

LMZ34002

SNVS989C -JULY 2013-REVISED APRIL 2018

# LMZ34002 15-W Negative Output Power Module With 4.5-V to 40-V Input in QFN Package

### **Features**

- Complete Integrated Power Solution Allows Small Footprint, Low-Profile Design
- Wide Input Voltage Range from 4.5 V to 40 V
- Output Adjustable from -3 V to -17 V
- Supplies up to 2-A of Output Current
- 45-V Surge Capability
- Synchronizes to an External Clock
- Adjustable Slow-Start
- Programmable Undervoltage Lockout (UVLO)
- **Output Overcurrent Protection**
- Over Temperature Protection
- Operating Temperature Range: -40°C to +85°C
- Enhanced Thermal Performance: 14°C/W
- Meets EN55022 Class B Emissions
  - Integrated Shielded Inductor
- For Design Help visit http://www.ti.com/product/lmz34002
- Create a Custom Design Using the LMZ34002 With the WEBENCH® Power Designer

# **Applications**

- Industrial and Motor Controls
- Automated Test Equipment
- Bipolar Amplifiers in Audio/Video
- High Density Power Systems

## Safe Operating Current

# 3 Description

The LMZ34002 SIMPLE SWITCHER® power module is an easy-to-use, negative output voltage power module that combines a 15-W DC-DC converter with a shielded inductor, and passives into a low profile, QFN package. This total power solution allows as few as five external components and eliminates the loop compensation and magnetics part selection process.

The 9x11x2.8 mm QFN package is easy to solder onto a printed circuit board and allows a compact design with fewer components and excellent power dissipation capability. The LMZ34002 offers the flexibility and the feature-set of a discrete design and is ideal for powering a wide range of ICs and analog circuits requiring a negative output voltage. Advanced packaging technology affords a robust and reliable power solution compatible with standard QFN mounting and testing techniques.

## Simplified Application

# 4 Specifications

# 4.1 Absolute Maximum Ratings<sup>(1)</sup>

over operating temperature range (unless otherwise noted)

		MIN	MAX	UNIT
	VIN	-0.3	45	V
	INH/UVLO	-0.3	5 <sup>(2)</sup>	V
	VADJ	-0.3	3 <sup>(2)</sup>	V
Input Voltage	SS	-0.3	3 <sup>(2)</sup>	V
	STSEL	-0.3	3 <sup>(2)</sup>	V
	RT	-0.3	3.6 <sup>(2)</sup>	V
	CLK	-0.3	3.6 <sup>(2)</sup>	V
	PH	-0.6	45	V
Output Voltage	PH 10ns Transient	-2	45	V
	VOUT	-0.6	VIN <sup>(2)</sup>	V
V <sub>DIFF</sub> (VOUT to expos thermal pad)	ed		±200	mV
Source Current	INH/UVLO		100	μA
Sink Current	SS	200		μA
Operating Junction Te	emperature	-40	105 <sup>(3)</sup>	°C
Storage Temperature		-65	150	°C
Peak Reflow Case Temperature (4)			250 <sup>(5)</sup>	°C
Maximum Number of Reflows Allowed <sup>(4)</sup>			3 <sup>(5)</sup>	
Mechanical Shock Mil-STD-883D, Method 2002.3, 1 ms, 1/2 sine, mounted			1500	G
Mechanical Vibration Mil-STD-883D, Method 2007.2, 20-2000Hz			20	

<sup>(1)</sup> Stresses beyond those listed under absolute maximum ratings may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated under recommended operating conditions is not implied. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.

## 4.2 Recommended Operating Conditions

over operating free-air temperature range (unless otherwise noted)

		MIN	MAX	UNIT
$V_{IN}$	Input Voltage	4.5	40	٧
V <sub>OUT</sub>	Output Voltage	-3	-17	٧

<sup>(2)</sup> This voltage rating is referenced to A\_VOUT, not GND.

<sup>(3)</sup> See the temperature derating curves in the Typical Characteristics section for thermal information.

<sup>(4)</sup> For soldering specifications, refer to the *Soldering Requirements for BQFN Packages* application note.

<sup>(5)</sup> Devices with a date code prior to week 14 2018 (1814) have a peak reflow case temperature of 240°C with a maximum of one reflow.

