

# ISO224 Reinforced Isolated Amplifier

## With Single-Ended Input of $\pm 12\text{ V}$ and Differential Output of $\pm 4\text{ V}$

### 1 Features

- Offered in High-Grade (ISO224B) and Low-Grade (ISO224A) Versions
- $\pm 12\text{-V}$  Input Voltage Range Optimized for Isolated Voltage Measurement in Industrial Applications
- Overvoltage Input Clamp With 9-kV ESD
- $\pm 4\text{-V}$  Differential Output Voltage Range With Common-Mode at  $V_{DD2} / 2$
- Low DC-Error Operation (ISO224B):
  - Input Offset:  $\pm 5\text{ mV}$  at  $25^\circ\text{C}$ ,  $\pm 15\text{ }\mu\text{V}/^\circ\text{C}$  max
  - Gain Error:  $\pm 0.3\%$  at  $25^\circ\text{C}$ ,  $\pm 35\text{ ppm}/^\circ\text{C}$  max
  - Nonlinearity:  $\pm 0.01\%$  max,  $\pm 0.1\text{ ppm}/^\circ\text{C}$  typ
- 4.5-V to 18-V Single-Supply on High-Side
- 4.5-V to 5.5-V Operation on Low-Side
- Safety-Related Certifications:
  - 7071- $V_{PEAK}$  Reinforced Isolation per DIN VDE V 0884-11: 2017-01
  - 5000- $V_{RMS}$  Isolation for 1 Minute per UL1577
- High CMTI (ISO224B):  $80\text{ kV}/\mu\text{s}$  (typ)

### 2 Applications

- Isolated Analog Signal Acquisition in:
  - Grid Automation
  - Protection Relays
  - Factory Automation and Control
  - Rail Transport
  - Motor Drives
  - Power Analyzers

### 3 Description

The ISO224 is a precision isolated amplifier with an output separated from the input circuitry by an isolation barrier with high immunity to magnetic interference. This barrier is certified to provide reinforced galvanic isolation of up to  $5\text{ kV}_{RMS}$  with an exceptionally long lifetime and low power dissipation. When used with isolated power supplies, this device separates parts of the system that operate on different common-mode voltage levels and protects lower-voltage devices from damage.

The input of the ISO224 is optimized for accurate sensing of  $\pm 10\text{-V}$  signals that are widely used in industrial applications. The device operates of a single supply on the high-side. This unique feature simplifies the design of the isolated power supply and reduces the system cost. The integrated high-side supply voltage detection feature simplifies system level diagnostics. The  $\pm 4\text{-V}$  output of the ISO224 allows lower-cost analog-to-digital converters (ADCs) to be used. The differential structure of the output supports high immunity to noise.

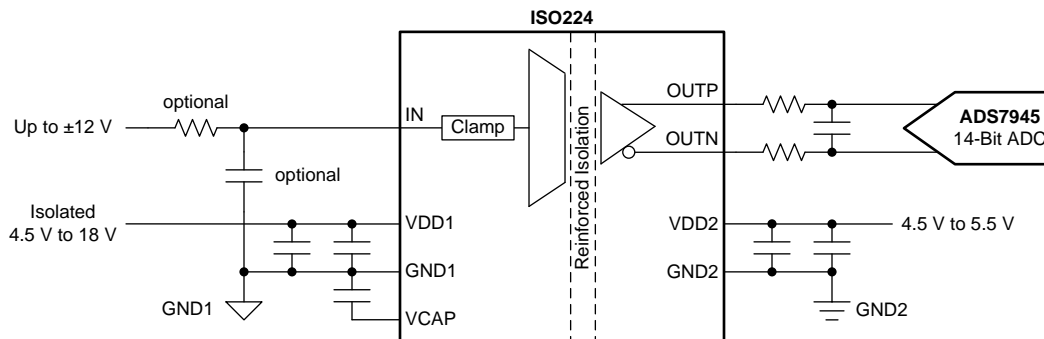

The ISO224 is fully specified over the extended industrial temperature range of  $-55^\circ\text{C}$  to  $+125^\circ\text{C}$  and is available in a wide-body 8-pin SOIC (DWV) package.

**Device Information<sup>(1)</sup>**

DEVICE NAME	PACKAGE	BODY SIZE
ISO224	SOIC (8)	5.85 mm x 7.5 mm

(1) For all available packages, see the orderable addendum at the end of the datasheet.

## 4 Revision History

### Changes from Original (June 2018) to Revision A

Page

• Changed document status from Advance Information to Production Data	1
---	---

## 5 Device Comparison Table

PARAMETER	ISO224B	ISO224A
Input offset voltage, $V_{OS}$	$\pm 5$ mV (max)	$\pm 50$ mV (max)
Input offset drift, $TCV_{OS}$	$\pm 15$ $\mu V/^{\circ}C$ (max)	$\pm 60$ $\mu V/^{\circ}C$ (max)
Input-referred noise	3 $\mu V/\sqrt{Hz}$ (typ)	4 $\mu V/\sqrt{Hz}$ (typ)
Gain error, $E_G$	$\pm 0.3\%$ (max)	$\pm 1\%$ (max)
Gain error drift, $TCE_G$	$\pm 35$ ppm/ $^{\circ}C$ (max)	$\pm 60$ ppm/ $^{\circ}C$ (max)
Nonlinearity	$\pm 0.01\%$ (max)	$\pm 0.02\%$ (max)
Output bandwidth, BW	275 kHz (typ)	185 kHz (typ)
Common-mode transient immunity, CMTI	80 kV/ $\mu s$ (typ)	30 kV/ $\mu s$ (typ)
IN to OUTP, OUTN signal delay (50% – 50%)	2.2 $\mu s$ (typ)	2.8 $\mu s$ (typ)

