LP5815 3-Channel I²C Interface RGB LED Driver with Instant Blinking and Auto Animation Control

1 Features

- Operating voltage range
  - V_{CC} range: 2.5V to 5.5V
  - Logic pins compatible with 1.8V, 3.3V, and 5V
  - Output voltage up to 5.5V
- 3-constant current sinks with high precision
  - 0.1mA to 51mA per channel
  - Device-to-device error: ±8% (max.)
  - Channel-to-channel error: ±3% (max.)
  - Ultra-low headroom voltage: 135mV (max.) at 25.5mA; 275mV (max.) at 51mA
- Ultra-low power consumption
  - Shutdown: I_{SD} = 0.1μA (typ.)
  - Standby: I_{STB} = 22μA (typ.)
  - Active:
    - I_{NOR} = 0.15mA(typ.), disable output channel
    - I_{NOR} = 0.23mA(typ.), LED current = 25.5mA
- Analog dimming (current gain control)
  - Global 1-bit Maximum Current (MC) 25.5mA/ 51mA
  - Individual 8-bits Dot Current (DC) setting
- PWM dimming up to audible-noise-free 23kHz
  - Individual 8-bits PWM dimming resolution
  - Linear or exponential dimming curves
- Autonomous animation engine control
- Instant blinking via STAT pin control
- 1MHz (max.) I²C interface
- ESD: 4kV HBM, 1.5kV CDM
- Package
  - 1.6x2.1mm SOT583-8 with 0.5mm pitch
  - 1.36x0.8mm DSBGA-8 with 0.35mm pitch
- –40°C to 125°C operating temperature range

2 Applications

LED animation and indication for:

- Personal Electronics
  - Virtual Reality (VR) Headset
  - Gaming Controller and Peripherals
  - Electronic and Robotic Toys
  - Smart Speaker
  - Wireless Speaker
  - Solid State Drive (SSD)
  - Electronic Smart Lock
  - Headsets/Headphones and Earbuds
  - GPS Personal Navigation Device
- WLAN/Wi-Fi Access Point
- Video Doorbell
- Video Conference System

3 Description

The LP5815 is a 3-channel RGB LED driver with autonomous animation engine control and controllable Instant Blinking feature. The device has ultra-low operation current with 0.1μA (typical) in shutdown mode, 0.1mA (typical) when enable device and 0.2mA (typical) when illuminate LEDs.

Both analog dimming and PWM dimming methods are adopted to achieve powerful dimming performance. The output current of each LED can be adjusted with 256 steps from 0.1mA to 25.5mA or 0.2mA to 51mA. The 8-bits PWM generator enables smooth and audible-noise-free dimming control for LED brightness.

The autonomous animation engine can significantly reduce the real-time loading of controller. Each LED can be configured through the related registers to realize vivid and fancy lighting effects.

The Instant Blinking via STAT pin control feature can provide automatic blinking on OUT0 channel without I²C communication after powering up.

Package Information

PART NUMBER	PACKAGE	PACKAGE SIZE (NOM)
LP5815DRL	SOT583 (8)	1.6mm × 2.1mm
LP5815YCH	DSBGA (8)(1)	1.36mm × 0.8mm

5 Pin Configuration and Functions

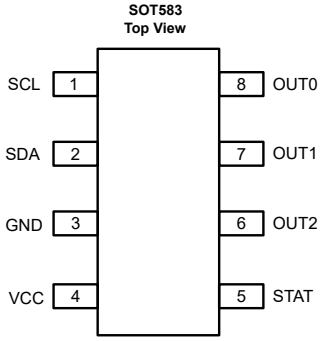

Figure 5-1. LP5815 DRL Package 8-Pin SOT583 Top View

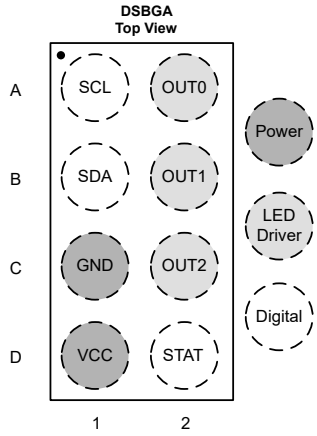

Figure 5-2. LP5815 YCH Package 8-Pin DSBGA Top View

Table 5-1. Pin Functions

PIN			TYPE(1)	DESCRIPTION
NAME	DRL	YCH		
SCL	1	A1	I	I^2C serial interface clock input.
SDA	2	B1	I/O	I^2C serial interface data input/output.
GND	3	C1	P	Ground.
VCC	4	D1	P	Power supply of the device. A 1 µF capacitor is recommended to be connected between this pin with GND and be placed as close to the device as possible.
STAT	5	D2	I	Instant blinking control input.
OUT2	6	C2	O	Constant current sink output 2.
OUT1	7	B2	O	Constant current sink output 1.
OUT0	8	A2	O	Constant current sink output 0.

