

ISO7320C, ISO7320FC, ISO7321C, ISO7321FC

SLLSEK8C - JANUARY 2015-REVISED APRIL 2015

ISO732x Robust EMC, Low Power, Dual-Channel Digital Isolators

Features

- Signaling Rate: 25 Mbps
- Integrated Noise Filter on the Inputs
- Default Output 'High' and 'Low' Options
- Low Power Consumption: Typical I_{CC} per Channel
 - ISO7320: 1.2 mA (5 V Supplies), 0.9 mA (3.3 V Supplies)
 - ISO7321: 1.7 mA (5 V Supplies), 1.2 mA (3.3 V Supplies)
- Low Propagation Delay: 33 ns Typical (5V Supplies)
- 3.3 V and 5 V Level Translation
- Wide Temperature Range: -40°C to 125°C
- 65 KV/µs Transient Immunity, Typical (5V Supplies)
- Robust Electromagnetic Compatibility (EMC)
 - System-level ESD, EFT, and Surge Immunity
 - Low Emissions
- Isolation Barrier Life: > 25 Years
- Operates from 3.3 V and 5 V Supplies
- Narrow Body SOIC-8 Package
- Safety and Regulatory Approvals:
 - 4242 V_{PK} Isolation per DIN V VDE V 0884-10 and DIN EN 61010-1
 - 3000 V_{RMS} Isolation for 1 minute per UL 1577
 - CSA Component Acceptance Notice 5A, IEC 60950-1 and IEC 61010-1 Standards
 - CQC Certification per GB4943.1-2011

2 Applications

- Opto-Coupler Replacement in:
 - Industrial FieldBus
 - **ProfiBus**
 - ModBus
 - DeviceNet™ Data Buses
 - Servo Control Interface
 - Motor Control
 - **Power Supplies**
 - **Battery Packs**

3 Description

ISO732x provide galvanic isolation up to 3000 V_{RMS} for 1 minute per UL and 4242 V_{PK} per VDE. These devices have two isolated channels comprised of logic input and output buffers separated by silicon dioxide (SiO₂) insulation barriers. ISO7320 has both channels in the same direction while ISO7321 has the two channels in opposite direction. In case of input power or signal loss, default output is 'low' for devices with suffix 'F' and 'high' for devices without suffix 'F'. See Device Functional Modes for further details. Used in conjunction with isolated power supplies, these devices prevent noise currents on a data bus or other circuits from entering the local ground and interfering with or damaging sensitive circuitry. ISO732x have integrated noise filters for harsh industrial environment where short noise pulses may be present at the device input pins. ISO732x have TTL input thresholds and operate from 3 V to 5.5 V supply levels. Through innovative chip design and layout techniques, electromagnetic compatibility of ISO732x have been significantly enhanced to enable system-level ESD, EFT, Surge and Emissions compliance.

Device Information⁽¹⁾

PART NUMBER	PACKAGE	BODY SIZE (NOM)
ISO7320C		
ISO7320FC	COIC (0)	4.00
ISO7321C	SOIC (8)	4,90mm x 3,91mm
ISO7321FC		

(1) For all available packages, see the orderable addendum at the end of the datasheet.

Simplified Schematic

- (1) V_{CCI} and GNDI are supply and ground connections respectively for the input channels.
- V_{CCO} and GNDO are supply and ground connections respectively for the output channels.

4 Revision History

CI	hanges from Revision B (April 2015) to Revision C	Page
•	Added "and DINEN 61010-1" to the 4242 VPK in the Features	1
•	Deleted "(Approval Pending)" from the the CSA Component Acceptance list item in Features	1
•	Changed From: V _{CC1} To: V _{CCI} in Figure 11	9
•	Changed From: V _{CC1} To: V _{CC1} and From: V _{CC2} To: V _{CC0} in Figure 13	9
•	Deleted IEC from the section title: Insulation and Safety-Related Specifications for D-8 Package	1′
•	Changed the CTI Test Conditions in Insulation and Safety-Related Specifications for D-8 Package	11
•	Changed V _{ISO} Test Condition in the <i>Insulation Characteristics</i> table	12
CI	hanges from Revision A (March 2015) to Revision B	Page
•	Changed from device status From: Product Preview To: Production	1
CI	hanges from Original (January 2015) to Revision A	Page
•	Changed from First page only to the full datasheet.	1
•	Changed Voca to Voca to Voca GND1 to GNDI, GND2 to GND0 and added foot notes to the Simplified S	Schematic 1

