

LMT89 2.4-V, 10-μA, SC70 Temperature Sensor

1 Features

- Cost-Effective Alternative to Thermistors
- Rated for full -55°C to 130°C Range
- Available in an SC70 Package
- Predictable Curvature Error
- Suitable for Remote Applications

2 Applications

- Industrial
- HVAC
- Automotive
- Disk Drives
- Portable Medical Instruments
- Computers
- Battery Management
- Printers
- Power Supply Modules
- FAX Machines
- Mobile Phones
- Automotive

3 Description

The LMT89 device is a precision analog output CMOS integrated-circuit temperature sensor that operates over a -55°C to 130°C temperature range. The power supply operating range is 2.4 V to 5.5 V. The transfer function of LMT89 device is predominately linear, yet has a slight predictable parabolic curvature. The accuracy of the LMT89 device, when specified to a parabolic transfer function, is typically $\pm 1.5^{\circ}\text{C}$ at an ambient temperature of 30°C . The temperature error increases linearly and reaches a maximum of $\pm 2.5^{\circ}\text{C}$ at the temperature range extremes. The temperature range is affected by the power supply voltage. At a power supply voltage of 2.7 V to 5.5 V, the temperature range extremes are 130°C and -55°C . Decreasing the power supply voltage to 2.4 V changes the negative extreme to -30°C , while the positive remains at 130°C .

The quiescent current of the LMT89 device is less than 10 μA . Therefore, self-heating is less than 0.02°C in still air. Shutdown capability for the LMT89 device is intrinsic because its inherent low power consumption allows it to be powered directly from the output of many logic gates or does not necessitate shutdown at all.

The LMT89 device is a cost-competitive alternative to thermistors.

Device Information⁽¹⁾

PART NUMBER	PACKAGE	BODY SIZE (NOM)
LMT89	SOT (5)	2.00 mm x 1.25 mm

5 Pin Configuration and Functions

Pin Functions

PIN		I/O	DESCRIPTION
NO.	NAME		
1	NC	—	NC (pin 1) must be left floating or grounded. Other signal traces must not be connected to this pin.
2	GND	GND	Device substrate and die attach paddle, connect to power supply negative terminal. For optimum thermal conductivity to the PC board ground plane, pin 2 must be grounded. This pin may also be left floating.
3	V _O	Analog Output	Temperature sensor analog output
4	V ⁺	Power	Positive power supply pin
5	GND	GND	Device ground pin, connect to power supply negative terminal.

6 Specifications

6.1 Absolute Maximum Ratings

over operating free-air temperature range (unless otherwise noted)⁽¹⁾⁽²⁾

	MIN	MAX	UNIT
Supply Voltage	−0.2	6.5	V
Output Voltage	(V ⁺ + 0.6 V)	−0.6	V
Output Current		10	mA
Input Current at any pin ⁽³⁾	5		mA
Maximum Junction Temperature (T _{JMAX})		150	°C
Storage temperature (T _{stg})	−65	150	°C

- (1) Stresses beyond those listed under *Absolute Maximum Ratings* may cause permanent damage to the device. These are stress ratings only, which do not imply functional operation of the device at these or any other conditions beyond those indicated under *Recommended Operating Conditions*. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.
- (2) Soldering process must comply with the Reflow Temperature Profile specifications. Refer to <http://www.ti.com/packaging>. Reflow temperature profiles are different for lead-free and non-lead-free packages.
- (3) When the input voltage (V_I) at any pin exceeds power supplies (V_I < GND or V_I > V⁺), the current at that pin should be limited to 5 mA.

6.2 ESD Ratings

		VALUE	UNIT
V _(ESD) ⁽¹⁾ Electrostatic discharge	Human-body model (HBM), per ANSI/ESDA/JEDEC JS-001 ⁽²⁾	±2500	V
	Charged-device model (CDM), per JEDEC specification JESD22-C101 ⁽³⁾	±250	

- (1) Accuracy is defined as the error between the measured and calculated output voltage at the specified conditions of voltage, current, and temperature (expressed in °C).
- (2) JEDEC document JEP155 states that 500-V HBM allows safe manufacturing with a standard ESD control process.
- (3) JEDEC document JEP157 states that 250-V CDM allows safe manufacturing with a standard ESD control process.