6 Specifications

6.1 Absolute Maximum Ratings

over operating free-air temperature range (unless otherwise noted)(1)

		MIN	MAX	UNIT
Voltage range at terminals	VCC, SCL, SDA, STAT, OUT0, OUT1, OUT2	–0.3	6	V
T_J	Junction temperature	–40	150	°C
T_{stg}	Storage temperature	–65	150	°C

(1) Operation outside the Absolute Maximum Ratings may cause permanent device damage. Absolute Maximum Ratings do not imply functional operation of the device at these or any other conditions beyond those listed under Recommended Operating Conditions. If used outside the Recommended Operating Conditions but within the Absolute Maximum Ratings, the device may not be fully functional, and this may affect device reliability, functionality, performance, and shorten the device lifetime.

6.2 ESD Ratings

			VALUE	UNIT
$V_{(ESD)}$	Electrostatic discharge	Human body model (HBM), per ANSI/ESDA/JEDEC JS-001, all pins(1)	±4000	V
		Charged device model (CDM), per ANSI/ESDA/JEDEC JS-002, all pins(2)	±1500	

(1) JEDEC document JEP155 states that 500V HBM allows safe manufacturing with a standard ESD control process.
(2) JEDEC document JEP157 states that 250V CDM allows safe manufacturing with a standard ESD control process.

6.3 Recommended Operating Conditions

over operating free-air temperature range (unless otherwise noted)

		MIN	NOM	MAX	UNIT
V_{CC}	Input voltage range	2.5		5.5	V
C_{IN}	Effective input capacitance range	1	4.7		µF
OUT0, OUT1, OUT2	Voltage on OUT0, OUT1, OUT2 pins	0		5.5	V
SCL, SDA, STAT	Voltage on SCL, SDA, STAT pins	0		5.5	V
T_A	Ambient temperature	–40		85	°C
T_J	Operating junction temperature	–40		125	°C

6.4 Thermal Information

THERMAL METRIC(1)		LP5815 DRL (SOT583) 8 PINS	UNIT
$R_{\theta JA}$	Junction-to-ambient thermal resistance	118.9	°C/W
$R_{\theta JC(top)}$	Junction-to-case (top) thermal resistance	47.1	°C/W
$R_{\theta JB}$	Junction-to-board thermal resistance	27.5	°C/W
Ψ_{JT}	Junction-to-top characterization parameter	1.4	°C/W
Ψ_{JB}	Junction-to-board characterization parameter	27.2	°C/W
$R_{\theta JC(bot)}$	Junction-to-case (bottom) thermal resistance	n/a	°C/W

(1) For more information about traditional and new thermal metrics, see the Semiconductor and IC Package Thermal Metrics application report.

6.5 Electrical Characteristics

Unless specified otherwise, typical characteristics apply over the full ambient temperature range (–40°C < T_A < +85°C), V_{CC} = 3.6V, C_{IN} = 1µF.

PARAMETER		TEST CONDITIONS	MIN	TYP	MAX	UNIT
Power Supply						
V_{CC}	Input voltage range		2.5		5.5	V
V_{CC_UVLO}	Under-voltage lockout threshold	V_{CC} rising	2.2	2.3	2.4	V
		V_{CC} falling	2	2.1	2.2	V
I_{SD}	Shutdown current into VCC pin	V_{CC} = 3.6V		0.1	0.3	µA
I_{STB}	Standby current into VCC pin	V_{CC} = 3.6V, CHIP_EN = 0 (bit)		22	26	µA
I_{NOR}	Normal operation current into VCC pin	V_{CC} = 3.6V, CHIP_EN = 1 (bit), OUT0_EN = OUT1_EN = OUT2_EN = 0 (bit)		0.15	0.17	mA
I_{NOR}	Normal operation current into VCC pin	V_{CC} = 3.6V, CHIP_EN = 1 (bit), OUT0_EN = OUT1_EN = OUT2_EN = 1 (bit), I_{OUT0} = I_{OUT1} = I_{OUT2} = 25.5mA (MAX_CURRENT = 0 (bit), OUTx_DC = FFh, OUTx_MANUAL_PWM = FFh)		0.23	0.29	mA
LED Driver Output						
I_{CS}	Constant current sink output range	V_{CC} = 3.6V, VLED = 5V, MAX_CURRENT = 0 (bit), OUTx_MANUAL_PWM = FFh (100% ON)	0.1		25.5	mA
		V_{CC} = 3.6V, VLED = 5V, MAX_CURRENT = 1 (bit), OUTx_MANUAL_PWM = FFh (100% ON)	0.2		51	mA
I_{CS_LKG}	Constant current sink leakage current	V_{CC} = 3.6V, OUTx = 1V, OUTx_MANUAL_PWM = 0 (0%)		0.1	1	µA
I_{ERR_D2D}	Device to device current error, I_{ERR_D2D} = (I_{AVE}-I_{SET})/I_{SET}×100%	All LEDs turn ON. Current set to 25.5mA (MAX_CURRENT = 0 (bit), OUTx_DC = FFh, OUTx_MANUAL_PWM = FFh)	–8		8	%
		All LEDs turn ON. Current set to 51mA (MAX_CURRENT = 1 (bit), OUTx_DC = FFh, OUTx_MANUAL_PWM = FFh)	–8		8	%
I_{ERR_C2C}	Channel to Channel current error I_{ERR_C2C} = (I_{OUTX}-I_{AVE})/I_{AVE}×100%	All LEDs turn ON. Current set to 25.5mA (MAX_CURRENT = 0 (bit), OUTx_DC = FFh, OUTx_MANUAL_PWM = FFh)	–3		3	%
		All LEDs turn ON. Current set to 51mA (MAX_CURRENT = 1 (bit), OUTx_DC = FFh, OUTx_MANUAL_PWM = FFh)	–2		2	%
V_{HR}	LED driver output headroom voltage	All LEDs turn ON. Current set to 25.5mA (MAX_CURRENT = 0 (bit), OUTx_DC = FFh, OUTx_MANUAL_PWM = FFh), V_{CC} = 3.6V			0.135	V
		All LEDs turn ON. Current set to 51mA (MAX_CURRENT = 1 (bit), OUTx_DC = FFh, OUTx_MANUAL_PWM = FFh), V_{CC} = 3.6V			0.275	V
		All LEDs turn ON. Current set to 25.5mA (MAX_CURRENT = 0 (bit), OUTx_DC = FFh, OUTx_MANUAL_PWM = FFh), V_{CC} = 2.5V			0.15	V
		All LEDs turn ON. Current set to 51mA (MAX_CURRENT = 1 (bit), OUTx_DC = FFh, OUTx_MANUAL_PWM = FFh), , V_{CC} = 2.5V			0.3	V
f_{LED_PWM}	PWM dimming frequency			23		kHz
f_{OSC}	Internal oscillator frequency			6		MHz