## 6 Pin Configuration and Functions

### Pin Functions

PIN		I/O	DESCRIPTION
NO.	NAME		
1	VCAP	—	Supply decoupling capacitor. Connect a 0.22- $\mu F$ capacitor between this pin and the high-side analog ground.
2	IN	I	Analog input
3	VDD1	—	High-side power supply, 4.5 V to 18 V. See the <a href="#">Power Supply Recommendations</a> section for decoupling recommendations.
4	GND1	—	High-side analog ground
5	GND2	—	Low-side analog ground
6	OUTN	O	Inverting analog output
7	OUTP	O	Noninverting analog output
8	VDD2	—	Low-side power supply, 4.5 V to 5.5 V. See the <a href="#">Power Supply Recommendations</a> section for decoupling recommendations.

## 7 Specifications

### 7.1 Absolute Maximum Ratings

see <sup>(1)</sup>

		MIN	MAX	UNIT
Power-supply voltage	VDD1 to GND1	−0.3	26	V
	VDD2 to GND2	−0.3	6.5	
Input voltage	IN to GND1 <sup>(2)</sup>	−15	15	V
Input current	Continuous, at IN pin <sup>(3)</sup>	−10	10	mA
Output voltage	OUTP, OUTN	GND2 − 0.3	VDD2 + 0.3	V
Temperature	Junction, T <sub>J</sub>		150	°C
	Storage, T <sub>stg</sub>	−65	150	

- (1) Stresses beyond those listed under *Absolute Maximum Ratings* may cause permanent damage to the device. These are stress ratings only, which do not imply functional operation of the device at these or any other conditions beyond those indicated under *Recommended Operating Conditions*. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.
- (2) Exposure to absolute-maximum-rated condition for extended periods may increase input leakage current.
- (3) Limit the input current at IN pin to prevent permanent damage to the device. The IN pin is internally protected by a voltage clamp. See [Figure 42](#) for a typical current versus voltage characteristic curve of the input clamp.

### 7.2 ESD Ratings

			VALUE	UNIT
V <sub>(ESD)</sub>	Electrostatic discharge	Human-body model (HBM), per ANSI/ESDA/JEDEC JS-001 <sup>(1)</sup>	IN pin only	±9000
			All pins except IN	±3000
		Charged-device model (CDM), per JEDEC specification JESD22-C101 <sup>(2)</sup>		±1000

- (1) JEDEC document JEP155 states that 500-V HBM allows safe manufacturing with a standard ESD control process.
- (2) JEDEC document JEP157 states that 250-V CDM allows safe manufacturing with a standard ESD control process.

### 7.3 Recommended Operating Conditions

over operating ambient temperature range (unless otherwise noted)

			MIN	NOM	MAX	UNIT
<b>POWER SUPPLY</b>						
	High-side power supply	VDD1 to GND1	4.5	5	18	V
	Low-side power supply	VDD2 to GND2	4.5	5	5.5	V
<b>ANALOG INPUT</b>						
V <sub>Clipping</sub>	Input voltage before clipping output <sup>(1)</sup>	IN to GND1		±13.8		V
V <sub>FSR</sub>	Specified linear input full-scale voltage <sup>(1)</sup>	IN to GND1	−12		12	V
<b>TEMPERATURE RANGE</b>						
T <sub>A</sub>	Specified ambient temperature		−55	25	125	°C

- (1) See the [Analog Input](#) section for more details.

## 7.4 Thermal Information

THERMAL METRIC <sup>(1)</sup>		ISO224x	UNIT
		DWV (SOIC)	
		8 PINS	
$R_{\theta JA}$	Junction-to-ambient thermal resistance	96.3	°C/W
$R_{\theta JC(top)}$	Junction-to-case (top) thermal resistance	36.9	°C/W
$R_{\theta JB}$	Junction-to-board thermal resistance	60.1	°C/W
$\Psi_{JT}$	Junction-to-top characterization parameter	16.9	°C/W
$\Psi_{JB}$	Junction-to-board characterization parameter	58.2	°C/W
$R_{\theta JC(bot)}$	Junction-to-case (bottom) thermal resistance	n/a	°C/W

(1) For more information about traditional and new thermal metrics, see the [Semiconductor and IC Package Thermal Metrics](#) application report.

## 7.5 Power Ratings<sup>(1)</sup>

PARAMETER		TEST CONDITIONS	VALUE	UNIT
$P_D$	Maximum power dissipation (both sides)	VDD1 = 18 V, VDD2 = 5.5 V	194.9	mW
		VDD1 = VDD2 = 5.5 V	97.4	
$P_{D1}$	Maximum power dissipation (high-side supply)	VDD1 = 18 V	140.4	mW
		VDD1 = 5.5 V	42.9	
$P_{D2}$	Maximum power dissipation (low-side supply)	VDD2 = 5.5 V	54.5	mW

(1) See the [Electrical Characteristics](#) table for maximum supply current specifications.