6.3 Recommended Operating Conditions

over operating free-air temperature range (unless otherwise noted)

	MIN	MAX	UNIT
LMT89 with 2.4 V ≤ V ⁺ ≤ 2.7 V	−30	130	°C
LMT89 with 2.7 V ≤ V ⁺ ≤ 5.5 V	−55	130	°C
Supply Voltage Range (V ⁺)	2.4	5.5	V

6.4 Thermal Information

THERMAL METRIC ⁽¹⁾		LMT89	UNIT
		SOT	
		5 PINS	
R _{θJA}	Junction-to-ambient thermal resistance	282	°C/W
R _{θJC(top)}	Junction-to-case (top) thermal resistance	93	
R _{θJB}	Junction-to-board thermal resistance	62	
Ψ _{JT}	Junction-to-top characterization parameter	1.6	
Ψ _{JB}	Junction-to-board characterization parameter	62	
R _{θJC(bot)}	Junction-to-case (bottom) thermal resistance	—	

- (1) For more information about traditional and new thermal metrics, see the *IC Package Thermal Metrics* application report, [SPRA953](#). For measured thermal resistance using specific printed circuit board layouts for the LMT89, see [Layout](#).

6.5 Electrical Characteristics

Unless otherwise noted, these specifications apply for $V^+ = 2.7 V_{DC}$. All limits $T_A = T_J = T_{MIN}$ to T_{MAX} , unless otherwise noted.

PARAMETER	TEST CONDITIONS	MIN ⁽¹⁾	TYP ⁽²⁾	MAX ⁽¹⁾	UNIT
Temperature to Voltage Error $V_O = (-3.88 \times 10^{-6} \times T^2) + (-1.15 \times 10^{-2} \times T) + 1.8639 V^{(3)}$		-2.5	±1.5	2.5	°C
Output Voltage at 0°C			1.8639		V
Variance from Curve			±1.0		°C
Non-Linearity ⁽⁴⁾	-20°C ≤ T_A ≤ 80°C		±0.4%		
Sensor Gain (Temperature Sensitivity or Average Slope) to equation: $V_O = -11.77 mV/°C \times T + 1.860 V$	-30°C ≤ T_A ≤ 100°C	-12.2	-11.77	-11.4	mV/°C
Output Impedance	Sourcing I_L 0 µA to 16 µA ⁽⁵⁾⁽⁶⁾			160	Ω
Load Regulation ⁽⁷⁾	Sourcing I_L 0 µA to 16 µA ⁽⁵⁾⁽⁶⁾			-2.5	mV
Line Regulation ⁽⁸⁾	2.4 V ≤ $V^+ \leq 5.0 V$			3.3	mV/V
	5.0 V ≤ $V^+ \leq 5.5 V$			11	mV
Quiescent Current	2.4V ≤ $V^+ \leq 5.0 V$; $T_A = 25°C$		4.5	7	µA
	5.0V ≤ $V^+ \leq 5.5 V$; $T_A = 25°C$		4.5	9	µA
	2.4V ≤ $V^+ \leq 5.0 V$		4.5	10	µA
Change of Quiescent Current	2.4 V ≤ $V^+ \leq 5.5 V$		0.7		µA
Temperature Coefficient of Quiescent Current			-11		nA/°C
Shutdown Current	$V^+ \leq 0.8 V$		0.02		µA

