

# LMK1D1208P Pin-Controlled OE Low Additive Jitter LVDS Buffer

## 1 Features

- High-performance LVDS clock buffer family with 2 inputs and 8 outputs (2:8)
- Output frequency up to 2 GHz
- Hardware pins for individual output enable/disable
- Supply voltage: 1.8 V / 2.5 V / 3.3 V  $\pm$  5%
- Low additive jitter: < 60 fs rms maximum in 12 kHz to 20 MHz at 156.25 MHz
  - Very low phase noise floor: -164 dBc/Hz (typical)
- Very low propagation delay: < 575 ps maximum
- Output skew: 20 ps maximum
- Fail-safe inputs
- Universal inputs accept LVDS, LVPECL, LVCMOS, HCSL and CML
- LVDS reference voltage,  $V_{AC\_REF}$ , available for capacitive-coupled inputs
- Industrial temperature range: -40°C to 105°C
- Packages available:
  - 6-mm  $\times$  6-mm, 40-pin VQFN (RHA)

## 2 Applications

- [Telecommunications and networking](#)
- [Medical imaging](#)
- [Test and measurement](#)
- [Wireless infrastructure](#)
- [Pro audio, video and signage](#)

## 3 Description

The LMK1D1208P clock buffer distributes one of two selectable clock inputs (IN0 and IN1) to 8 pairs of differential LVDS clock outputs (OUT0 through OUT7) with minimum skew for clock distribution. The inputs can be either LVDS, LVPECL, LVCMOS, HCSL, or CML.

The LMK1D1208P is specifically designed for driving 50- $\Omega$  transmission lines. When driving inputs in single-ended mode, apply the appropriate bias voltage to the unused negative input pin (see [Figure 9-6](#)). The IN\_SEL pin selects the input which is routed to the outputs. The part supports a fail-safe input function. The device further incorporates an input hysteresis which prevents random oscillation of the outputs in the absence of an input signal.

Each LVDS differential output is enabled by setting the corresponding OEx pin to a logic high 1. If this pin is set to a logic low 0, the output is disabled in a Hi-Z state resulting in reduced power consumption.

The device operates in a 1.8-V, 2.5-V, or 3.3-V supply environment and is characterized from -40°C to 105°C (ambient temperature).

### Package Information

PART NUMBER	PACKAGE <sup>(1)</sup>	PACKAGE SIZE (NOM) <sup>(2)</sup>
LMK1D1208P	VQFN (40)	6.00 mm $\times$ 6.00 mm

- (1) For all available packages, see the orderable addendum at the end of the data sheet.
- (2) The package size (length  $\times$  width) is a nominal value and includes pins, where applicable.

**Application Example**

## 6 Pin Configuration and Functions

Figure 6-1. LMK1D1208P: RHA Package 40-Pin VQFN Top View

Table 6-1. Pin Functions

NAME	NO.	TYPE <sup>(1)</sup>	DESCRIPTION
DIFFERENTIAL/SINGLE-ENDED CLOCK INPUT			
IN0_P	8	I	Primary: Differential input pair or single-ended input
IN0_N	9		
IN1_P	2	I	Secondary: Differential input pair or single-ended input. Note that INP0, INN0 are used indistinguishably with IN0_P, IN0_N.
IN1_N	3		
INPUT SELECT			
IN_SEL	1	I	Input selection with an internal 500-kΩ pullup and 320-kΩ pulldown, selects input port. See <a href="#">Table 9-2</a> .
AMPLITUDE SELECT			
AMP_SEL	10	I	Output amplitude swing select with an internal 500-kΩ pullup and 320-kΩ pulldown. See <a href="#">Table 9-4</a> .
OUTPUT ENABLE			
OE0	6	I	Output Enable for channel 0 HIGH (default): Enable output channel 0 LOW: Disable output channel 0 in Hi-Z state
OE1	16	I	Output Enable for channel 1 HIGH (default): Enable output channel 1 LOW: Disable output channel 1 in Hi-Z state
OE2	17	I	Output Enable for channel 2 HIGH (default): Enable output channel 2 LOW: Disable output channel 2 in Hi-Z state
OE3	18	I	Output Enable for channel 3 HIGH (default): Enable output channel 3 LOW: Disable output channel 3 in Hi-Z state
OE4	33	I	Output Enable for channel 4 HIGH (default): Enable output channel 4 LOW: Disable output channel 4 in Hi-Z state