## 7.6 Insulation Specifications

over operating ambient temperature range (unless otherwise noted)

PARAMETER		TEST CONDITIONS	VALUE	UNIT
GENERAL				
CLR	External clearance <sup>(1)</sup>	Shortest pin-to-pin distance through air	≥ 8.5	mm
CPG	External creepage <sup>(1)</sup>	Shortest pin-to-pin distance across the package surface	≥ 8.5	mm
DTI	Distance through insulation	Minimum internal gap (internal clearance) of the double insulation	≥ 0.021	mm
CTI	Comparative tracking index	DIN EN 60112 (VDE 0303-11); IEC 60112	≥ 600	V
	Material group	According to IEC 60664-1	I	
	Overvoltage category per IEC 60664-1	Rated mains voltage ≤ 600 V <sub>RMS</sub>	I-IV	
		Rated mains voltage ≤ 1000 V <sub>RMS</sub>	I-III	
DIN VDE V 0884-11 (VDE V 0884-11): 2017-01 <sup>(2)</sup>				
V <sub>IORM</sub>	Maximum repetitive peak isolation voltage	At AC voltage (bipolar or unipolar)	2121	V <sub>PK</sub>
V <sub>IOWM</sub>	Maximum-rated isolation working voltage	At AC voltage (sine wave); time dependent dielectric breakdown (TDDb) test; see Figure 4	1500	V <sub>RMS</sub>
		At DC voltage	2121	V <sub>DC</sub>
V <sub>IOTM</sub>	Maximum transient isolation voltage	V <sub>TEST</sub> = V <sub>IOTM</sub> , t = 60 s (qualification test)	7071	V <sub>PK</sub>
		V <sub>TEST</sub> = 1.2 × V <sub>IOTM</sub> , t = 1 s (100% production test)	8485	
V <sub>IOSM</sub>	Maximum surge isolation voltage <sup>(3)</sup>	Test method per IEC 60065, 1.2/50-μs waveform, V <sub>TEST</sub> = 1.6 × V <sub>IOSM</sub> = 12800 V <sub>PK</sub> (qualification)	8000	V <sub>PK</sub>
q <sub>pd</sub>	Apparent charge <sup>(4)</sup>	Method A, after input/output safety test subgroup 2/3, V <sub>ini</sub> = V <sub>IOTM</sub> , t <sub>ini</sub> = 60 s, V <sub>pd(m)</sub> = 1.2 × V <sub>IORM</sub> = 2545 V <sub>PK</sub> , t <sub>m</sub> = 10 s	≤ 5	pC
		Method A, after environmental tests subgroup 1, V <sub>ini</sub> = V <sub>IOTM</sub> , t <sub>ini</sub> = 60 s, V <sub>pd(m)</sub> = 1.6 × V <sub>IORM</sub> = 3394 V <sub>PK</sub> , t <sub>m</sub> = 10 s	≤ 5	
		Method B1, at routine test (100% production) and preconditioning (type test), V <sub>ini</sub> = V <sub>IOTM</sub> , t <sub>ini</sub> = 1 s, V <sub>pd(m)</sub> = 1.875 × V <sub>IORM</sub> = 3977 V <sub>PK</sub> , t <sub>m</sub> = 1 s	≤ 5	
C <sub>IO</sub>	Barrier capacitance, input to output <sup>(5)</sup>	V <sub>IO</sub> = 0.5 V <sub>PP</sub> at 1 MHz	~1	pF
R <sub>IO</sub>	Insulation resistance, input to output <sup>(5)</sup>	V <sub>IO</sub> = 500 V at T <sub>A</sub> = 25°C	> 10 <sup>12</sup>	Ω
		V <sub>IO</sub> = 500 V at 100°C ≤ T <sub>A</sub> ≤ 125°C	> 10 <sup>11</sup>	
		V <sub>IO</sub> = 500 V at T <sub>S</sub> = 150°C	> 10 <sup>9</sup>	
	Pollution degree		2	
	Climatic category		55/125/21	
UL1577				
V <sub>ISO</sub>	Withstand isolation voltage	V <sub>TEST</sub> = V <sub>ISO</sub> = 5000 V <sub>RMS</sub> or 7071 V <sub>DC</sub> , t = 60 s (qualification), V <sub>TEST</sub> = 1.2 × V <sub>ISO</sub> = 6000 V <sub>RMS</sub> , t = 1 s (100% production test)	5000	V <sub>RMS</sub>

- (1) Apply creepage and clearance requirements according to the specific equipment isolation standards of an application. Care must be taken to maintain the creepage and clearance distance of a board design to ensure that the mounting pads of the isolator on the printed circuit board (PCB) do not reduce this distance. Creepage and clearance on a PCB become equal in certain cases. Techniques such as inserting grooves and ribs on the PCB are used to help increase these specifications.
- (2) This coupler is suitable for *safe electrical insulation* only within the safety ratings. Compliance with the safety ratings shall be ensured by means of suitable protective circuits.
- (3) Testing is carried out in air or oil to determine the intrinsic surge immunity of the isolation barrier.
- (4) Apparent charge is electrical discharge caused by a partial discharge (pd).
- (5) All pins on each side of the barrier are tied together, creating a two-pin device.