- (1) Limits are specified to TI's AOQL (Average Outgoing Quality Level).
- (2) Typical values are at $T_J = T_A = 25°C$ and represent most likely parametric norm.
- (3) Accuracy is defined as the error between the measured and calculated output voltage at the specified conditions of voltage, current, and temperature (expressed in °C).
- (4) Non-Linearity is defined as the deviation of the calculated output-voltage-versus-temperature curve from the best-fit straight line, over the temperature range specified.
- (5) The LMT89 can at most sink 1 µA and source 16 µA.
- (6) Load regulation or output impedance specifications apply over the supply voltage range of 2.4 V to 5.5 V.
- (7) Regulation is measured at constant junction temperature, using pulse testing with a low duty cycle. Changes in output due to heating effects can be computed by multiplying the internal dissipation by the thermal resistance.
- (8) Line regulation is calculated by subtracting the output voltage at the highest supply input voltage from the output voltage at the lowest supply input voltage.

6.6 Typical Characteristics

Figure 1. Temperature Sensor Accuracy

7 Detailed Description

7.1 Overview

The LMT89 device is a precision analog output CMOS integrated-circuit temperature sensor that operates over a temperature range of -55°C to 130°C . The power supply operating range is 2.4 V to 5.5 V. The transfer function of LMT89 is predominately linear, yet has a slight predictable parabolic curvature. The accuracy of the LMT89 device, when specified to a parabolic transfer function, is typically $\pm 1.5^{\circ}\text{C}$ at an ambient temperature of 30°C . The temperature error increases linearly and reaches a maximum of $\pm 5^{\circ}\text{C}$ at the temperature range extremes. The temperature range is affected by the power supply voltage. At a power supply voltage of 2.7 V to 5.5 V, the temperature range extremes are 130°C and -55°C . Decreasing the power supply voltage to 2.4 V changes the negative extreme to -30°C , while the positive remains at 130°C .

The LMT89 quiescent current is less than 10 μA . Therefore, self-heating is less than 0.02°C in still air. Shutdown capability for the LMT89 is intrinsic because its inherent low power consumption allows it to be powered directly from the output of many logic gates or does not necessitate shutdown at all.

The temperature sensing element is comprised of a simple base emitter junction that is forward biased by a current source. The temperature sensing element is then buffered by an amplifier and provided to the OUT pin. The amplifier has a simple class A output stage thus providing a low impedance output that can source 16 μA and sink 1 μA .

7.2 Functional Block Diagram

7.3 Feature Description

7.3.1 LMT89 Transfer Function

The transfer function of the LMT89 device can be described in different ways with varying levels of precision. A simple linear transfer function with good accuracy near 25°C is shown in [Equation 1](#).

$$V_o = -11.69 \text{ mV}/^{\circ}\text{C} \times T + 1.8663 \text{ V} \quad (1)$$

Over the full operating temperature range of -55°C to 130°C , best accuracy can be obtained by using the parabolic transfer function.

$$V_o = (-3.88 \times 10^{-6} \times T^2) + (-1.15 \times 10^{-2} \times T) + 1.8639 \quad (2)$$

Using [Equation 2](#) the following temperature to voltage output characteristic table can be generated.

Feature Description (continued)

–30	2.2054	–3	1.8984	24	1.5857	51	1.2673	78	0.9433	105	0.6136	—	—
–29	2.1941	–2	1.8869	25	1.5740	52	1.2554	79	0.9312	106	0.6013	—	—

Solving Equation 2 for T:

$$T = -1481.96 + \sqrt{2.1962 \times 10^6 + \frac{(1.8639 - V_O)}{3.88 \times 10^{-6}}} \quad (3)$$

For other methods of calculating T, see [Detailed Design Procedure](#).

7.4 Device Functional Modes

The only functional mode of the LMT89 device is that it has an analog output inversely proportional to temperature.

8 Application and Implementation

NOTE

Information in the following applications sections is not part of the TI component specification, and TI does not warrant its accuracy or completeness. TI's customers are responsible for determining suitability of components for their purposes. Customers should validate and test their design implementation to confirm system functionality.

8.1 Application Information

The LMT89 has a very low supply current and a wide supply range therefore it can easily be driven by a battery as shown in [Figure 4](#).