5 Pin Configuration and Functions

Pin Functions

	1 III I dilottotio							
	PIN		1/0	DESCRIPTION				
NAME	ISO7320	ISO7321	I/O	DESCRIPTION				
INA	2	7	I	Input, channel A				
INB	3	3	1	Input, channel B				
GND1	4	4	_	Ground connection for V _{CC1}				
GND2	5	5	_	Ground connection for V _{CC2}				
OUTA	7	2	0	Output, channel A

6 Specifications

6.1 Absolute Maximum Ratings⁽¹⁾

		MIN	MAX	UNIT
Supply voltage, V _{CC1} ,	V _{CC2} ⁽²⁾	-0.5	6	V
Voltage (2)	INx, OUTx	-0.5	V _{CC} + 0.5 ⁽³⁾	V
Output current, IO			±15	mA
Junction temperature,	Τ _J		150	°C
Storage temperature,	- stg	-65	150	°C

- (1) Stresses beyond those listed under absolute maximum ratings may cause permanent damage to the device. These are stress ratings only and functional operation of the device at these or any other conditions beyond those indicated under recommended operating conditions is not implied. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.
- 2) All voltage values are with respect to network ground terminal and are peak voltage values.
- 3) Maximum voltage must not exceed 6 V.

6.2 ESD Ratings

		VALUE	UNIT
V	Human body model (HBM), per ANSI/ESDA/JEDEC JS-001 (1)	±4000	
V _{ESD}	Charged device model (CDM), per JEDEC specification JESD22-C101 (2)	±1500	V

- (1) JEDEC document JEP155 states that 500-V HBM allows safe manufacturing with a standard ESD control process.
- (2) JEDEC document JEP157 states that 250-V CDM allows safe manufacturing with a standard ESD control process.

6.3 Recommended Operating Conditions

		MIN	TYP	MAX	UNIT
V _{CC1} , V _{CC2}	Supply voltage	3		5.5	V
I _{OH}	High-level output current	-4			mA
I _{OL}	Low-level output current			4	mA
V_{IH}	High-level input voltage	2		5.5	V
V_{IL}	Low-level input voltage	0		0.8	V
t _{ui}	Input pulse duration	40			ns
1 / t _{ui}	Signaling rate	0		25	Mbps
T _J ⁽¹⁾	Junction temperature			136	°C
T _A	Ambient temperature	-40	25	125	°C

⁽¹⁾ To maintain the recommended operating conditions for T_J, see the *Thermal Information* table.

6.4 Thermal Information

	THERMAL METRIC ⁽¹⁾		D PACKAGE	LIMIT
	I THERMAL METRIC		(8) PINS	UNIT
$R_{\theta JA}$	Junction-to-ambient thermal resistance		121	
$R_{\theta JCtop}$	Junction-to-case (top) thermal resistance		67.9	
$R_{\theta JB}$	Junction-to-board thermal resistance		61.6	°C/W
Ψ_{JT}	Junction-to-top characterization parameter	to-top characterization parameter to-board characterization parameter to-case (bottom) thermal resistance	21.5	*C/VV
ΨЈВ	Junction-to-board characterization parameter		61.1	
R _{0JCbot}	Junction-to-case (bottom) thermal resistance		N/A	
P _D (ISO7320)	Maximum power dissipation by ISO7320	$V_{CC1} = V_{CC2} = 5.5 \text{ V}, T_J = 150^{\circ}\text{C}, C_L = 15$	56	
P _{D1} (ISO7320)	Maximum power dissipation by side-1 of ISO7320	pF, Input a 12.5 MHz 50% duty-cycle square	15	mW
P _{D2} (ISO7320)	Maximum power dissipation by side-2 of ISO7320	wave	41	
P _D (ISO7321)	Maximum power dissipation by ISO7321	V _{CC1} = V _{CC2} = 5.5 V, T _J = 150°C, C _J = 15	67	
P _{D1} (ISO7321)	Maximum power dissipation by side-1 of ISO7321	pF, Input a 12.5 MHz 50% duty-cycle square	33.5	mW
P _{D2} (ISO7321)	Maximum power dissipation by side-2 of ISO7321	wave	33.5	

(1) For more information about traditional and new thermal metrics, see the IC Package Thermal Metrics application report, SPRA953.