## 7.7 Safety-Related Certifications

VDE	UL
Certified according to DIN VDE V 0884-11 (VDE V 0884-11): 2017-01, DIN EN 60950-1 (VDE 0805 Teil 1): 2014-08, and DIN EN 60065 (VDE 0860): 2005-11	Recognized under 1577 component recognition and CSA component acceptance NO 5 programs
Reinforced insulation	Single protection
File number: 40040142	File number: E181974

## 7.8 Safety Limiting Values

Safety limiting intends to minimize potential damage to the isolation barrier upon failure of input or output circuitry.

PARAMETER		TEST CONDITIONS	MIN	TYP	MAX	UNIT
I <sub>S</sub>	Safety input, output, or supply current	R <sub>θJA</sub> = 96.3°C/W, T <sub>J</sub> = 150°C, T <sub>A</sub> = 25°C, VDD1 = 18 V, VDD2 = 5.5 V, see <a href="#">Figure 2</a>			55	mA
		R <sub>θJA</sub> = 96.3°C/W, T <sub>J</sub> = 150°C, T <sub>A</sub> = 25°C, VDD1 = VDD2 = 5.5 V, see <a href="#">Figure 2</a>			236	
P <sub>S</sub>	Safety input, output, or total power	R <sub>θJA</sub> = 96.3°C/W, T <sub>J</sub> = 150°C, T <sub>A</sub> = 25°C, see <a href="#">Figure 3</a>			1298 <sup>(1)</sup>	mW
T <sub>S</sub>	Maximum safety temperature				150	°C

- (1) The maximum safety temperature,  $T_S$ , has the same value as the maximum junction temperature,  $T_J$ , specified for the device. The  $I_S$  and  $P_S$  parameters represent the safety current and safety power, respectively. Do not exceed the maximum limits of  $I_S$  and  $P_S$ . These limits vary with the ambient temperature,  $T_A$ .

The junction-to-air thermal resistance,  $R_{\theta JA}$ , in the [Thermal Information](#) table is that of a device installed on a high-K test board for leaded surface-mount packages. Use these equations to calculate the value for each parameter:

$T_J = T_A + R_{\theta JA} \times P$ , where  $P$  is the power dissipated in the device.

$T_{J(max)} = T_S = T_A + R_{\theta JA} \times P_S$ , where  $T_{J(max)}$  is the maximum junction temperature.

$P_S = I_S \times V_{DD1_{max}} + I_S \times V_{DD2_{max}}$ , where  $V_{DD1_{max}}$  is the maximum high-side supply voltage and  $V_{DD2_{max}}$  is the maximum low-side supply voltage.

## 7.9 Electrical Characteristics

minimum and maximum specifications apply from  $T_A = -55^{\circ}\text{C}$  to  $+125^{\circ}\text{C}$ ,  $V_{DD1} = 4.5\text{ V}$  to  $18\text{ V}$ ,  $V_{DD2} = 4.5\text{ V}$  to  $5.5\text{ V}$ ,  $V_{IN} = -12\text{ V}$  to  $12\text{ V}$ , and  $R_{LOAD} = 10\text{ k}\Omega$ ; typical specifications are at  $T_A = 25^{\circ}\text{C}$ , and  $V_{DD1} = V_{DD2} = 5\text{ V}$  (unless otherwise noted)

PARAMETER		TEST CONDITIONS		MIN	TYP	MAX	UNIT
ANALOG INPUT							
V <sub>OS</sub>	Input offset voltage <sup>(1)</sup>	Initial, at T <sub>A</sub> = 25°C, IN = GND1, ISO224B	-5	±1	5	mV	
		Initial, at T <sub>A</sub> = 25°C, IN = GND1, ISO224A	-50	±1	50		
TCV <sub>OS</sub>	Input offset voltage drift <sup>(1)</sup>	ISO224B	-15	±3	15	μV/°C	
		ISO224A	-60	±12	60		
C <sub>IN</sub>	Input capacitance	IN to GND1	2			pF	
R <sub>IN</sub>	Input resistance	IN to GND1	1	1.25	MΩ		
I <sub>IB</sub>	Input bias current	IN = GND1	±15			nA	
TCI <sub>IB</sub>	Input bias current drift	IN = GND1	±30			pA/°C	
e <sub>n</sub>	Input-referred noise density	ISO224B	3			μV/√Hz	
		ISO224A	4				

- (1) The typical value includes one sigma statistical variation.

