

# LM7332 Dual Rail-to-Rail Input and Output 30-V, Wide Voltage Range, High Output, Operational Amplifier

## 1 Features

- $V_S = \pm 15\text{ V}$ ,  $T_A = 25^\circ\text{C}$ , Typical Values Unless Specified
- Wide Supply Voltage Range 2.5 V to 32 V
- Wide Input Common Mode Voltage 0.3 V Beyond Rails
- Output Short Circuit Current  $> 100\text{ mA}$
- High Output Current (1 V from Rails)  $\pm 70\text{ mA}$
- GBWP 21 MHz
- Slew Rate 15.2 V/ $\mu\text{s}$
- Capacitive Load Tolerance Unlimited
- Total Supply Current 2 mA
- Temperature Range  $-40^\circ\text{C}$  to  $+125^\circ\text{C}$
- Tested at  $-40^\circ\text{C}$ ,  $+125^\circ\text{C}$ , and  $+25^\circ\text{C}$  at 5 V,  $\pm 5\text{ V}$ ,  $\pm 15\text{ V}$

## 2 Applications

- MOSFET and Power Transistor Driver
- Replaces Discrete Transistors in High Current Output Circuits
- Instrumentation 4–20 mA Current Loops
- Analog Data Transmission
- Multiple Voltage Power Supplies and Battery Chargers
- High-Side and Low-Side Current Sensing
- Bridge and Sensor Driving
- Digital-to-Analog Converter Output

## 3 Description

The LM7332 device is a dual rail-to-rail input and output amplifier with a wide operating temperature range ( $-40^\circ\text{C}$  to  $+125^\circ\text{C}$ ) that meets the needs of automotive, industrial, and power supply applications. The LM7332 has an output current of 100 mA, which is higher than that of most monolithic operational amplifiers. Circuit designs with high output current requirements often require discrete transistors because many operational amplifiers have low current output. The LM7332 has enough current output to drive many loads directly, saving the cost and space of the discrete transistors.

The exceptionally wide operating supply voltage range of 2.5 V to 32 V alleviates any concerns over functionality under extreme conditions and offers flexibility of use in a multitude of applications. Most parameters of this device are insensitive to power supply variations; this design enhancement is another step in simplifying usage. Greater than rail-to-rail input common mode voltage range allows operation in many applications, including high-side and low-side sensing, without exceeding the input range.

The LM7332 can drive unlimited capacitive loads without oscillations.

The LM7332 is offered in the 8-pin VSSOP and SOIC packages.

### Device Information<sup>(1)</sup>

PART NUMBER	PACKAGE	BODY SIZE (NOM)
LM7332	VSSOP (8)	3.00 mm x 3.00 mm
	SOIC (8)	3.91 mm x 4.90 mm

(1) For all available packages, see the orderable addendum at the end of the data sheet.

### Output Swing vs Sourcing Current

## 6 Specifications

### 6.1 Absolute Maximum Ratings

 See <sup>(1)(2)</sup>

	MIN	MAX	UNIT
$V_{IN}$ differential		±10	V
Output short-circuit duration	See <sup>(3)(4)</sup>		
Supply voltage ( $V_S = V^+ - V^-$ )		35	V
Voltage at input/output pins	$V^+ + 0.3$	$V^- - 0.3$	V
Junction temperature <sup>(5)</sup>		150	°C
Soldering information	Infrared or convection (20 sec.)	235	°C
	Wave soldering (10 sec.)	260	°C
Storage temperature, $T_{stg}$	-65	150	°C

- (1) Stresses beyond those listed under *Absolute Maximum Ratings* may cause permanent damage to the device. These are stress ratings only, which do not imply functional operation of the device at these or any other conditions beyond those indicated under *Recommended Operating Conditions*. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.
- (2) If Military/Aerospace specified devices are required, contact the TI Sales Office/Distributors for availability and specifications.
- (3) Applies to both single-supply and split-supply operation. Continuous short circuit operation at elevated ambient temperature can result in exceeding the maximum allowed junction temperature of 150°C.
- (4) Short-circuit test is a momentary test. Output short circuit duration is infinite for  $V_S \leq 6$  V at room temperature and below. For  $V_S > 6$  V, allowable short circuit duration is 1.5 ms.
- (5) The maximum power dissipation is a function of  $T_{J(MAX)}$ ,  $R_{\theta JA}$ . The maximum allowable power dissipation at any ambient temperature is  $P_D = (T_{J(MAX)} - T_A) / R_{\theta JA}$ . All numbers apply for packages soldered directly onto a PC board.