**Table 6-1. Pin Functions (continued)**

NAME	NO.	TYPE <sup>(1)</sup>	DESCRIPTION
OE5	34	I	Output Enable for channel 5 HIGH (default): Enable output channel 5 LOW: Disable output channel 5 in Hi-Z state
OE6	35	I	Output Enable for channel 6 HIGH (default): Enable output channel 6 LOW: Disable output channel 6 in Hi-Z state
OE7	5	I	Output Enable for channel 7 HIGH (default): Enable output channel 7 LOW: Disable output channel 7 in Hi-Z state
BIAS VOLTAGE OUTPUT			
V <sub>AC_REF0</sub>	4	O	Bias voltage output for capacitive-coupled inputs. If used, TI recommends using a 0.1-μF capacitor to GND on this pin.
V <sub>AC_REF1</sub>	7		
DIFFERENTIAL CLOCK OUTPUT			
OUT0_P	12	O	Differential LVDS output pair number 0
OUT0_N	13		
OUT1_P	14	O	Differential LVDS output pair number 1
OUT1_N	15		
OUT2_P	22	O	Differential LVDS output pair number 2
OUT2_N	23		
OUT3_P	24	O	Differential LVDS output pair number 3
OUT3_N	25		
OUT4_P	26	O	Differential LVDS output pair number 4
OUT4_N	27		
OUT5_P	28	O	Differential LVDS output pair number 5
OUT5_N	29		
OUT6_P	36	O	Differential LVDS output pair number 6
OUT6_N	37		
OUT7_P	38	O	Differential LVDS output pair number 7
OUT7_N	39		
SUPPLY VOLTAGE			
V <sub>DD</sub>	11, 20, 31, 40	P	Device power supply (1.8 V, 2.5 V, or 3.3 V)
GROUND			
GND	21, 30	G	Ground
MISC			
DAP	DAP	G	Die Attach Pad. Connect to the printed circuit board (PCB) ground plane for heat dissipation.
NC	19, 32	—	No Connection. Leave floating.

(1) G = Ground, I = Input, O = Output, P = Power

## 7 Specifications

### 7.1 Absolute Maximum Ratings

over operating free-air temperature range (unless otherwise noted)<sup>(1)</sup>

		MIN	MAX	UNIT
V <sub>DD</sub>	Supply voltage	−0.3	3.6	V
V <sub>IN</sub>	Input voltage	−0.3	3.6	V
V <sub>O</sub>	Output voltage	−0.3	V <sub>DD</sub> + 0.3	V
I <sub>IN</sub>	Input current	−20	20	mA
I <sub>O</sub>	Continuous output current	−50	50	mA
T <sub>J</sub>	Junction temperature		135	°C
T <sub>stg</sub>	Storage temperature <sup>(2)</sup>	−65	150	°C

(1) Stresses beyond those listed under *Absolute Maximum Rating* may cause permanent damage to the device. These are stress ratings only, which do not imply functional operation of the device at these or any other conditions beyond those indicated under *Recommended Operating Condition*. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.

(2) Device unpowered

### 7.2 ESD Ratings

			VALUE	UNIT
V <sub>(ESD)</sub>	Electrostatic discharge	Human body model (HBM), per ANSI/ESDA/JEDEC JS-001, all pins <sup>(1)</sup>	±3000	V
		Charged device model (CDM), per ANSI/ESDA/JEDEC JS-002, all pins <sup>(2)</sup>	±1000	

(1) JEDEC document JEP155 states that 500-V HBM allows safe manufacturing with a standard ESD control process.

(2) JEDEC document JEP157 states that 250-V CDM allows safe manufacturing with a standard ESD control process.