## Electrical Characteristics (continued)

minimum and maximum specifications apply from  $T_A = -55^{\circ}\text{C}$  to  $+125^{\circ}\text{C}$ ,  $V_{DD1} = 4.5\text{ V}$  to  $18\text{ V}$ ,  $V_{DD2} = 4.5\text{ V}$  to  $5.5\text{ V}$ ,  $V_{IN} = -12\text{ V}$  to  $12\text{ V}$ , and  $R_{LOAD} = 10\text{ k}\Omega$ ; typical specifications are at  $T_A = 25^{\circ}\text{C}$ , and  $V_{DD1} = V_{DD2} = 5\text{ V}$  (unless otherwise noted)

PARAMETER		TEST CONDITIONS	MIN	TYP	MAX	UNIT
ANALOG OUTPUTS						
	Nominal gain	$(V_{\text{OUTP}} - V_{\text{OUTN}}) / V_{\text{IN}}$	1/3			V/V
E <sub>G</sub>	Gain error <sup>(1)</sup>	Initial, at T <sub>A</sub> = 25°C, ISO224B	-0.3%	±0.05%	0.3%	
		Initial, at T <sub>A</sub> = 25°C, ISO224A	-1%	0.4%	1%	
TCE <sub>G</sub>	Gain error drift <sup>(1)</sup>	ISO224B	-35	±10	35	ppm/°C
		ISO224A	-60	±20	60	
	Nonlinearity	ISO224B	-0.01%	±0.003%	0.01%	
		ISO224A	-0.02%	±0.003%	0.02%	
	Nonlinearity drift		±0.1			ppm/°C
THD	Total harmonic distortion	f <sub>IN</sub> = 10 kHz	-84			dB
	Output noise	IN = GND1, f <sub>IN</sub> = 0 Hz, BW = 10 kHz	300			μV <sub>RMS</sub>
		IN = GND1, f <sub>IN</sub> = 0 Hz, BW = 100 kHz	360			
PSRR	Power-supply rejection ratio <sup>(2)</sup>	vs VDD1, at DC	-107			dB
		vs VDD1, 100-mV and 10-kHz ripple	-101			
		vs VDD2, at DC	-71			
		vs VDD2, 100-mV and 10-kHz ripple	-56			
V <sub>OUT</sub>	Output voltage	OUTP or OUTN to GND2	GND2 + 0.2	VDD2 - 0.2		V
V <sub>CMout</sub>	Common-mode output voltage	$(V_{\text{OUTP}} + V_{\text{OUTN}}) / 2$	0.48 × VDD2	VDD2 / 2	0.52 × VDD2	V
V <sub>FAILSAFE</sub>	Failsafe output voltage	VDD1 missing, OUTP and OUTN forced to GND2	GND2 + 0.1			V
I <sub>SC</sub>	Output short-circuit current	On OUTP or OUTN to GND2	±18			mA

## 8 Detailed Description

### 8.1 Overview

The ISO224 is a precision, isolated amplifier with a high input impedance and wide input voltage range suitable for wide range of industrial applications. The input stage of the device drives a delta-sigma ( $\Delta\Sigma$ ) modulator. The modulator uses the internal voltage reference and clock generator to convert the analog input signal to a digital bitstream. The drivers (called *TX* in the [Functional Block Diagram](#) section) transfer the output of the modulator across the isolation barrier that separates the high-side and low-side voltage domains. The received bitstream and clock are synchronized and processed by a digital-to-analog conversion stage on the low-side and presented as a differential analog output.

The SiO<sub>2</sub>-based, double-capacitive isolation barrier supports a high level of magnetic field immunity, as described in [ISO72x Digital Isolator Magnetic-Field Immunity](#). The digital modulation used in the ISO224 and the isolation barrier characteristics result in high reliability and high common-mode transient immunity.

### 8.2 Functional Block Diagram

## 8.3 Feature Description

### 8.3.1 Analog Input

The input stage of the ISO224 feeds a switched capacitor, feed-forward  $\Delta\Sigma$  modulator. The modulator converts the analog signal into a bitstream that is transferred over the isolation barrier, as described in the [Isolation Channel Signal Transmission](#) section. The high-impedance and low bias-current input of the ISO224 makes the device suitable for isolated voltage sensing applications.

Figure 41 visualizes the difference in the transfer function of the ISO224 depending on the input signal  $V_{IN}$ , as specified in the [Recommended Operating Conditions](#) table. With the input voltage within the specified full-scale range  $V_{FSR}$ , the output of the device changes in a linear way with small error as specified by the nonlinearity parameter in the [Electrical Characteristics](#) table. If the input signal exceeds the  $V_{FSR}$  range, the nonlinearity of the output signals increases and the amplitude clips at  $V_{IN} = V_{CLIPPING}$ .

**Figure 41. Transfer Function of the ISO224**

There are two restrictions on the analog input signal at the IN pin. First, if the input voltage  $V_{IN}$  exceeds the range of  $-15\text{ V}$  to  $15\text{ V}$ , the current must be limited to  $10\text{ mA}$  to prevent damage to the input clamp, see the [Input Clamp Protection Circuit](#) section for further information. In addition, the linearity and noise performance of the ISO224 are ensured only when the analog input voltage remains within the specified linear full-scale range ( $V_{FSR}$ ).

## Feature Description (continued)

### 8.3.2 Input Clamp Protection Circuit

As illustrated in the [Functional Block Diagram](#), the ISO224 features an internal clamp protection circuit on the analog input IN. Using external protection circuits is recommended as a secondary protection scheme to protect the device against surges, ESD events, and electrical fast transient (EFT) conditions.