### 6.2 ESD Ratings

	VALUE	UNIT
$V_{(ESD)}$ Electrostatic discharge	Human-body model (HBM), per ANSI/ESDA/JEDEC JS-001 <sup>(1)(2)</sup>	±2000
	Machine model (MM)	±200

- (1) JEDEC document JEP155 states that 500-V HBM allows safe manufacturing with a standard ESD control process.
- (2) Human Body Model, applicable std. MIL-STD-883, Method 3015.7. Machine Model, applicable std. JESD22-A115-A (ESD MM std. of JEDEC) Field-Induced Charge-Device Model, applicable std. JESD22-C101-C (ESD FICDM std. of JEDEC).

### 6.3 Recommended Operating Conditions

	MIN	MAX	UNIT
Supply voltage ( $V_S = V^+ - V^-$ )	2.5	32	V
Temperature range <sup>(1)</sup>	-40	125	°C

- (1) The maximum power dissipation is a function of  $T_{J(MAX)}$ ,  $R_{\theta JA}$ . The maximum allowable power dissipation at any ambient temperature is  $P_D = (T_{J(MAX)} - T_A) / R_{\theta JA}$ . All numbers apply for packages soldered directly onto a PCB.

### 6.4 Thermal Information

THERMAL METRIC <sup>(1)</sup>		LM7332		UNIT
		DGK (VSSOP)	D (SOIC)	
		8 PINS	8 PINS	
$R_{\theta JA}$	Junction-to-ambient thermal resistance <sup>(2)</sup>	161.1	109.1	°C/W
$R_{\theta JC(top)}$	Junction-to-case (top) thermal resistance	55	55.8	°C/W
$R_{\theta JB}$	Junction-to-board thermal resistance	80.5	49.2	°C/W
$\Psi_{JT}$	Junction-to-top characterization parameter	5.5	10.7	°C/W
$\Psi_{JB}$	Junction-to-board characterization parameter	79.2	48.7	°C/W

- (1) For more information about traditional and new thermal metrics, see the *Semiconductor and IC Package Thermal Metrics* application report, [SPRA953](#).
- (2) The maximum power dissipation is a function of  $T_{J(MAX)}$ ,  $R_{\theta JA}$ . The maximum allowable power dissipation at any ambient temperature is  $P_D = (T_{J(MAX)} - T_A) / R_{\theta JA}$ . All numbers apply for packages soldered directly onto a PCB.

## 6.5 5-V Electrical Characteristics

Unless otherwise specified, all limits are ensured for  $T_A = 25^\circ\text{C}$ ,  $V^+ = 5\text{ V}$ ,  $V^- = 0\text{ V}$ ,  $V_{CM} = 0.5\text{ V}$ ,  $V_O = 2.5\text{ V}$ , and  $R_L > 1\text{ M}\Omega$  to  $2.5\text{ V}$ .<sup>(1)</sup>

PARAMETER		TEST CONDITIONS	MIN <sup>(2)</sup>	TYP <sup>(3)</sup>	MAX <sup>(2)</sup>	UNIT
$V_{OS}$	Input offset voltage	$V_{CM} = 0.5\text{ V}$ and $V_{CM} = 4.5\text{ V}$	-4	$\pm 1.6$	4	mV
		At the temperature extremes	-5		5	
$TC\ V_{OS}$	Input offset voltage temperature drift	$V_{CM} = 0.5\text{ V}$ and $V_{CM} = 4.5\text{ V}$ <sup>(4)</sup>		$\pm 2$		$\mu\text{V}/^\circ\text{C}$
$I_B$	Input bias current	See <sup>(5)</sup>	-2	$\pm 1$	2	$\mu\text{A}$
		At the temperature extremes	-2.5		2.5	
$I_{OS}$	Input offset current			20	250	nA

