴⁾ **Lead finish/Ball material:** Parts may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead finish/Ball material values may wrap to two lines if the finish value exceeds the maximum column width.

⁽⁵⁾ **MSL rating/Peak reflow:** The moisture sensitivity level ratings and peak solder (reflow) temperatures. In the event that a part has multiple moisture sensitivity ratings, only the lowest level per JEDEC standards is shown. Refer to the shipping label for the actual reflow temperature that will be used to mount the part to the printed circuit board.

⁽⁶⁾ **Part marking:** There may be an additional marking, which relates to the logo, the lot trace code information, or the environmental category of the part.

Multiple part markings will be inside parentheses. Only one part marking contained in parentheses and separated by a "-" will appear on a part. If a line is indented then it is a continuation of the previous line and the two combined represent the entire part marking for that device.

This image is a representation of the package family, actual package may vary.
Refer to the product data sheet for package details.

4219117/B 04/2022

NOTES:

1. All linear dimensions are in millimeters. Any dimensions in parenthesis are for reference only. Dimensioning and tolerancing per ASME Y14.5M.
2. This drawing is subject to change without notice.
3. The package thermal pad must be soldered to the printed circuit board for thermal and mechanical performance.

RTE0016C

WQFN - 0.8 mm max height

PLASTIC QUAD FLATPACK - NO LEAD

LAND PATTERN EXAMPLE
EXPOSED METAL SHOWN
SCALE:20X

SOLDER MASK DETAILS

4219117/B 04/2022

NOTES: (continued)

4. This package is designed to be soldered to a thermal pad on the board. For more information, see Texas Instruments literature number SLUA271 (www.ti.com/lit/slua271).
5. Vias are optional depending on application, refer to device data sheet. If any vias are implemented, refer to their locations shown on this view. It is recommended that vias under paste be filled, plugged or tented.

RTE0016C

WQFN - 0.8 mm max height

PLASTIC QUAD FLATPACK - NO LEAD

SOLDER PASTE EXAMPLE BASED ON 0.125 mm THICK STENCIL

EXPOSED PAD 17:
85% PRINTED SOLDER COVERAGE BY AREA UNDER PACKAGE
SCALE:25X

4219117/B 04/2022

NOTES: (continued)

6. Laser cutting apertures with trapezoidal walls and rounded corners may offer better paste release. IPC-7525 may have alternate design recommendations.

IMPORTANT NOTICE AND DISCLAIMER

TI PROVIDES TECHNICAL AND RELIABILITY DATA (INCLUDING DATA SHEETS), DESIGN RESOURCES (INCLUDING REFERENCE DESIGNS), APPLICATION OR OTHER DESIGN ADVICE, WEB TOOLS, SAFETY INFORMATION, AND OTHER RESOURCES "AS IS" AND WITH ALL FAULTS, AND DISCLAIMS ALL WARRANTIES, EXPRESS AND IMPLIED, INCLUDING WITHOUT LIMITATION ANY IMPLIED WARRANTIES OF MERCHANTABILITY, FITNESS FOR A PARTICULAR PURPOSE OR NON-INFRINGEMENT OF THIRD PARTY INTELLECTUAL PROPERTY RIGHTS.

These resources are intended for skilled developers designing with TI products. You are solely responsible for (1) selecting the appropriate TI products for your application, (2) designing, validating and testing your application, and (3) ensuring your application meets applicable standards, and any other safety, security, regulatory or other requirements.

These resources are subject to change without notice. TI grants you permission to use these resources only for development of an application that uses the TI products described in the resource. Other reproduction and display of these resources is prohibited. No license is granted to any other TI intellectual property right or to any third party intellectual property right. TI disclaims responsibility for, and you will fully indemnify TI and its representatives against, any claims, damages, costs, losses, and liabilities arising out of your use of these resources.

TI's products are provided subject to [TI's Terms of Sale](#) or other applicable terms available either on [ti.com](https://www.ti.com) or provided in conjunction with such TI products. TI's provision of these resources does not expand or otherwise alter TI's applicable warranties or warranty disclaimers for TI products.

TI objects to and rejects any additional or different terms you may have proposed.