[Figure 42](#) shows a typical current versus voltage characteristic curve for the input clamp. Limit either the voltage  $V_{IN}$  at the input pin IN to the voltage range as defined in the [Recommended Operating Conditions](#) table or the input current to the limits as defined in the [Absolute Maximum Ratings](#) table.

**Figure 42. I-V Curve of the Input Clamp Protection Circuit**

[Figure 43](#) shows a simple method to limit the input current with an external series resistor that is also used as part of the input low-pass filter.

**Figure 43. Series Resistor-Based Input Current Limitation on the Analog Inputs of ISO224**

The input overvoltage protection clamp on the ISO224 is intended to control transient excursions on the input pins. Leaving the device in a state such that the clamp circuit is activated for extended periods of time in normal or power-down mode is not recommended because this fault condition can degrade device performance and reliability.

## Feature Description (continued)

### 8.3.3 Isolation Channel Signal Transmission

The ISO224 uses an on-off keying (OOK) modulation scheme to transmit the modulator output bitstream across the SiO<sub>2</sub>-based isolation barrier. As shown in Figure 44, the transmitter modulates the bitstream at TX IN with an internally-generated, high-frequency carrier across the isolation barrier to represent a digital *one* and does not send a signal to represent the digital *zero*. The nominal frequency of the carrier used inside the ISO224 is 480 MHz.

The receiver demodulates the signal after advanced signal conditioning and produces the output. The ISO224 also incorporates advanced circuit techniques to maximize the CMTI performance and minimize the radiated emissions caused by the high-frequency carrier and IO buffer switching.

**Figure 44. Block Diagram of an Isolation Channel**

Figure 45 shows the concept of the OOK scheme.

**Figure 45. OOK-Based Modulation Scheme**

## Feature Description (continued)

### 8.3.4 Fail-Safe Output

The ISO224 offers a fail-safe output that simplifies diagnostics on system level. The fail-safe output is active when the high-side power supply VDD1 of the device is missing, independent of the input signal at the IN pin. Figure 46 shows that in that case both outputs, OUTP and OUTN, of the device are actively driven close to GND2 (see the  $V_{\text{FAILSAFE}}$  specification in the [Electrical Characteristics](#) table for details). For easy visualization, an example with the input signal  $V_{\text{IN}} = 0$  V is shown for the valid VDD1 range of 4.5 V to 5.5 V.

Figure 46. ISO224 Failsafe Output Behavior With  $V_{\text{IN}} = 0$  V

The [ISO224 Fail-Safe Output Feature application report](#) describes an example of a comparator-based circuit that detects the missing high-side supply in a system.

### 8.4 Device Functional Modes

The ISO224 is operational when the power supplies VDD1 and VDD2 are applied, as specified in the [Recommended Operating Conditions](#) table.

## 9 Application and Implementation

### NOTE

Information in the following applications sections is not part of the TI component specification, and TI does not warrant its accuracy or completeness. TI's customers are responsible for determining suitability of components for their purposes. Customers should validate and test their design implementation to confirm system functionality.

### 9.1 Application Information

The ISO224 enables high-precision measurement of  $\pm 10$ -V signals that are used in a harsh environment in a wide range of industrial applications. The high input resistance of the device simplifies the connection of its input to different sensors or other signal sources. The very low nonlinearity, AC and DC errors, and temperature drift make the ISO224 a robust, high-performance, isolated amplifier for applications where high voltage isolation is required. The differential output with a full-scale voltage of 4 V offers high immunity to noise and allows connection to a wide range of analog-to-digital converters (ADCs) powered on a 5-V nominal supply.

### 9.2 Typical Application

Isolated amplifiers are often used for data acquisition in industrial applications to safely separate the low-voltage portion of the system from the high common-mode voltage input of the system. The input structure of the ISO224 is optimized for isolated voltage sensing in this kind of application.

Figure 47 shows a typical operation of the device for voltage sensing as used in power line monitoring systems. The phase voltage amplitude is reduced with a resistive divider to match the input voltage range of the ISO224. The high input voltage range and the high common-mode transient immunity of the device ensure reliable and accurate operation even in high-noise environments.

**Figure 47. Using the ISO224 for AC Voltage Sensing**

#### 9.2.1 Design Requirements

Table 1 summarizes the typical design requirements for an AC power line voltage sensing application.

**Table 1. Design Requirements**

PARAMETER	VALUE
AC voltage range, $V_{AC}$	50 V to 750 V
Bandwidth	600 Hz (minimum)
Current through the resistive divider, $I_{AC}$	1 mA (maximum)

## 9.2.2 Detailed Design Procedure

The high-side power supply (VDD1) for the device is generated with a suitable isolated power source. An example of such a circuit is provided in the [Power Supply Recommendations](#) section.

The floating ground reference (GND1) is derived from one of the ends of the shunt resistor that is connected to the negative input of the device (VINN). If a four-pin shunt is used, the inputs of the device are connected to the inner leads and GND1 is connected to one of the outer shunt leads.