Unless specified otherwise, typical characteristics apply over the full ambient temperature range (–40°C < T_A < +85°C), V_{CC} = 3.6V, C_{IN} = 1µF.

PARAMETER		TEST CONDITIONS	MIN	TYP	MAX	UNIT
Logic Interface						
V_{STAT_H}	STAT logic high	VCC > 2.5V	2.3			V
V_{STAT_L}	STAT logic low	VCC > 2.5V			0.4	V
V_{IH_LOGIC}	High level input voltage of SDA, SCL		1.4			V
V_{IL_LOGIC}	Low level input voltage of SDA, SCL				0.4	V
V_{OL_LOGIC}	Low level output voltage of SDA				0.4	V
Protection						
T_{SD}	Thermal shutdown threshold for LED driver part	T_J rising		150		°C
T_{SD_HYS}	Thermal shutdown hysteresis	T_J falling below T_{SD}		15		°C

6.6 Timing Requirements

Unless specified otherwise, typical characteristics apply over the full ambient temperature range (–40°C < TA < +85°C), V_{CC} = 3.6V, C_{IN} = 1µF.

I^2C Timing Requirements		MIN	NOM	MAX	UNIT
Standard-mode					
f_{SCL}	SCL clock frequency	0		100	kHz
1	Hold time (repeated) START condition. After this period, the first clock pulse is generated.	4			µs
2	LOW period of the SCL clock	4.7			µs
3	HIGH period of the SCL clock	4			µs
4	Set-up time for a repeated START condition	4.7			µs
5	Data hold time	0			µs
6	Data set-up time	250			ns
7	Rise time of both SDA and SCL signals			1000	ns
8	Fall time of both SDA and SCL signals			300	ns
9	Set-up time for STOP condition	4			µs
10	Bus free time between a STOP and START condition	4.7			µs
C_b	Capacitive load for each bus line			400	pF
Fast-mode					
f_{SCL}	SCL clock frequency	0		400	kHz
1	Hold time (repeated) START condition. After this period, the first clock pulse is generated.	0.6			µs
2	LOW period of the SCL clock	1.3			µs
3	HIGH period of the SCL clock	0.6			µs
4	Set-up time for a repeated START condition	0.6			µs
5	Data hold time	0			µs
6	Data set-up time	100			ns
7	Rise time of both SDA and SCL signals			300	ns
8	Fall time of both SDA and SCL signals			300	ns
9	Set-up time for STOP condition	0.6			µs
10	Bus free time between a STOP and START condition	1.3			µs
C_b	Capacitive load for each bus line			400	pF
Fast-mode Plus					
f_{SCL}	SCL clock frequency	0		1000	kHz

Unless specified otherwise, typical characteristics apply over the full ambient temperature range (–40°C < TA < +85°C), V_{CC} = 3.6V, C_{IN} = 1µF.