		$0\text{ V} \leq V_{CM} \leq 5\text{ V}$	62	70		
		At the temperature extremes	60			
PSRR	Power supply Rejection Ratio	$5\text{ V} \leq V^+ \leq 30\text{ V}$	78	100		dB
		At the temperature extremes	74			
CMVR	Input common-mode Voltage Range	CMRR > 50 dB	5.1	-0.3	-0.1	V
		At the temperature extremes	5	5.3	0	
$A_{VOL}$	Large signal Voltage Gain	$0.5\text{ V} \leq V_O \leq 4.5\text{ V}$ $R_L = 10\text{ k}\Omega$ to $2.5\text{ V}$	70	77		dB
		At the temperature extremes	65			
$V_O$	Output swing high	$R_L = 10\text{ k}\Omega$ to $2.5\text{ V}$ $V_{ID} = 100\text{ mV}$		60	150	mV from either rail
		At the temperature extremes			200	
		$R_L = 2\text{ k}\Omega$ to $2.5\text{ V}$ $V_{ID} = 100\text{ mV}$		100	300	
		At the temperature extremes			350	
	Output swing low	$R_L = 10\text{ k}\Omega$ to $2.5\text{ V}$ $V_{ID} = -100\text{ mV}$		5	150	
		At the temperature extremes			200	
		$R_L = 2\text{ k}\Omega$ to $2.5\text{ V}$ $V_{ID} = -100\text{ mV}$		20	300	
		At the temperature extremes			350	
$I_{SC}$	Output short circuit current	Sourcing from $V^+$ , $V_{ID} = 200\text{ mV}$ <sup>(6)</sup>	60	90		mA
		Sinking to $V^-$ , $V_{ID} = -200\text{ mV}$ <sup>(6)</sup>	60	90		
$I_{OUT}$	Output current	$V_{ID} = \pm 200\text{ mV}$ , $V_O = 1\text{ V}$ from rails		$\pm 55$		mA
$I_S$	Total supply current	No Load, $V_{CM} = 0.5\text{ V}$		1.5	2.3	mA
		At the temperature extremes			2.6	
SR	Slew rate <sup>(7)</sup>	$A_V = +1$ , $V_I = 5\text{-V Step}$ , $R_L = 1\text{ M}\Omega$ , $C_L = 10\text{ pF}$		12		V/ $\mu\text{s}$
$f_u$	Unity-gain frequency	$R_L = 10\text{ M}\Omega$ , $C_L = 20\text{ pF}$		7.5		MHz

- (1) *Electrical Characteristics* values apply only for factory testing conditions at the temperature indicated. Factory testing conditions result in very limited self-heating of the device such that  $T_J = T_A$ . No ensured specification of parametric performance is indicated in the electrical tables under conditions of internal self-heating where  $T_J > T_A$ .
- (2) All limits are ensured by testing or statistical analysis.
- (3) Typical values represent the most likely parametric norm as determined at the time of characterization. Actual typical values may vary over time and will also depend on the application and configuration. The typical values are not tested and are not ensured on shipped production material.
- (4) Offset voltage temperature drift determined by dividing the change in  $V_{OS}$  at temperature extremes into the total temperature change.
- (5) Positive current corresponds to current flowing in the device.
- (6) Short-circuit test is a momentary test. Output short circuit duration is infinite for  $V_S \leq 6\text{ V}$  at room temperature and below. For  $V_S > 6\text{ V}$ , allowable short circuit duration is 1.5 ms.
- (7) Slew rate is the slower of the rising and falling slew rates. Connected as a voltage follower.

## 5-V Electrical Characteristics (continued)

Unless otherwise specified, all limits are ensured for  $T_A = 25^\circ\text{C}$ ,  $V^+ = 5\text{ V}$ ,  $V^- = 0\text{ V}$ ,  $V_{CM} = 0.5\text{ V}$ ,  $V_O = 2.5\text{ V}$ , and  $R_L > 1\text{ M}\Omega$  to  $2.5\text{ V}$ .<sup>(1)</sup>

PARAMETER	TEST CONDITIONS	MIN <sup>(2)</sup>	TYP <sup>(3)</sup>	MAX <sup>(2)</sup>	UNIT
GBWP	Gain bandwidth product	$f = 50\text{ kHz}$	19.3		MHz
$e_n$	Input-referred voltage noise	$f = 2\text{ kHz}$	14.8		$\text{nV}/\sqrt{\text{Hz}}$
$i_n$	Input-referred current noise	$f = 2\text{ kHz}$	1.35		$\text{pA}/\sqrt{\text{Hz}}$
THD+N	Total harmonic distortion + noise	$A_V = +2$ , $R_L = 100\text{ k}\Omega$ , $f = 1\text{ kHz}$ , $V_O = 4\text{ V}_{PP}$	-84		dB
CT Rej.	Crosstalk rejection	$f = 3\text{ MHz}$ , Driver $R_L = 10\text{ k}\Omega$	68		dB

## 6.6 $\pm 5\text{-V}$ Electrical Characteristics

Unless otherwise specified, all limits are ensured for  $T_A = 25^\circ\text{C}$ ,  $V^+ = +5\text{ V}$ ,  $V^- = -5\text{ V}$ ,  $V_{CM} = 0\text{ V}$ ,  $V_O = 0\text{ V}$ , and  $R_L > 1\text{ M}\Omega$  to  $0\text{ V}$ .<sup>(1)</sup>

PARAMETER	TEST CONDITIONS	MIN <sup>(2)</sup>	TYP <sup>(3)</sup>	MAX <sup>(2)</sup>	UNIT

## 7 Detailed Description

### 7.1 Overview

The LM7332 device is a rail-to-rail input and output amplifier with wide operating voltages and high-output currents. The LM7332 is efficient, achieving 15.2-V/ $\mu$ s slew rate and 21-MHz unity gain bandwidth while requiring only 2 mA of total supply current. The LM7332 device performance is fully specified for operation at 5 V,  $\pm 5$  V and  $\pm 15$  V.