6.5 Electrical Characteristics, 5 V

 V_{CC1} and V_{CC2} at 5 V \pm 10% (over recommended operating conditions unless otherwise noted)

	PARAMETER		TEST CONDITIONS			MAX	UNIT

t _f	Output signal fall time		See Figure 11		2.1		ns
t _{fs}	Fail-safe output delay time from input power lo	oss	See Figure 12		7.5		μs

⁽¹⁾ Also known as pulse skew.

6.8 Switching Characteristics, 3.3 V

 V_{CC1} and V_{CC2} at 3.3 V ± 10% (over recommended operating conditions unless otherwise noted)

	PARAMETER		TEST CONDITIONS	MIN	TYP	MAX	UNIT3
t_{PLH},t_{PHL}	Propagation delay time		See Figure 11	22	37	66	ns
PWD ⁽¹⁾	Pulse width distortion t _{PHL} - t _{PLH}		See Figure 11			3	ns
4 (2)	Channel to shannel output alread time	ISO7320				3	
t _{sk(o)} (2)	Channel-to-channel output skew time	ISO7321				16	ns
t _{sk(pp)} (3)	Part-to-part skew time	•				28	ns
t _r	Output signal rise time		See Figure 44		3.1		ns
t _f	Output signal fall time	See Figure 11		2.6		ns	
t _{fs}	Fail-safe output delay time from input power los	SS	See Figure 12		7.4		μs

⁽¹⁾ Also known as pulse skew.

⁽²⁾ t_{sk(o)} is the skew between outputs of a single device with all driving inputs connected together and the outputs switching in the same direction while driving identical loads.

⁽³⁾ t_{sk(pp)} is the magnitude of the difference in propagation delay times between any terminals of different devices switching in the same direction while operating at identical supply voltages, temperature, input signals and loads.

⁽z) t_{sk(o)} is the skew between outputs of a single device with all driving inputs connected together and the outputs switching in the same direction while driving identical loads.

⁽³⁾ $t_{sk(pp)}$ is the magnitude of the difference in propagation delay times between any terminals of different devices switching in the same direction while operating at identical supply voltages, temperature, input signals and loads.

6.9 Typical Characteristics

Typical Characteristics (continued)

7 Parameter Measurement Information

- (1) The input pulse is supplied by a generator having the following characteristics: PRR \leq 50 kHz, 50% duty cycle, $t_f \leq 3$ ns, $t_f \leq 3$ ns, $Z_O = 50 \Omega$. At the input, a 50- Ω resistor is required to terminate the Input Generator signal. It is not needed in actual application.
- (2) $C_L = 15 \text{ pF}$ and includes instrumentation and fixture capacitance within $\pm 20\%$.

Figure 11. Switching Characteristic Test Circuit and Voltage Waveforms

A. $C_L = 15 \text{ pF}$ and includes instrumentation and fixture capacitance within $\pm 20\%$.

Figure 12. Fail-Safe Output Delay-Time Test Circuit and Voltage Waveforms

(1) $C_L = 15 \text{ pF}$ and includes instrumentation and fixture capacitance within $\pm 20\%$.

Figure 13. Common-Mode Transient Immunity Test Circuit

8 Detailed Description

8.1 Overview

The isolator in Figure 14 is based on a capacitive isolation barrier technique. The I/O channel of the device consists of two internal data channels, a high-frequency (HF) channel with a bandwidth from 100 kbps up to 25 Mbps, and a low-frequency (LF) channel covering the range from 100 kbps down to DC.

