

LMX1204 Low-Noise, High-Frequency JESD Buffer/Multiplier/Divider

1 Features

- 300MHz to 12.8GHz output frequency
- Ultra-low noise
 - Noise floor of -161dBc/Hz at 6GHz output
 - $1/f$ Noise of -154dBc/Hz at 6GHz output, 10kHz offset
 - 5fs jitter (12kHz to 20MHz)
 - $<30\text{fs}$ additive jitter (DC to f_{CLK})
- 4 high-frequency clocks with corresponding SYSREF outputs
 - Shared divider that supports $\div 1$ (buffer mode), $\div 2$, 3, 4, 5, 6, 7, and 8
 - Shared PLL-based multiplier that supports $\times 1$ (filter mode), $\times 2$, $\times 3$, and $\times 4$
- LOGICLK and corresponding SYSREF outputs
 - On separate divide bank
 - $\div 1$, 2, 4 pre-divider
 - $\div 1$ (bypass), 2, ..., 1023 post divider
- 8 programmable output power levels
- Synchronized SYSREF clock outputs
 - 508 delay step adjustments of less than 2.5ps each at 12.8GHz
 - Generator and repeater modes
 - Windowing feature for SYSREFREQ pins to optimize timing
- SYNC feature to all divides and multiple devices
- 2.5V operating voltage
- -40°C to 85°C operating temperature

2 Applications

- Test & Measurement:
 - [Oscilloscope](#)
 - [Wireless equipment testers](#)
 - Wideband digitizers
- Aerospace & Defense:
 - [Radar](#)
 - [Electronic warfare](#)
 - [Seeker Front end](#)
 - Munitions
 - Phase array antenna / Beam forming
- General Purpose:
 - Data converter clocking
 - Clock buffer distribution / division

3 Description

The high-frequency capability and extremely low jitter of this device, makes a great approach to clock precision, high-frequency data converters without degradation to the signal-to-noise ratio. Each of the four high-frequency clock outputs, and additional LOGICLK output with larger divider range, is paired with a SYSREF output clock signal. The SYSREF signal for JESD interfaces can either be internally generated or passed in as an input and re-clocked to the device clocks. For data converter clocking applications, having the jitter of the clock be less than the aperture jitter of the data converter is critical. In applications where more than four data converters must be clocked, a variety of cascading architectures can be developed using multiple devices to distribute all the high-frequency clocks and SYSREF signals required. With low jitter and noise floor, this device combined with an ultra-low noise reference clock source is an exemplary selection for clocking data converters, especially when sampling above 3GHz.

Package Information

PART NUMBER	PACKAGE ⁽¹⁾	PACKAGE SIZE ⁽²⁾
LMX1204	RHA (VQFN, 40)	6.00mm × 6.00mm

- (1) For more information, see [Section 11](#).
- (2) The package size (length × width) is a nominal value and includes pins, where applicable.

4 Pin Configuration and Functions

Figure 4-1. RHA Package 40-Pin VQFN Top View

Table 4-1. Pin Functions

NAME	NO.	TYPE ⁽¹⁾	DESCRIPTION
BIAS01	20	BYP	If not using the multiplier, this pin can be left open. If using the multiplier, bypass this pin to GND with a 10-nF capacitor for optimal noise performance.
BIAS23	31	BYP	If not using the multiplier, this pin can be left open. If using the multiplier, bypass this pin to GND with a 10-μF and 0.1-μF capacitor for optimal noise performance.
CLKIN_N	7	I	Differential reference input clock. Internal 50-Ω termination. AC-couple with a capacitor appropriate to the input frequency (typically 0.1 μF or smaller). If using single-ended, terminate unused side with a series AC-coupling capacitor 50-Ω resistor to GND.
CLKIN_P	6		
CLKOUT0_N	15	O	Differential clock output pairs. Each pin is an open-collector output with internally integrated 50-Ω resistor with programmable output swing. AC coupling required.
CLKOUT0_P	14		
CLKOUT1_N	19		
CLKOUT1_P	18		
CLKOUT2_N	32		
CLKOUT2_P	33		
CLKOUT3_N	36		
CLKOUT3_P	37		
CS#	10	I	SPI chip select. High impedance CMOS input. Accepts up to 3.3 V.
DAP	DAP	GND	Ground these pins.
GND	5,13,17,26,34,38		
LOGICLKOUT_N	27	O	Differential clock output pair. Selectable CML, LVDS, or LVPECL format. Programmable common-mode voltage.
LOGICLKOUT_P	28		
LOGISYSREFOUT_N	23	O	Differential clock output pair. Selectable CML, LVDS, or LVPECL format. Programmable common-mode voltage.
LOGISYSREFOUT_P	24		
MUXOUT	1	O	Multiplexed pin serial data readback and lock status of the multiplier.
SCK	8	I	SPI clock. High impedance CMOS input. Accepts up to 3.3 V.
SDI	9	I	SPI data input. High impedance CMOS input. Accepts up to 3.3 V.
SYSREFREQ_N	3	I	Differential SYSREF request input for JESD204B support. Internal 50-Ω AC coupled to internal common-mode voltage or capacitor to GND. Supports AC and DC coupling which can directly accept a common mode voltage of 1.2 to 2 V.
SYSREFREQ_P	2		
SYSREFOUT0_N	12	O	Differential SYSREF CML output pairs for JESD204B support. Supports AC and DC coupling with programmable common-mode voltage of 0.6 to 2 volts.
SYSREFOUT0_P	11		
SYSREFOUT1_N	22		
SYSREFOUT1_P	21		
SYSREFOUT2_N	29		
SYSREFOUT2_P	30		
SYSREFOUT3_N	39		
SYSREFOUT3_P	40		
VCC_CLKIN	4	PWR	Connect to a 2.5-V supply. Recommend a shunt high frequency capacitor (typically 0.1 μF or smaller) close to the pin in parallel with larger capacitors (typically 1 μF and 10 μF) farther away.
VCC_LOGICLK	25		
VCC01	16		
VCC23	35		

(1) I = Input, O = Output, GND = Ground, PWR = Power, BYP = Bypass

5 Specifications

5.1 Absolute Maximum Ratings

over operating free-air temperature range (unless otherwise noted)⁽¹⁾

		MIN	MAX	UNIT
V _{DD}	Power supply voltage	−0.3	2.75	V
V _{IN}	DC Input Voltage (SCK, SDI, CSB)	GND	3.6	V
V _{IN}	DC Input Voltage (SYSREFREQ)	GND	V _{DD} + 0.3	V
V _{IN}	AC Input Voltage (CLKIN)		V _{DD}	V _{pp}
T _J	Junction temperature		150	°C
T _{stg}	Storage temperature	−65	150	°C

- (1) Operation outside the Absolute Maximum Ratings may cause permanent device damage. Absolute Maximum Ratings do not imply functional operation of the device at these or any other conditions beyond those listed under Recommended Operating Conditions. If used outside the Recommended Operating Conditions but within the Absolute Maximum Ratings, the device may not be fully functional, and this may affect device reliability, functionality, performance, and shorten the device lifetime.

5.2 ESD Ratings

			VALUE	UNIT
V _(ESD)	Electrostatic discharge	Human body model (HBM), per ANSI/ESDA/JEDEC JS-001, all pins ⁽¹⁾	±2500	V
		Charged device model (CDM), per JEDEC specification JESD22-C101, all pins ⁽²⁾	±500	

- (1) JEDEC document JEP155 states that 500-V HBM allows safe manufacturing with a standard ESD control process.
 (2) JEDEC document JEP157 states that 250-V CDM allows safe manufacturing with a standard ESD control process.

5.3 Recommended Operating Conditions

over operating free-air temperature range (unless otherwise noted)

		MIN	NOM	MAX	UNIT
V _{DD}	Supply voltage	2.4	2.5	2.6	V
T _A	Ambient temperature	−40		85	°C
T _J	Junction temperature			125	°C

5.4 Thermal Information

SYMBOL	THERMAL METRIC ⁽¹⁾	VALUE	UNIT
		RHA (VQFN)	
		40 Pins	
R _{θJA}	Junction-to-ambient thermal resistance	24.8	°C/W
R _{θJC(top)}	Junction-to-case (top) thermal resistance	13.0	°C/W
R _{θJB}	Junction-to-board thermal resistance	6.9	°C/W
Ψ _{JT}	Junction-to-top characterization parameter	0.1	°C/W
Ψ _{JB}	Junction-to-board characterization parameter	6.9	°C/W
R _{θJC(bot)}	Junction-to-case (bottom) thermal resistance	0.5	°C/W

- (1) For more information about traditional and new thermal metrics, see the [Semiconductor and IC Package Thermal Metrics](#) application note.

5.5 Electrical Characteristics

PARAMETER		TEST CONDITIONS		MIN	TYP	MAX	UNIT
Current Consumption							
I _{CC}	Supply Current ⁽¹⁾	Powered up, all outputs and SYSREF on		1050		mA	
		Powered up, all outputs on, all SYSREF off		600			
		Powered up, all outputs and SYSREF off		265

f _{OUT}	Output frequency	Buffer Mode		0.3	12.8		
f _{OUT}	Output frequency	x1 (filter mode) , x2, x3, x4		3.2	6.4		
f _{OUT}	Output frequency	LOGICLK output		1	800	MHz	
t _{CAL}	Calibration-time	Multiplier calibration time	f _{IN} = 3.2 GHz; x2 f _{SMCLK} = 28 MHz	750		μs	
P _{OUT}	Output power	Single-Ended	f _{CLKLOUT} = 6 GHz OUTx_PWR = 7	4		dBm	
t _{RISE}	Rise time (20% to 80%)	f _{CLKOUT} = 300 MHz		45		ps	
t _{FALL}	Fall time (20% to 80%)	f _{CLKOUT} = 300 MHz		45		ps	
Propagation Delay and Skew							
t _{SKEW}	Magnitude of skew between outputs	CLKOUTx to CLKOUTy, not LOGICLK		1	15	ps	

PARAMETER		TEST CONDITIONS		MIN	TYP	MAX	UNIT
Noise, Jitter, and Spurs							
J _{CKx}	Additive jitter	Additive Jitter. 12k to 100 MHz integration bandwidth.	Buffer Mode	5		fs, rms	
			Filter Mode	12			
			x2 Multiplier	16			
			x3 Multiplier	21			
			x4 Multiplier	26			
Flicker	1/f flicker noise	Slew Rate > 8 V/ns, f _{CLK} = 6 GHz	Buffer Mode	-154		dBc/Hz	
NF	Noise Floor	f _{OUT} = 6 GHz; f _{Offset} ≥ 100 MHz	Buffer Mode	-161		dBc/Hz	
NF			Divide-by-2	-160.5			
NF			Multiplier (x1, x2,x3,x4)	-161.5			
NFL	Noise Floor	LOGICLK output, 300 MHz	CML	-150.5		dBc/Hz	
NFL			LVDS	-151.5			
NFL			LVPECL	-153.5			
H2	Second harmonic	f _{OUT} = 6 GHz (differential), Buffer Mode		-25		dBc	
		f _{OUT} = 6 GHz (single-ended), Buffer Mode		-13			
		f _{OUT} = 6 GHz, single-ended, Divide by 2		-16			
H1/2	Input clock leakage spur	f _{OUT} = 6 GHz (single-ended)	x2 (f _{SPUR} = 3 GHz)	-40		dBc	
H1/3			x3 (f _{SPUR} = 2 GHz)	-50			
H1/4			x4 (f _{SPUR} = 1.5 GHz)	-54		dBc	
I _{SPUR}	LOGICLK to CLKOUT	f _{SPUR} = 300 MHz (differential)		-70		dBc	
Digital Interface (SCK, SDI, CS#, MUXOUT)							
V _{IH}	High-level input voltage	SCK, SDI, CS#		1.4		3.3	V
V _{IL}	Low-level input voltage			0		0.4	
V _{OH}	High-level output voltage	I _{OH} = 5 mA		1.4		V _{CC}	
		I _{OH} = 0.1 mA		2.2		V _{CC}	
V _{OL}	Low-level output voltage	I _{OL} = 5 mA				0.45	
I _{IH}	High-level input current			-42		42	uA
I _{IL}	Low-level input current			-25		25	

- (1) Unless Otherwise Stated, f_{CLKIN}=6 GHz, CLK_MUX=Buffer, All clocks on with OUTx_PWR=7, SYSREFREQ_MODE=1
(2) For powered down mode, if the LOGISYSREFOUT field is set to LVPECL mode AND the LVPECL resistors are placed, this powerdown current increases to approximately 40 mA.

5.6 Timing Requirements

		MIN	NOM	MAX	UNIT
Timing Requirements					
f_{SPI}	SPI Read/Write Speed			2	MHz
t_{CE}	Clock to enable low time	20			ns
t_{CS}	Clock to data wait time	20			ns
t_{CH}	Clock to data hold time	20			ns
t_{CWH}	Clock pulse width high	100			ns
t_{CWL}	Clock pulse width low	100			ns
t_{CES}	Enable to clock setup time	20			ns
t_{EWH}	Enable pulse width high	50			ns
t_{CD}	Falling clock edge to data wait time	100			ns

5.7 Timing Diagram

Figure 5-1. Serial Data Input Timing Diagram

There are several other considerations for writing on the SPI:

- The R/W bit must be set to 0.
- The data on SDI pin is clocked into a shift register on each rising edge on the SCK pin.
- The CS# must be held low for data to be clocked. The device ignores clock pulses if CS# is held high.
- Recommended SPI settings for this device are CPOL=0 and CPHA=0.
- When SCK and SDI lines are shared between devices, TI recommends to hold the CS# line high on the device that is not to be clocked.