The LM7332 device is designed to drive unlimited capacitive loads without oscillations. The LM7332 is fully tested at  $-40^{\circ}\text{C}$ ,  $125^{\circ}\text{C}$ , and  $25^{\circ}\text{C}$ , with modern automatic test equipment. High performance from  $-40^{\circ}\text{C}$  to  $+125^{\circ}\text{C}$ , detailed specifications, and extensive testing makes them suitable for industrial, automotive, and communications applications.

Most device parameters are insensitive to power supply voltage, and this makes the parts easier to use where supply voltage may vary, such as automotive electrical systems and battery-powered equipment. The LM7332 has a true rail-to-rail output and can supply a respectable amount of current ( $\pm 70$  mA) with minimal head room from either rail (1 V).

### 7.2 Functional Block Diagram

### 7.3 Feature Description

#### 7.3.1 Estimating the Output Voltage Swing

It is important to keep in mind that the steady-state output current will be less than the current available when there is an input overdrive present. For steady-state conditions, [Figure 47](#) and [Figure 48](#) plots can be used to predict the output swing. These plots also show several load lines corresponding to loads tied between the output and ground. In each case, the intersection of the device plot at the appropriate temperature with the load line would be the typical output swing possible for that load. For example, a 600- $\Omega$  load can accommodate an output swing to within 100 mV of  $V^-$  and to 250 mV of  $V^+$  ( $V_S = \pm 5$  V) corresponding to a typical 9.65- $V_{PP}$  unclipped swing.

## Feature Description (continued)

**Figure 47. Steady-State Output Sourcing Characteristics With Load Lines**

**Figure 48. Steady-State Output Sinking Characteristics With Load Lines**

## 7.4 Device Functional Modes

### 7.4.1 Driving Capacitive Loads

The LM7332 is specifically designed to drive unlimited capacitive loads without oscillations as shown in [Figure 49](#).

**Figure 49. Settling Time and Slew Rate vs Capacitive Load**

In addition, the output current handling capability of the device allows for good slewing characteristics even with large capacitive loads as shown in [Figure 49](#). The combination of these features is ideal for applications such as TFT flat panel buffers, A/D converter input amplifiers and power transistor driver.

However, as in most operational amplifiers, addition of a series isolation resistor between the operational amplifier and the capacitive load improves the settling and overshoot performance.

Output current drive is an important parameter when driving capacitive loads. This parameter will determine how fast the output voltage can change. Referring to [Figure 49](#), two distinct regions can be identified. Below about 10,000 pF, the output slew rate is solely determined by the compensation capacitor value of the operational amplifier and available current into that capacitor. Beyond 10 nF, the slew rate is determined by the available output current of the operational amplifier. An estimate of positive and negative slew rates for loads larger than 100 nF can be made by dividing the short circuit current value by the capacitor.

## Device Functional Modes (continued)

### 7.4.2 Output Voltage Swing Close to $V^-$

The output stage design of the LM7332 allows voltage swings to within millivolts of either supply rail for maximum flexibility and improved useful range. Because of this design architecture, with output approaching either supply rail, the output transistor collector-base junction reverse bias decreases. With output less than a  $V_{be}$  from either rail, the corresponding output transistor operates near saturation. In this mode of operation, the transistor exhibits higher junction capacitance and lower  $f_t$  which reduces phase margin. With the Noise Gain ( $NG = 1 + R_F/R_G$ ,  $R_F$  and  $R_G$  are external gain setting resistors) of 2 or higher, there is sufficient phase margin that this reduction in phase margin is of no consequence. However, with lower Noise Gain ( $<2$ ) and with less than 150 mV to the supply rail, if the output loading is light, the phase margin reduction could result in unwanted oscillations.

In the case of the LM7332, due to inherent architectural specifics, the oscillation occurs only with respect to the output transistor at  $V^-$  when output swings to within 150 mV of  $V^-$ . However, if this output transistor's collector current is larger than its idle value of a few microamps, the phase margin loss becomes insignificant. In this case, 300  $\mu$ A is the required collector current of the output transistor to remedy this situation. Therefore, when all the aforementioned critical conditions are present at the same time ( $NG < 2$ ,  $V_{OUT} < 150$  mV from supply rails and output load is light) it is possible to ensure stability by adding a load resistor to the output to provide the output transistor the necessary minimum collector current (300  $\mu$ A).