#### 4.3 Thermal Information

		LMZ34002	
	THERMAL METRIC <sup>(1)</sup>	RKG	UNIT
		41 PINS	
θ <sub>JA</sub> Junctio	n-to-ambient thermal resistance (2)	14	°C/W
Ψ <sub>JT</sub> Junctio	n-to-top characterization parameter <sup>(3)</sup>	3.3	°C/W
Ψ <sub>JB</sub> Junctio	n-to-board characterization parameter <sup>(4)</sup>	6.8	°C/W

- (1) For more information about traditional and new thermal metrics, see the Semiconductor and IC Package Thermal Metrics (SPRA953) application report.
- The junction-to-ambient thermal resistance,  $\theta_{JA}$ , applies to devices soldered directly to a 100 mm x 100 mm double-sided PCB with 1 oz. copper and natural convection cooling. Additional airflow reduces  $\theta_{JA}$ .
- (3) The junction-to-top characterization parameter,  $\psi_{JT}$ , estimates the junction temperature,  $T_J$ , of a device in a real system, using a procedure described in JESD51-2A (sections 6 and 7).  $T_J = \psi_{JT}$  \* Pdis +  $T_T$ , where Pdis is the power dissipated in the device and  $T_T$  is the temperature of the top of the device.
- The junction-to-board characterization parameter,  $\psi_{JB}$ , estimates the junction temperature,  $T_J$ , of a device in a real system, using a procedure described in JESD51-2A (sections 6 and 7).  $T_J = \psi_{JB} * Pdis + T_B$ ; where Pdis is the power dissipated in the device and  $T_B$  is the temperature of the board 1mm from the device.

### 4.4 Package Specifications

	LMZ34002			
Weight		0.9 grams		
Flammability	Meets UL 94 V-O			
MTBF Calculated reliability	Per Bellcore TR-332, 50% stress, T <sub>A</sub> = 40°C, ground benign	31.7 MHrs		

### 4.5 Electrical Characteristics

-40°C  $\leq$  T<sub>A</sub>  $\leq$  +85°C, V<sub>IN</sub> = 12 V, V<sub>OUT</sub> = -5 V, I<sub>OUT</sub> = 2 A C<sub>IN</sub> = 2 × 2.2  $\mu$ F ceramic, C<sub>OUT</sub> = 2 × 47  $\mu$ F ceramic (unless otherwise noted)

	PARAMETER	TEST CONDITIONS				TYP	MAX	UNIT
I <sub>OUT</sub>	Output current	Over input voltage and	d output voltag	e range	0 <sup>(1)</sup>		2 <sup>(2)</sup>	Α
$V_{IN}$	Input voltage range	Over output current ra	ange		4.5		40 <sup>(3)</sup>	V
UVLO	V <sub>IN</sub> Undervoltage lockout	Rising only, R <sub>UVLO1</sub> =	174 kΩ, R <sub>UVLO</sub>	<sub>2</sub> = 63.4 kΩ		4.5		V
$V_{OUT(adj)}$	Output voltage adjust range	Over output current ra	ange		-3		-17 <sup>(3)</sup>	V
	Set-point voltage tolerance	T <sub>A</sub> = 25°C, I <sub>OUT</sub> = 100	mA				2.0% (4)	
	Temperature variation	-40°C ≤ T <sub>A</sub> ≤ +85°C				±0.5%	±1%	
V <sub>OUT</sub>	Line regulation	Over input voltage ran	nge			±0.1%		
	Load regulation	From 100 mA to I <sub>OUT(r</sub>	From 100 mA to I <sub>OUT(max)</sub>			±0.4%		
	Total output voltage variation	Includes set-point, line	Includes set-point, line, load, and temperature variation				3% (4)	
				V <sub>OUT</sub> = -12 V, I <sub>OUT</sub> = 1.0 A		85%		
	$V_{IN} = 24$	V <sub>IN</sub> = 24 V		V <sub>OUT</sub> = -5.0 V, I <sub>OUT</sub> = 1.0 A		81%		
	F#: :			$V_{OUT} = -3.3 \text{ V}, I_{OUT} = 1.0 \text{ A}$		77%		
η	Efficiency	V <sub>IN</sub> = 12 V		V <sub>OUT</sub> = -12 V, I <sub>OUT</sub> = 0.6 A		86%		
				V <sub>OUT</sub> = -5.0 V, I <sub>OUT</sub> = 1.0 A		81%		
				$V_{OUT} = -3.3 \text{ V}, I_{OUT} = 1.0 \text{ A}$		78%		
	Output voltage ripple	20 MHz bandwith, 100 mA ≤ I <sub>OUT</sub> ≤ I <sub>OUT(max)</sub>			1%		V <sub>OUT</sub>	
I <sub>LIM</sub>	Current limit threshold					3 (5)		Α
	Townsient near and	1.0 A/µs load step from 25 to 75% Recovery time		Recovery time		500		μs
	Transient response	I <sub>OUT(max)</sub>				80		mV

This device can regulate V<sub>OUT</sub> down to 0 A, however the ripple may increase due to pulse-skipping at light loads. See Light-Load Behavior for more information. See No-Load Operation when operating at 0 A.