### 7.3 Recommended Operating Conditions

over operating free-air temperature range (unless otherwise noted)

			MIN	NOM	MAX	UNIT
V <sub>DD</sub>	Core supply voltage	3.3-V supply	3.135	3.3	3.465	V
		2.5-V supply	2.375	2.5	2.625	
		1.8-V supply	1.71	1.8	1.89	
Supply Ramp	Supply voltage ramp	Requires monotonic ramp (10-90 % of VDD)	0.1		20	ms
T <sub>A</sub>	Operating free-air temperature		−40		105	°C
T <sub>J</sub>	Operating junction temperature		−40		135	°C

## 7.4 Thermal Information

THERMAL METRIC <sup>(1)</sup>		LMK1D1208P	UNIT
		RHA (VQFN)	
		40 PINS	
R <sub>θJA</sub>	Junction-to-ambient thermal resistance	30.3	°C/W
R <sub>θJC(top)</sub>	Junction-to-case (top) thermal resistance	21.6	°C/W
R <sub>θJB</sub>	Junction-to-board thermal resistance	13.1	°C/W
Ψ <sub>JT</sub>	Junction-to-top characterization parameter	0.4	°C/W
Ψ <sub>JB</sub>	Junction-to-board characterization parameter	13	°C/W
R <sub>θJC(bot)</sub>	Junction-to-case (bottom) thermal resistance	4.5	°C/W

(1) For more information about traditional and new thermal metrics, see the [Semiconductor and IC Package Thermal Metrics](#) application report.

## 7.5 Electrical Characteristics

V<sub>DD</sub> = 1.8 V ± 5 %, –40°C ≤ T<sub>A</sub> ≤ 105°C. Typical values are at V<sub>DD</sub> = 1.8 V, 25°C (unless otherwise noted)

PARAMETER		TEST CONDITIONS	MIN	TYP	MAX	UNIT
<b>POWER SUPPLY CHARACTERISTICS</b>						
IDD <sub>STAT</sub>	Core supply current, static (LMK1D1208P)	All outputs enabled and unterminated, f = 0 Hz		75		mA

$V_{DD} = 1.8 \text{ V} \pm 5\%$ ,  $-40^{\circ}\text{C} \leq T_A \leq 105^{\circ}\text{C}$ . Typical values are at  $V_{DD} = 1.8 \text{ V}$ ,  $25^{\circ}\text{C}$  (unless otherwise noted)

PARAMETER		TEST CONDITIONS	MIN	TYP	MAX	UNIT
Phase noise	Phase Noise for a carrier frequency of 156.25 MHz with 50% duty-cycle, Input slew rate = 1.5V/ns with output load $R_{LOAD} = 100 \Omega$	$PN_{1\text{kHz}}$		-143		dBc/Hz
		$PN_{10\text{kHz}}$		-150		
		$PN_{100\text{kHz}}$		-157		
		$PN_{1\text{MHz}}$		-160		
		$PN_{\text{floor}}$		-164		
$MUX_{ISO}$	Mux Isolation	$f_{IN} = 156.25 \text{ MHz}$ . The difference in power level at $f_{IN}$ when the selected clock is active and the unselected clock is static versus when the selected clock is inactive and the unselected clock is active.		80		dB
ODC	Output duty cycle	With 50% duty cycle input	45		55	%
$t_R/t_F$	Output rise and fall time	20% to 80% with $R_{LOAD} = 100 \Omega$			300	ps
$t_R/t_F$	Output rise and fall time	20% to 80% with $R_{LOAD} = 100 \Omega$ (AMP_SEL = 1)			300	ps
$t_{en/disable}$	Output Enable and Disable Time	Time taken for outputs to go from disable state to enable state and vice versa. (3)			1	$\mu\text{s}$
$I_{leakZ}$	Output leakage current in High Z	Outputs are held in high Z mode with $OUTP = OUTN$ (max applied external voltage is the lesser of $V_{DD}$ or 1.89V and minimum applied external voltage is 0V)			50	$\mu\text{A}$
$V_{AC\_REF}$	Reference output voltage	$V_{DD} = 2.5 \text{ V}$ , $I_{LOAD} = 100 \mu\text{A}$	0.9	1.25	1.375	V
<b>POWER SUPPLY NOISE REJECTION (PSNR) <math>V_{DD} = 2.5 \text{ V} / 3.3 \text{ V}</math></b>						
PSNR	Power Supply Noise Rejection ( $f_{\text{carrier}} = 156.25 \text{ MHz}$ )	10 kHz, 100 mVpp ripple injected on $V_{DD}$		-70		dBc
		1 MHz, 100 mVpp ripple injected on $V_{DD}$		-50		

- (1) Measured between single-ended/differential input crossing point to the differential output crossing point.
- (2) For the dual bank devices, the inputs are phase aligned and have 50% duty cycle.
- (3) Applies to the dual bank family.
- (4) Defined as the magnitude of the time difference between the high-to-low and low-to-high propagation delay times at an output.