8.1.1 Capacitive Loads

The LMT89 device handles capacitive loading well. Without any precautions, the LMT89 device can drive any capacitive load less than 300 pF as shown in [Figure 2](#). The specified temperature range the LMT89 device has a maximum output impedance of 160 Ω . In an extremely noisy environment it may be necessary to add some filtering to minimize noise pickup. TI recommends that 0.1 μF be added from V^+ to GND to bypass the power supply voltage, as shown in [Figure 2](#). In a noisy environment it may even be necessary to add a capacitor from the output to ground with a series resistor as shown in [Figure 2](#). A 1- μF output capacitor with the 160- Ω maximum output impedance and a 200- Ω series resistor will form a 442-Hz lowpass filter. Because the thermal time constant of the LMT89 device is much slower, the overall response time of the LMT89 device will not be significantly affected.

In situations where a transient load current is placed on the circuit output, the series resistance value may be increased to compensate for any ringing that may be observed.

Figure 2. LMT89 No Decoupling Required for Capacitive Loads Less Than 300 pF

Table 2. Design Parameters

Minimum R (Ω)	C (μF)
200	1
470	0.1
680	0.01
1 k	0.001

Figure 3. LMT89 With Filter for Noisy Environment and Capacitive Loading Greater Than 300 pF

NOTE

Either placement of resistor, as shown in [Figure 2](#) and [Figure 3](#), is just as effective.

8.2 Typical Applications

8.2.1 Full-Range Centigrade Temperature Sensor

Figure 4. Full-Range Celsius (Centigrade) Temperature Sensor (–55°C to 130°C) Operating from a Single Li-Ion Battery Cell

8.2.1.1 Design Requirements

Design requirements related to layout are also important because the LMT89 device is a simple temperature sensor that provides an analog output, refer to [Layout](#) for a detailed description.

8.2.1.2 Detailed Design Procedure

The LMT89 device output is shown in [Equation 4](#).

$$V_O = (-3.88 \times 10^{-6} \times T^2) + (-1.15 \times 10^{-2} \times T) + 1.8639 \quad (4)$$

Solve for T as shown in [Equation 5](#):

$$T = -1481.96 + \sqrt{2.1962 \times 10^6 + \frac{(1.8639 - V_O)}{3.88 \times 10^{-6}}}$$

where

- T is temperature, and V_O is the measured output voltage of the LMT89 device. [Equation 5](#) is the most accurate equation that can be used to calculate the temperature of the LMT89 device. (5)

An alternative to the quadratic equation a second order transfer function can be determined using the least squares method shown in [Equation 6](#).

$$T = (-2.3654 \times V_O^2) + (-78.154 \times V_O) + 153.857$$

where

- T is temperature expressed in °C and V_O is the output voltage expressed in volts. (6)

A linear transfer function can be used over a limited temperature range by calculating a slope and offset that give best results over that range. A linear transfer function can be calculated from the parabolic transfer function of the LMT89 device. The slope of the linear transfer function can be calculated using [Equation 7](#).

$$m = -7.76 \times 10^{-6} \times T - 0.0115,$$

where

- T is the middle of the temperature range of interest and m is in V/°C. For example for the temperature range of $T_{MIN} = -30$ to $T_{MAX} = 100^\circ\text{C}$ (7)

$$T = 35^\circ\text{C} \quad (8)$$

and

$$m = -11.77 \text{ mV}/^\circ\text{C} \quad (9)$$

Typical Applications (continued)

The offset of the linear transfer function can be calculated using [Equation 10](#).

$$b = (V_{OP}(T_{MAX}) + V_{OP}(T) - m \times (T_{MAX} + T)) / 2$$

where

- $V_{OP}(T_{MAX})$ is the calculated output voltage at T_{MAX} using the parabolic transfer function for V_O .
- $V_{OP}(T)$ is the calculated output voltage at T using the parabolic transfer function for V_O . (10)

The best fit linear transfer function for many popular temperature ranges was calculated in [Table 3](#). As shown in [Table 3](#), the error introduced by the linear transfer function increases with wider temperature ranges.