There are several other considerations for SPI readback:

- The R/W bit must be set to 1.
- The MUXOUT pin is always be low for the address portion of the transaction.
- The data on MUXOUT is clocked out at the falling edge of SCK. In other words, the readback data is available at the MUXOUT pin t_{CD} after the clock falling edge.
- The data portion of the transition on the SDI line is always ignored.
- The MUXOUT pin does not automatically tri-state after a readback transaction completes. When sharing the SPI bus readback pin with other devices, set MUXOUT_EN=0 after all readback transactions from device are complete to manually tri-state the MUXOUT pin, permitting other devices to control the readback line.
- The values read back, even for R/W bits are not always the value written but rather an internal device state that takes into account the programmed value as well as other factors, such as pin states.

5.8 Typical Characteristics

Unless stated otherwise, the following conditions can be assumed: Temperature = 25°C, V_{CC} = 2.5 V, OUT_x_PWR=5, CLKIN driven differentially with 8 dBm at each pin. Signal source used is SMA100B with ultra-low noise option B711.

Noise Floor = -161 dBc/Hz, 1/f Noise = -154 dBc/Hz @ 10 kHz, Integrates to 28 fs jitter from 100 Hz to 6 GHz offset

6 Detailed Description

6.1 Overview

The LMX1204 has four main clock outputs and another LOGICLK output. The main clock outputs are all the same frequency. This frequency can be the same, divided, or multiplied relative to the input clock. Each of these clock outputs has programmable power level. The LOGICLK output frequency is independent and typically lower frequency than the other four main clocks and has programmable output format (CML, LVDS, LVPECL) and power level.

The SYSREF can be generated by either repeating the input from the SYSREFREQ pins, or internally generated. There is an internal SYSREF windowing feature that allows the internal timing of the device to be adjusted to optimize setup/hold times of the SYSREFREQ input with respect to the CLKIN input. This feature assumes that the delay between the SYSREF edge and the next rising clock edge is consistent. Each of the five outputs has a corresponding SYSREF output that has individual delays and programmable common mode. For the LOGISYSREF output, the output format is programmable as CML, LVDS, or LVPECL.

6.1.1 Range of Dividers and Multiplier

There are dividers that allow the main and LOGICLK outputs to be a divided value of the input clock. The main clock outputs also have a multiplier. In addition to this, dividers are used for SYSREF generation in generator mode as well as generation of the delay block.

Table 6-1. Range of Dividers and Multiplier

CATEGORY			RANGE	COMMENTS
Main Clocks	Buffer			
	Divider		2, 3, 4, ... 8	Odd divides (except 1) do not have 50% duty cycle
	Multiplier		1, 2, 3, 4	x1 Multiplier and Filter mode are the same thing.
LOGICLK	Divide	PreDivide	1, 2, 4	TotalDivide = PreDivide × Divide
		Divide	1, 2, 3, ... 1023	Odd divides (except 1) do not have 50% duty cycle
SYSREF	Divide for frequency generation	PreDivide	1, 2, 4	Pre-divides clock for phase interpolator.
		Divide	2, 3, 4, ... 4095	TotalDivide = PreDivide × Divide Odd divides do not have 50% duty cycle
	Divide for delay generation	Divide	2, 4, 8, 16	This divide is set according to the input frequency.

6.2 Functional Block Diagram

Figure 6-1. Functional Block Diagram

6.3 Feature Description

6.3.1 Power On Reset

When the device is powered up, the power on reset (POR) resets all registers to a default state as well as resets all state machines and dividers. For the power on reset state, all SYSREF outputs are disabled and all the dividers are bypassed; the device functions as a 4-output buffer. Users must wait 100 µs after the power supply rails before programming other registers to verify that the RESET is finished. If the power on reset happens when there is no device clock present, the device functions properly, however, the current changes once an input clock is presented.

Performing a software power on reset by writing RESET=1 in the SPI bus is both possible and generally good practice. The RESET bit self-clears once any other register is written to. The SPI bus can be used to override these states to the desired settings.

Although the device does have an automatic power on reset, the device can be impacted by different ramp rates on the different supply pins, especially in the presence of a strong input clock signal. Performing a software reset after POR is recommended. This reset can be done by programming RESET=1. The reset bit can be cleared by programming any other register or setting RESET back to zero. Even at maximum allowed SPI bus speed, the software reset event always completes before the subsequent SPI write.

6.3.2 Temperature Sensor

The junction temperature can be read back for purposes such as characterization or to make adjustments based on temperature. Such adjustments can include adjusting CLKOUTx_PWR to make the output power more stable or using external or digital delays to compensate for changes in propagation delay over temperature.

The junction temperature is typically higher than the ambient temperature due to power dissipation from the outputs and other functions on the device. Equation 1 shows the relationship between the code read back and the junction temperature.

$$\text{Temperature} = 0.65 \times \text{Code} - 351 \quad (1)$$

Equation 1 is based on a best-fit line created from three devices from slow, nominal, and fast corner lots (nine parts total). The worst-case variation of the actual temperature from the temperature predicted by the best-fit line is 13°C, which works out to 20 codes.

6.3.3 Clock Outputs

This device has four main output clocks which share a common frequency. This does not include the additional lower frequency LOGICLK output.

6.3.3.1 Clock Output Buffers

The output buffers have a format that is open collector with an integrated pullup resistor, similar to CML.

Figure 6-2. CLKOUT Output Buffer

The CLKOUTx_EN bits can enable the output buffers. The output power of the buffers can be individually set with the CLKOUTx_PWR field. However, these fields only control the output buffer, not the internal channel path that drives this buffer. To power down the entire path, disable the CHx_EN bit.

Table 6-2. Clock Output Power

CHx_EN	INTERNAL CHANNEL PATH	CLKOUTx_EN	CLKOUTx_PWR	OUTPUT BUFFER
0	Powered Down	Don't Care	Don't Care	Powered Down
1	Powered Up	0	Don't Care	Powered Down
		1	0	Minimum
			1	
			...	
			7	Maximum

6.3.3.2 Clock MUX

The four main clocks must be the same frequency, but this frequency can be bypassed, multiplied, or divided. This is determined by the CLK_MUX word.

Table 6-3. Clock MUX

CLK_MUX	OPTION	VALUES SUPPORTED
0	Buffer Mode	+1 (bypass)
1	Divider Mode	+2, 3, 4, 5, 6, 7, and 8
2	Multiplier Mode	x1 (filter mode), x2, x3, x4

6.3.3.3 Clock Divider

Set the CLK_MUX to Divided to a divide value by 2, 3, 4, 5, 6, 7, or 8. This is set by the CLK_DIV word. When using the clock divider, any change to the input frequency requires the CLK_DIV_RST bit to be toggled from 1 to 0.

Table 6-4. Clock Divider

CLK_DIV	DIVIDE	DUTY CYCLE
0	Reserved	n/a
1	2	50%
2	3	33%
3	4	50%

Table 6-4. Clock Divider (continued)

CLK_DIV	DIVIDE	DUTY CYCLE
4	5	40%
5	6	50%
6	7	43%
7	8	50%

6.3.3.4 Clock Multiplier and Filter Modes

6.3.3.4.1 General Information About the Clock Multiplier

The clock multiplier can be used to multiply up the input clock frequency by a factor of $\times 1$, $\times 2$, $\times 3$, or $\times 4$. The multiply value is set by the CLK_MULT field. As the multiplier is PLL-based and includes an integrated VCO, the multiplier has a state machine clock, requires calibration, has a lock detect feature, and can be used as a tunable filter. Note that if the multiplier is not being used, there is no need for the state machine clock or the lock detect feature.

6.3.3.4.2 State Machine Clock for the Clock Multiplier

The state machine clock frequency, f_{SMCLK} , is derived by dividing down the input clock frequency by a programmed divider value. The state machine clock is also necessary for the multiplier calibration and lock detect. If there are concerns about the state machine clock creating spurs, then the state machine can be shut off provided that the multiplier calibration is not running and the lock detect feature is not being used.

6.3.3.4.2.1 State Machine Clock

If not using the clock multiplier, the state machine clock must be disabled by setting SMCLK_EN=0 to minimize crosstalk and spurs. However, when using the clock multiplier, the state machine clock is required to run the calibration engine when the frequency is changed and also used to have the lock detect continuously monitor if the PLL-based clock multiplier is in lock. The state machine clock must be less than 30MHz. Consult the register map document for more details.

6.3.3.4.3 Calibration for the Clock Multiplier

For optimal phase noise, the VCO in the multiplier divides up the frequency range into many different bands and cores and has optimized amplitude settings for each one of these bands. For this reason, upon initial use, or whenever the frequency is changed, a calibration routine needs to be run to determine the correct core, frequency band, and amplitude setting. Calibration is performed by programming the R0 register with a valid input signal. Increasing the speed of the state machine clock speeds up the multiplier calibration time. To provide reliable multiplier calibration, the state machine clock frequency needs to be at least twice the SPI write speed, but no more than 30MHz. Whenever the CLK_MUX mode is changed or the multiplier is calibrated for the first time, the calibration time is substantially longer, on the order of 5ms.

6.3.3.4.4 Using the x1 Clock Multiplier as a Filter

As the multiplier is PLL based, the multiplier acts as a programmable filter that attenuates noise, spurs, harmonics, and sub-harmonics that are outside the PLL loop bandwidth (about 10MHz). Filter mode ($\times 1$ Multiplier) allows the user to use the clock multiplier as a tunable filter with 10MHz bandwidth that has lower additive noise than the higher multiply values. In this filter mode, the spurs are first amplified by the input stage and then attenuated by the loop filter making this mode most effective for filtering spurs at offsets of 100MHz or higher. Note that the filter mode is different than buffer mode because filter mode filters the input frequency, but adds more close in phase noise. A $\times 1$ multiplier value does not support the SYNC operation. At frequencies above 4.2GHz, there is a possibility of the subharmonics at $F_{ref}/3$. These subharmonics can be eliminated by using the filter at the output.

6.3.3.4.5 Lock Detect for the Clock Multiplier

The lock detect status of the multiplier can be read back through the rb_LD field or from the MUXOUT pin. The state machine clock must be running for the lock detect to work properly.

6.3.4 Device Functional Modes Configurations

The device can configure in high frequency clock buffer, divider or multiplier mode. Each mode requires the below register configurations for functioning.

Table 6-5. Configurations for Device Functional Modes

REGISTER ADDRESS	BIT	FIELD	FUNCTION	BUFFER	DIVIDER	MULTIPLIER
R25	2:0	CLK_MUX	Select the mode	1	2	3
R25	5:3	CLK_DIV / CLK_MULT	Select the division or multiplication value	x	CLK_DIV 0x1 = ÷2 0x2 = ÷3 0x3 = ÷4 0x4 = ÷5 0x5 = ÷6 0x6 = ÷7 0x7 = ÷8	CLK_MULT 0x2 = x2 0x3 = x3 0x4 = x4
R2	5	SMCLK_EN	Enables the state machine clock generator	x	x	1
R2	9:6	SMCLK_DIV_PRE	Sets pre-divider for state machine clock	x	x	Pre-clock divider for state machine clock 0x2 = ÷2 0x4 = ÷4 0x8 = ÷8
R3	2:0	SMCLK_DIV	Sets state machine clock divider	x	x	Additional SMCLK divider to keep output frequency must be ≤ 30 MHz. 0x0 = ÷1 0x1 = ÷2 0x2 = ÷4 0x3 = ÷8 0x4 = ÷16 0x5 = ÷32 0x6 = ÷64 0x7 = ÷128
R0	All	Calibrate Multiplier	Calibrate the PLL based multiplier	x	x	Write R0 for calibrate multiplier

6.3.5 LOGICLK Output

The LOGICLK output can be used to drive devices using lower frequency clocks, such as FPGAs. The LOGICLK output has a programmable output format and a corresponding SYSREF output.

6.3.5.1 LOGICLK Output Format

The LOGICLK output format can be programmed to LVDS, LVPECL, and CML modes. Depending on the format, the common mode can be programmable or external components can be required (see [Table 6-6](#)).

Table 6-6. LOGICLK Formats and Properties

LOGICLKOUT_FMT	FORMAT	EXTERNAL COMPONENTS REQUIRED	OUTPUT LEVEL	COMMON MODE
0	LVDS	None	Fixed	Programmable through LOGICLKOUT_VCM
1	LVPECL	Emitter Resistors	Fixed	Not programmable
2	CML	Pullup Resistors 50 Ω to V_{CC}	Programmable through LOGICLKOUT_PWR	Not programmable
3	Invalid			

6.3.5.2 LOGICLK_DIV_PRE and LOGICLK_DIV Dividers

The LOGICLK_DIV_PRE divider and LOGICLK_DIV dividers are used for the LOGICLK output. The LOGICLK_DIV_PRE divider is necessary to divide the frequency down to verify that the input to the LOGICLK_DIV divider is 3.2GHz or less. When LOGICLK_DIV is not even and not bypassed, the duty cycle is not 50%. Both the LOGICLK dividers are synchronized by the SYNC feature, which allows synchronization across multiple devices.