## 7.6 Typical Characteristics

Figure 7-1 captures the variation of the LMK1D1208P current consumption with input frequency and supply voltage. Figure 7-2 shows the variation of the differential output voltage (VOD) swept across frequency. It is important to note that Figure 7-1 and Figure 7-2 serve as a guidance to the users on what to expect for the range of operating frequency supported by LMK1D1208P. These graphs were plotted for a limited number of frequencies and load conditions, which may not represent the customer system.

Figure 7-1. LMK1D1208P Current Consumption vs Frequency

Figure 7-2. LMK1D1208P VOD vs Frequency

## 8 Parameter Measurement Information

**Figure 8-1. LVDS Output DC Configuration During Device Test**

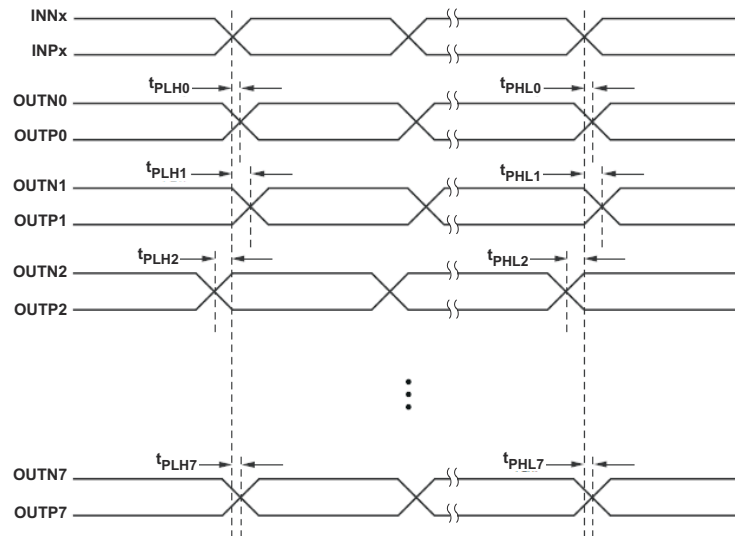

**Figure 8-2. LVDS Output AC Configuration During Device Test**

**Figure 8-3. DC-Coupled LVCMOS Input During Device Test**

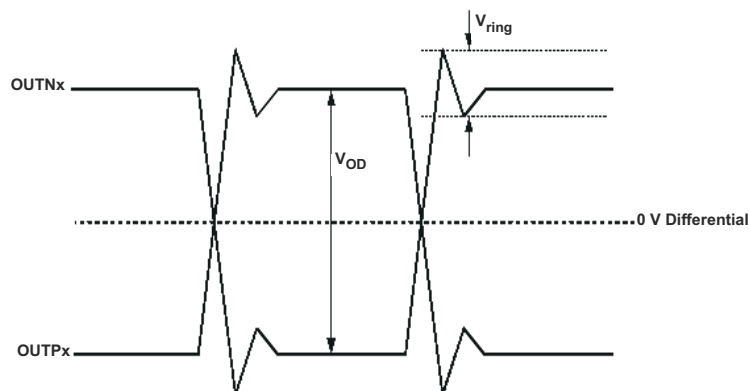

**Figure 8-4. Output Voltage and Rise/Fall Time**

- A. Output skew is calculated as the greater of the following: the difference between the fastest and the slowest  $t_{PLHn}$  or the difference between the fastest and the slowest  $t_{PHLn}$  ( $n = 0, 1, 2, \dots, 7$ )
- B. Part to part skew is calculated as the greater of the following: the difference between the fastest and the slowest  $t_{PLHn}$  or the difference between the fastest and the slowest  $t_{PHLn}$  across multiple devices ( $n = 0, 1, 2, \dots, 7$ )

**Figure 8-7. Output AC Common Mode**

## 9 Detailed Description

### 9.1 Overview

The LMK1D1208P LVDS drivers use CMOS transistors to control the output current. Therefore, proper biasing and termination are required to ensure correct operation of the device and to maximize signal integrity.