The maximum current is dependant on  $V_{\text{IN}}$  and  $V_{\text{OUT}}$ , see Figure 33.

The sum of  $V_{IN} + |V_{OUT}|$  must not exceed 50 V.

The stated limit of the set-point voltage tolerance includes the tolerance of both the internal voltage reference and the internal adjustment resistor. The overall output voltage tolerance will be affected by the tolerance of the external R<sub>SET</sub> resistor.

This product is not designed to endure a sustained (> 5 sec) over-current condition.

# **Electrical Characteristics (continued)**

-40°C  $\leq$  T<sub>A</sub>  $\leq$  +85°C, V<sub>IN</sub> = 12 V, V<sub>OUT</sub> = -5 V, I<sub>OUT</sub> = 2 A C<sub>IN</sub> = 2 × 2.2  $\mu$ F ceramic, C<sub>OUT</sub> = 2 × 47  $\mu$ F ceramic (unless otherwise noted)

	PARAMETER	TEST CONI	MIN	TYP	MAX	UNIT	
V <sub>INH</sub>	Inhibit threshold voltage	INH with respect to A_VOUT		1.15	1.25	1.36 <sup>(6)</sup>	V
	INII I Innut ourrent	V <sub>INH</sub> < 1.15 V			-0.9		μА
I <sub>INH</sub>	INH Input current	V <sub>INH</sub> > 1.36 V			-3.8		μА
I <sub>I(stby)</sub>	Input standby current	INH pin to A_VOUT			1.3	4	μΑ
f <sub>SW</sub>	Switching frequency	RT pin to A_VOUT		700	800	900	kHz
	0		$R_{RT} = 0 \Omega$	700 (7)		900 (7)	kHz
f <sub>CLK</sub> Synchronization frequency			$R_{RT} = 93.1 \text{ k}\Omega$	400 (7)		600 <sup>(7)</sup>	kHz
V <sub>CLK-H</sub>	CLK High-Level Threshold	With respect to A_VOUT			1.9	2.2	V
V <sub>CLK-L</sub>	CLK Low-Level Threshold	With respect to A_VOUT		0.5	0.7		V
D <sub>CLK</sub>	CLK Duty cycle			25%	50%	75%	
	T. 101.11	Thermal shutdown			180		°C
	Thermal Shutdown	Thermal shutdown hysteresis			15		°C
			Ceramic	4.7 (8)	10		
C <sub>IN</sub>	External input capacitance	nal input capacitance Non-ceramic			22		μF
C <sub>OUT</sub>	External output capacitance			100 <sup>(9)</sup>		430 <sup>(9)</sup>	μF

<sup>(6)</sup> If this pin is left open circuit, the device operates when input power is applied. An external level-shifter is required to interface with this pin. See Output On/Off Inhibit (INH) for further guidance.

 <sup>(7)</sup> The synchronization frequency is dependent on V<sub>IN</sub> and V<sub>OUT</sub> as shown in Switching Frequency. R<sub>RT</sub> must be either 0 Ω or 93.1kΩ.
 (8) A minimum of 4.7 μF of ceramic external capacitance is required across the input (VIN and PGND connected) for proper operation. Locate the capacitor close to the device. See Table 1 for more details.

<sup>(9)</sup> The amount of required capacitance must include at least 2 x 47 µF ceramic capacitor (or 4 x 22 µF). Locate the capacitance close to the device. Adding additional capacitance close to the load improves the response of the regulator to load transients. See Table 1 for more details. See *Inrush Current* section when adding additional output capacitance.