Table 6-7. Minimum N-Divider Restrictions

f_{CLKIN} (MHz)	LOGICLK_DIV_PRE	LOGICLK_DIV	TOTAL DIVIDE RANGE
$f_{CLKIN} \leq 3.2$ GHz	$\div 1, 2, 4$	$\div 1, 2, 3, \dots 1023$	[1, 2, ...1023] [2, 4, ... 2046] [4, 8, 4092]
$3.2\text{GHz} < f_{CLKIN} \leq 6.4$ GHz	$\div 2, 4$	$\div 1, 2, 3, \dots 1023$	[4, ... 2046] [4, 8, 4092]
$f_{CLKIN} > 6.4$ GHz	$\div 4$	1, 2, 3, ...1023	[8, 4092]

6.3.6 SYSREF

SYSREF allows a low frequency JESD204B/C compliant signal to be produced that is reclocked to a main or LOGICLK output. The delays between the CLKOUT and SYSREF outputs are adjustable with software. The SYSREF output can be configured as a generator using the internal SYSREF divider, or as a repeater duplicating the signal on the SYSREFREQ pins. The SYSREF generator for both the main clocks and the LOGICLK output are the same.

Table 6-8. SYSREF Modes

SYSREF_MODE	DESCRIPTION
0	Generator Mode Internal generator creates a continuous stream of SYSREF pulses. The SYSREFREQ pins or the SYSREFREQ_SPI bit can be used to gate the SYSREF divider from the channels for improved noise isolation without disrupting the synchronization of the SYSREF dividers. The SYSREFREQ pins or the SYSREFREQ_SPI bit must be high for a SYSREF output to come out.
1	Pulser Internal generator generates a burst of 1 - 16 pulses that is set by SYSREF_PULSE_COUNT that occurs after a rising edge on the SYSREFREQ pins or after changing SYSREFREQ_SPI bit from 0 to 1 (assuming SYSREFREQ pins to be forced to a low state).
2	Repeater Mode SYSREFREQ pins input are reclocked to clock outputs and then delayed in accordance to the SYSREF_DELAY_BYPASS field before sent to the SYSREFOUT output pins.

Figure 6-3. Functional Block Diagram of SYSREF Circuitry in Generator Mode

Figure 6-4. Functional Block Diagram of SYSREF Circuitry in Pulser Mode

Figure 6-5. Functional Block Diagram of SYSREF Circuitry in Repeater Mode

To operate the SYSREF_FREQ_SPI bit controlled SYSREF output (Pulser) and SYNC, set the SYSREF_FREQ pins to low logic state externally. For example, make sure the SYSREF_FREQ_N pin is at a higher level (400mV) than the SYSREF_FREQ_P pin and maintain the input common-mode voltage requirement.

Figure 6-6. SYSREFREQ Pin Logic Low Setup

As an example, to maintain the minimum 400mV voltage difference for a VCC of 2.5V, the current draw through 100Ω is 4mA. In this example, keep the SYSREFREQ_P pin at 1.4V DC, set the R2 to 350Ω and the R1 to 175 Ω with 1.8V at SYSREFREQ_N pin.

6.3.6.1 SYSREF Output Buffers

6.3.6.1.1 SYSREF Output Buffers for Main Clocks (SYSREFOUT)

The SYSREF outputs within the clock output channels have the same output buffer structure as the clock output buffer, with the addition of circuitry to adjust the common-mode voltage. The SYSREF outputs are CML outputs with a common-mode voltage that can be adjusted with the SYSREFOUTx_VCM field, and the output level that can be programmed with the SYSREFOUTx_PWR field. This feature is to allow DC coupling. Note that the CLKOUT outputs do not have adjustable common-mode voltage and must be AC coupled for optimal noise performance.

Figure 6-7. SYSREF Output Buffer

The common-mode voltage and output power are interrelated and can be simulated assuming a 100Ω differential load and no DC path to ground. The common mode voltage and output are interrelated as shown in [Table 6-9](#). As there is a restriction required for long term reliability that $V_{CM} - V_{OD}/2 \geq 0.5$ V combinations of V_{CM} and V_{OD} that do not satisfy this constraint are excluded from the table.

Table 6-9. Single-Ended Voltage (V_{OD}) and Common Mode Voltage (V_{CM})

SYSREFOUTx_PWR	SYSREFOUTx_VCM	V_{OD}	V_{CM}
0	0	0.31	0.91
	1	0.31	1.06
	2	0.31	1.23
	3	0.32	1.41
	4	0.32	1.58
	5	0.33	1.75
	6	0.33	1.94

5	3	0.58	0.54
	4	0.64	0.69
	5	0.67	0.98
	6	0.69	1.37
	7	0.71	1.72

Table 6-9. Single-Ended Voltage (V_{OD}) and Common Mode Voltage (V_{CM}) (continued)

SYSREFOUTx_PWR	SYSREFOUTx_VCM	V_{OD}	V_{CM}
6	5	0.73	0.84
	6	0.75	1.26
	7	0.78	1.64
7	5	0.78	0.73
	6	0.82	1.15
	7	0.84	1.57

6.3.6.1.2 SYSREF Output Buffer for LOGICLK

The LOGISYSREFOUT output supports the three formats of LVDS, LVPECL, and CML. The LOGISYSREFOUT_EN enables the output buffer and LOGISYSREF_FMT sets the format. LVDS mode allows programmable common mode, LVPECL and CML require external components, and CML allows programmable output power (see [Table 6-10](#)).

Table 6-10. LOGISYSREFOUT Output Buffer Configuration

LOGISYSREFOUT_EN	LOGISYSREF_FMT	LOGISYSREF FORMAT	EXTERNAL TERMINATION REQUIRED	OUTPUT POWER	OUTPUT COMMON MODE
0	Powered Down				
1	0	LVDS	None	Fixed	Programmable with LOGISYSREF_VCM
	1	LVPECL	Emitter Resistors	Fixed	Fixed
	2	CML	Pullup resistors 50 Ω to V_{CC}	Controlled by LOGISYSREF_PWR	LOGISYSREF_VCM has no impact, but this changes with LOGISYSREF_PWR.
	3	Reserved			

6.3.6.2 SYSREF Frequency and Delay Generation

The SYSREF circuitry can produce an output signal that is synchronized to f_{CLKIN} . This output can be a single pulse, series of pulses, or a continuous stream of pulses. In generator mode, the SYSREF_DIV_PRE and SYSREF_DIV values are used to divide the CLKIN frequency to a lower frequency that is reclocked to the output. In repeater mode, this signal is instead input at the SYSREFREQ pins. For each of the outputs, there is an independent delay control.

Table 6-11. SYSREF Modes

SYSREF_MODE	DESCRIPTION
0	Generator Mode (Continuous) Internal generator creates a continuous stream of SYSREF pulses. The SYSREFREQ pins or the SYSREFREQ_SPI field can be used to gate the SYSREF divider from the channels for improved noise isolation without disrupting the synchronization of the SYSREF dividers. The SYSREFREQ pins or the SYSREFREQ_SPI field must be high for a SYSREF output to come out.
1	Generator Mode (Pulser) Internal generator generates a burst of 1 - 16 pulses that is set by SYSREF_PULSE_COUNT that occurs after a rising edge on the SYSREFREQ pins
2	Repeater Mode SYSREFREQ pins are reclocked to clock outputs and then delayed in accordance to the SYSREF_DELAY_BYPASS field before being sent to the SYSREFOUT outputs.

Figure 6-8. SYSREF Generator Diagram

For the frequency of the SYSREF output in generator mode, the SYSREF_DIV_PRE divider is necessary to verify that the input of the SYSREF_DIV divider is not more than 3.2 GHz.

Table 6-12. SYSREF_DIV_PRE Setup

f_{CLKIN}	SYSREF_DIV_PRE	TOTAL SYSREF DIVIDE RANGE
3.2 GHz or Less	÷1, 2, or 4	+2,3,4,...16380
3.2 GHz < f_{CLKIN} ≤ 6.4 GHz	÷2 or 4	+4,6,8, ... 16380
f_{CLKIN} > 6.4 GHz	÷4	+8,12,16, ... 16380

For the delay, the input clock frequency is divided by SYSREF_DELAY_DIV to generate $f_{INTERPOLATOR}$. This has a restricted range as shown in Table 6-13. Note also that when SYSREF_DELAY_BYPASS=0 or 2 (delaygen engaged for generator mode), and SYSREF_MODE = 0 or 1 (a generator mode) the SYSREF output frequency must be a multiple of the phase interpolator frequency.

$$f_{INTERPOLATOR} \% f_{SYSREF} = 0.$$

Table 6-13. SYSREF Delay Setup

f_{CLKIN}	SYSREF_DELAY_DIV	SYSREFx_DELAY_SCALE	$f_{INTERPOLATOR}$
6.4 GHz < f_{CLKIN} ≤ 12.8GHz	16	0	0.4 to 0.8 GHz
3.2 GHz < f_{CLKIN} ≤ 6.4 GHz	8	0	0.4 to 0.8 GHz
1.6 GHz < f_{CLKIN} ≤ 3.2 GHz	4	0	0.4 to 0.8 GHz
0.8 GHz < f_{CLKIN} ≤ 1.6 GHz	2	0	0.4 to 0.8 GHz
0.4 GHz < f_{CLKIN} ≤ 0.8 GHz	2	1	0.2 to 0.4 GHz
0.3 GHz < f_{CLKIN} ≤ 0.4 GHz	2	2	0.15 to 0.2 GHz

The maximum delay is equal to the phase interpolator period and there are $4 \times 127 = 508$ different delay steps. Use Equation 2 to calculate the size of each step.

$$\text{DelayStepSize} = 1 / (f_{INTERPOLATOR} \times 508) = \text{SYSREF_DELAY_DIV} / (f_{CLKIN} \times 508) \quad (2)$$

Use Equation 3 to calculate the total delay.

$$\text{TotalDelay} = \text{DelayStepSize} \times \text{StepNumber} \quad (3)$$

Table 6-14 shows the number of steps for each delay.

Table 6-14. Calculation of StepNumber

SYSREFx_DELAY_PHASE	STEPNUMBER
3	127 - SYSREFx_DELAY_I
2	254 - SYSREFx_DELAY_Q
0	381 - SYSREFx_DELAY_I

Table 6-14. Calculation of StepNumber (continued)

SYSREFx_DELAY_PHASE	STEPNUMBER
1	508 - SYSREFx_DELAY_Q

The SYSREF_DELAY_BYPASS field selects between the delay generator output and the repeater mode bypass signal. When SYSREF_MODE is set to continuous or pulser mode, TI recommends to set SYSREF_DELAY_BYPASS to generator mode. If SYSREF_MODE is set to repeater mode, TI recommends to set SYSREF_DELAY_BYPASS to bypass mode.

6.3.6.3 SYSREFREQ pins and SYSREFREQ_SPI Field

The SYSREFREQ pins are multipurpose and can be used for SYNC, SYSREF requests, and SYSREF Windowing. These pins can be DC or AC coupled and have dual 50-Ω, single-ended termination with programmable common-mode support.

In addition to these pins, the SYSREFREQ_SPI field can be set to 1 to emulate the same effect as forcing these pins high, simplifying hardware in some cases.

6.3.6.3.1 SYSREFREQ Pins Common-Mode Voltage

The SYSREFREQ_P and SYSREFREQ_N pins can be driven either AC or DC coupled. When driven AC coupled, the common-mode voltage can be adjusted with the SYSREFREQ_VCM bit.

Table 6-15. SYSREFREQ Pin Common-Mode Voltage

SYSREFREQ_VCM	COMMON-MODE VOLTAGE
0	1.3V AC-coupled
1	1.1V AC-coupled
2	1.5V AC-coupled
3	No Bias (DC Coupled)

6.3.6.3.2 SYSREFREQ Windowing Feature

The SYSREF windowing can be used to internally calibrate the timing between the SYSREFREQ and CLKIN pins to optimize setup and hold timing and trim out any mismatches between SYSREFREQ and CLKIN paths. This feature requires that the timing from the SYSREFREQ rising edge to the CLKIN rising edge is consistent. The timing from the SYSREFREQ rising edge to the CLKIN rising edges can be tracked with the rb_CLKPOS field. Once the timing to the rising edge of the CLKIN pin is found, then the SYSREFREQ rising edge can be internally adjusted with the SYSREFREQ_DELAY_STEP and SYSREF_DELAY_STEPSIZE fields to optimize setup or hold times.