The proper LVDS termination for signal integrity over two 50-Ω lines is 100 Ω between the outputs on the receiver end. Either DC-coupled termination or AC-coupled termination can be used for LVDS outputs. TI recommends placing a termination resistor close to the receiver. If the receiver is internally biased to a voltage different than the output common-mode voltage of the LMK1D1208P, AC coupling must be used. If the LVDS receiver has internal 100-Ω termination, external termination must be omitted.

### 9.2 Functional Block Diagram

### 9.3 Feature Description

The LMK1D1208P is a low additive jitter LVDS fan-out buffer that can generate up to four copies of two selectable LVPECL, LVDS, HCSL, CML, or LVCMOS inputs. The LMK1D1208P can accept reference clock frequencies up to 2 GHz while providing low output skew.

[Table 9-1](#) lists the LMK1D1208P outputs divided into two banks.

**Table 9-1. Output Bank Mapping**

BANK	CLOCK OUTPUTS
0	OUT0, OUT1, OUT2, OUT3
1	OUT4, OUT5, OUT6, OUT7

Apart from providing a very low additive jitter and low output skew, the LMK1D1208P has an input select pin (IN\_SEL) and an output amplitude control pin (AMP\_SEL).

#### 9.3.1 Fail-Safe Input

The LMK1D120x family of devices is designed to support fail-safe input operation feature. This feature allows the user to drive the device inputs before  $V_{DD}$  is applied without damaging the device. Refer to [Specifications](#) for more information on the maximum input supported by the device. The user should note that incorporating the fail-safe inputs also results in a slight increase in clock input pin capacitance. The device also incorporates an input hysteresis which prevents random oscillation in absence of an input signal. Furthermore, this feature allows the input pins to be left open.

### 9.4 Device Functional Modes

The two inputs of the LMK1D1208P are internally muxed together and can be selected through the control pin (see [Table 9-2](#)). Unused inputs can be left floating to reduce overall component cost. Both AC- and DC-coupling schemes can be used with the LMK1D1208P to provide greater system flexibility.

**Table 9-2. Input Selection Table**

IN_SEL	ACTIVE CLOCK INPUT
0	IN0_P, IN0_N
1	IN1_P, IN1_N
Open	None <sup>(1)</sup>

- (1) The input buffers are disabled and the state of the outputs are dependent on the state of OEx (see [Table 9-3](#)). If OEx = 0, the corresponding output will be disabled in Hi-Z state, whereas if OEx = 1 (default), the corresponding output will be logic low.

The outputs of the LMK1D1208P can be individually enabled or disabled using the OEx hardware pins (see [Table 9-3](#)). The disabled state of the outputs is Hi-Z (high impedance) as this reduces the power consumption and also prevents back-biasing of the devices connected to these outputs.

Unused outputs should be disabled to eliminate the need for a termination resistor. In the case of enabled unused outputs, TI recommends a 100-Ω termination for optimal performance.

**Table 9-3. Output Control**

OEx	CLOCK OUTPUTS
0	OUTPx, OUTNx disabled in Hi-Z state
1 (default)	OUTPx, OUTNx enabled

The output amplitude of the banks of the LMK1D1208P can be selected through the amplitude selection pin (see [Table 9-4](#)). The higher output amplitude mode (boosted LVDS swing mode) can be used in applications which require higher amplitude either for better noise performance (higher slew rate) or if the receiver has swing requirements which the standard LVDS swing cannot meet.

**Table 9-4. Amplitude Selection**

AMP_SEL	OUTPUT AMPLITUDE (mV)
0	Bank 0: boosted LVDS swing (500 mV) Bank 1: standard LVDS swing (350 mV)
OPEN	Bank 0: standard LVDS swing (350 mV) Bank 1: standard LVDS swing (350 mV)
1	Bank 0: boosted LVDS swing (500 mV) Bank 1: boosted LVDS swing (500 mV)

#### 9.4.1 LVDS Output Termination

TI recommends that unused outputs are terminated differentially with a 100-Ω resistor for optimum performance, although unterminated outputs are also okay but will result in slight degradation in performance (Output AC common-mode  $V_{OS}$ ) in the outputs being used.

The LMK1D1208P can be connected to LVDS receiver inputs with DC and AC coupling as shown in Figure 9-1 and Figure 9-2, respectively.

**Figure 9-1. Output DC Termination**

**Figure 9-2. Output AC Termination (With the Receiver Internally Biased)**

#### 9.4.2 Input Termination

The LMK1D1208P inputs can be interfaced with LVDS, LVPECL, HCSL, or LVCMOS drivers.