Table 3. First Order Equations Optimized for Different Temperature Ranges

TEMPERATURE RANGE		LINEAR EQUATION	MAXIMUM DEVIATION OF LINEAR EQUATION FROM PARABOLIC EQUATION (°C)
T_{min} (°C)	T_{max} (°C)		
-55	130	$V_O = -11.79 \text{ mV/}^\circ\text{C} \times T + 1.8528 \text{ V}$	± 1.41
-40	110	$V_O = -11.77 \text{ mV/}^\circ\text{C} \times T + 1.8577 \text{ V}$	± 0.93
-30	100	$V_O = -11.77 \text{ mV/}^\circ\text{C} \times T + 1.8605 \text{ V}$	± 0.70
-40	85	$V_O = -11.67 \text{ mV/}^\circ\text{C} \times T + 1.8583 \text{ V}$	± 0.65
-10	65	$V_O = -11.71 \text{ mV/}^\circ\text{C} \times T + 1.8641 \text{ V}$	± 0.23
35	45	$V_O = -11.81 \text{ mV/}^\circ\text{C} \times T + 1.8701 \text{ V}$	± 0.004
20	30	$V_O = -11.69 \text{ mV/}^\circ\text{C} \times T + 1.8663 \text{ V}$	± 0.004

8.2.1.3 Application Curve

Figure 5. Output Voltage vs Temperature

8.2.2 Centigrade Thermostat

Figure 6. Centigrade Thermostat

8.2.2.1 Design Requirements

A simple thermostat can be created by using a reference (LM4040) and a comparator (LM7211) as shown in Figure 6.

8.2.2.2 Detailed Design Procedure

The threshold values can be calculated using Equation 11 and Equation 12.

$$V_{T1} = \frac{(4.1)R2}{R2 + R1 \parallel R3} \quad (11)$$

$$V_{T2} = \frac{(4.1)R2 \parallel R3}{R1 + R2 \parallel R3} \quad (12)$$

8.2.2.3 Application Curve

Figure 7. Thermostat Output Waveform

8.3 System Examples

8.3.1 Conserving Power Dissipation With Shutdown

The LMT89 device draws very little power therefore it can simply be shutdown by driving its supply pin with the output of an logic gate as shown in Figure 8.

Figure 8. Conserving Power Dissipation With Shutdown

System Examples (continued)

8.3.2 Analog-to-Digital Converter Input Stage

Most CMOS ADCs found in ASICs have a sampled data comparator input structure that is notorious for causing problems for analog output devices, such as the LMT89 and many op amps. The cause of this difficulty is the requirement of instantaneous charge of the input sampling capacitor in the ADC. This requirement is easily accommodated by the addition of a capacitor. Because not all ADCs have identical input stages, the charge requirements will vary necessitating a different value of compensating capacitor. This ADC is shown as an example only. If a digital output temperature is required, refer to devices such as the LM74 device.

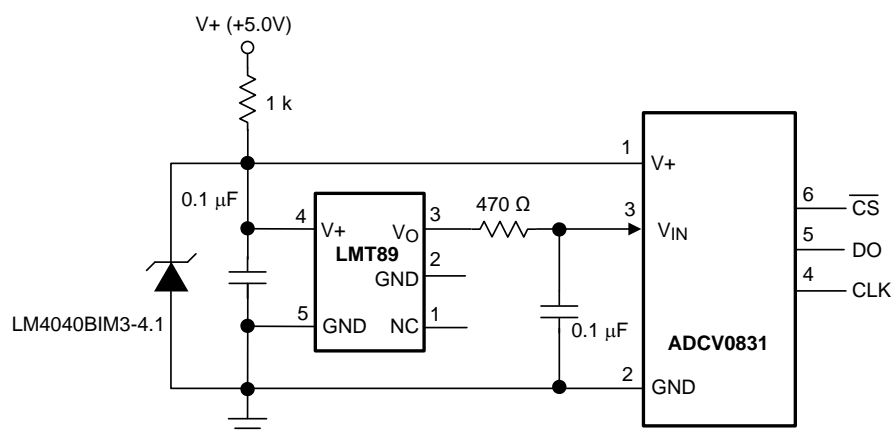

Figure 9. Suggested Connection to a Sampling Analog-to-Digital Converter Input Stage