**Figure 6-9. SYSREFREQ Internal Timing Adjustment**

6.3.6.3.2.1 General Procedure Flowchart for SYSREF Windowing Operation

Figure 6-10. Flowchart for SYSREF Windowing Operation

Table 6-16. SYSREFREQ_DELAY_STEPSIZE

INPUT FREQUENCY	RECOMMENDED SYSREFREQ_DELAY_STEPSIZE	DELAY (ps)
$1.4\text{GHz} < f_{\text{CLKIN}} \leq 2.7\text{ GHz}$	0	22.25
$2.4\text{ GHz} < f_{\text{CLKIN}} \leq 4.7\text{ GHz}$	1	13
$3.1\text{ GHz} < f_{\text{CLKIN}} \leq 5.7\text{ GHz}$	2	10.5
$f_{\text{CLKIN}} \geq 4.5\text{ GHz}$	3	7.75

6.3.6.3.2.2 SYSREFREQ Repeater Mode With Delay Gen (Retime)

SYSREF repeater mode with delay enabled is possible with LMX to LMX fanout devices by retiming the SYSREFout at different edge of IQ gen. This retiming can have the delay margin between CLKIN and SYSREFREQ inputs based on SYSREF_DELAY_DIV value.

Table 6-17 shows how the total delay margin for the SYSREF windowing relates the various SYSREF settings.

Table 6-17. SYSREF Phase Adjust Settings for Retime in Repeater Mode

SYSREF_DELAY_DIV	POSITION CODE SELECTED DURING SYNC	EDGE FOR MAX MARGIN	TOTAL MARGIN IN CLKIN CYCLE	SYSREFx_DELA_Y_PHASE	SYSREFx_DELA_Y_Q	SYSREFx_DELA_Y_I
/2	Before 1 st edge	I	-1, +1	"11"	0	127
	After 1 st edge	Qz	-1, +1	"01"	127	0
	After 2 nd edge	Iz	-1, +1	"00"	0	127
/4	Before 1 st edge	Qz	-2, +2	"01"	127	0
	After 1 st edge	Iz	-2, +2	"00"	0	127
	After 2 nd edge	Q	-2, +2	"10"	127	0
/8	Before 1 st edge	Qz	-5, +3	"01"	127	0
	After 1 st edge	Qz	-4, +4	"01"	127	0
	After 2 nd edge	Qz	-3, +5	"01"	127	0
/16	Before 1 st edge	I	-9, +7	"11"	0	127
	After 1 st edge	I	-8, +8	"11"	0	127
	After 2 nd edge	I	-7, +9	"11"	0	127

Repeater retime mode is required to perform the SYSREF windowing in the initial phase to synchronize the SYSREF_DELAY_DIV in multiple devices. The user can later choose the SYSREFx_DELAY_PHASE, SYSREF_DELAY_Q and SYSREFx_DELAY_I settings for the selected edge for the SYNC.

Figure 6-11. SYSREF Windowing to Select the Edge Position for SYNC

This configuration must set the device in **SYSREF_MODE** R17[1:0] value "2" (Repeater mode) and **SYSREF_DELAY_BYPASS** R72[1:0] value "2" (Delay gen engaged in all modes).

For Glitch Free Output

- Keep the same state for the SYSREFREQ pin when switching from request mode to windowing mode and back to request mode. For example, if the SYSREFREQ pin is high (or low) when windowing mode starts, make sure the pin state is high (or low) again after windowing mode ends before programming CLKPOS_CAPTURE_EN.
- The SYSREFREQ pin must be set low when switching from or to SYNC mode.

Other Pointers With SYSREF Windowing

- The SYSREFREQ pins need to be held high for a minimum time of $3/f_{CLKIN} + 1.6\text{ns}$ and only after this time rb_CLKPOS field is valid.

- If the user infers multiple valid SYSREFREQ_DELAY_STEP values from rb_CLKPOS registers to avoid setup-hold violations, choosing the lowest valid SYSREFREQ_DELAY_STEP is recommended to minimize variation over temperature.

If Using SYNC Feature

- Only one SYSREFREQ pin rising edge is permitted per 75 input clock cycles
- SYSREFREQ has to stay high for >6 clock cycles

6.3.7 SYNC Feature

The SYNC feature allows the user to synchronize the CLK_DIV, LOGICLK_DIV, LOGICLK_DIV_PRE, SYSREF_DIV, SYSREF_DIV_PRE, and SYSREF_DELAY_DIV dividers so that the phase offset can be made consistent between power cycles. This allows multiple devices to be synchronized. This synchronization dividers can only be done through the SYSREFREQ pin, not the software.

6.4 Device Functional Modes

Table 6-18 shows the different modes for the device. The CLK_MUX field allows the user to configure the device as a buffer, divider, or multiplier. The SYSREF can also be enabled as well for applications that need this feature.

Table 6-18. Device Configurations

CLK_MUX	CLK_DIV / CLK_MULT	SYSREF_EN	FUNCTIONAL MODE
1	x	0	Buffer
		1	Buffer w/SYSREF
2	2,3,4,...,8	0	Divider
		1	Divider w/SYSREF
3	2,3,4	0	Multiplier
		1	Multiplier w/SYSREF

7.1 LMX1204 Registers

Table 7-1 lists the memory-mapped registers for the Device registers. All register addresses not listed in **Table 7-1** are undocumented addresses and can be considered reserved. Writing to undocumented addresses can prevent the device from working as intended. Unless specifically instructed by TI, do not write to undocumented addresses.

The recommended initial programming sequence starts by writing R0 with RESET = 0x1, followed by writing all registers required for the desired configuration in descending order (largest to smallest address). Registers related to specific features can be skipped if those features are not used, or if desired values do not differ from reset values. Several registers are documented only to allow readback of certain multiplier values, and can be omitted from initial programming or ignored entirely if the multiplier is not used.

Table 7-1. LMX1204 Registers

Address	Acronym	Features Requiring This Register	Section
0x0	R0	Powerdown, Reset, Multiplier Mode Calibration	Go
0x2	R2	Multiplier Mode (State Machine Clock)	Go
0x3	R3	Multiplier Mode (State Machine Clock), Output Enables	Go
0x4	R4	Output Enables, CLKOUT Power	Go
0x5	R5	CLKOUT Power, SYSREFOUT Power	Go
0x6	R6	LOGICLK Enable, SYSREFOUT Power/VCM	Go
0x7	R7	LOGICLK and LOGISYSREF	Go
0x8	R8	LOGICLK and LOGISYSREF	Go
0x9	R9	LOGICLK Divider, SYNC, SYSREFREQ	Go
0xB	R11	SYSREFREQ Windowing (readback)	Go
0xC	R12	SYSREFREQ Windowing (readback)	Go
0xD	R13	SYSREFREQ Windowing	Go
0xE	R14	SYSREFREQ Windowing, SYNC, SYSREF	Go
0xF	R15	SYSREFREQ Windowing, SYNC, SYSREF	Go
0x10	R16	SYSREF	Go
0x11	R17	SYSREF, SYSREFOUT Delay	Go
0x12	R18	SYSREFOUT Delay	Go
0x13	R19	SYSREFOUT Delay	Go
0x14	R20	SYSREFOUT Delay	Go
0x15	R21	SYSREFOUT Delay	Go
0x16	R22	SYSREFOUT Delay	Go
0x17	R23	Temperature Sensor, MUXOUT, SYSREFOUT Delay	Go
0x18	R24	Temperature Sensor	Go
0x19	R25	Multiplier Mode, Divider Mode	Go
0x1C	R28	Multiplier Mode (optional, partial assist calibration)	Go
0x1D	R29	Multiplier Mode (optional, partial assist calibration)	Go
0x21	R33	Multiplier Mode (RESERVED, must write in multiplier mode)	Go
0x22	R34	Multiplier Mode (RESERVED, must write in multiplier mode)	Go
0x41	R65	Multiplier Mode (read-only, optional, for partial assist calibration)	Go
0x43	R67	Multiplier Mode (RESERVED, must write in multiplier mode)	Go
0x48	R72	SYSREF	Go
0x4B	R75	Multiplier Mode (read-only, optional, lock detect)	Go
0x4F	R79	LOGICLK Divider (RESERVED, optional, for divider bypass)	Go
0x56	R86	MUXOUT (RESERVED, optional, for tri-state)	Go

Table 7-1. LMX1204 Registers (continued)

Address	Acronym	Features Requiring This Register	Section
0x5A	R90	LOGICLK Divider (RESERVED, optional, for divider bypass)	Go

Complex bit access types are encoded to fit into small table cells. [Device Access Type Codes](#) shows the codes that are used for access types in this section.

Table 7-2. Device Access Type Codes

Access Type	Code	Description
Read Type		
R	R	Read
Write Type		
W	W	Write

7.1.1 R0 Register (Offset = 0x0) [Reset = 0x0000]

R0 is shown in [Table 7-3](#).

Return to the [Summary Table](#).

Table 7-3. R0 Register Field Descriptions

Bit	Field	Type	Reset	Description
15:3	RESERVED	R	0x0000	Reserved (not used).
2	POWERDOWN	R/W	0x0	Sets the device in a low-power state. The states of other registers are maintained.
1	RESERVED	R/W	0x0	Reserved. If this register is written, set this bit to 0x0.
0	RESET	R/W	0x0	Soft Reset. Resets the entire logic and registers (equivalent to power-on reset). Self-clearing on next register write.

7.1.2 R2 Register (Offset = 0x2) [Reset = 0x0223]

R2 is shown in [Table 7-4](#).

Return to the [Summary Table](#).

Table 7-4. R2 Register Field Descriptions

Bit	Field	Type	Reset	Description
15:11	RESERVED	R	0x00	Reserved (not used).
10	RESERVED	R/W	0x0	Reserved. If this register is written, set this bit to 0x0.
9:6	SMCLK_DIV_PRE	R/W	0x8	Sets pre-divider for state machine clock. The state machine clock is divided from CLKIN. The output of the pre-divider must be ≤ 1600 MHz. Values other than those listed below are reserved. 0x2 = $\div 2$ 0x4 = $\div 4$ 0x8 = $\div 8$
5	SMCLK_EN	R/W	0x1	Enables the state machine clock generator. Only required to calibrate the multiplier, and for multiplier lock detect (including on MUXOUT pin). If the multiplier is not used, or if the multiplier lock detect feature is not used, the state machine clock generator can be disabled to minimize crosstalk.
4:0	RESERVED	R/W	0x03	Reserved. If this register is written, set these bits to 0x03.

7.1.3 R3 Register (Offset = 0x3) [Reset = 0xFF86]

R3 is shown in [Table 7-5](#).

Return to the [Summary Table](#).

Table 7-5. R3 Register Field Descriptions

Bit	Field	Type	Reset	Description
15	CH3_EN	R/W	0x1	Enables CH3 (CLKOUT3, SYSREFOUT3). Setting this bit to 0x0 completely disables all CH3 circuitry, overriding the state of other powerdown/enable bits.
14	CH2_EN	R/W	0x1	Enables CH2 (CLKOUT2, SYSREFOUT2). Setting this bit to 0x0 completely disables all CH2 circuitry, overriding the state of other powerdown/enable bits.
13	CH1_EN	R/W	0x1	Enables CH1 (CLKOUT1, SYSREFOUT1). Setting this bit to 0x0 completely disables all CH1 circuitry, overriding the state of other powerdown/enable bits.
12	CH0_EN	R/W	0x1	Enables CH0 (CLKOUT0, SYSREFOUT0). Setting this bit to 0x0 completely disables all CH0 circuitry, overriding the state of other powerdown/enable bits.
11	LOGIC_MUTE_CAL	R/W	0x1	Mutes LOGIC outputs (LOGICLKOUT, LOGISYSREFOUT) during multiplier calibration.
10	CH3_MUTE_CAL	R/W	0x1	Mutes CH3 (CLKOUT3, SYSREFOUT3) during multiplier calibration.
9	CH2_MUTE_CAL	R/W	0x1	Mutes CH2 (CLKOUT2, SYSREFOUT2) during multiplier calibration.
8	CH1_MUTE_CAL	R/W	0x1	Mutes CH1 (CLKOUT1, SYSREFOUT1) during multiplier calibration.
7	CH0_MUTE_CAL	R/W	0x1	Mutes CH0 (CLKOUT0, SYSREFOUT0) during multiplier calibration.
6:3	RESERVED	R/W	0x0	Reserved. If this register is written, set these bits to 0x0.
2:0	SMCLK_DIV	R/W	0x6	Sets state machine clock divider. Further divides the output of the state machine clock pre-divider. Input frequency from SMCLK_DIV_PRE must be ≤ 1600 MHz. Output frequency must be ≤ 30 MHz. Divide value is $2^{\text{SMCLK_DIV}}$. 0x0 = $\div 1$ 0x1 = $\div 2$ 0x2 = $\div 4$ 0x3 = $\div 8$ 0x4 = $\div 16$ 0x5 = $\div 32$ 0x6 = $\div 64$ 0x7 = $\div 128$

7.1.4 R4 Register (Offset = 0x4) [Reset = 0x360F]

R4 is shown in [Table 7-6](#).

Return to the [Summary Table](#).