In principle, a single-ended input signal entering the HF channel is split into a differential signal via the inverter gate at the input. The following capacitor-resistor networks differentiate the signal into transient pulses, which then are converted into CMOS levels by a comparator. The transient pulses at the input of the comparator can be either above or below the common mode voltage VREF depending on whether the input bit transitioned from 0 to 1 or 1 to 0. The comparator threshold is adjusted based on the expected bit transition. A decision logic (DCL) at the output of the HF channel comparator measures the durations between signal transients. If the duration between two consecutive transients exceeds a certain time limit, (as in the case of a low-frequency signal), the DCL forces the output-multiplexer to switch from the high-frequency to the low-frequency channel.

8.2 Functional Block Diagram

Figure 14. Conceptual Block Diagram of a Digital Capacitive Isolator

Because low-frequency input signals require the internal capacitors to assume prohibitively large values, these signals are pulse-width modulated (PWM) with the carrier frequency of an internal oscillator, thus creating a sufficiently high frequency, capable of passing the capacitive barrier. As the input is modulated, a low-pass filter (LPF) is needed to remove the high-frequency carrier from the actual data before passing it on to the output multiplexer.

8.3 Feature Description

PRODUCT	CHANNEL DIRECTION	RATED ISOLATION	MAX DATA RATE	DEFAULT OUTPUT
ISO7320C	Same			High
ISO7320FC	Same	2000 V (4242 V (1)	OF Mhno	Low
ISO7321C	Opposite	3000 V _{RMS} / 4242 V _{PK} ⁽¹⁾	25 Mbps	High
ISO7321FC				Low

⁽¹⁾ See the Regulatory Information section for detailed Isolation Ratings

8.3.1 High Voltage Feature Description

8.3.1.1 Insulation and Safety-Related Specifications for D-8 Package

over recommended operating conditions (unless otherwise noted)

PARAMETER		TEST CONDITIONS	MIN	TYP	MAX	UNIT
L(I01)	Minimum air gap (clearance)	Shortest terminal-to-terminal distance through air	4			mm
L(102)	Minimum external tracking (creepage)	Shortest terminal-to-terminal distance across the package surface	4			mm
СТІ	Tracking resistance (comparative tracking index)	DIN EN 60112 (VDE 0303-11); IEC 60112	400			V
DTI	Minimum internal gap (internal clearance)	Distance through insulation	13			μm
_	Isolation resistance, input to	V _{IO} = 500 V, T _A = 25°C	10 ¹²			Ω
R _{IO}	output ⁽¹⁾	V _{IO} = 500 V, 100°C ≤ T _A ≤ 125°C	10 ¹¹			Ω
C _{IO}	Isolation capacitance, input to output ⁽¹⁾	$V_{IO} = 0.4 \sin (2\pi ft), f = 1 \text{ MHz}$		1.5		pF
C _I	Input capacitance ⁽²⁾	$V_{I} = V_{CC}/2 + 0.4 \sin(2\pi ft), f = 1 \text{ MHz}, V_{CC} = 5 \text{ V}$		1.8		pF

⁽¹⁾ All pins on each side of the barrier tied together creating a two-terminal device.

NOTE

Creepage and clearance requirements should be applied according to the specific equipment isolation standards of an application. Care should be taken to maintain the creepage and clearance distance of a board design to ensure that the mounting pads of the isolator on the printed-circuit board do not reduce this distance.

Creepage and clearance on a printed-circuit board become equal in certain cases. Techniques such as inserting grooves and/or ribs on a printed circuit board are used to help increase these specifications.

⁽¹⁾ Production tested \geq 3600 V_{RMS} for 1 second in accordance with UL 1577.

8.3.1.4 Safety Limiting Values

Safety limiting intends to prevent potential damage to the isolation barrier upon failure of input or output circuitry. A failure of the I/O can allow low resistance to ground or the supply and, without current limiting, dissipate sufficient power to overheat the die and damage the isolation barrier, potentially leading to secondary system failures.