Use Ohm's Law to calculate the minimum total resistance of the resistive divider to limit the cross current  $I_{AC}$  to the desired value:  $R_1 + R_2 = V_{AC} / I_{AC}$ . The input voltage at the ISO224 results from the resistance ratio of  $R_1$  and  $R_2$  and the actual AC voltage:  $V_{IN} = V_{AC} \times R_2 / (R_1 + R_2)$ .

Consider the following two restrictions to choose the proper value of the  $R_1$  and  $R_2$  resistors:

- The voltage drop on  $R_2$  caused by the nominal AC voltage range of the system must not exceed the recommended input voltage range  $V_{IN}$  of the ISO224
- The voltage drop on  $R_2$  caused by the maximum allowed system overvoltage must not exceed the input voltage that causes a clipping output:  $V_{IN} \leq V_{Clipping}$

[Table 2](#) lists examples of nominal E96-series (1% accuracy) resistor values for AC systems using 120 V, 240 V, and 400 V as nominal voltages.

**Table 2. Resistor Value Examples**

PARAMETER	120-V <sub>AC</sub> SYSTEM	240-V <sub>AC</sub> SYSTEM	400-V <sub>AC</sub> SYSTEM
Resistive divider resistor $R_1$	115 k $\Omega$	237 k $\Omega$	392 k $\Omega$
Resistive divider resistor $R_2$	12.7 k $\Omega$	12.4 k $\Omega$	12.1 k $\Omega$
Resulting current through resistive divider $I_{AC}$	0.93 mA	0.93 mA	0.98 mA
Resulting input voltage $V_{IN}$	$\pm 11.934$ V	$\pm 11.933$ V	$\pm 11.977$ V

For systems using single-ended input ADCs with a 5-V supply, [Figure 48](#) shows an example of a **TLV6001**-based signal conversion and filter circuit. Tailor the bandwidth of this filter stage to the bandwidth requirement of the system and use NP0-type capacitors for best performance.

**Figure 48. Connecting the ISO224 Output to a Single-Ended Input 5-V ADC**

For systems using single-ended,  $\pm 10$ -V input ADCs, the [ISO224EVM](#) offers a signal path based on an [OPA277](#) that converts the differential output of the ISO224 and limits the signal bandwidth to 50 kHz.

For more information on the general procedure to design the filtering and driving stages of SAR ADCs, consult the [18-Bit, 1MSPS Data Acquisition Block \(DAQ\) Optimized for Lowest Distortion and Noise](#) and [18-Bit Data Acquisition Block \(DAQ\) Optimized for Lowest Power](#) TI Precision Designs, available for download at [www.ti.com](#).

### 9.2.3 Application Curves

In some applications the system must be protected in case of an overvoltage condition. To allow for fast powering off of the system, a low delay caused by the isolated amplifier is required. [Figure 49](#) shows the typical full-scale step response of the device. Consider the delay of the required window comparator and the MCU to calculate the overall response time of the system.

**Figure 49. Step Response of the ISO224**

[Figure 50](#) shows the typical AC response of the device with a full-scale sine wave with a frequency of 20 kHz applied at the input.

**Figure 50. AC Response of the ISO224 at  $f_{IN} = 20$  kHz**

### 9.3 What to Do and What Not to Do

Do not leave the input of the ISO224 unconnected (floating) when the device is powered up. If the device input is left floating, both outputs are at the common-mode output voltage level  $V_{CMout}$  as specified in the [Switching Characteristics](#) table. See the [ISO224 Fail-Safe Output Feature application report](#) for more details.

## 10 Power Supply Recommendations

In a typical application, the high-side power supply (VDD1) for the ISO224 is generated from the low-side supply (VDD2) of the device by an isolated DC/DC converter circuit. A low-cost solution is based on the push-pull driver [SN6501](#) and a transformer that supports the desired isolation voltage ratings. TI recommends using a low-ESR decoupling capacitor of 0.1  $\mu\text{F}$  and an additional capacitor of a minimum 1  $\mu\text{F}$  for both supplies of the ISO224. [Figure 51](#) shows the recommended placement of these decoupling capacitors as close as possible to the ISO224 power-supply pins to minimize supply current loops and electromagnetic emissions.

To decouple the output of the integrated LDO, use a 0.22- $\mu\text{F}$  capacitor placed as close to the VCAP pin of the ISO224 as possible.

The ISO224 does not require any specific power up sequencing. Consider the analog settling time  $t_{AS}$  as specified in the [Switching Characteristics](#) table after ramp up of the VDD1 high-side supply.