Table 7-6. R4 Register Field Descriptions

Bit	Field	Type	Reset	Description
15:14	RESERVED	R	0x0	Reserved (not used).
13:11	CLKOUT1_PWR	R/W	0x6	Sets the output power of CLKOUT1. Larger values correspond to higher output power.
10:8	CLKOUT0_PWR	R/W	0x6	Sets the output power of CLKOUT0. Larger values correspond to higher output power.
7	SYSREFOUT3_EN	R/W	0x0	Enables SYSREFOUT3 output buffer.
6	SYSREFOUT2_EN	R/W	0x0	Enables SYSREFOUT2 output buffer.
5	SYSREFOUT1_EN	R/W	0x0	Enables SYSREFOUT1 output buffer.
4	SYSREFOUT0_EN	R/W	0x0	Enables SYSREFOUT0 output buffer.
3	CLKOUT3_EN	R/W	0x1	Enables CLKOUT3 output buffer.
2	CLKOUT2_EN	R/W	0x1	Enables CLKOUT2 output buffer.
1	CLKOUT1_EN	R/W	0x1	Enables CLKOUT1 output buffer.
0	CLKOUT0_EN	R/W	0x1	Enables CLKOUT0 output buffer.

7.1.5 R5 Register (Offset = 0x5) [Reset = 0x4936]

R5 is shown in [Table 7-7](#).

Return to the [Summary Table](#).

Table 7-7. R5 Register Field Descriptions

Bit	Field	Type	Reset	Description
15	RESERVED	R	0x0	Reserved (not used).
14:12	SYSREFOUT2_PWR	R/W	0x4	Sets the output power of SYSREFOUT2. Larger values correspond to higher output power. SYSREFOUT2_VCM must be set properly to bring the output common-mode voltage within permissible limits. See also R6 Register .
11:9	SYSREFOUT1_PWR	R/W	0x4	Sets the output power of SYSREFOUT1. Larger values correspond to higher output power. SYSREFOUT1_VCM must be set properly to bring the output common-mode voltage within permissible limits. See also R6 Register .
8:6	SYSREFOUT0_PWR	R/W	0x4	Sets the output power of SYSREFOUT0. Larger values correspond to higher output power. SYSREFOUT0_VCM must be set properly to bring the output common-mode voltage within permissible limits. See also R6 Register .
5:3	CLKOUT3_PWR	R/W	0x6	Sets the output power of CLKOUT3. Larger values correspond to higher output power.
2:0	CLKOUT2_PWR	R/W	0x6	Sets the output power of CLKOUT2. Larger values correspond to higher output power.

7.1.6 R6 Register (Offset = 0x6) [Reset = 0x36D6]

R6 is shown in [Table 7-8](#).

Return to the [Summary Table](#).

Table 7-8. R6 Register Field Descriptions

Bit	Field	Type	Reset	Description
15	LOGICLKOUT_EN	R/W	0x0	Enables the LOGICLKOUT output buffer.
14:12	SYSREFOUT3_VCM	R/W	0x3	Sets the output common mode of SYSREFOUT3. SYSREFOUT3_PWR must be set properly to bring the minimum and maximum output voltage within permissible limits.
11:9	SYSREFOUT2_VCM	R/W	0x3	Sets the output common mode of SYSREFOUT2. SYSREFOUT2_PWR must be set properly to bring the minimum and maximum output voltage within permissible limits. See also R5 Register .
8:6	SYSREFOUT1_VCM	R/W	0x3	Sets the output common mode of SYSREFOUT1. SYSREFOUT1_PWR must be set properly to bring the minimum and maximum output voltage within permissible limits. See also R5 Register .
5:3	SYSREFOUT0_VCM	R/W	0x3	Sets the output common mode of SYSREFOUT0. SYSREFOUT0_PWR must be set properly to bring the minimum and maximum output voltage within permissible limits. See also R5 Register .
2:0	SYSREFOUT3_PWR	R/W	0x4	Sets the output power of SYSREFOUT3. Larger values correspond to higher output power. SYSREFOUT3_VCM must be set properly to bring the output common-mode voltage within permissible limits.

7.1.7 R7 Register (Offset = 0x7) [Reset = 0x0000]

R7 is shown in [Table 7-9](#).

Return to the [Summary Table](#).

Table 7-9. R7 Register Field Descriptions

Bit	Field	Type	Reset	Description
15	RESERVED	R	0x0	Reserved (not used).
14:13	LOGISYSREFOUT_VCM	R/W	0x0	Sets the output common mode of LOGISYSREFOUT in LVDS format. Other output formats (CML, LVPECL) ignore this field. 0x0 = 1.2 V 0x1 = 1.1 V 0x2 = 1.0 V 0x3 = 0.9 V
12:11	LOGICLKOUT_VCM	R/W	0x0	Sets the output common mode of LOGICLKOUT in LVDS format. Other output formats (CML, LVPECL) ignore this field. 0x0 = 1.2 V 0x1 = 1.1 V 0x2 = 1.0 V 0x3 = 0.9 V
10:9	LOGISYSREFOUT_PREDRV_PWR	R/W	0x0	Sets the output power of the LOGISYSREFOUT pre-driver. Larger values correspond to higher output power. Default value is sufficient for typical use.
8:7	LOGICLKOUT_PREDRV_PWR	R/W	0x0	Sets the output power of the LOGICLKOUT pre-driver. Larger values correspond to higher output power. Default value is sufficient for typical use.
6:4	LOGISYSREFOUT_PWR	R/W	0x0	Sets the output power of LOGISYSREFOUT in CML format. Larger values correspond to higher output power. Other output formats (LVDS, LVPECL) ignore this field. Valid range is 0x0 to 0x3.
3:1	LOGICLKOUT_PWR	R/W	0x0	Sets the output power of LOGICLKOUT in CML format. Larger values correspond to higher output power. Other output formats (LVDS, LVPECL) ignore this field. Valid range is 0x0 to 0x3.
0	LOGISYSREFOUT_EN	R/W	0x0	Enables LOGISYSREFOUT output buffer.

7.1.8 R8 Register (Offset = 0x8) [Reset = 0x0120]

R8 is shown in [Table 7-10](#).

Return to the [Summary Table](#).

Table 7-10. R8 Register Field Descriptions

Bit	Field	Type	Reset	Description
15:9	RESERVED	R	0x00	Reserved (not used).
8:6	LOGICLK_DIV_PRE	R/W	0x4	Sets pre-divider value for logic clock divider. Output of the pre-divider must be ≤ 3.2 GHz. Values other than those listed below are reserved. 0x1 = $\div 1$ 0x2 = $\div 2$ 0x4 = $\div 4$
5	RESERVED	R/W	0x1	Reserved. If this register is written, set this bit to 0x1.
4	LOGIC_EN	R/W	0x0	Enables LOGICLK subsystem (LOGICLKOUT, LOGISYSREFOUT). Setting this bit to 0x0 completely disables all LOGICLKOUT and LOGISYSREFOUT circuitry, overriding the state of other powerdown/enable bits.
3:2	LOGISYSREFOUT_FMT	R/W	0x0	Selects the output driver format of the LOGISYSREFOUT output. LVDS allows for common mode control with LOGISYSREFOUT_VCM field. CML allows for output power control with LOGISYSREFOUT_PWR field. CML format requires external 50- Ω pull-up resistors. LVPECL requires external 220- Ω emitter resistors to GND when AC-coupled, or 50- Ω to VCC - 2 V (0.5 V) when DC-coupled. See also R7 Register . 0x0 = LVDS 0x1 = LVPECL 0x2 = CML 0x3 = Reserved
1:0	LOGICLKOUT_FMT	R/W	0x0	Selects the output driver format of the LOGICLKOUT output. LVDS allows for common mode control with LOGICLKOUT_VCM field. CML allows for output power control with LOGICLKOUT_PWR field. CML format requires external 50- Ω pull-up resistors. LVPECL requires external 220- Ω emitter resistors to GND when AC-coupled, or 50- Ω to VCC - 2 V (0.5 V) when DC-coupled. See also R7 Register . 0x0 = LVDS 0x1 = LVPECL 0x2 = CML 0x3 = Reserved

7.1.9 R9 Register (Offset = 0x9) [Reset = 0x001E]

R9 is shown in [Table 7-11](#).

Return to the [Summary Table](#).

Table 7-11. R9 Register Field Descriptions

Bit	Field	Type	Reset	Description
15:14	SYSREFREQ_VCM	R/W	0x0	Sets the internal DC Bias for the SYSREFREQ pins. Bias must be enabled for AC-coupled inputs; but can be enabled and overdriven, or disabled, for DC-coupled inputs. SYSREFREQ DC pin voltage must be in the range of 0.7 V to VCC, including minimum and maximum signal swing. 0x0 = 1.3 V 0x1 = 1.1 V 0x2 = 1.5 V 0x3 = Disabled (DC-coupled only)
13	SYNC_EN	R/W	0x0	Enables synchronization path for the dividers and allows the clock position capture circuitry to be enabled. Used for multi-device synchronization. Redundant if SYSREF_EN = 0x1.
12	LOGICLK_DIV_PD	R/W	0x0	Disables the LOGICLK divider. LOGICLK pre-divider remains enabled. Used to reduce current consumption when bypassing the LOGICLK divider. When LOGICLK_DIV_PRE = 0x2 or 0x4, this bit must be set to 0x0.
11	LOGICLK_DIV_BYPASS	R/W	0x0	Bypasses the LOGICLK divider, deriving LOGICLK output directly from the pre-divider. Used to achieve divide-by-1 when LOGICLK_DIV_PRE = 0x1. When LOGICLK_DIV_PRE = 0x2 or 0x4, this bit must be set to 0x0. When LOGICLK_DIV_BYPASS = 0x1, set R90[6:5] = 0x3 and R79[9:8] = 0x0. When LOGICLK_DIV_BYPASS = 0x0, if R90[6:5] = 0x3 due to previous user setting, set R90[6:5] = 0x0. When LOGICLK_DIV_BYPASS = 0x1, the LOGICLKOUT frequency must be ≤ 800 MHz to avoid amplitude degradation. See also R79 Register and R90 Register .
10	RESERVED	R/W	0x0	Reserved. If this register is written, set this bit to 0x0.
9:0	LOGICLK_DIV	R/W	0x1E	Sets LOGICLK divider value. Maximum input frequency from LOGICLK_DIV_PRE must be ≤ 3200 MHz. The maximum LOGICLKOUT frequency must be ≤ 800 MHz to avoid amplitude degradation. 0x0: Reserved 0x1: Reserved 0x2: ÷2 0x3: ÷3 ... 0x1FF: ÷1023

7.1.10 R11 Register (Offset = 0xB) [Reset = 0xFFFF]

R11 is shown in [Table 7-12](#).

Return to the [Summary Table](#).

Table 7-12. R11 Register Field Descriptions

Bit	Field	Type	Reset	Description
15:0	rb_CLKPOS[15:0]	R	0xFFFF	Stores a snapshot of the CLKIN signal rising edge positions relative to a SYSREFREQ rising edge, with the snapshot starting from the LSB and ending at the MSB. Each bit represents a sample of the CLKIN signal, separated by a delay determined by the SYSREFREQ_DELAY_STEPSIZE field. The first and last bits of rb_CLKPOS are always set, indicating uncertainty at the capture window boundary conditions. CLKIN rising edges are represented by every sequence of two set bits from LSB to MSB, including bits at the boundary conditions. The position of the CLKIN rising edges in the snapshot, along with the CLKIN signal period and the delay step size, can be used to compute the value of SYSREFREQ_DELAY_STEP which maximizes setup and hold times for SYNC signals on the SYSREFREQ pins. See also R12 Register , R13 Register , R14 Register , and R15 Register .

7.1.11 R12 Register (Offset = 0xC) [Reset = 0xFFFF]

R12 is shown in [Table 7-13](#).

Return to the [Summary Table](#).

Table 7-13. R12 Register Field Descriptions

Bit	Field	Type	Reset	Description
15:0	rb_CLKPOS[31:16]	R	0xFFFF	MSBs of rb_CLKPOS field. See also R11 Register , R13 Register , R14 Register , and R15 Register .

7.1.12 R13 Register (Offset = 0xD) [Reset = 0x0003]

R13 is shown in [Table 7-14](#).

Return to the [Summary Table](#).

Table 7-14. R13 Register Field Descriptions

Bit	Field	Type	Reset	Description
15:2	RESERVED	R	0x0000	Reserved (not used).
1:0	SYSREFREQ_DELAY_STEPSIZE	R/W	0x3	Sets the step size of the delay element used in the SYSREFREQ path, both for SYSREFREQ input delay and for clock position captures. The recommended frequency range for each step size creates the maximum number of usable steps for a given CLKIN frequency. The ranges include some overlap to account for process and temperature variations. If the CLKIN frequency is covered by an overlapping span, larger delay step sizes improve the likelihood of detecting a CLKIN rising edge during a clock position capture. However, since larger values include more delay steps, larger step sizes have greater total delay variation across PVT relative to smaller step sizes. See also R11 Register , R12 Register , R14 Register , and R15 Register . 0x0 = 28 ps (1.4 GHz to 2.7 GHz) 0x1 = 15 ps (2.4 GHz to 4.7 GHz) 0x2 = 11 ps (3.1 GHz to 5.7 GHz) 0x3 = 8 ps (4.5 GHz to 12.8 GHz)

7.1.13 R14 Register (Offset = 0xE) [Reset = 0x0002]

R14 is shown in [Table 7-15](#).