LVDS drivers can be connected to LMK1D1208P inputs with DC and AC coupling as shown Figure 9-3 and Figure 9-4, respectively.

**Figure 9-3. LVDS Clock Driver Connected to LMK1D1208P Input (DC-Coupled)**

**Figure 9-4. LVDS Clock Driver Connected to LMK1D1208P Input (AC-Coupled)**

Figure 9-5 shows how to connect LVPECL inputs to the LMK1D1208P. The series resistors are required to reduce the LVPECL signal swing if the signal swing is  $>1.6 V_{PP}$ .

**Figure 9-5. LVPECL Clock Driver Connected to LMK1D1208P Input**

Figure 9-6 shows how to couple a LVCMOS clock input to the LMK1D1208P directly.

**Figure 9-6. 1.8-V, 2.5-V, or 3.3-V LVCMOS Clock Driver Connected to LMK1D1208P Input**

For unused input, TI recommends grounding both input pins (INP, INN) using 1-kΩ resistors.

## 10 Application and Implementation

### Note

Information in the following applications sections is not part of the TI component specification, and TI does not warrant its accuracy or completeness. TI's customers are responsible for determining suitability of components for their purposes, as well as validating and testing their design implementation to confirm system functionality.

### 10.1 Application Information

The LMK1D1208P is a low additive jitter universal to LVDS fan-out buffer with two selectable inputs, output amplitude selection, and pin-controlled output enables. The small package size, low output skew, low propagation delay and low additive jitter of this device is designed for applications that require high-performance clock distribution as well as for low-power and space-constraint applications.