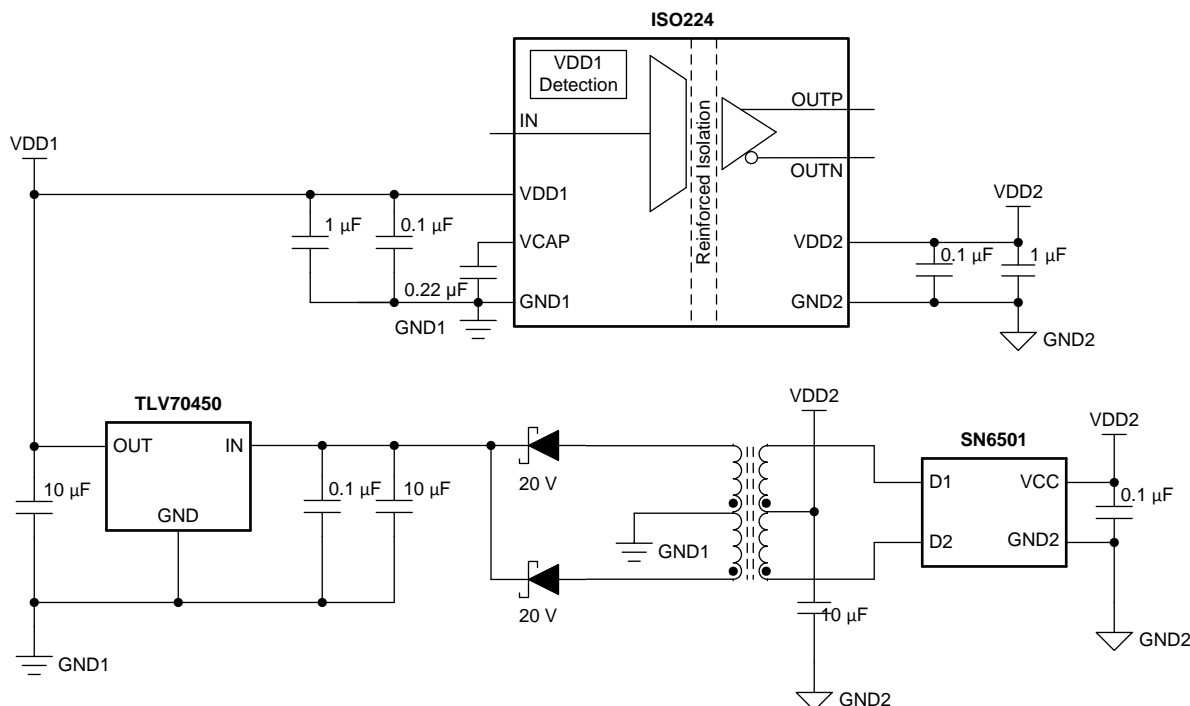

Figure 51. SN6501-Based, High-Side Power Supply

## 11 Layout

### 11.1 Layout Guidelines

For best performance, place the 0.22- $\mu$ F capacitor (C7, as shown in [Figure 52](#)) required for decoupling of the internal LDO output as close as possible to the ISO224 VCAP pin. The 0.1- $\mu$ F ceramic decoupling capacitors for both power supplies (C8 and C9) are located as close as possible to the corresponding VDDx pins followed by the additional 1- $\mu$ F ceramic capacitors for lower-frequency decoupling (C3 and C12). The resistor and capacitor used for the analog input (R1 and C2) are placed next to the decoupling capacitors. For best performance, use 0603-size or 1206-size, SMD-type, ceramic capacitors with low ESR. Connect the supply voltage sources in a way that allows the supply current to flow through the pads of the decoupling capacitors before powering the device.

[Figure 52](#) shows this approach as implemented on the [ISO224EVM](#). Capacitors C3 and C8 decouple the high-side supply VDD1 and capacitors C9 and C12 are used to support the low-side supply VDD2 of the ISO224.

<sup>(1)</sup> **Status:** For more details on status, see our [product life cycle](#).

<sup>(2)</sup> **Material type:** When designated, preproduction parts are prototypes/experimental devices, and are not yet approved or released for full production. Testing and final process, including without limitation quality assurance, reliability performance testing, and/or process qualification, may not yet be complete, and this item is subject to further changes or possible discontinuation. If available for ordering, purchases will be subject to an additional waiver at checkout, and are intended for early internal evaluation purposes only. These items are sold without warranties of any kind.

<sup>(3)</sup> **RoHS values:** Yes, No, RoHS Exempt. See the [TI RoHS Statement](#) for additional information and value definition.

<sup>(4)</sup> **Lead finish/Ball material:** Parts may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead finish/Ball material values may wrap to two lines if the finish value exceeds the maximum column width.

<sup>(5)</sup> **MSL rating/Peak reflow:** The moisture sensitivity level ratings and peak solder (reflow) temperatures. In the event that a part has multiple moisture sensitivity ratings, only the lowest level per JEDEC standards is shown. Refer to the shipping label for the actual reflow temperature that will be used to mount the part to the printed circuit board.

<sup>(6)</sup> **Part marking:** There may be an additional marking, which relates to the logo, the lot trace code information, or the environmental category of the part.

Multiple part markings will be inside parentheses. Only one part marking contained in parentheses and separated by a "~" will appear on a part. If a line is indented then it is a continuation of the previous line and the two combined represent the entire part marking for that device.

**Important Information and Disclaimer:** The information provided on this page represents TI's knowledge and belief as of the date that it is provided. TI bases its knowledge and belief on information provided by third parties, and makes no representation or warranty as to the accuracy of such information. Efforts are underway to better integrate information from third parties. TI has taken and continues to take reasonable steps to provide representative and accurate information but may not have conducted destructive testing or chemical analysis on incoming materials and chemicals. TI and TI suppliers consider certain information to be proprietary, and thus CAS numbers and other limited information may not be available for release.

In no event shall TI's liability arising out of such information exceed the total purchase price of the TI part(s) at issue in this document sold by TI to Customer on an annual basis.