	I²C Timing Requirements	MIN	NOM	MAX	UNIT
1	Hold time (repeated) START condition. After this period, the first clock pulse is generated.	0.26			µs
2	LOW period of the SCL clock	0.5			µs
3	HIGH period of the SCL clock	0.26			µs
4	Set-up time for a repeated START condition	0.26			µs
5	Data hold time	0			µs
6	Data set-up time	50			ns
7	Rise time of both SDA and SCL signals			120	ns
8	Fall time of both SDA and SCL signals			120	ns
9	Set-up time for STOP condition	0.26			µs
10	Bus free time between a STOP and START condition	0.5			µs
C_b	Capacitive load for each bus line			550	pF

7 Detailed Description

7.1 Overview

The LP5815 is a 3 channel RGB LED driver with instant blinking and autonomous animation control. The maximum output current of each channel is up to 51mA and can be adjusted by 256 steps from 0 to the full current. Besides the annalog dimming, every channel supports 8-bit PWM dimming in both manaul mode and autonomous animation mode.

The LP5815 features ultra-low shutdown current that is about 0.1uA. Two approaches are provided to control the LP5815 enter shutdown mode, sending shutdown command or constantly pulling down SCL, which improves the flexibility in system design for different application requirements.

The LP5815 integrates advanced autonomous animation control architecture. Four basic configurable independent pattern units can be selected and organized for each channel arbitrarily to realize both simple and complicated pattern effects.

7.2 Functional Block Diagram

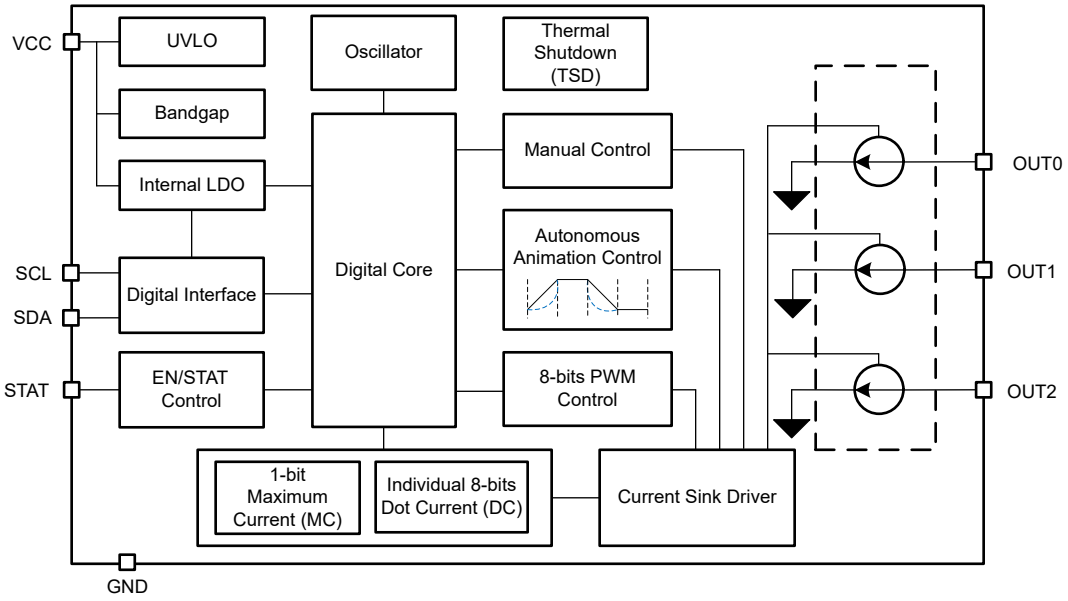

Figure 7-1. LP5815 Function Block

7.3 Feature Description

7.3.1 Analog Dimming

There are two methods to control the current gain of each output channel.

- Global 1-bit Maximum Current (MC) control for all channels without external resistor
- Individual 8-bit Dot Current (DC) control for each channel

The maximum output current I_{OUT_max} of each channel can be programmed by the 1 bit MAX_CURRENT. When the device is powered on, the default value of MC is 0h, which is 25.5mA.

Table 7-1. Maximum Current (MC) Bit Setting

1-bit Maximum Current (MC)		I_{OUT_MAX} (mA)
Binary	Decimal	
0 (default)	0 (default)	25.5 (default)
1	1	51

The LP5815 can individually adjust the analog output current of each channel by using Dot Current (DC) function. The brightness deviation among the LED bins can be miminized to achieve uniform display performance through the DC setting. The DC is programmed in an 8-bit depth, so the analog current can be adjusted with 256 steps from 0 to 100% of I_{OUT_MAX}. The default value of all DC is 0h, which is not current output.

Table 7-2. Dot Current (DC) Bits Setting

8-bits Dot Current (DC) Register		Ratio of I_{OUT_MAX}
Binary	Decimal	
0000 0000 (default)	0 (default)	0% (default)
0000 0001	1	0.39%
0000 0010	2	0.78%
---	---	---
1000 0000	128	50.2%
---	---	---
1111 1101	253	99.2%
1111 1110	254	99.6%
1111 1111	255	100%

By configuring the MC and DC, the analog output current of each channel can be calculated as Equation 1:

$$I_{OUT}\left(mA\right) = I_{OUT\_MAX} \times \frac{DC}{255} \quad (1)$$

The average output current of each channel can be caculated asEquation 2:

$$I_{AVE}\left(mA\right) = I_{OUT\_MAX} \times \frac{DC}{255} \times D_{PWM} \quad (2)$$

- D_{PWM} is the PWM duty.