9 Power Supply Recommendations

The LMT89 device has a very wide 2.4-V to 5.5-V power supply voltage range making it ideal for many applications. In noisy environments, TI recommends adding at minimum 0.1 µF from V⁺ to GND to bypass the power supply voltage. Larger capacitances may be required and are dependent on the power supply noise.

10 Layout

10.1 Layout Guidelines

The LMT89 device can be applied easily in the same way as other integrated-circuit temperature sensors. It can be glued or cemented to a surface. The temperature that the LMT89 device is sensing will be within about 0.02°C of the surface temperature to which the leads of the LMT89 device are attached.

This presumes that the ambient air temperature is almost the same as the surface temperature; if the air temperature were much higher or lower than the surface temperature, the actual temperature measured would be at an intermediate temperature between the surface temperature and the air temperature.

To ensure good thermal conductivity the backside of the LMT89 die is directly attached to the pin 2 GND pin. The temperatures of the lands and traces to the other leads of the LMT89 will also affect the temperature that is being sensed.

Alternatively, the LMT89 device can be mounted inside a sealed-end metal tube, and can then be dipped into a bath or screwed into a threaded hole in a tank. As with any IC, the LMT89 device and accompanying wiring and circuits must be kept insulated and dry, to avoid leakage and corrosion. This is especially true if the circuit may operate at cold temperatures where condensation can occur. Printed-circuit coatings and varnishes such as Humiseal and epoxy paints or dips are often used to ensure that moisture cannot corrode the LMT89 or its connections.

Layout Guidelines (continued)

The thermal resistance junction to ambient ($R_{\theta JA}$) is the parameter used to calculate the rise of a device junction temperature due to its power dissipation. Equation 13 is used to calculate the rise in the die temperature.

$$T_J = T_A + R_{\theta JA} [(V^+ I_Q) + (V^+ - V_O) I_L]$$

where

- I_Q is the quiescent current and I_L is the load current on the output. Because the junction temperature of the LMT89 is the actual temperature being measured, take care to minimize the load current that the LMT89 device is required to drive. (13)

Table 4 summarizes the rise in die temperature of the LMT89 device (without any loading), and the thermal resistance for different conditions.

Table 4. Temperature Rise of LMT89 Due to Self-Heating and Thermal Resistance ($R_{\theta JA}$)⁽¹⁾

	SC70-5		SC70-5	
	NO HEAT SINK		SMALL HEAT SINK	
	$R_{\theta JA}$ (°C/W)	$T_J - T_A$ (°C)	$R_{\theta JA}$ (°C/W)	$T_J - T_A$ (°C)
Still air	412	0.2	350	0.19
Moving air	312	0.17	266	0.15

(1) See [Layout Examples](#) for PCB layout samples.

11.1 Trademarks

All trademarks are the property of their respective owners.

11.2 Electrostatic Discharge Caution

These devices have limited built-in ESD protection. The leads should be shorted together or the device placed in conductive foam during storage or handling to prevent electrostatic damage to the MOS gates.

11.3 Glossary

[SLYZ022](#) — *TI Glossary*.

This glossary lists and explains terms, acronyms, and definitions.

12 Mechanical, Packaging, and Orderable Information

The following pages include mechanical, packaging, and orderable information. This information is the most current data available for the designated devices. This data is subject to change without notice and revision of this document. For browser-based versions of this data sheet, refer to the left-hand navigation.