	PARAMETER	TEST CONDITIONS	MIN	TYP	MAX	UNIT
	Safety input, output, or supply	$R_{\theta JA} = 121 \text{ °C/W}, V_I = 5.5 \text{ V}, T_J = 150 \text{ °C}, T_A = 25 \text{ °C}$			188	m ^
IS	current	R _{0JA} = 121 °C/W, V _I = 3.6 V, T _J = 150°C, T _A = 25°C			287	mA
T _S	Maximum case temperature				150	°C

The safety-limiting constraint is the absolute-maximum junction temperature specified in the *Absolut Maximun Ratings* table. The power dissipation and junction-to-air thermal impedance of the device installed in the application hardware determines the junction temperature. The assumed junction-to-air thermal resistance in the *Thermal Information* table is that of a device installed on a High-K Test Board for Leaded Surface-Mount Packages. The power is the recommended maximum input voltage times the current. The junction temperature is then the ambient temperature plus the power times the junction-to-air thermal resistance.

9 Applications and Implementation

NOTE

Information in the following applications sections is not part of the TI component specification, and TI does not warrant its accuracy or completeness. TI's customers are responsible for determining suitability of components for their purposes. Customers should validate and test their design implementation to confirm system functionality.

9.1 Application Information

ISO732x utilize single-ended TTL-logic switching technology. Its supply voltage range is from 3 V to 5.5 V for both supplies, V_{CC1} and V_{CC2} . When designing with digital isolators, it is important to keep in mind that due to the single-ended design structure, digital isolators do not conform to any specific interface standard and are only intended for isolating single-ended CMOS or TTL digital signal lines. The isolator is typically placed between the data controller (i.e. μ C or UART), and a data converter or a line transceiver, regardless of the interface type or standard.

9.2 Typical Application

ISO7321 can be used with Texas Instruments' mixed signal micro-controller, digital-to-analog converter, transformer driver, and voltage regulator to create an isolated 4-20 mA current loop.

Figure 17. Typical ISO7321 Application Circuit

Typical Application (continued)

9.2.1 Design Requirements

9.2.1.1 Typical Supply Current Equations

ISO7320:

At
$$V_{CC1} = V_{CC2} = 5 \text{ V}$$

•
$$I_{CC1} = 0.3838 + (0.0431 \times f)$$

•
$$I_{CC1} = 0.3838 + (0.0431 \text{ x f})$$

 $I_{CC2} = 2.74567 + (0.08433 \times f) + (0.01 \times f \times C_L)$

At
$$V_{CC1} = V_{CC2} = 3.3 \text{ V}$$

- $I_{CC1} = 0.2394 + (0.02355 \times f)$
- $I_{CC2} = 2.10681 + (0.04374 \text{ x f}) + (0.007045 \text{ x f x C}_{L})$

ISO7321:

At
$$V_{CC1} = V_{CC2} = 5 \text{ V}$$

• I_{CC1} and $I_{CC2} = 1.5877 + (0.066 \text{ x f}) + (0.00123 \text{ x f x C}_L)$

At
$$V_{CC1} = V_{CC2} = 3.3 \text{ V}$$

 I_{CC1} and I_{CC2} = 1.187572 + (0.019399 x f) + (0.0019029 x f x C_L)

I_{CC1} and I_{CC2} are typical supply currents measured in mA, f is data rate measured in Mbps, C₁ is the capacitive load measured in pF.

9.2.2 Detailed Design Procedure

9.2.2.1 Electromagnetic Compatibility (EMC) Considerations

Many applications in harsh industrial environment are sensitive to disturbances such as electrostatic discharge (ESD), electrical fast transient (EFT), surge and electromagnetic emissions. These electromagnetic disturbances are regulated by international standards such as IEC 61000-4-x and CISPR 22. Although system-level performance and reliability depends, to a large extent, on the application board design and layout, the ISO732x incorporate many chip-level design improvements for overall system robustness. Some of these improvements include:

- Robust ESD protection cells for input and output signal pins and inter-chip bond pads.
- Low-resistance connectivity of ESD cells to supply and ground pins.
- Enhanced performance of high voltage isolation capacitor for better tolerance of ESD, EFT and surge events.
- Bigger on-chip decoupling capacitors to bypass undesirable high energy signals through a low impedance path.
- PMOS and NMOS devices isolated from each other by using guard rings to avoid triggering of parasitic SCRs.
- Reduced common mode currents across the isolation barrier by ensuring purely differential internal operation.