7.3.2 PWM Dimming

The LP5815 supports 8-bit PWM dimming with 23kHz frequency in both manual mode and autonomous animation mode. The device integrates an internal 6MHz oscillator to generate the PWM clock.

- **Manual Mode**: When OUT0_AUTO_EN, OUT1_AUTO_EN, OUT2_AUTO_EN bit in DEV_CONFIG3 register is set as 0. The output PWM value of each channel is controlled by OUT0_MANUAL_PWM, OUT1_MANUAL_PWM, OUT2_MANUAL_PWM separately. In manual mode, if OUT0_FADE_EN, OUT1_FADE_EN, OUT2_FADE_EN bit in DEV_CONFIG2 register is set as 0, the output PWM value updates immeditaly to the latest received PWM set value. If OUT0_FADE_EN, OUT1_FADE_EN, OUT2_FADE_EN bit in DEV_CONFIG2 register is set as 1, the fade in or out function is enabled, the output PWM ramps up or down smoothly to the latest received PWM value within the time defined by OUT_FADE_TIME automatically.
- **Autonomous Animation Mode**: When OUT0_AUTO_EN, OUT1_AUTO_EN, OUT2_AUTO_EN bit in DEV_CONFIG3 register is set as 1. The PWM output value of each channel is controlled by the autonomous animation pattern PWM value. Refer to the Autonomous Animation Control for detailed description.

The LP5815 allows users to configure the dimming scale as exponential curve or linear curve for each channel separately through the OUT0_EXP_EN, OUT1_EXP_EN, OUT2_EXP_EN in DEV_CONFIG3 register. A human-eye-friendly visual performance can be achieved by using the internal exponential scale. The linear scale has great linearity between PWM duty cycle and PWM setting value, which provides flexible approach for external controlled gamma correction algorithm. The 8-bit linear and exponential curves are shown as Figure 7-2.

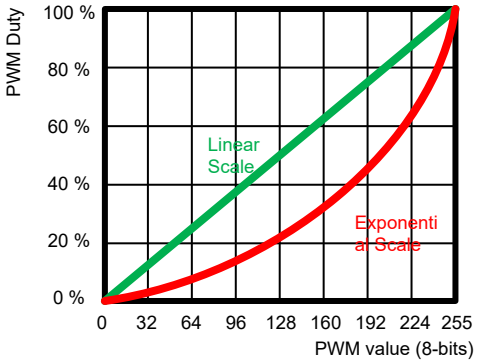

Figure 7-2. Linear and Exponential PWM Dimming Curves

7.3.3 Sloper

In manual control mode, output fade in or out is supported when LED0_FADE_EN, LED1_FADE_EN, LED2_FADE_EN bit in DEV_CONFIG2 register is set as 1. Sloper is the basic element to achieve autonomous fade in and fade out animations. The output can achieve 256 steps fade in or fade out effects from 'PWM_Start' to 'PWM_End' within a specified time period T as shown in Figure 7-3. Exponential dimming curve can also be supported in the sloper.

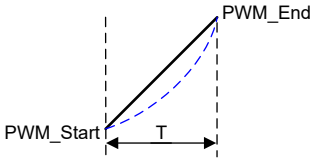

Figure 7-3. Sloper Curve Demonstration

The programable time T is selectable from 0 to around 8s with 16 levels shown in Table 7-3.

Table 7-3. Programable Time Options

Register Value	0h	1h	2h	3h	4h	5h	6h	7h	8h	9h	Ah	Bh	Ch	Dh	Eh	Fh
Time (Typ.)	0s	0.05s	0.1s	0.15s	0.2s	0.25s	0.3s	0.35s	0.4s	0.45s	0.5s	1s	2s	4s	6s	8s

7.3.4 Autonomous Animation Control

The LP5815 supports autonomous animation control for each channel. With the animation engine the device can realize vivid lighting effects while releasing the loading of external controller.

As showed in Figure 7-4 , the LP5815 has 4 independent configurable animation engine units, ENGINE0, ENGINE1, ENGINE2 and ENGINE3. Any one of the 4 engines can be selected by each output channel. There are 4 engine orders to construct one engine unit. For each engine order, one pattern unit can be selected to execute when the engine order is enabled. At the bottom layer, there are 4 independent configurable pattern units.