Return to the [Summary Table](#).

Table 7-15. R14 Register Field Descriptions

Bit	Field	Type	Reset	Description
15:9	RESERVED	R/W	0x00	Reserved. If this register is written, set these bits to 0x00.
8	SYNC_MUTE_PD	R/W	0x0	Removes the mute condition on the SYSREFOUT and LOGISYSREFOUT pins during SYNC mode (SYSREFREQ_MODE = 0x0). Since the SYNC operation also resets the SYSREF dividers, the mute condition is usually desirable, and this bit can be left at the default value.
7:3	RESERVED	R/W	0x00	Reserved. If this register is written, set these bits to 0x00.
2	CLKPOS_CAPTURE_EN	R/W	0x0	Enables the windowing circuit which captures the clock position in the rb_CLKPOS registers with respect to a SYSREF edge. The windowing circuit must be cleared by toggling SYSREFREQ_CLR high then low before a clock position capture. The first rising edge on the SYSREFREQ pins after clearing the windowing circuit triggers the capture. The capture circuitry greatly increases supply current, and does not need to be enabled to delay the SYSREFREQ signal in SYNC or SYSREF modes. Once the desired value of SYSREFREQ_DELAY_STEP is determined, set this bit to 0x0 to minimize current consumption. If SYNC_EN = 0x0 and SYSREF_EN = 0x0, the value of this bit is ignored, and the windowing circuit is disabled. See also R11 Register , R12 Register , R13 Register , and R15 Register .
1	SYSREFREQ_MODE	R/W	0x1	Selects the function of the SYSREFREQ pins. 0x0 = SYNC Pin 0x1 = SYSREFREQ Pin
0	SYSREFREQ_LATCH	R/W	0x0	Latches the internal SYSREFREQ state to logic high on the first rising edge of the SYSREFREQ pins. This latch can be cleared by setting SYSREFREQ_CLR to 0x1, or bypassed by setting SYSREFREQ_LATCH to 0x0. See also R15 Register .

7.1.14 R15 Register (Offset = 0xF) [Reset = 0x0901]

R15 is shown in [Table 7-16](#).

Return to the [Summary Table](#).

Table 7-16. R15 Register Field Descriptions

Bit	Field	Type	Reset	Description
15:12	RESERVED	R	0x0	Reserved (not used).
11:10	SYSREF_DIV_PRE	R/W	0x2	Sets the SYSREF pre-divider. Maximum output frequency must be ≤ 3.2 GHz. 0x0 = ÷1 0x1 = ÷2 0x2 = ÷4 0x3 = Reserved
9:8	RESERVED	R/W	0x1	Reserved. If this register is written, set these bits to 0x1.
7	SYSREF_EN	R/W	0x0	Enables SYSREF subsystem (and SYNC subsystem when SYSREFREQ_MODE = 0x0). Setting this bit to 0x0 completely disables all SYNC, SYSREF, and clock position capture circuitry, overriding the state of other powerdown/enable bits <i>except</i> SYNC_EN. If SYNC_EN = 0x1, the SYNC path and clock position capture circuitry are still enabled, regardless of the state of SYSREF_EN.
6:1	SYSREFREQ_DELAY_STEP	R/W	0x0	Sets the delay line step for the external SYSREFREQ signal. Each delay line step delays the SYSREFREQ signal by an amount equal to SYSREFREQ_DELAY_STEP x SYSREFREQ_DELAY_STEPSIZE. In SYNC mode, the value for this field can be determined based on the rb_CLKPOS value to satisfy the internal setup and hold time of the SYNC signal with respect to the CLKIN signal. In SYSREF Repeater Mode, the value for this field can be used as a coarse global delay. Values greater than 0x3F are invalid. Since larger values include more delay steps, larger values have greater total step size variation across PVT relative to smaller values. Refer to the data sheet or the device TICS Pro profile for detailed description of the delay step computation procedure. See also R11 Register , R12 Register , R13 Register , and R14 Register .
0	SYSREFREQ_CLR	R/W	0x1	Clears SYSREFREQ_LATCH, which resets the SYSREFREQ input latch, the internal divider synchronization retimers, and the clock position capture flip-flops comprising rb_CLKPOS. When set, holds the internal SYSREFREQ signal low in all modes except SYSREF repeater mode, overriding the state of SYSREFREQ_SPI. This bit must be set and cleared once before the SYNC or clock position capture operations are performed. See also R14 Register .

7.1.15 R16 Register (Offset = 0x10) [Reset = 0x1003]

R16 is shown in [Table 7-17](#).

Return to the [Summary Table](#).

Table 7-17. R16 Register Field Descriptions

Bit	Field	Type	Reset	Description
15:12	SYSREF_PULSE_COUNT	R/W	0x1	Programs the number of pulses generated in pulser mode. The pulser is a counter gating the SYSREF divider; consequently, the pulse duration and frequency are equal to the duty cycle and frequency of the SYSREF divider output, respectively. 0x0: Reserved 0x1: 1 pulse 0x2: 2 pulses ... 0xF: 15 pulses
11:0	SYSREF_DIV	R/W	0x3	Sets the SYSREF divider. Maximum input frequency from SYSREF_DIV_PRE must be ≤ 3200 MHz. Maximum output frequency must be ≤ 100 MHz. Odd divides (with duty cycle $\neq 50\%$) are only allowed when the delay generators are bypassed. See also R72 Register . 0x0: Reserved 0x1: Reserved 0x2: +2 0x3: +3 ... 0xFFF: +4095

7.1.16 R17 Register (Offset = 0x11) [Reset = 0x07F0]

R17 is shown in [Table 7-18](#).

Return to the [Summary Table](#).

Table 7-18. R17 Register Field Descriptions

Bit	Field	Type	Reset	Description
15:11	RESERVED	R	0x0	Reserved (not used).
10:4	SYSREFOUT0_DELAY_I	R/W	0x7F	Sets the delay step for the SYSREFOUT0 delay generator. Must satisfy $\text{SYSREFOUT0_DELAY_I} + \text{SYSREFOUT0_DELAY_Q} = 0x7F$. Consult the data sheet for configuration instructions. See also R18 Register and R22 Register .
3:2	SYSREFOUT0_DELAY_PHASE	R/W	0x0	Sets the quadrature phase of the interpolator clock used for the SYSREFOUT0 delay generator retimer. Consult the data sheet for configuration instructions. See also R18 Register and R22 Register . 0x0 = $\overline{\text{ICLK}}$ 0x1 = $\overline{\text{QCLK}}$ 0x2 = QCLK 0x3 = ICLK
1:0	SYSREF_MODE	R/W	0x0	Controls how the SYSREF signal is generated or repeated. See also SYSREF_DELAY_BYPASS in R79 Register for additional configuration options. 0x0 = Continuous (Generator Mode) 0x1 = Pulser (Generator Mode) 0x2 = Repeater (Repeater Mode) 0x3 = Reserved

R22 is shown in [Table 7-23](#).

Return to the [Summary Table](#).

Table 7-23. R22 Register Field Descriptions

Bit	Field	Type	Reset	Description
15:14	SYSREFOUT1_DELAY_SCALE	R/W	0x0	Sets the frequency range of the SYSREFOUT1 delay generator. Set according to $f_{\text{INTERPOLATOR}}$ frequency. Consult the data sheet for configuration instructions. See also R18 Register and R19 Register . 0x0 = 400 MHz to 800 MHz 0x1 = 200 MHz to 400 MHz 0x2 = 150 MHz to 200 MHz 0x3 = Reserved
13:12	SYSREFOUT0_DELAY_SCALE	R/W	0x0	Sets the frequency range of the SYSREFOUT0 delay generator. Set according to $f_{\text{INTERPOLATOR}}$ frequency. Consult the data sheet for configuration instructions. See also R17 Register and R18 Register . 0x0 = 400 MHz to 800 MHz 0x1 = 200 MHz to 400 MHz 0x2 = 150 MHz to 200 MHz 0x3 = Reserved
11:9	SYSREF_DELAY_DIV	R/W	0x4	Sets the delay generator clock division, determining $f_{\text{INTERPOLATOR}}$ and the delay generator resolution. Values other than those listed below are reserved. See also R23 Register . 0x0 = ± 2 (≤ 1.6 GHz) 0x1 = ± 4 (1.6 GHz to 3.2 GHz) 0x2 = ± 8 (3.2 GHz to 6.4 GHz) 0x4 = ± 16 (6.4 GHz to 12.8 GHz)
8:7	RESERVED	R/W	0x0	Reserved. If this register is written, set these bits to 0x0.
6:0	LOGISYSREFOUT_DELAY_Q	R/W	0x0	Sets the delay step for the LOGISYSREFOUT delay generator. Must satisfy LOGISYSREFOUT_DELAY_I + LOGISYSREFOUT_DELAY_Q = 0x7F. See also R21 Register and R23 Register .

7.1.22 R23 Register (Offset = 0x17) [Reset = 0x4000]

R23 is shown in [Table 7-24](#).

Return to the [Summary Table](#).

Table 7-24. R23 Register Field Descriptions

Bit	Field	Type	Reset	Description
15	EN_TEMPSENSE	R/W	0x0	Enables the on-die temperature sensor. Temperature sensor counter (EN_TS_COUNT) must also be enabled for readback. See also R24 Register .
14	RESERVED	R/W	0x1	Reserved. If this register is written, set this bit to 0x1.
13	MUXOUT_EN	R/W	0x0	Enables or tri-states the MUXOUT pin driver. See also R86 Register . 0x0 = Tri-State 0x1 = Push-Pull
12:7	RESERVED	R/W	0x00	Reserved. If this register is written, set these bits to 0x00.
6	MUXOUT_SEL	R/W	0x0	Selects MUXOUT pin function. 0x0 = Lock Detect (Multiplier Only) 0x1 = SDO (SPI readback)
5:4	LOGISYSREFOUT_DELAY_SCALE	R/W	0x0	Sets the frequency range of the LOGISYSREFOUT delay generator. Set according to $f_{\text{INTERPOLATOR}}$ frequency. Consult the data sheet for configuration instructions. See also R21 Register and R22 Register . 0x0 = 400 MHz to 800 MHz 0x1 = 200 MHz to 400 MHz 0x2 = 150 MHz to 200 MHz 0x3 = Reserved
3:2	SYSREFOUT3_DELAY_SCALE	R/W	0x0	Sets the frequency range of the SYSREFOUT3 delay generator. Set according to $f_{\text{INTERPOLATOR}}$ frequency. Consult the data sheet for configuration instructions. See also R20 Register , R21 Register , and R22 Register . 0x0 = 400 MHz to 800 MHz 0x1 = 200 MHz to 400 MHz 0x2 = 150 MHz to 200 MHz 0x3 = Reserved
1:0	SYSREFOUT2_DELAY_SCALE	R/W	0x0	Sets the frequency range of the SYSREFOUT2 delay generator. Set according to $f_{\text{INTERPOLATOR}}$ frequency. Consult the data sheet for configuration instructions. See also R19 Register , R20 Register , and R22 Register . 0x0 = 400 MHz to 800 MHz 0x1 = 200 MHz to 400 MHz 0x2 = 150 MHz to 200 MHz 0x3 = Reserved

7.1.23 R24 Register (Offset = 0x18) [Reset = 0x0FFE]

R24 is shown in [Table 7-25](#).

Return to the [Summary Table](#).

Table 7-25. R24 Register Field Descriptions

Bit	Field	Type	Reset	Description
15:14	RESERVED	R	0x0	Reserved (not used).
13:12	RESERVED	R/W	0x0	Reserved. If this register is written, set these bits to 0x0.
11:1	rb_TEMPSENSE	R	0x7FF	Output of on-die temperature sensor. Readback code can be converted to junction temperature (in °C) according to the following equation: $T_J = 0.65 * rb_TEMPSENSE - 351$
0	EN_TS_COUNT	R/W	0x0	Enables temperature sensor counter. Temperature sensor (EN_TEMPSENSE) must be enabled for accurate data. See also R23 Register .

7.1.24 R25 Register (Offset = 0x19) [Reset = 0x0211]

R25 is shown in [Table 7-26](#).

Return to the [Summary Table](#).

Table 7-26. R25 Register Field Descriptions

Bit	Field	Type	Reset	Description
15:7	RESERVED	R/W	0x004	Reserved. If this register is written, set these bits to 0x004.
6	CLK_DIV_RST	R/W	0x0	Resets the main clock divider. If the clock divider value is changed during operation, set this bit high then low after setting the new divider value. Synchronizing the device with the SYSREFREQ pins in SYSREFREQ_MODE = 0x0 and SYNC_EN = 0x1 also resets the main clock divider. This bit has no effect when outside of Divider Mode.
5:3	CLK_DIV CLK_MULT	R/W	0x2	CLK_DIV and CLK_MULT are aliases for the same field. When CLK_MUX = 0x2 (Divider Mode), sets the clock divider equal to CLK_DIV + 1. Valid range is 0x1 to 0x7. Setting CLK_DIV = 0x0 disables the main clock divider and reverts to buffer mode. When CLK_MUX = 0x3 (Multiplier Mode), sets the multiplier equal to CLK_MULT. Valid range is 0x1 to 0x4. Setting CLK_MULT to an invalid value disables the multiplier and reverts to buffer mode. When CLK_MUX = 0x1 (buffer mode), this field is ignored.
2:0	CLK_MUX	R/W	0x1	Selects the function of the device. Multiplier Mode requires writing several other registers (R33 , R34 , and R67) to values differing from POR defaults, as well as configuring the state machine clock (R2 and R3), before multiplier calibration. Writing any value to R0 (as long as POWERDOWN = 0x0 and RESET = 0x0) triggers a multiplier calibration. Values other than those listed below are reserved. 0x1 = Buffer Mode 0x2 = Divider Mode 0x3 = Multiplier Mode

7.1.25 R28 Register (Offset = 0x1C) [Reset = 0x0A08]

R28 is shown in [Table 7-27](#).