For 12-V (or  $\pm 6$ -V) operation, for example, add a 39-k $\Omega$  resistor from the output to  $V^+$  to cause 300- $\mu$ A output sinking current and ensure stability. This is equivalent to about 15% increase in total quiescent power dissipation.

## 8 Application and Implementation

### NOTE

Information in the following applications sections is not part of the TI component specification, and TI does not warrant its accuracy or completeness. TI's customers are responsible for determining suitability of components for their purposes. Customers should validate and test their design implementation to confirm system functionality.

### 8.1 Application Information

The LM7332 is a rail-to-rail input and output part with a slightly higher GBW of 20 MHz. It has current capability of 40-mA sourcing and 65-mA sinking, and can drive unlimited capacitive loads. The LM7332 is available in both VSSOP and SOIC packages.

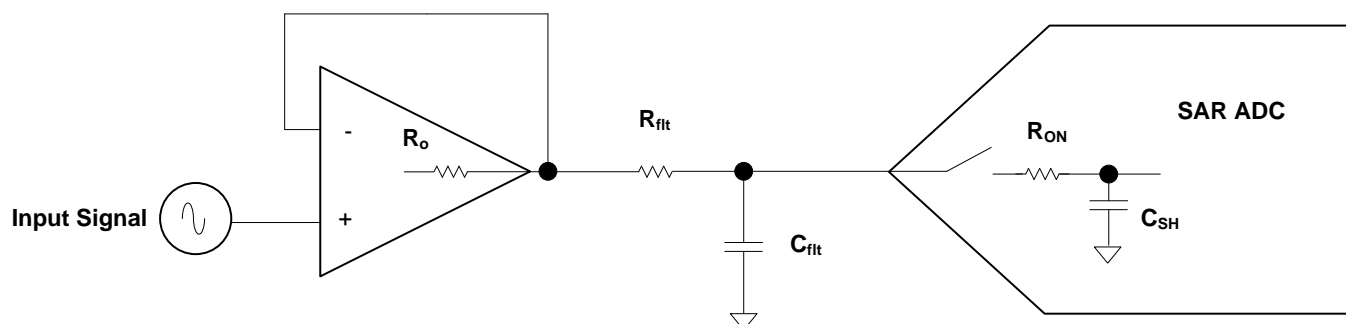

#### 8.1.1 Similar High Current Output Devices

The LM6172 has a higher GBW of 100 MHz and over 80 mA of current output. There is also a single version, the LM6171. The LM7372 has 120 MHz of GBW and 150 mA of current output. The LM7372 is available in an 8-pin SO PowerPAD™, and 16-pin SOIC packages with higher power dissipation.

The LME49600 buffer has 250 mA of current out and a 110-MHz bandwidth. The LME49600 is available in a DDPACK/TO-263 package for higher power dissipation.

Detailed information on these parts can be found at [www.ti.com](http://www.ti.com).

### 8.2 Typical Application

**Figure 50. Drive Amplifier for SAR ADC Schematic**

#### 8.2.1 Design Requirements

Assume a portable application requires the use of a 12-bit SAR ADC with acquisition time ( $t_{AQ}$ ) of 1  $\mu$ s and sample and hold capacitance ( $C_{SH}$ ) of 80 pF.

The ADC runs on a single supply voltage of 5 V and has a full scale input of 2.5 V<sub>PP</sub>. A total harmonic distortion plus noise (THD+N) of less than –80 dB is required to maintain signal fidelity. Determine if the LM7332 is a suitable drive amplifier and find the values of  $R_{fit}$  and  $C_{fit}$ .

## Typical Application (continued)

### 8.2.2 Detailed Design Procedure

The LM7332 can be used as a drive amplifier for SAR ADCs as shown in [Figure 50](#).

The values of  $R_{flt}$  and  $C_{flt}$  depend on the ADC specifications as well as amplifier gain bandwidth product (GBWP) and output resistance ( $R_O$ ). It is also common to have a single ground-referenced supply voltage and sample signals up to half of the supply voltage with low distortion.

To determine whether or not the LM7332 is a suitable driver for this application, one must compare the settling time of the amplifier to the acquisition time of the ADC with [Equation 1](#):

$$GBWP_{min} \geq 4 \times (N+1) \times \ln(2) / (2\pi \times t_{AQ})$$

where

- $GBWP_{min}$ : The minimum required gain bandwidth product of the drive amplifier
  - $N$ : Number of bits in ADC
  - $t_{AQ}$ : The acquisition time of the ADC
- (1)

Using a value of 12 bits for  $N$  and  $1\mu s$  for  $t_{AQ}$ , the  $GBWP_{min}$  must be greater than 5.7 MHz. The LM7332 has a GBWP of 21 MHz so it is indeed a suitable driver for this application.