9.2.3 Application Performance Curves

Typical eye diagrams of ISO732x below indicate low jitter and wide open eye at the maximum data rate of 25 Mbps.

10 Power Supply Recommendations

To ensure reliable operation at all data rates and supply voltages, a 0.1 μ F bypass capacitor is recommended at input and output supply pins (V_{CC1} & V_{CC2}). The capacitors should be placed as close to the supply pins as possible. If only a single primary-side power supply is available in an application, isolated power can be generated for the secondary-side with the help of a transformer driver such as Texas Instruments' SN6501. For such applications, detailed power supply design and transformer selection recommendations are available in SN6501 datasheet (SLLSEA0) .

11 Layout

11.1 PCB Material

For digital circuit boards operating below 150 Mbps, (or rise and fall times higher than 1 ns), and trace lengths of up to 10 inches, use standard FR-4 epoxy-glass as PCB material. FR-4 (Flame Retardant 4) meets the requirements of Underwriters Laboratories UL94-V0, and is preferred over cheaper alternatives due to its lower dielectric losses at high frequencies, less moisture absorption, greater strength and stiffness, and its self-extinguishing flammability-characteristics.

11.2 Layout Guidelines

A minimum of four layers is required to accomplish a low EMI PCB design (see Figure 20). Layer stacking should be in the following order (top-to-bottom): high-speed signal layer, ground plane, power plane and low-frequency signal layer.

- Routing the high-speed traces on the top layer avoids the use of vias (and the introduction of their inductances) and allows for clean interconnects between the isolator and the transmitter and receiver circuits of the data link.
- Placing a solid ground plane next to the high-speed signal layer establishes controlled impedance for transmission line interconnects and provides an excellent low-inductance path for the return current flow.
- Placing the power plane next to the ground plane creates additional high-frequency bypass capacitance of approximately 100pF/in².
- Routing the slower speed control signals on the bottom layer allows for greater flexibility as these signal links
 usually have margin to tolerate discontinuities such as vias.

If an additional supply voltage plane or signal layer is needed, add a second power / ground plane system to the stack to keep it symmetrical. This makes the stack mechanically stable and prevents it from warping. Also the power and ground plane of each power system can be placed closer together, thus increasing the high-frequency bypass capacitance significantly.

For detailed layout recommendations, see Application Note SLLA284, Digital Isolator Design Guide.

⁽¹⁾ Status: For more details on status, see our product life cycle.

⁽²⁾ Material type: When designated, preproduction parts are prototypes/experimental devices, and are not yet approved or released for full production. Testing and final process, including without limitation quality assurance, reliability performance testing, and/or process qualification, may not yet be complete, and this item is subject to further changes or possible discontinuation. If available for ordering, purchases will be subject to an additional waiver at checkout, and are intended for early internal evaluation purposes only. These items are sold without warranties of any kind.

PACKAGE OPTION ADDENDUM

www.ti.com 10-Nov-2025

- (3) RoHS values: Yes, No, RoHS Exempt. See the TI RoHS Statement for additional information and value definition.
- (4) Lead finish/Ball material: Parts may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead finish/Ball material values may wrap to two lines if the finish value exceeds the maximum column width.
- (5) MSL rating/Peak reflow: The moisture sensitivity level ratings and peak solder (reflow) temperatures. In the event that a part has multiple moisture sensitivity ratings, only the lowest level per JEDEC standards is shown. Refer to the shipping label for the actual reflow temperature that will be used to mount the part to the printed circuit board.
- (6) Part marking: There may be an additional marking, which relates to the logo, the lot trace code information, or the environmental category of the part.

Multiple part markings will be inside parentheses. Only one part marking contained in parentheses and separated by a "~" will appear on a part. If a line is indented then it is a continuation of the previous line and the two combined represent the entire part marking for that device.