# 5 Device Information

# **Functional Block Diagram**

# **Pin Functions**

TER	TERMINAL DESCRIPTION									
NAME	NO.	DESCRIPTION								
VIN	26	Input voltage. This pin supplies all power to the converter. Connect this pin to the input supply and connect bypass capacitors between this pin and GND.								
	16									
	17									
VOUT	18	Negative output voltage with respect to GND. Connect these pins to the output load and connect external								
VOOT	19	bypass capacitors between these pins and GND. Pad 40 should be connected to PCB VOUT planes using multiple vias for good thermal performance.								
	20									
	40									
	10									
	11									
	12	This is the return current path for the power stage of the device. These pins are connected to the internal								
GND	13	output inductor. Connect these pins to the load and to the bypass capacitors associated with VIN and								
	14	VOUT.								
	15									
	39									
	6									
	7									
	21									
PH	22	Phase switch node. Do not place any external component on these pins or tie them to a pin of another								
	23	function.								
	24									
	38									
	41									
VOLIT DT	8	VOUT and A_VOUT Connection Point. Connect VOUT to A_VOUT at these pins as shown in the Layout								
VOUT_PT	9	Considerations section. These pins are not connected to internal circuitry, and are not connected to one other.								
	2									
DNC	3	Do Not Connect. Do not connect these pins to GND, to another DNC pin, or to any other voltage. These pins are connected to internal circuitry. Each pin must be soldered to an isolated pad.								
DINC	25									
	35									
	1									
	4	These pins are connected to the internal analog reference (A_VOUT) of the device. This node should be								
	5	treated as the negative voltage reference for the analog control circuitry. Pad 37 should be connected to the								
A_VOUT	32	PCB A_VOUT plane using multiple vias for good thermal performance. Not all pins are connected together internally. All pins must be connected together externally with a copper plane or pour directly under the								
	33	module. Connect A_VOUT to VOUT at a single point (VOUT_PT; pins 8 & 9). See Layout								
	34	Recommendations.								
	37									
RT	30	Switching frequency adjust pin. To operate at the recommended free-running frequency, connect this pin to A_VOUT. Connecting a resistor between this pin and A_VOUT will reduce the switching frequency. See Switching Frequency section.								
CLK	31	Use this pin to synchronize to an external clock. If unused, isolate this pin from any other signal.								
INH/UVLO	27	Inhibit and UVLO adjust pin. Use an external level-shifter device to ground this pin to control the INH function. A resistor divider between this pin, A_VOUT, and VIN sets the UVLO voltage.								
SS	28	Slow-start pin. Connecting an external capacitor between this pin and A_VOUT adjusts the output voltage rise time.								
STSEL	29	Slow-start select. Connect this pin to A_VOUT to enable the internal SS capacitor.								
VADJ	36	Connecting a resistor between this pin and GND sets the output voltage. A dedicated GND sense line connected at the load will improve regulation at the load. See Figure 48 in the Layout Considerations section.

# 11 Capacitor Recommendations for the LMZ34002 Power Supply

### 11.1 Capacitor Technologies

### 11.1.1 Electrolytic, Polymer-Electrolytic Capacitors

When using electrolytic capacitors, high-quality, computer-grade electrolytic capacitors are recommended. Polymer-electrolytic type capacitors are recommended for applications where the ambient operating temperature is less than 0°C. The Sanyo OS-CON capacitor series is suggested due to the lower ESR, higher rated surge, power dissipation, ripple current capability, and small package size. Aluminum electrolytic capacitors provide adequate decoupling over the frequency range of 2 kHz to 150 kHz, and are suitable when ambient temperatures are above 0°C.

### 11.1.2 Ceramic Capacitors

The performance of aluminum electrolytic capacitors is less effective than ceramic capacitors above 150 kHz. Multilayer ceramic capacitors have a low ESR and a resonant frequency higher than the bandwidth of the regulator. They can be used to reduce the reflected ripple current at the input as well as improve the transient response of the output.

### 11.1.3 Tantalum, Polymer-Tantalum Capacitors

Polymer-tantalum type capacitors are recommended for applications where the ambient operating temperature is less than 0°C. The Sanyo POSCAP series and Kemet T530 capacitor series are recommended rather than many other tantalum types due to their lower ESR, higher rated surge, power dissipation, ripple current capability, and small package size. Tantalum capacitors that have no stated ESR or surge current rating are not recommended for power applications.

### 11.2 Input Capacitor

The LMZ34002 requires a minimum input capacitance of 4.7  $\mu$ F of ceramic type. The voltage rating of input capacitors must be greater than the maximum input voltage. The ripple current rating of the capacitor must be at least 450 mArms. Table 1 includes a preferred list of capacitors by vendor.

### 11.3 Output Capacitor

The required output capacitance of the LMZ34002 can be comprised of either all ceramic capacitors, or a combination of ceramic and bulk capacitors. The required output capacitance must include at least  $2 \times 47 \mu F$  of ceramic type (or  $4 \times 22 \mu F$ ). The voltage rating of output capacitors must be greater than the output voltage. When adding additional non-ceramic bulk capacitors, low-ESR devices like the ones recommended in Table 1 are required. Additional capacitance above the required minimum is determined by actual transient deviation requirements. Table 1 includes a preferred list of capacitors by vendor.