PACKAGING INFORMATION

Orderable part number	Status (1)	Material type (2)	Package Pins	Package qty Carrier	RoHS (3)	Lead finish/ Ball material (4)	MSL rating/ Peak reflow (5)	Op temp (°C)	Part marking (6)
LMT89DCKR	Active	Production	SC70 (DCK) 5	3000 LARGE T&R	Yes	SN	Level-1-260C-UNLIM	-55 to 130	T3B
LMT89DCKR.A	Active	Production	SC70 (DCK) 5	3000 LARGE T&R	Yes	SN	Level-1-260C-UNLIM	-55 to 130	T3B
LMT89DCKR.B	Active	Production	SC70 (DCK) 5	3000 LARGE T&R	-	SN	Level-1-260C-UNLIM	-55 to 130	T3B

⁽¹⁾ **Status:** For more details on status, see our [product life cycle](#).

⁽²⁾ **Material type:** When designated, preproduction parts are prototypes/experimental devices, and are not yet approved or released for full production. Testing and final process, including without limitation quality assurance, reliability performance testing, and/or process qualification, may not yet be complete, and this item is subject to further changes or possible discontinuation. If available for ordering, purchases will be subject to an additional waiver at checkout, and are intended for early internal evaluation purposes only. These items are sold without warranties of any kind.

⁽³⁾ **RoHS values:** Yes, No, RoHS Exempt. See the [TI RoHS Statement](#) for additional information and value definition.

⁽⁴⁾ **Lead finish/Ball material:** Parts may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead finish/Ball material values may wrap to two lines if the finish value exceeds the maximum column width.

⁽⁵⁾ **MSL rating/Peak reflow:** The moisture sensitivity level ratings and peak solder (reflow) temperatures. In the event that a part has multiple moisture sensitivity ratings, only the lowest level per JEDEC standards is shown. Refer to the shipping label for the actual reflow temperature that will be used to mount the part to the printed circuit board.

⁽⁶⁾ **Part marking:** There may be an additional marking, which relates to the logo, the lot trace code information, or the environmental category of the part.

Multiple part markings will be inside parentheses. Only one part marking contained in parentheses and separated by a "~" will appear on a part. If a line is indented then it is a continuation of the previous line and the two combined represent the entire part marking for that device.

Important Information and Disclaimer: The information provided on this page represents TI's knowledge and belief as of the date that it is provided. TI bases its knowledge and belief on information provided by third parties, and makes no representation or warranty as to the accuracy of such information. Efforts are underway to better integrate information from third parties. TI has taken and continues to take reasonable steps to provide representative and accurate information but may not have conducted destructive testing or chemical analysis on incoming materials and chemicals. TI and TI suppliers consider certain information to be proprietary, and thus CAS numbers and other limited information may not be available for release.

In no event shall TI's liability arising out of such information exceed the total purchase price of the TI part(s) at issue in this document sold by TI to Customer on an annual basis.

TAPE AND REEL INFORMATION

*All dimensions are nominal

Device	Package Type	Package Drawing	Pins	SPQ	Reel Diameter (mm)	Reel Width W1 (mm)	A0 (mm)	B0 (mm)	K0 (mm)	P1 (mm)	W (mm)	Pin1 Quadrant
LMT89DCKR	SC70	DCK	5	3000	178.0	8.4	2.25	2.45	1.2	4.0	8.0	Q3

TAPE AND REEL BOX DIMENSIONS

PACKAGE OUTLINE

SOT - 1.1 max height

SMALL OUTLINE TRANSISTOR

4214834/G 11/2024

NOTES:

1. All linear dimensions are in millimeters. Any dimensions in parenthesis are for reference only. Dimensioning and tolerancing per ASME Y14.5M.
2. This drawing is subject to change without notice.
3. Reference JEDEC MO-203.
4. Support pin may differ or may not be present.
5. Lead width does not comply with JEDEC.
6. Body dimensions do not include mold flash, protrusions, or gate burrs. Mold flash, protrusions, or gate burrs shall not exceed 0.25mm per side.

EXAMPLE BOARD LAYOUT