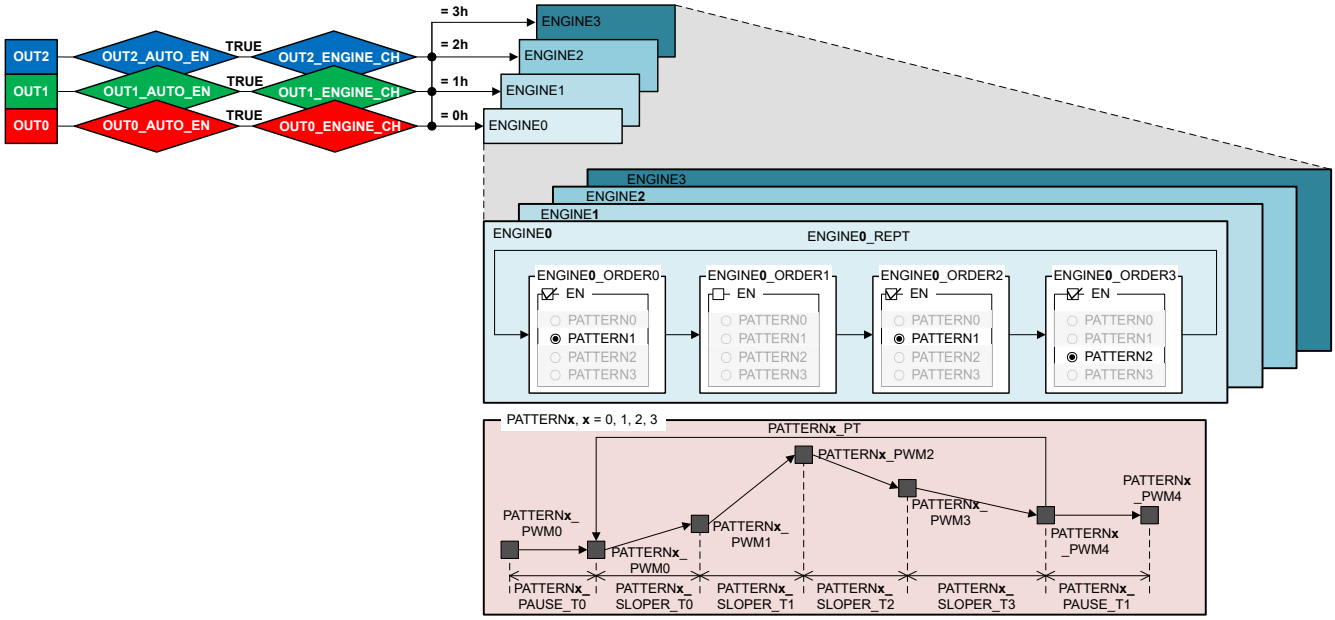

Figure 7-4. Animation Pattern Overview

7.3.4.1 Animation Engine Unit

The LP5815 has 4 independent animation engine units ENGINE0, ENGINE1, ENGIN2 and ENGINE3. For each output, any one of the 4 engines can be selected by setting the register OUT*x*_ENGINE_CH bits in DEV_CONFIG4 register (*x* = 0, 1, 2).

- OUT*x*_ENGINE_CH = 0, ENGINE0 is selected
- OUT*x*_ENGINE_CH = 1, ENGINE1 is selected
- OUT*x*_ENGINE_CH = 2, ENGINE2 is selected
- OUT*x*_ENGINE_CH = 3, ENGINE3 is selected

There are 4 engine orders, ENGINE*x*_ORDER0, ENGINE*x*_ORDER1, ENGINE*x*_ORDER2 and ENGINE*x*_ORDER3, to construct one engine unit ENGINE*x* (*x* = 0, 1, 2, 3). The 4 engine orders in one engine unit is executed sequentially. But any one of the 4 engine orders can be skipped by disabling the engine order through setting the corresponding E*x*O*y*_EN bit as 0 (*x*, *y* = 0, 1, 2, 3) in ENGINE_CONFIG4 and ENGINE_CONFIG5 registers.

If 4 engine orders in one engine unit are all disabled, the engine unit is not started after sending the Start_command. The corresponding internal engine busy flag is not set as shown in Figure 7-7.

The engine unit ENGINE*x* can be defined to execute repeately as the times specified in ENGINE*x*_REPT in ENGINE_CONFIG6 register.

- ENGINE*x*_REPT = 0, ENGINEx doesn't repeat
- ENGINE*x*_REPT = 1, ENGINEx repeats 1 time
- ENGINE*x*_REPT = 2, ENGINEx repeats 2 times

- ENGINE*x*_REPT = 3, ENGINEx repeats infinitely

Engine order is enabled by setting the corresponding E*x*O*y*_EN bit as 1. Any one of 4 basic patterns can be selected through the ENGINE*x*_ORDER*y* from ENGINE_CONFIG0 to ENGINE_CONFIG3 registers (*x*, *y* = 0, 1, 2, 3).

- ENGINEx_ORDERy = 0, PATTERN0 is selected
- ENGINEx_ORDERy = 1, PATTERN1 is selected
- ENGINEx_ORDERy = 2, PATTERN2 is selected
- ENGINEx_ORDERy = 3, PATTERN3 is selected

7.3.4.2 Animation Pattern Unit

The LP5815 has 4 independent configurable pattern units, PATTERN0, PATTERN1, PATTERN2 and PATTERN3. Every pattern unit has 5 PWM values, 6 time values and 1 play times value.