Table 1. Recommended Input/Output Capacitors (1)

			CAPA	CAPACITOR CHARACTERISTICS				
VENDOR	SERIES	PART NUMBER	WORKING VOLTAGE (V)	CAPACITANCE (µF)	ESR <sup>(2)</sup> (mΩ)			
Murata	X5R	GRM31CR61H225KA88L	50	2.2	2			
TDK	X5R	C3216X5R1H475K	50	4.7	2			
Murata	X5R	GRM32ER61E226K	16	22	2			
TDK	X5R	C3225X5R0J476K	6.3	47	2			
Murata	X5R	GRM32ER60J476M	6.3	47	2			
Sanyo	POSCAP	16TQC68M	16	68	50			
Sanyo	POSCAP	6TPE100MI	6.3	100	25			
Kemet	T530	T530D227M006ATE006	6.3	220	6			

<sup>(1)</sup> Capacitor Supplier Verification, RoHS, Lead-free and Material Details Consult capacitor suppliers regarding availability, material composition, RoHS and lead-free status, and manufacturing process requirements for any capacitors identified in this table.

(2) Maximum ESR @ 100 kHz, 25°C.

# 12 Application Information

### 12.1 Adjusting the Output Voltage

The LMZ34002 is designed to provide output voltages from -3 V to -17 V. The output voltage is determined by the value of  $R_{SET}$ , which must be connected between the VADJ pin (Pin 36) and GND. Table 2 gives the standard external  $R_{SET}$  resistor for a number of common bus voltages.

Table 2. Standard R<sub>SET</sub> Resistor Values for Common Output Voltages

OUTPUT VOLTAGE V <sub>OUT</sub> (V)	-3.3	-5.0	-8.0	-12.0	-15.0
R <sub>SET</sub> (kΩ)	31.6	52.3	90.9	140	178

For other output voltages the value of  $R_{\text{SET}}$  can be calculated using the following formula, or simply selected from the range of values given in Table 3.

$$R_{SET} = 10 \times \left( \frac{|V_{OUT}|}{0.798} - 1 \right) (k\Omega)$$
(1)

Table 3. Standard R<sub>SET</sub> Resistor Values

			02.		
V <sub>OUT</sub> (V)	R <sub>SET</sub> (kΩ)	V <sub>OUT</sub> (V)	R <sub>SET</sub> (kΩ)	V <sub>OUT</sub> (V)	R <sub>SET</sub> (kΩ)
-3.0	27.4	-7.5	84.5	-12.5	147
-3.3	31.6	-8.0	90.9	-13.0	154
-3.5	34.0	-8.5	97.6	-13.5	158
-4.0	40.2	-9.0	102	-14.0	165
-4.5	46.4	-9.5	110	-14.5	174
-5.0	52.3	-10.0	115	-15.0	178
-5.5	59.0	-10.5	121	-15.5	187
-6.0	64.9	-11.0	127	-16.0	191
-6.5	71.5	-11.5	133	-16.5	196
-7.0	78.7	-12.0	140	-17.0	205

### 12.2 Safe Operating Current

The amount of output current that can safely be delivered by the LMZ34002 depends on the input voltage and the output voltage. Figure 33 shows the maximum output current for four standard output voltages over input voltage.

Figure 33. Safe Operating Current

# 12.4 Custom Design With WEBENCH® Tools

Click here to create a custom design using the LMZ34002 device with the WEBENCH® Power Designer.

- 1. Start by entering the input voltage  $(V_{IN})$ , output voltage  $(V_{OUT})$ , and output current  $(I_{OUT})$  requirements.
- 2. Optimize the design for key parameters such as efficiency, footprint, and cost using the optimizer dial.
- 3. Compare the generated design with other possible solutions from Texas Instruments.

The WEBENCH Power Designer provides a customized schematic along with a list of materials with real-time pricing and component availability.

In most cases, these actions are available:

- Run electrical simulations to see important waveforms and circuit performance
- · Run thermal simulations to understand board thermal performance
- Export customized schematic and layout into popular CAD formats
- Print PDF reports for the design, and share the design with colleagues

Get more information about WEBENCH tools at www.ti.com/WEBENCH.

Product Folder Links: LMZ34002

### 12.5 Input Voltage

The LMZ34002 operates over the input voltage range of 4.5 V to 40 V. The maximum input voltage is 40 V, however, the sum of  $V_{IN} + |V_{OUT}|$  must not exceed 50 V.

See the Undervoltage Lockout (UVLO) Threshold section of this datasheet for more information.

### 12.6 Undervoltage Lockout (UVLO) Threshold

At turn-on, the  $V_{ON}$  UVLO threshold determines the input voltage level where the device begins power conversion.  $R_{UVLO1}$  and  $R_{UVLO2}$  set the turn-on threshold as shown in Figure 36. The UVLO threshold is not present during the power-down sequence. Applications requiring a turn-off threshold must monitor the input voltage with external circuitry and shut-down using the INH control (see Output On/Off Inhibit (INH)).

The  $V_{ON}$  UVLO threshold must be set to at least 4.5 V to insure proper start-up and reduce current surges on the host input supply as the voltage rises. If possible, it is recommended to set the UVLO threshold to appproximantely 80 to 85% of the minimum expected input voltage.