### 10.2 Typical Application

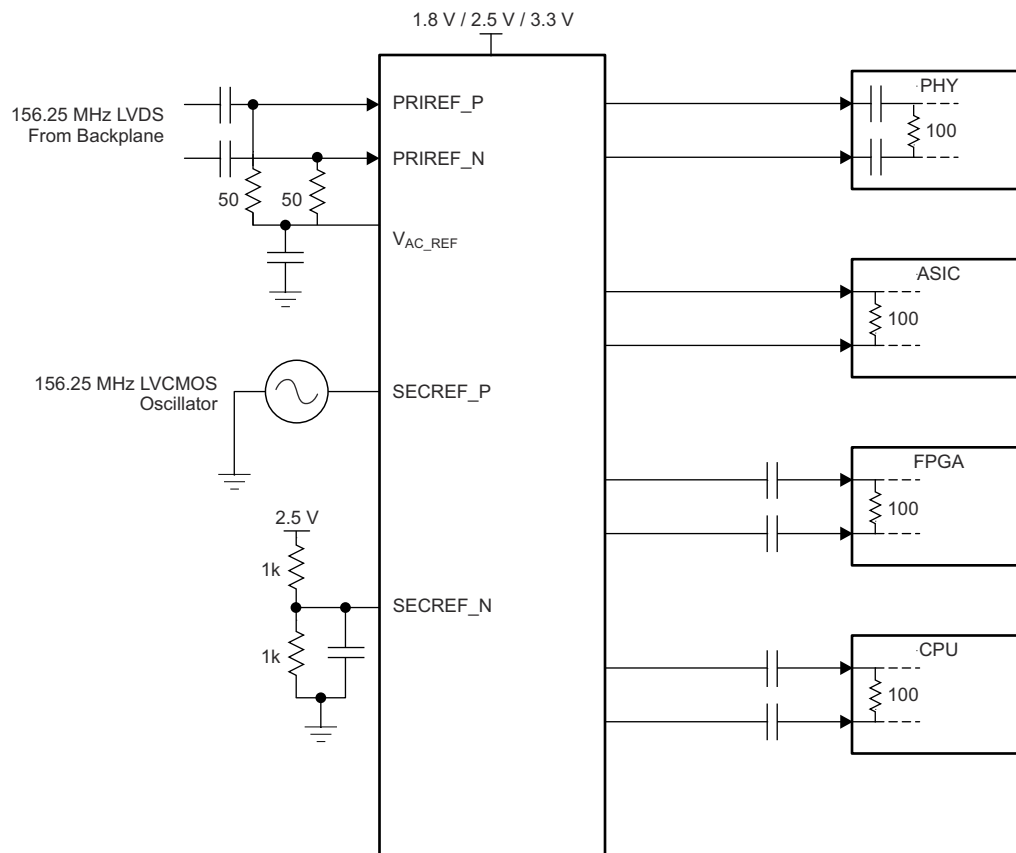

Figure 10-1. Fan-Out Buffer for Line Card Application

### 10.2.1 Design Requirements

The LMK1D1208P shown in [Figure 10-1](#) is configured to select two inputs: a 156.25-MHz LVDS clock from the backplane, or a secondary 156.25-MHz, LVCMOS, 2.5-V oscillator. The LVDS clock is AC-coupled and biased using the integrated reference voltage generator. A resistor divider is used to set the threshold voltage correctly for the LVCMOS clock. 0.1- $\mu$ F capacitors are used to reduce noise on both  $V_{AC\_REF}$  and  $SECREP\_N$ . Either input signal can be then fanned out to desired devices, as shown. The configuration example is driving 4 LVDS receivers in a line card application with the following properties:

- The PHY device is capable of DC coupling with an LVDS driver such as the LMK1D1208P. This PHY device features internal termination so no additional components are required for proper operation.
- The ASIC LVDS receiver features internal termination and operates at the same common-mode voltage as the LMK1D1208P. Again, no additional components are required.
- The FPGA requires external AC coupling, but has internal termination. 0.1- $\mu$ F capacitors are placed to provide AC coupling. Similarly, the CPU is internally terminated, and requires only external AC-coupling capacitors.
- The unused outputs of the LMK1D1208P can be disabled using the corresponding OEx pin. This results in a lower power consumption.

### 10.2.2 Detailed Design Procedure

See [Input Termination](#) for proper input terminations, dependent on single-ended or differential inputs.

See [LVDS Output Termination](#) for output termination schemes depending on the receiver application.

Unused outputs can be disabled using the corresponding OEx pin setting according to [Table 9-3](#). Disabling the outputs also eliminates requirement of termination resistors.

In this example, the PHY, ASIC, FPGA and CPU require different schemes. Power supply filtering and bypassing is critical for low-noise applications.

See [Power Supply Recommendations](#) for recommended filtering techniques. A reference layout is provided in [Low-Additive Jitter, Four LVDS Outputs Clock Buffer Evaluation Board user's guide](#) (SCAU043).

### 10.2.3 Application Curves

This section shows the low additive noise for the LMK1D1208P. The low noise 156.25-MHz source with 24-fs RMS jitter shown in Figure 10-2 drives the LMK1D1208P, resulting in 46.4-fs RMS when integrated from 12 kHz to 20 MHz (see Figure 10-3). The resultant additive jitter is 39.7-fs RMS for this configuration.

Note: Reference signal is a low-noise Rhode and Schwarz SMA100B

Figure 10-2. LMK1D1208P Reference Phase Noise, 156.25 MHz, 24-fs RMS (12 kHz to 20 MHz)

Figure 10-3. LMK1D1208P Output Phase Noise, 156.25 MHz, 46.4-fs RMS (12 kHz to 20 MHz)

### 10.3 Power Supply Recommendations

High-performance clock buffers are sensitive to noise on the power supply, which can dramatically increase the additive jitter of the buffer. Thus, it is essential to reduce noise from the system power supply, especially when jitter or phase noise is critical to applications.

Filter capacitors are used to eliminate the low-frequency noise from the power supply, where the bypass capacitors provide the low impedance path for high-frequency noise and guard the power-supply system against the induced fluctuations. These bypass capacitors also provide instantaneous current surges as required by the device and must have low equivalent series resistance (ESR). To properly use the bypass capacitors, they must be placed close to the power-supply pins and laid out with short loops to minimize inductance. TI recommends adding as many high-frequency (for example, 0.1- $\mu$ F) bypass capacitors as there are supply pins in the package. TI recommends, but does not require, inserting a ferrite bead between the board power supply and the chip power supply that isolates the high-frequency switching noises generated by the clock driver. These ferrite beads prevent the switching noise from leaking into the board supply. Choose an appropriate ferrite bead with low DC resistance because it is imperative to provide adequate isolation between the board supply and the chip supply, as well as to maintain a voltage at the supply pins that is greater than the minimum voltage required for proper operation.