For PATTERN*x* (*x* = 0, 1, 2, 3),

- The 5 PWM values are stored in PATTERN*x*_PWM0, PATTERN*x*_PWM1, PATTERN*x*_PWM2, PATTERN*x*_PWM3 and PATTERN*x*_PWM4. The 8 bits PWM value can be programmed from 0 to 255. Exponential dimming curve can also be supported in the sloper time.
- The 6 time values are devided into 2 types, pause time and sloper time. There are 2 pause time, PATTERN*x*_PAUSE_T0 and PATTERN*x*_PAUSE_T1. 4 sloper time, PATTERN*x*_SLOPER_T0, PATTERN*x*_SLOPER_T1, PATTERN*x*_SLOPER_T2 and PATTERN*x*_SLOPER_T3. Evey time value can be configured from 0 to 8s with 16 options.
- The pattern play times value is stored in PATTERN*x*_PT and can be configued from 0 to infinite times with 16 options. When the PATTERN*x*_PT = 0, the 2 pause time, output PWM0 for PAUSE_T0 and output PWM4 for PAUSE_T1, are still executed to construct the pattern unit.

Typical breathing effect example is illustrated as shown in Figure 7-5.

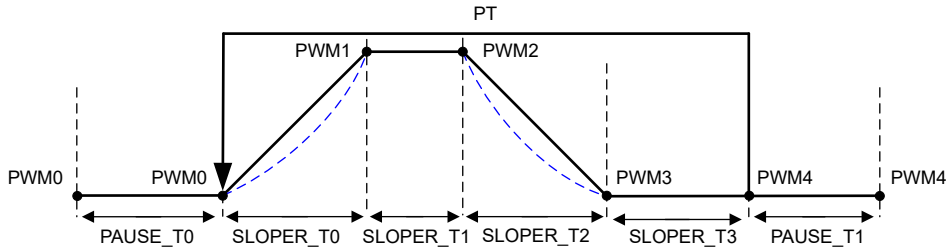

Figure 7-5. Animation Pattern Unit - Example 1

Advanced breathing effect example is shown in Figure 7-6. There are 2 different fading speeds are set in the PWM rising and falling phases, to achieve a complex animation.

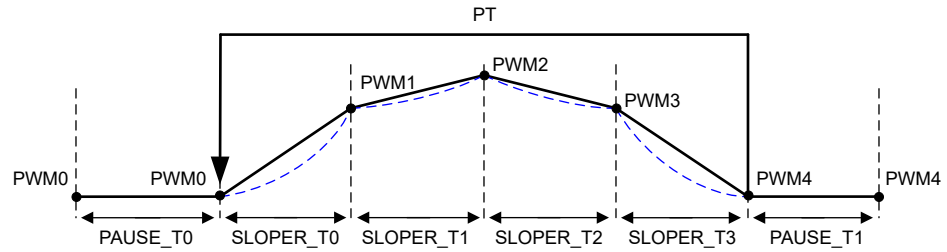

Figure 7-6. Animation Pattern Unit - Example 2

7.3.4.3 Animation Control

The LP5815 has individual engine busy flag for each output channel, OUT0_ENGINE_BUSY, OUT1_ENGINE_BUSY and OUT2_ENGINE_BUSY, to indicate whether the engine selected by the output channel is under running or not. Besides the individule output busy flag there is a global engine busy flag, ENGINE_BUSY, to indicate if there is engine under running or not.

When the ENGINE_BUSY is set as 1, the engine configure registers and pattern configure registers shown in Table 7-4 are locked for modification protection. These engine busy lock registers can only be modified when **ENGINE_BUSY = 0**.

Table 7-4. Engine Busy Lock Registers

Description	Register Address	Register Acronym
Engine configure registers	0x06 to 0x0C	ENGINE_CONFIG0 to ENGINE_CONFIG6
Pattern configure registers	0x1C to 0x3F	• PATTERN*x*_PAUSE_TIME • PATTERN*x*_REPEAT_TIME • PATTERN*x*_PWM0 • PATTERN*x*_PWM1 • PATTERN*x*_PWM2 • PATTERN*x*_PWM3 • PATTERN*x*_PWM4 • PATTERN*x*_SLOPER_TIME1 • PATTERN*x*_SLOPER_TIME2 *x* = 0, 1, 2, 3

The LP5815 has 4 internal engine busy flags, ENGINE0_BUSY, ENGINE1_BUSY, ENGINE2_BUSY and ENGINE3_BUSY, as shown in Figure 7-7. The ENGINEy_BUSY is set as 1 after Start_command is received with all the below conditions.

- The engine has been selected by at least one channel, for example OUTx, and there is at least one engine order enabled in this engine
- The autonomous enable bit is set as 1 of the OUTx

The internal ENGINEy_BUSY flag keeps as 1 until the engine has completed or there is Stop_command received.