Return to the [Summary Table](#).

Table 7-27. R28 Register Field Descriptions

Bit	Field	Type	Reset	Description
15:13	RESERVED	R	0x0	Reserved (not used).
12	FORCE_VCO	R/W	0x0	Forces the PLL VCO of the multiplier to the value selected by VCO_SEL. Not required for Multiplier Mode programming, but can optionally be used to reduce calibration time.
11:9	VCO_SEL	R/W	0x5	User specified start VCO for multiplier PLL. When FORCE_VCO = 0x0, multiplier calibration starts from the VCO set by this field. When FORCE_VCO = 0x1, this field sets the VCO core used by the multiplier. Not required for Multiplier Mode programming, but can optionally be used to reduce calibration time.
8:0	RESERVED	R/W	0x008	Reserved. If this register is written, set these bits to 0x008.

7.1.26 R29 Register (Offset = 0x1D) [Reset = 0x05FF]

R29 is shown in [Table 7-28](#).

Return to the [Summary Table](#).

Table 7-28. R29 Register Field Descriptions

Bit	Field	Type	Reset	Description
15:13	RESERVED	R	0x0	Reserved (not used).
12:8	RESERVED	R/W	0x5	Reserved. If this register is written, set these bits to 0x05.
7:0	CAPCTRL	R/W	0xFF	Sets the starting value for the VCO tuning capacitance during multiplier calibration. Not required for Multiplier Mode programming, but can optionally be used to reduce calibration time.

7.1.27 R33 Register (Offset = 0x21) [Reset = 0x7777]

R33 is shown in [Table 7-29](#).

Return to the [Summary Table](#).

Table 7-29. R33 Register Field Descriptions

Bit	Field	Type	Reset	Description
15:0	RESERVED	R/W	0x7777	Reserved. If the Multiplier Mode is used, set to 0x5666 before calibration. Otherwise, writing this register can be skipped.

7.1.28 R34 Register (Offset = 0x22) [Reset = 0x0000]

R34 is shown in [Table 7-30](#).

Return to the [Summary Table](#).

Table 7-30. R34 Register Field Descriptions

Bit	Field	Type	Reset	Description
15:14	RESERVED	R	0x0	Reserved (not used).
13:0	RESERVED	R/W	0x0000	Reserved. If the Multiplier Mode is used, set to 0x04C5 before calibration. Otherwise, writing this register can be skipped.

7.1.29 R65 Register (Offset = 0x41) [Reset = 0x45F0]

R65 is shown in [Table 7-31](#).

Return to the [Summary Table](#).

Table 7-31. R65 Register Field Descriptions

Bit	Field	Type	Reset	Description
15:9	RESERVED	R/W	0x22	Since this register is only used for readback, avoid writing these bits when possible. If this register must be written, set these bits to 0x22. Readback can differ from default and written values.
8:4	rb_VCO_SEL	R	0x1F	Readback PLL VCO of the multiplier core selection. Can be optionally used in conjunction with VCO_SEL and FORCE_VCO fields to improve calibration time. 0xF = VCO5 0x17 = VCO4 0x1B = VCO3 0x1D = VCO2 0x1E = VCO1
3:0	RESERVED	R/W	0x0	Since this register is only used for readback, avoid writing these bits when possible. If this register must be written, set these bits to 0x0.

7.1.30 R67 Register (Offset = 0x43) [Reset = 0x50C8]

R67 is shown in [Table 7-32](#).

Return to the [Summary Table](#).

Table 7-32. R67 Register Field Descriptions

Bit	Field	Type	Reset	Description
15:0	RESERVED	R/W	0x50C8	Reserved. If the Multiplier Mode is used, set to 0x51CB before calibration. Otherwise, writing this register can be skipped.

7.1.31 R72 Register (Offset = 0x48) [Reset = 0x0000]

R72 is shown in [Table 7-33](#).

Return to the [Summary Table](#).

Table 7-33. R72 Register Field Descriptions

Bit	Field	Type	Reset	Description
15	RESERVED	R	0x0	Reserved (not used).
14:4	RESERVED	R/W	0x000	Reserved. Set to 0x000.
3	PULSER_LATCH	R/W	0x0	Latches the pulser input when programmed to 0x1. When this bit is set, external signals on SYSREFREQ pins in pulser mode (SYSREF_MODE = 0x1) can not trigger the pulser more than once, until this bit is cleared. This bit is provided to enable changing SYSREF_MODE in repeater mode without risk of accidentally triggering the pulser.
2	SYSREFREQ_SPI	R/W	0x0	Trigger SYSREFREQ using SPI. Setting this bit emulates the behavior of a logic HIGH at SYSREFREQ pins. External signals on SYSREFREQ pins are ignored while this bit is set.
1:0	SYSREF_DELAY_BYPASS	R/W	0x0	Option to bypass delay generator retiming. Under normal circumstances (SYSREF_DELAY_BYPASS = 0) the delay generator is engaged for continuous or pulser modes (Generator Modes), and bypassed in Repeater Mode. Generally this configuration is desirable: the delay generators rely on a signal generated by the SYSREF_DELAY_DIV from the CLKIN frequency, so the Generator Mode SYSREF signal is always well-aligned to the delay generator; in repeater mode, external signal sources can typically utilize a different delay mechanism. In certain cases, bypassing the delay generator retiming in Generator Mode by setting SYSREF_DELAY_BYPASS = 0x1 can substantially reduce the device current consumption if the SYSREF delay can be compensated at the JESD receiver. In other cases, retiming the SYSREFREQ signal to the delay generators by setting SYSREF_DELAY_BYPASS = 0x2 can improve the accuracy of the SYSREF output phase with respect to the CLKIN phase, or can vary the delay of individual outputs independently, as long as coherent phase relationship exists between the interpolator divider phase and the SYSREFREQ phase. 0x0 = Engage in Generator Mode, Bypass in Repeater Mode 0x1 = Bypass in All Modes 0x2 = Engage in All Modes 0x3 = Reserved

7.1.32 R75 Register (Offset = 0x4B) [Reset = 0xE716]

R75 is shown in [Table 7-34](#).

Return to the [Summary Table](#).

Table 7-34. R75 Register Field Descriptions

Bit	Field	Type	Reset	Description
15:10	RESERVED	R	0x39	Read-only. Writes to these bits are ignored. Readback can differ from default values.
9:8	rb_LD	R	0x3	Multiplier PLL Lock Detect. Read-only. Field value has no meaning if device is not in Multiplier Mode. 0x0 = Unlocked (VTUNE low) 0x1 = Reserved 0x2 = Locked 0x3 = Unlocked (VTUNE high)
7:4	RESERVED	R	0x1	Read-only. Writes to these bits are ignored. Readback can differ from default values.
3:0	RESERVED	R/W	0x6	Reserved. Since this register is only used for readback, avoid writing these bits when possible. If this register must be written, set to 0x6.

7.1.33 R79 Register (Offset = 0x4F) [Reset = 0x0104]

R79 is shown in [Table 7-35](#).

Return to the [Summary Table](#).

Table 7-35. R79 Register Field Descriptions

Bit	Field	Type	Reset	Description
15	RESERVED	R	0x0	Reserved (not used).
14:0	RESERVED	R/W	0x0104	Reserved. Set to 0x0104 immediately after setting LOGICLK_DIV_BYPASS = 0x1; R90 must also be written immediately afterward. If LOGICLK_DIV_BYPASS is not used or set to 0x0, this register does not need to be written and can be skipped. See also R90 Register .

7.1.34 R86 Register (Offset = 0x56) [Reset = 0x0000]

R86 is shown in [Table 7-36](#).

Return to the [Summary Table](#).

Table 7-36. R86 Register Field Descriptions

Bit	Field	Type	Reset	Description
15:0	RESERVED	R/W	0x0000	Reserved. This register must be set to 0x0004 to allow MUXOUT_EN to tri-state the MUXOUT pin after SPI readback. If SPI readback is not required, or if tri-state is not required on the MUXOUT pin, writing this register can be skipped, forcing MUXOUT_EN to 0x1 (push-pull mode).

7.1.35 R90 Register (Offset = 0x5A) [Reset = 0x0000]

R90 is shown in [Table 7-37](#).

Return to the [Summary Table](#).

Table 7-37. R90 Register Field Descriptions

Bit	Field	Type	Reset	Description
15:8	RESERVED	R	0x00	Reserved (not used).
15:0	RESERVED	R/W	0x00	Reserved. Set to 0x60 immediately after setting LOGICLK_DIV_BYPASS = 0x1 and setting R79 = 0x0104. If LOGICLK_DIV_BYPASS is not used or left at the default value, this register does not need to be written and can be skipped. However, if transitioning from LOGICLK_DIV_BYPASS = 0x1 to 0x0, this register must be re-written to 0x00. See also R79 Register .

8 Application and Implementation

Note

Information in the following applications sections is not part of the TI component specification, and TI does not warrant its accuracy or completeness. TI's customers are responsible for determining suitability of components for their purposes, as well as validating and testing their design implementation to confirm system functionality.

8.1 Application Information

8.1.1 SYSREFREQ Input Configuration

The SYSREFREQ pins support single-ended or differential input in AC or DC coupling mode. The SYSREFREQ pins have an internal 50-Ω termination with capacitive ground, which acts as 100-Ω differential.

Figure 8-1 shows the generic SYSREFREQ input circuit recommendation to support all AC/DC, single-ended or differential inputs. Some of the discrete components in Figure 8-1 are just placeholder for individual input signal (single-ended or differential input) and AC or DC coupled input.

Figure 8-1. SYSREFREQ Input Circuit Recommendations

The following figures show the individual circuit diagram for each configurations:

Figure 8-2. AC-Coupled Differential Input

Figure 8-3. AC-Coupled, Single-Ended Input

Figure 8-4. DC-Coupled Differential Input

Figure 8-5. DC-Coupled, Single-Ended Input

- AC coupled differential and single-ended input configurations required the resistor terminations (R2 and R3) to create the VCM at each pin and resistor values must select to maintain greater than 150-mV potential difference between pin P and pin N.
 - As an example, to create the VCM of 1.5 V at pin P and 1.65 V at pin N, with the 2.5 V VCC, set R3 = 550 Ω and R2 = 1 k Ω
 - For single-ended input configuration, place R6 = 50 Ω to avoid any reflection at complementary input pin.
- DC coupled differential and single-ended input configuration required to have the source common-mode voltage matched with the device input common mode specifications.
 - For single-ended input configuration, keep the R1, R2, R3 and R4 resistors. This method creates the same common-mode voltage at both pins, and the resistive dividers create 75 Ω at pin P and 50 Ω Thevenin's equivalent at pin N.
 - As an example, to have the common-mode voltage of 1.35 V at each pin, set the resistive divider components values to R1 = 130 Ω , R2 = 165 Ω , R3 = 86.6 Ω and R4 = 110 Ω with the 2.5V VCC.

8.1.2 Reducing SYSREF Common Mode Voltages

For DC coupled SYSREF applications, some data converters can require a lower common voltage for the SYSREF outputs than the output can support. For these applications, a resistive divider can be used to reduce the common mode voltage. However, when a path to ground is there, the loading inherently reduces the common mode voltage. For a few test cases, the common mode voltage is measured as shown in [Table 8-1](#). Note that this table is for the SYSREFOUTx pins, not the LOGISYSREFout pins.

**Table 8-1. Impact of Load to GND (Both Pins) on Single-Ended V_{OD} and V_{CM} for
SYSREFOUTx_PWR=SYSREFOUTx_VCM=7**

Load to GND	V_{OD}	V_{CM}	VOL
50- Ω	0.72	0.79	0.43
78- Ω	0.86	0.99	0.56
100- Ω	0.96	1.07	0.59
215- Ω	1.13	1.33	0.76

Once the load as seen by the SYSREFOUTx pins is known, the V_{OD} and V_{CM} voltage at those pins can be known. From this point, a resistive divider can be used to create the desired V_{OD} and V_{CM} voltages as shown in [Figure 8-6](#) and [Figure 8-7](#).

Figure 8-6. Reducing V_{CM} With Resistive Dividers (Case 1)

Figure 8-7. Reducing V_{CM} With Resistive Dividers (Case 2)

These examples lead to the calculations in [Table 8-2](#). Note that the resistive divider reduces the V_{OD} , V_{CM} , and ΔV_{CM} (typical variation in V_{CM}).