Next, determine the value of  $C_{flt}$  with [Equation 2](#):

$$20 \times C_{SH} \leq C_{flt} \leq 60 \times C_{SH}$$

where

- $C_{SH}$ : The ADC sample and hold capacitance
  - $C_{flt}$ : The external filter capacitance
- (2)

Using a value of 80 pF for  $C_{SH}$ , the value of  $C_{flt}$  must be between 1600 pF and 4800 pF. According to [Figure 39](#), the LM7332 can drive a capacitive load of 2000 pF with 5  $V_{PP}$  and settle within 1  $\mu s$ , therefore select 1800 pF as the nearest common capacitor value within the range.

Next determine the value of  $R_{flt}$  with [Equation 3](#):

$$R_{flt} = 40 / (2\pi \times C_{flt} \times GBWP_{min}) - R_O$$

where

- $R_{flt}$ : The external filter resistance
  - $C_{flt}$ : The external filter capacitance determined above
  - $GBWP_{min}$ : The minimum required gain bandwidth product of the drive amplifier determined above
  - $R_O$ : The closed loop output impedance of the drive amplifier typically specified in the electrical characteristics table
- (3)

Using a value of 1800 pF for  $C_{flt}$ , 5.7 MHz for  $GBWP_{min}$ , and a value of 3  $\Omega$  for  $R_O$  the value of  $R_{flt}$  is determined to be 617.5  $\Omega$ . Use closest value of 620  $\Omega$  for a filter frequency ( $f_{flt}$ ) of 142 kHz given [Equation 4](#):

$$f_{flt} = 1 / (2\pi \times (R_O + R_{flt}) \times C_{flt})$$
(4)

The last requirement is to drive input signals of 2.5  $V_{PP}$  on a single 5-V supply with THD+N less than –80 dB.

[Figure 51](#) shows the THD+N response of the LM7332 with a single supply voltage of 5 V. The LM7332 can maintain THD+N levels as low as –83 dB for output levels up to 4  $V_{PP}$ . Therefore the final requirement has been met, and the LM7332 is a suitable drive amplifier for the 12-bit SAR ADC in this design example.

Driving two independent channels of the SAR ADC within minimal crosstalk between the channels may also be required. [Figure 52](#) shows the crosstalk rejection over frequency. The LM7332 achieves 105 dB of crosstalk rejection up to 20 kHz and greater than 75 dB up to 1MHz which demonstrates the suitability of measuring very large input signals without interfering with adjacent channels.

## Typical Application (continued)

### 8.2.3 Application Curves

Figure 51. THD+N vs Output Amplitude

Figure 52. Crosstalk Rejection vs. Frequency

## 9 Power Supply Recommendations

The use of supply decoupling is mandatory in most applications. As with most relatively high-speed or high output current operational amplifiers, best results are achieved when each supply line is decoupled with two capacitors: a small value ceramic capacitor (approximately 0.01  $\mu\text{F}$ ) placed very close to the supply lead in addition to a large value tantalum or aluminum capacitor ( $> 4.7 \mu\text{F}$ ). The large capacitor can be shared by more than one device if necessary. The small ceramic capacitor maintains low supply impedance at high frequencies while the large capacitor acts as the charge *bucket* for fast load current spikes at the operational amplifier output. The combination of these capacitors provides supply decoupling and helps keep the operational amplifier oscillation free under any load.

## 10 Layout

### 10.1 Layout Guidelines

Take care to minimize the loop area formed by the bypass capacitor connection between supply pins and ground. A ground plane underneath the device is recommended; any bypass components to ground must have a nearby via to the ground plane. The optimum bypass capacitor placement is closest to the corresponding supply pin. Use of thicker traces from the bypass capacitors to the corresponding supply pins lowers the power supply inductance and provide a more stable power supply.

The feedback components must be placed as close to the device as possible to minimize stray parasitics.

### 10.2 Layout Example

Figure 53. LM7332 Layout Example

### 10.3 Output Short Circuit Current and Dissipation Issues

The LM7332 output stage is designed for maximum output current capability. Even though momentary output shorts to ground and either supply can be tolerated at all operating voltages, longer-lasting short conditions can cause the junction temperature to rise beyond the absolute maximum rating of the device, especially at higher supply voltage conditions. Below a supply voltage of 6 V, the output short circuit condition can be tolerated indefinitely.

With the operational amplifier tied to a load, the device power dissipation consists of the quiescent power due to the supply current flow into the device, in addition to power dissipation due to the load current. The load portion of the power itself could include an average value (due to a DC load current) and an AC component. DC load current would flow if there is an output voltage offset, or the output AC average current is non-zero, or if the operational amplifier operates in a single-supply application where the output is maintained somewhere in the range of linear operation.