Use Equation 2 and Equation 3 to calculate the values of  $R_{UVLO1}$  and  $R_{UVLO2}$ .  $V_{ON}$  is the voltage threshold during power-up when the input voltage is rising. Table 4 lists standard resistor values for  $R_{UVLO1}$  and  $R_{UVLO2}$  for adjusting the  $V_{ON}$  UVLO threshold for several input voltages.

$$R_{UVLO1} = \frac{0.5}{2.9 \times 10^{-3}} (k\Omega)$$

$$R_{UVLO2} = \frac{1.25}{\left(\frac{(V_{ON} - 1.25)}{R_{UVLO1}}\right) + 0.9 \times 10^{-3}} (k\Omega)$$
(3)

Table 4. Standard Resistor Values to set V<sub>ON</sub> UVLO Threshold

V <sub>ON</sub> THRESHOLD (V)	4.5	5.0	6.5	8.0	9.0	10.0	15.0	20.0	30.0
$R_{UVLO1}$ ( $k\Omega$ )	174	174	174	174	174	174	174	174	174

### 12.7 Power-Up Characteristics

When configured as shown in the application schematics, the LMZ34002 produces a regulated output voltage following the application of a valid input voltage. During the power-up, internal soft-start circuitry slows the rate that the output voltage rises, thereby limiting the amount of in-rush current that can be drawn from the input source. The soft-start circuitry introduces a short time delay from the point that a valid input voltage is recognized. Figure 37 shows the start-up waveforms for a LMZ34002, operating from a 12 V input and the output voltage adjusted to –5 V. The waveform were measured with a 1.5-A constant current load.

Figure 37. Start-Up Sequence

### 12.8 Light-Load Behavior

The LMZ34002 is a non-synchronous converter. One of the characteristics of non-synchronous operation is that as the output load current decreases, a point is reached where the energy delivered by a single switching pulse is more than the load can absorb. This energy causes the output voltage to rise slightly. This rise in output voltage is sensed by the feedback loop and the device responds by skipping one or more switching cycles until the output voltages falls back to the set point. At very light loads or no load, many switching cycles are skipped. The observed effect during this pulse skipping mode of operation is an increase in the peak to peak ripple voltage, and a decrease in the ripple frequency. The amount of load current when pulse skipping begins is a function of the input voltage, the output voltage, and the switching frequency.

### 12.9 No-Load Operation

When operating at no load or very light load and the input voltage is removed, the output voltage discharges very slowly. If the input voltage is re-applied before the output voltage discharges, the slow-start circuit does not activate and the amount of inrush current is extremely large and may cause an over-current condition. To avoid this condition the output voltage must be allowed to discharge before re-applying the input voltage. Applying a 50-mA to 100-mA minimum load helps discharge the output voltage. Additionally, monitoring the input voltage with a supervisor and shuting-down using the INH control (see Output On/Off Inhibit (INH)) activates the internal slow-start circuit.

### 12.10 Switching Frequency

The recommended switching frequency of the LMZ34002 is 800 kHz. To operate at the recommended switching frequency, connect the RT pin (Pin 30) to A\_VOUT (at pin 32).

It is recommended to adjust the switching frequency in applications with both, higher input voltage (> 18V) and lower output voltage (< -8V). For these applications, improved operating performance can be obtained by decreasing the operating frequency to 500 kHz by adding a resistor,  $R_{RT}$  of 93.1 k $\Omega$  between the RT pin and A\_VOUT as shown in Figure 38. Figure 39 shows the recommended switching frequency over input voltage and output voltage.

Table 5. Standard Resistor Values For Setting Switching Frequency

f <sub>SW</sub> (kHz)	500	800
R <sub>RT</sub> (kΩ)	93.1	0 (short)

### 12.11 Synchronization (CLK)

An internal phase locked loop (PLL) allows synchronization from 700 kHz to 900 kHz for 800 kHz applications, or 400 kHz to 600 kHz for 500 kHz applications. See Figure 39 to determine switching frequency based on input voltage and output voltage. To implement the synchronization feature, connect a square wave clock signal to the RT/CLK pin with a duty cycle between 25% to 75%. The clock signal amplitude must transition lower than 0.5 V and higher than 2.2 V. The start of the switching cycle is synchronized to the falling edge of RT/CLK pin. In applications requiring CLK mode, configure the device as shown in Figure 40 (800 kHz) and Figure 41 (500kHz).