Figure 10-4 shows this recommended power-supply decoupling method.

Figure 10-4. Power Supply Decoupling

## 10.4 Layout

### 10.4.1 Layout Guidelines

For reliability and performance reasons, the die temperature must be limited to a maximum of 135°C.

The device package has an exposed pad that provides the primary heat removal path to the PCB. To maximize the heat dissipation from the package, a thermal landing pattern including multiple vias to a ground plane must be incorporated into the PCB within the footprint of the package. The thermal pad must be soldered down to ensure adequate heat conduction to of the package. [Figure 10-5](#) and [Figure 10-6](#) show the recommended land and via patterns for the 40-pin LMK1D1208P device.

### 11.2 Support Resources

[TI E2E™ support forums](#) are an engineer's go-to source for fast, verified answers and design help — straight from the experts. Search existing answers or ask your own question to get the quick design help you need.

Linked content is provided "AS IS" by the respective contributors. They do not constitute TI specifications and do not necessarily reflect TI's views; see TI's [Terms of Use](#).

### 11.3 Trademarks

TI E2E™ is a trademark of Texas Instruments.

All trademarks are the property of their respective owners.

### 11.4 Electrostatic Discharge Caution

This integrated circuit can be damaged by ESD. Texas Instruments recommends that all integrated circuits be handled with appropriate precautions. Failure to observe proper handling and installation procedures can cause damage.

ESD damage can range from subtle performance degradation to complete device failure. Precision integrated circuits may be more susceptible to damage because very small parametric changes could cause the device not to meet its published specifications.

### 11.5 Glossary

[TI Glossary](#) This glossary lists and explains terms, acronyms, and definitions.

## 12 Mechanical, Packaging, and Orderable Information

The following pages include mechanical, packaging, and orderable information. This information is the most current data available for the designated devices. This data is subject to change without notice and revision of this document. For browser-based versions of this data sheet, refer to the left-hand navigation.

## PACKAGING INFORMATION

Orderable part number	Status (1)	Material type (2)	Package   Pins	Package qty   Carrier	RoHS (3)	Lead finish/ Ball material (4)	MSL rating/ Peak reflow (5)	Op temp (°C)	Part marking (6)

<sup>(1)</sup> **Status:** For more details on status, see our [product life cycle](#).

<sup>(2)</sup> **Material type:** When designated, preproduction parts are prototypes/experimental devices, and are not yet approved or released for full production. Testing and final process, including without limitation quality assurance, reliability performance testing, and/or process qualification, may not yet be complete, and this item is subject to further changes or possible discontinuation. If available for ordering, purchases will be subject to an additional waiver at checkout, and are intended for early internal evaluation purposes only. These items are sold without warranties of any kind.

<sup>(3)</sup> **RoHS values:** Yes, No, RoHS Exempt. See the [TI RoHS Statement](#) for additional information and value definition.

<sup>(4)</sup> **Lead finish/Ball material:** Parts may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead finish/Ball material values may wrap to two lines if the finish value exceeds the maximum column width.

<sup>(5)</sup> **MSL rating/Peak reflow:** The moisture sensitivity level ratings and peak solder (reflow) temperatures. In the event that a part has multiple moisture sensitivity ratings, only the lowest level per JEDEC standards is shown. Refer to the shipping label for the actual reflow temperature that will be used to mount the part to the printed circuit board.

<sup>(6)</sup> **Part marking:** There may be an additional marking, which relates to the logo, the lot trace code information, or the environmental category of the part.

Multiple part markings will be inside parentheses. Only one part marking contained in parentheses and separated by a "~" will appear on a part. If a line is indented then it is a continuation of the previous line and the two combined represent the entire part marking for that device.

**Important Information and Disclaimer:** The information provided on this page represents TI's knowledge and belief as of the date that it is provided. TI bases its knowledge and belief on information provided by third parties, and makes no representation or warranty as to the accuracy of such information. Efforts are underway to better integrate information from third parties. TI has taken and continues to take reasonable steps to provide representative and accurate information but may not have conducted destructive testing or chemical analysis on incoming materials and chemicals. TI and TI suppliers consider certain information to be proprietary, and thus CAS numbers and other limited information may not be available for release.

In no event shall TI's liability arising out of such information exceed the total purchase price of the TI part(s) at issue in this document sold by TI to Customer on an annual basis.