Table 8-2. Calculated Voltage Values

Where Measured	Parameter	ADC12DJ5200	AFE7950
At LMX1204	R_{Load} (Ω)	100	215
	V_{OD} (V)	0.96	1.13
	V_{CM}	1.065	1.328
	ΔV_{CM}	0.2	0.2
External Resistors	$R1$ (Ω)	60	100

8.1.3 Current Consumption

The current consumption varies as a function of the setup condition. By adding up all the block currents shown in [Table 8-3](#), a reasonable estimate of the current for any setup condition can be obtained.

Table 8-3. Current Consumption per Block

BLOCK		CONDITION (s)		CURRENT (mA)
Device Core		CLK_MUX = Buffer Mode		294
		CLK_MUX = Divide Mode		260
		CLK_MUX = Multiply Mode	SMCLK_EN=0	540
			SMCLK_EN=1	560
SYSREF SYNC Windowing	Core	SYSREF_EN=1		80
	Delay Generator	Generator Mode (SYSREF_MODE=0,1)		53
		Repeater Mode (SYSREF_MODE=2)		40
	Windowing Circuitry	Windowing Circuitry (CLKPOS_CAPTURE_EN=1)	SYSREF_MODE=0,1	113
			SYSREF_MODE=2	0
SYSREF Pulser	SYSREF_MODE=1		7	
CLKOUT (Per active clock channel)	Core	SYSREF_EN=0		25
		SYSREF_EN = 1	Delay Not Used	30
			Delay Used	40
	Output Buffer	CHx_EN = CLKOUTx_EN=1		4+6*CLKOUTx_PWR
SYSREFOUT	Core	SYSREFOUT_EN = CHx_EN = 1		74 + SYSREFOUTx_PWR*5
	Output Buffer	SYSREFOUT_EN = CHx_EN = 1 (SYSREFOUTx_PWR and SYSREFOUTx_VCM can interact which makes the output buffer current lower than the formula predicts in some cases)		2*SYSREFOUTx_PWR + 2*SYSREFOUTx_VCM
LOGICLKOUT	Core	LOGIC_EN=1 LOGICLKOUT_EN=1	SYSREF_EN=0	49
			SYSREF_EN=1	59
	Output Buffer		CML(R _p =50Ω)	16+1*LOGICLKOUT_PWR
			LVDS	12
			LVPECL	30
LOGISYSREFOUT	Core	LOGIC_EN=1 LOGISYSREFOUT_EN=1	SYSREF_EN=0	0
			SYSREF_EN=1	55
	Output Buffer	LOGIC_EN=1 LOGISYSREFOUT_EN=1	CML(R _p =50Ω)	16+1*LOGICLKOUT_PWR
			LVDS	12
			LVPECL	30

This device can consume a significant amount of current if all the output clocks, LOGICLK, multiplier, and multiplier are all enabled. Turning off the SYSREF output buffers when not actively sending SYSREF pulses to conserve current is recommended to mitigate current consumption.

8.1.4 Treatment of Unused Pins

In many cases, not all pins are needed. [Table 8-4](#) gives recommendation on handling of these unused pins.

Table 8-4. Treatment of Unused or Partially Used Pins

PIN(S)	TREATMENT
All Vcc Pins	These pins must always be connected to the supply. If the block that this powers (as implied by the pin name) is not used, then the bypassing can be minimized or eliminated.
SYSREFREQ	If driving single-ended AC coupled, the complimentary input must have a AC-coupling capacitor to ground. If driving single-ended DC coupled, complimentary input must be externally biased at required VCM with Thevenin's equivalent. If using continuous SYSREF Generator mode, these pins can be either used to turn the output buffers on and off or they can be left floating. If left floating, use SYSREFREQ_SPI to control the output gating. If not using SYSREF at all, pins can be left open.
CLKIN Complementary Input	If driving single-ended, the complementary input must have a AC-coupling capacitor and 50 Ω to ground.

Table 8-4. Treatment of Unused or Partially Used Pins (continued)

PIN(S)	TREATMENT
BIAS01 and BIAS23	These pins can be left open if multiplier is not used.
CLKOUT SYSREFOUT LOGICLKOUT LOGISYSREFOUT	These pins can be left open if not used.

8.2 Typical Application

For this application, the additive noise impact of using the LMX1204 as a $\times 2$ multiplier is explored when added to the LMX2820 3-GHz output clock. This particular setup uses a single-ended clock to drive the LMX1204 to combine two EVMs together, but driving the setup differentially is generally recommended.

Figure 8-8. Typical Application Schematic

8.2.1 Design Requirements

Table 8-5 shows the design parameters for this example.

If not all outputs or SYSREF are used, TI recommends to compress the layout to minimize trace lengths, especially that of the input trace.

Table 8-5. Design Parameters

PARAMETER	VALUE
LMX2820 Input Frequency	100 MHz
LMX2820 Output Frequency	3 GHz
LMX1204 Input Clock Frequency	3 GHz
LMX1204 Output Clock Frequency	6 GHz
Multiplier Value	$\times 2$

8.2.2 Detailed Design Procedure

In this example, a 3-GHz input clock is being multiplied up to a 6-GHz input clock. The external components do not change that much based on internal configuration. The TICS Pro software is very useful in calculating the necessary register values and configuring the device.

Figure 8-9. LMX1204 TICS Pro Setup

8.2.3 Application Curve

In Figure 8-10, the total plot is the sum of the noise of the LMX1204 multiplier noise and the LMX2820 3-GHz output (scaled to 6 GHz by adding 6 dB). Note that the LMX1204 does increase the phase noise in the 1-MHz to 20-MHz range, but beyond 20 MHz, the input multiplier actually filters the output noise floor.

Figure 8-10. Multiplier Output Frequency

8.3 Power Supply Recommendations

This device uses a 2.5-V supply for the whole device. A direct connection to a switching power supply likely results in unwanted spurs at the output. Bypassing can be done individually at all the power pins. TI recommends placing smaller capacitors with higher frequency of minimum impedance on the same layer as the device, as close to the pins as possible. The frequencies of nearly all signals in the device are 100 MHz or greater, therefore larger value bypass capacitors with low frequency of minimum impedance are only used for internal LDO stability, and the distance to the device (and the loop inductance of the bypass path) can be larger. Isolate the supply pins for the clocks and the LOGICLK with a small resistor or ferrite bead if both are being used simultaneously. See the *Pin Configuration and Functions* section for additional recommendations for each pin.

Note

This device has minimal PSRR due to the low operating voltage and internal filtering by LDOs. Connecting this device to a low noise supply that does not have excessive spurious noise is important.

8.4 Layout

8.4.1 Layout Guidelines

- If using an output single-ended, terminate the complementary side so that the impedance as seen looking out from the complementary side is similar to side that is used.
- GND pins on the outer perimeter of the package can be routed on the package back to the DAP.
- Minimize the length of the CLKIN trace for optimal phase noise. Poor matching can degrade the noise floor.
- Verify that the DAP on device is well-grounded with many vias.
- Use a low loss dielectric material, such as Rogers 4350B, for optimal output power.
- Be aware that if all the outputs and SYSREF are operating, the current consumption can be high enough to exceed the recommended internal junction temperature of 125°C; a heat sink can be necessary.

8.4.2 Layout Example

Figure 8-11. Layout Example

9 Device and Documentation Support

9.1 Device Support

TI offers an extensive line of development tools and software to simulate the device performance and program the device.

Table 9-1. Development Tools and Software

TOOL	TYPE	DESCRIPTION
PLLatinum™ Sim	Software	Simulates phase noise in all modes
TICS Pro	Software	Programs the device with a user-friendly GUI with interactive feedback and hex register export.

9.2 Documentation Support

9.2.1 Related Documentation

- Texas Instruments, [LMX1204 Multiplier Clock Distribution Drives Large Phased-Array Systems](#), application note
- Texas Instruments, [Getting the Most of Your Data Converter Clocking System Using LMX1204](#), application note

9.3 Receiving Notification of Documentation Updates

To receive notification of documentation updates, navigate to the device product folder on [ti.com](#). Click on *Notifications* to register and receive a weekly digest of any product information that has changed. For change details, review the revision history included in any revised document.

9.4 Support Resources

[TI E2E™ support forums](#) are an engineer's go-to source for fast, verified answers and design help — straight from the experts. Search existing answers or ask your own question to get the quick design help you need.

Linked content is provided "AS IS" by the respective contributors. They do not constitute TI specifications and do not necessarily reflect TI's views; see TI's [Terms of Use](#).

9.5 Trademarks

PLLatinum™ and TI E2E™ are trademarks of Texas Instruments.

All trademarks are the property of their respective owners.

9.6 Electrostatic Discharge Caution

This integrated circuit can be damaged by ESD. Texas Instruments recommends that all integrated circuits be handled with appropriate precautions. Failure to observe proper handling and installation procedures can cause damage.

ESD damage can range from subtle performance degradation to complete device failure. Precision integrated circuits may be more susceptible to damage because very small parametric changes could cause the device not to meet its published specifications.

9.7 Glossary

[TI Glossary](#)

This glossary lists and explains terms, acronyms, and definitions.

10 Revision History

NOTE: Page numbers for previous revisions may differ from page numbers in the current version.

Changes from Revision A (August 2022) to Revision B (February 2024)	Page
• Added 5 fs jitter to features.....	1
• Updated SPI timing diagram and readback comments.....	8
• Changed the <i>Typical Characteristics</i> section for production data release.....	9
• Updated Functional Block Diagram.....	15
• Added that filter mode does not work with SYNC mode.....	18
• Updated VOD/VCM values in table.....	22
• Updated SYSREF windowing and repeater mode added.....	26
• Added SYSREF Windowing Flowchart.....	27
• Added AYSREF Repeater Mode with Delay Gen (Retime)	27
• Added Register Map.....	30
• Added SYSREFREQ Input Configuration Section.....	55
• Added Reducing SYSREF Common Mode Voltages section.....	56

Changes from Revision * (July 2021) to Revision A (August 2022)	Page
• Changed data sheet status from Advanced Information to Production Data.....	1
• Added filter mode information to the data sheet.....	1
• Added descriptions for POR, multiplier, filter mode, common mode voltage, and other topics in the <i>Detailed Description</i> section.....	14
• Changed register and field definitions from pre-production to production.....	32
• Changed Table 8-3	57
• Moved the <i>Power Supply Recommendations</i> and <i>Layout</i> sections to the <i>Application and Implementation</i> section.....	61

11 Mechanical, Packaging, and Orderable Information

The following pages include mechanical, packaging, and orderable information. This information is the most current data available for the designated devices. This data is subject to change without notice and revision of this document. For browser-based versions of this data sheet, refer to the left-hand navigation.

PACKAGING INFORMATION

Orderable part number	Status (1)	Material type (2)	Package Pins	Package qty Carrier	RoHS (3)	Lead finish/ Ball material (4)	MSL rating/ Peak reflow (5)	Op temp (°C)	Part marking (6)
LMX1204RHAR	Active	Production	VQFN (RHA) 40	2500 LARGE T&R	Yes	NIPDAUAG	Level-3-260C-168 HR	-40 to 85	LMX1204
LMX1204RHAR.A	Active	Production	VQFN (RHA) 40	2500 LARGE T&R	Yes	NIPDAUAG	Level-3-260C-168 HR	-40 to 85	LMX1204
LMX1204RHAT	Active	Production	VQFN (RHA) 40	250 SMALL T&R	Yes	NIPDAUAG	Level-3-260C-168 HR	-40 to 85	LMX1204
LMX1204RHAT.A	Active	Production	VQFN (RHA) 40	250 SMALL T&R	Yes	NIPDAUAG	Level-3-260C-168 HR	-40 to 85	LMX1204

⁽¹⁾ **Status:** For more details on status, see our [product life cycle](#).

⁽²⁾ **Material type:** When designated, preproduction parts are prototypes/experimental devices, and are not yet approved or released for full production. Testing and final process, including without limitation quality assurance, reliability performance testing, and/or process qualification, may not yet be complete, and this item is subject to further changes or possible discontinuation. If available for ordering, purchases will be subject to an additional waiver at checkout, and are intended for early internal evaluation purposes only. These items are sold without warranties of any kind.

⁽³⁾ **RoHS values:** Yes, No, RoHS Exempt. See the [TI RoHS Statement](#) for additional information and value definition.

⁽⁴⁾ **Lead finish/Ball material:** Parts may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead finish/Ball material values may wrap to two lines if the finish value exceeds the maximum column width.

⁽⁵⁾ **MSL rating/Peak reflow:** The moisture sensitivity level ratings and peak solder (reflow) temperatures. In the event that a part has multiple moisture sensitivity ratings, only the lowest level per JEDEC standards is shown. Refer to the shipping label for the actual reflow temperature that will be used to mount the part to the printed circuit board.

⁽⁶⁾ **Part marking:** There may be an additional marking, which relates to the logo, the lot trace code information, or the environmental category of the part.

Multiple part markings will be inside parentheses. Only one part marking contained in parentheses and separated by a "-" will appear on a part. If a line is indented then it is a continuation of the previous line and the two combined represent the entire part marking for that device.

Important Information and Disclaimer: The information provided on this page represents TI's knowledge and belief as of the date that it is provided.