Before the external clock is present, the device works in RT mode where the switching frequency is set by the R<sub>RT</sub> resistor. When the external clock is present, the CLK mode overrides the RT mode. The first time the CLK pin is pulled above the RT/CLK high threshold (2.2 V), the device switches from RT mode to CLK mode and the CLK pin becomes high impedance as the PLL starts to lock onto the frequency of the external clock. It is not recommended to switch from CLK mode back to RT mode because the internal switching frequency drops to 100 kHz first before returning to the switching frequency set by the RT resistor.

# Synchronization (CLK) (continued)

### 12.12 Output On/Off Inhibit (INH)

The INH pin provides electrical on/off control of the device. Once the INH pin voltage exceeds the threshold voltage, the device starts operation. If the INH pin voltage is pulled below the threshold voltage, the regulator stops switching and enters low quiescent current state.

The INH pin has an internal pull-up current source, allowing the user to float the INH pin for enabling the device. If an application requires controlling the INH pin, an external level-shifter is required to interface with the pin because in a positive-to-negative buck-boost supply, the INH pin is referenced to VOUT, not GND. Adding a level-shifter (U1) as shown in Figure 42, allows the INH control to be referenced to GND. A recommended level-shifter part # is DCX144EH-7 from Diodes Inc.

Pulling the input of U1 to GND applies a low voltage to the inhibit control pin and disables the output of the supply, shown in Figure 43. Releasing the input of U1 enables the device, which executes a soft-start power-up sequence, as shown in Figure 44. The device produces a regulated output voltage within 10 ms. The waveforms were measured with a 1.5-A constant current load.

Figure 42. Typical Inhibit Control

### 12.13 Slow-Start Circuit (SS)

Connecting the STSEL pin (Pin 29) to A\_VOUT while leaving SS pin (Pin 28) open, enables the internal SS capacitor with a slow-start interval of approximately 10 ms. Adding additional capacitance between the SS pin and A\_VOUT increases the slow-start time. Figure 45 shows an additional SS capacitor connected to the SS pin and the STSEL pin connected to A\_VOUT. See Table 6 below for SS capacitor values and timing interval.

Figure 45. Slow-Start Capacitor (C<sub>SS</sub>) and STSEL Connection

Table 6. Slow-Start Capacitor Values and Slow-Start Time

C <sub>SS</sub> (nF)	open	10	15	22
SS Time (ms)	10	15	17	20

#### 12.14 Inrush Current

During turn-on, as the LMZ34002 performs a slow-start sequence, an inrush current is induced as the output capacitors charge up. The inrush current is in addition to the DC input current. The amount of inrush current depends on the input voltage, output voltage and amount of output capacitance. Table 7 shows the typical inrush current for the input voltage, output voltage and the amount of output capacitance. Increasing the slow-start capacitor reduces the inrush current by slowing down the ramp of the output voltage. See Slow-Start Circuit (SS).

**Table 7. Typical Inrush Current** 

	Output Capacitance →	100 μF ceramic	200 μF <sup>(1)</sup>	320 μF <sup>(1)</sup>	430 μF <sup>(1)</sup>			
VIN (V)	VOUT (V)	Inrush Current (A)						
	-3.3	0.1	0.1	0.1	0.1			
E	<b>-</b> 5	0.1	0.2	0.2	0.3			
5	-12	0.3	0.8	1.2	1.8			
	-15	0.4	1.3	2.5	3.6			
	-3.3	0.1	0.1	0.1	0.1

	-15	0.3	0.5	0.9	1.3			
	-3.3	0.1	0.1	0.1	0.1			
24	<b>-</b> 5	0.1	0.1	0.2	0.2			
24	-12	0.2	0.2	0.3	0.5			
	-15	0.3	0.3	0.5	0.7			
	-3.3	0.2	0.2	0.2	0.2			
36	<b>-</b> 5	0.2	0.2	0.2	0.2			
	-12	0.2	0.3	0.4	0.4			

<sup>(1)</sup> This amount of capacitance includes the required 100 µF of ceramic capacitance with additional bulk capacitance.

### 12.15 Input to Output Coupling Capacitor

Adding an input to output coupling capacitor ( $C_{IO}$ ) across VIN to VOUT as shown in Figure 46 can help reduce output voltage ripple and improve transient response. A typical value for  $C_{IO}$  is 2.2  $\mu$ F ceramic with a voltage rating greater than the sum of VIN + |VOUT|.

Figure 46. Input to Output Coupling Capacitor

#### 12.16 Overcurrent Protection

For protection against load faults, the LMZ34002 incorporates cycle-by-cycle current limiting. During an overcurrent condition the output current is limited and the output voltage is reduced. If the output voltage drops more than 25%, the switching frequency is lowered to reduce power dissipation within the device. When the overcurrent condition is removed, the output voltage returns to the established voltage.