Therefore,

$$P_{\text{TOTAL}} = P_Q + P_{\text{DC}} + P_{\text{AC}} \quad (5)$$

## Output Short Circuit Current and Dissipation Issues (continued)

The operational amplifier quiescent power dissipation is calculated by [Equation 6](#):

$$P_Q = I_S \times V_S$$

where

- $I_S$ : Supply Current
  - $V_S$ : Total Supply Voltage ( $V^+ - V^-$ )
- (6)

The DC load power is calculated by [Equation 7](#):

$$P_{DC} = I_O \times (V_r - V_o)$$

where

- $V_O$ : Average Output Voltage
  - $V_r$ :  $V^+$  for sourcing and  $V^-$  for sinking current
- (7)

The AC load power is calculated as  $P_{AC}$  = the value shown in [Table 1](#).

[Table 1](#) shows the maximum AC component of the load power dissipated by the operational amplifier for standard sinusoidal, triangular, and square waveforms:

**Table 1. Normalized AC Power Dissipated in the Output Stage for Standard Waveforms**

$P_{AC} (W/\Omega/V^2)$		
SINUSOIDAL	TRIANGULAR	SQUARE
$50.7 \times 10^{-3}$	$46.9 \times 10^{-3}$	$62.5 \times 10^{-3}$

The table entries are normalized to  $V_S^2/R_L$ . To figure out the AC load current component of power dissipation, simply multiply the table entry corresponding to the output waveform by the factor  $V_S^2/R_L$ . For example, with  $\pm 12$ -V supplies, a 600- $\Omega$  load, and triangular waveform power dissipation in the output stage is calculated as:

$$P_{AC} = (46.9 \times 10^{-3}) \times [24^2/600] = 45.0 \text{ mW}$$
(8)

The maximum power dissipation allowed at a certain temperature is a function of maximum die junction temperature ( $T_{J(MAX)}$ ) allowed, ambient temperature  $T_A$ , and package thermal resistance from junction to ambient,  $R_{\theta JA}$ .

$$P_{D(MAX)} = \frac{T_{J(MAX)} - T_A}{R_{\theta JA}}$$
(9)

For the LM7332, the maximum junction temperature allowed is 150°C at which no power dissipation is allowed. The power capability at 25°C is given by [Equation 10](#) and [Equation 11](#).

For VSSOP package:

$$P_{D(MAX)} = \frac{150^\circ\text{C} - 25^\circ\text{C}}{161.1^\circ\text{C/W}} = 0.78\text{W}$$
(10)

For SOIC package:

$$P_{D(MAX)} = \frac{150^\circ\text{C} - 25^\circ\text{C}}{109.1^\circ\text{C/W}} = 1.15\text{W}$$
(11)

Similarly, the power capability at 125°C is given by [Equation 12](#) and [Equation 13](#).

For VSSOP package:

$$P_{D(MAX)} = \frac{150^\circ\text{C} - 125^\circ\text{C}}{161.1^\circ\text{C/W}} = 0.16\text{W}$$
(12)

For SOIC package:

$$P_{D(MAX)} = \frac{150^\circ\text{C} - 125^\circ\text{C}}{109.1^\circ\text{C/W}} = 0.23\text{W}$$
(13)

Figure 54 shows the power capability vs temperature for VSSOP and SOIC packages. The area under the maximum thermal capability line is the operating area for the device. When the device works in the operating area where  $P_{TOTAL}$  is less than  $P_{D(MAX)}$ , the device junction temperature will remain below 150°C. If the intersection of ambient temperature and package power is above the maximum thermal capability line, the junction temperature will exceed 150°C, and this must be strictly prohibited.

**Figure 54. Power Capability vs Temperature**

When high power is required and ambient temperature cannot be reduced, providing air flow is an effective approach to reduce thermal resistance therefore to improve power capability.

<sup>(1)</sup> **Status:** For more details on status, see our [product life cycle](#).

<sup>(2)</sup> **Material type:** When designated, preproduction parts are prototypes/experimental devices, and are not yet approved or released for full production. Testing and final process, including without limitation quality assurance, reliability performance testing, and/or process qualification, may not yet be complete, and this item is subject to further changes or possible discontinuation. If available for ordering, purchases will be subject to an additional waiver at checkout, and are intended for early internal evaluation purposes only. These items are sold without warranties of any kind.

<sup>(3)</sup> **RoHS values:** Yes, No, RoHS Exempt. See the [TI RoHS Statement](#) for additional information and value definition.

<sup>(4)</sup> **Lead finish/Ball material:** Parts may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead finish/Ball material values may wrap to two lines if the finish value exceeds the maximum column width.