The LMZ34002 is not designed to endure a sustained short circuit condition. The use of an output fuse, voltage supervisor circuit, or other overcurrent protection circuit is recommended.

### 12.17 Thermal Shutdown

The internal thermal shutdown circuitry forces the device to stop switching if the junction temperature exceeds 180°C typically. The device reinitiates the power up sequence when the junction temperature drops below 165°C typically.

# 12.18 Layout Considerations

To achieve optimal electrical and thermal performance, an optimized PCB layout is required. Figure 47 through Figure 50 show four layers of a typical PCB layout. Some considerations for an optimized layout are:

- Use large copper areas for power planes (VIN, VOUT, and GND) to minimize conduction loss and thermal stress.
- Place ceramic input and output capacitors close to the module pins to minimize high frequency noise.
- · Locate additional output capacitors between the ceramic capacitor and the load.
- Place a dedicated A VOUT copper area beneath the LMZ34002.
- Isolate the PH copper area from the GND copper area using the VOUT copper area.
- Connect the VOUT and A\_VOUT copper areas at one point; at pins 8 & 9.
- Place R<sub>SET</sub>, R<sub>RT</sub>, and C<sub>SS</sub> as close as possible to their respective pins.
- Use multiple vias to connect the power planes to internal layers.
- Use a dedicated sense line to connect R<sub>SET</sub> to GND near the load for best regulation.

Figure 48. Typical GND-Layer Recommended Layout

# 14 Device and Documentation Support

### 14.1 Device Support

### 14.1.1 Development Support

### 14.1.1.1 Custom Design With WEBENCH® Tools

Click here to create a custom design using the LMZ34002 device with the WEBENCH® Power Designer.

- 1. Start by entering the input voltage (V<sub>IN</sub>), output voltage (V<sub>OUT</sub>), and output current (I<sub>OUT</sub>) requirements.
- 2. Optimize the design for key parameters such as efficiency, footprint, and cost using the optimizer dial.
- 3. Compare the generated design with other possible solutions from Texas Instruments.

The WEBENCH Power Designer provides a customized schematic along with a list of materials with real-time pricing and component availability.

In most cases, these actions are available:

- Run electrical simulations to see important waveforms and circuit performance
- · Run thermal simulations to understand board thermal performance
- Export customized schematic and layout into popular CAD formats
- Print PDF reports for the design, and share the design with colleagues

Get more information about WEBENCH tools at www.ti.com/WEBENCH.

### 14.2 Documentation Support

### 14.2.1 Related Documentation

For related documentation see the following:

### 14.6 Electrostatic Discharge Caution

This integrated circuit can be damaged by ESD. Texas Instruments recommends that all integrated circuits be handled with appropriate precautions. Failure to observe proper handling and installation procedures can cause damage.

ESD damage can range from subtle performance degradation to complete device failure. Precision integrated circuits may be more susceptible to damage because very small parametric changes could cause the device not to meet its published specifications.

<sup>(1)</sup> Status: For more details on status, see our product life cycle.

Multiple part markings will be inside parentheses. Only one part marking contained in parentheses and separated by a "~" will appear on a part. If a line is indented then it is a continuation of the previous line and the two combined represent the entire part marking for that device.

Important Information and Disclaimer: The information provided on this page represents TI's knowledge and belief as of the date that it is provided. TI bases its knowledge and belief on information provided by third parties, and makes no representation or warranty as to the accuracy of such information. Efforts are underway to better integrate information from third parties. TI has taken and continues to take reasonable steps to provide representative

<sup>(2)</sup> Material type: When designated, preproduction parts are prototypes/experimental devices, and are not yet approved or released for full production. Testing and final process, including without limitation quality assurance, reliability performance testing, and/or process qualification, may not yet be complete, and this item is subject to further changes or possible discontinuation. If available for ordering, purchases will be subject to an additional waiver at checkout, and are intended for early internal evaluation purposes only. These items are sold without warranties of any kind.

<sup>(3)</sup> RoHS values: Yes, No, RoHS Exempt. See the TI RoHS Statement for additional information and value definition.

<sup>(4)</sup> Lead finish/Ball material: Parts may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead finish/Ball material values may wrap to two lines if the finish value exceeds the maximum column width.

<sup>(5)</sup> MSL rating/Peak reflow: The moisture sensitivity level ratings and peak solder (reflow) temperatures. In the event that a part has multiple moisture sensitivity ratings, only the lowest level per JEDEC standards is shown. Refer to the shipping label for the actual reflow temperature that will be used to mount the part to the printed circuit board.

<sup>(6)</sup> Part marking: There may be an additional marking, which relates to the logo, the lot trace code information, or the environmental category of the part.