<sup>(5)</sup> **MSL rating/Peak reflow:** The moisture sensitivity level ratings and peak solder (reflow) temperatures. In the event that a part has multiple moisture sensitivity ratings, only the lowest level per JEDEC standards is shown. Refer to the shipping label for the actual reflow temperature that will be used to mount the part to the printed circuit board.

<sup>(6)</sup> **Part marking:** There may be an additional marking, which relates to the logo, the lot trace code information, or the environmental category of the part.

Multiple part markings will be inside parentheses. Only one part marking contained in parentheses and separated by a "~" will appear on a part. If a line is indented then it is a continuation of the previous line and the two combined represent the entire part marking for that device.

TI bases its knowledge and belief on information provided by third parties, and makes no representation or warranty as to the accuracy of such information. Efforts are underway to better integrate information from third parties. TI has taken and continues to take reasonable steps to provide representative

and accurate information but may not have conducted destructive testing or chemical analysis on incoming materials and chemicals. TI and TI suppliers consider certain information to be proprietary, and thus CAS numbers and other limited information may not be available for release.

In no event shall TI's liability arising out of such information exceed the total purchase price of the TI part(s) at issue in this document sold by TI to Customer on an annual basis.

## TAPE AND REEL INFORMATION

\*All dimensions are nominal

Device	Package Type	Package Drawing	Pins	SPQ	Reel Diameter (mm)	Reel Width W1 (mm)	A0 (mm)	B0 (mm)	K0 (mm)	P1 (mm)	W (mm)	Pin1 Quadrant

## TAPE AND REEL BOX DIMENSIONS

\*All dimensions are nominal

Device	Package Type	Package Drawing	Pins	SPQ	Length (mm)	Width (mm)	Height (mm)
LM7332MAX/NOPB	SOIC	D	8	2500	367.0	367.0	35.0
LM7332MAX/NOPB	SOIC	D	8	2500	353.0	353.0	32.0
LM7332MMX/NOPB	VSSOP	DGK	8	3500	367.0	367.0	35.0
LM7332MMX/NOPB	VSSOP	DGK	8	3500	366.0	364.0	50.0

**DGK0008A****PACKAGE OUTLINE****VSSOP - 1.1 mm max height**

SMALL OUTLINE PACKAGE

4214862/A 04/2023

**NOTES:**

PowerPAD is a trademark of Texas Instruments.

1. All linear dimensions are in millimeters. Any dimensions in parenthesis are for reference only. Dimensioning and tolerancing per ASME Y14.5M.
2. This drawing is subject to change without notice.
3. This dimension does not include mold flash, protrusions, or gate burrs. Mold flash, protrusions, or gate burrs shall not exceed 0.15 mm per side.
4. This dimension does not include interlead flash. Interlead flash shall not exceed 0.25 mm per side.
5. Reference JEDEC registration MO-187.

# EXAMPLE BOARD LAYOUT

DGK0008A

™ VSSOP - 1.1 mm max height

SMALL OUTLINE PACKAGE

LAND PATTERN EXAMPLE  
EXPOSED METAL SHOWN  
SCALE: 15X

SOLDER MASK DETAILS

4214862/A 04/2023

NOTES: (continued)

6. Publication IPC-7351 may have alternate designs.
7. Solder mask tolerances between and around signal pads can vary based on board fabrication site.
8. Vias are optional depending on application, refer to device data sheet. If any vias are implemented, refer to their locations shown on this view. It is recommended that vias under paste be filled, plugged or tented.
9. Size of metal pad may vary due to creepage requirement.

## EXAMPLE STENCIL DESIGN

DGK0008A

™ VSSOP - 1.1 mm max height

SMALL OUTLINE PACKAGE

SOLDER PASTE EXAMPLE  
SCALE: 15X

4214862/A 04/2023

NOTES: (continued)

11. Laser cutting apertures with trapezoidal walls and rounded corners may offer better paste release. IPC-7525 may have alternate design recommendations.
12. Board assembly site may have different recommendations for stencil design.

**D0008A****PACKAGE OUTLINE****SOIC - 1.75 mm max height**

SMALL OUTLINE INTEGRATED CIRCUIT

4214825/C 02/2019

**NOTES:**

1. Linear dimensions are in inches [millimeters]. Dimensions in parenthesis are for reference only. Controlling dimensions are in inches. Dimensioning and tolerancing per ASME Y14.5M.
2. This drawing is subject to change without notice.
3. This dimension does not include mold flash, protrusions, or gate burrs. Mold flash, protrusions, or gate burrs shall not exceed .006 [0.15] per side.
4. This dimension does not include interlead flash.
5. Reference JEDEC registration MS-012, variation AA.