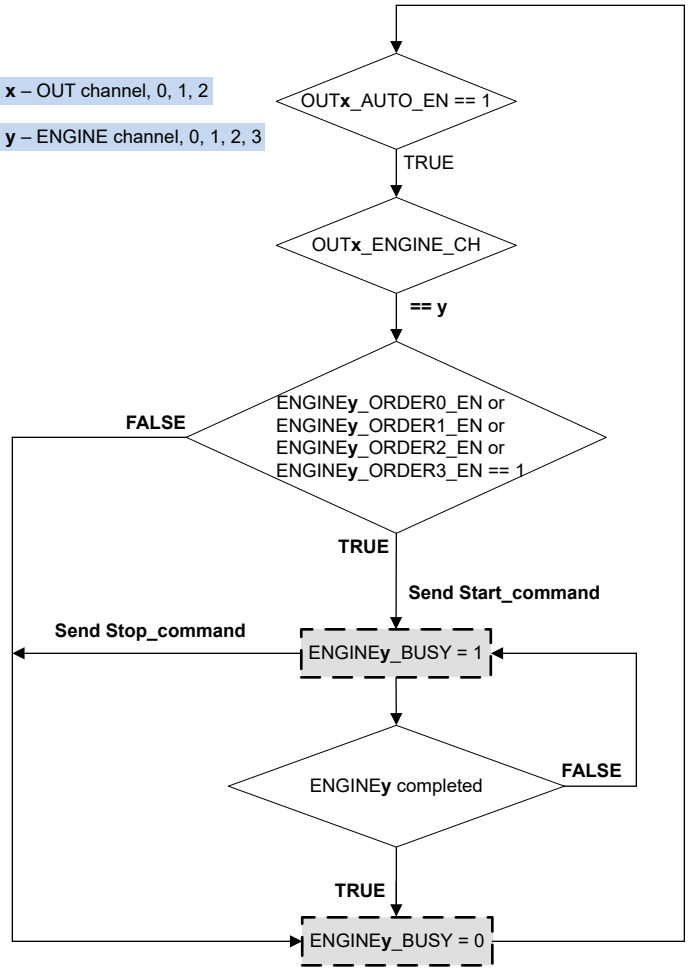

Figure 7-7. Internal Engine Busy Status

Any one of the internal engine busy flag, ENGINEx_BUSY, set to 1 leads to the global engine busy flag, ENGINE_BUSY, being 1, as shown in Figure 7-8.

The individual engine busy flag, OUTx_ENGINE_BUSY, is dependent on the internal engine busy flag selected by the correpsonding engine channel register value.

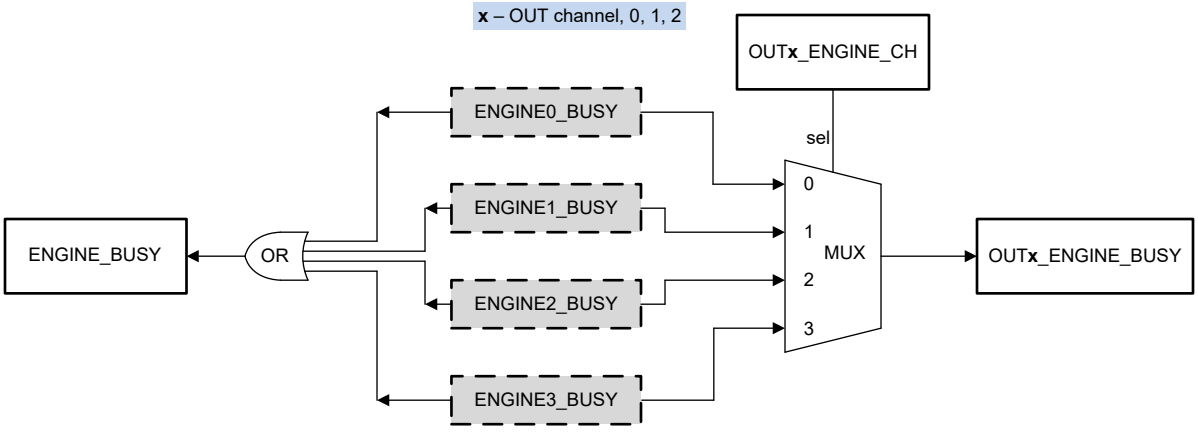

Figure 7-8. Individual and Global Engine Busy Flag

7.3.5 Instant Blinking

The LP5815 provides instant blinking via STAT control function for applications that require LED indication before controller is ready to send command. When VCC voltage is higher than V_{CC_UVLO} and instant blinking function is not disabled (INSTABLINK_DIS = 0), the OUT0 waits 300ms blank time to start blinking after STAT being pulled high. The timing is shown in Figure 7-9.

During the 300ms blank time after STAT being pulled high,

- if the instant blinking function is not disabled (INSTABLINK_DIS = 0 (default)), the LP5815 doesn't respond to the 5 dedicated software commands as described in Command Description and the OUT0 of the LP5815 starts running the blinking pattern as showed in Instant Blinking Pattern after the blank time.
- if the instant blinking function is disabled by setting the INSTABLINK_DIS as 1 through the I^2C interface, the LP5815 responds to the 5 dedicated software commands as described in Command Description except for the Shutdown_command that the LP5815 doesn't enter SHUTDOWN mode until the STAT is pulled low. The OUT0 doesn't run the blinking pattern after the blank time.

While the LP5815 staying in INSTANT BLINKING mode,

- the OUT0 keeps running the blinking pattern if STAT is kept high (STAT = H) and instant blinking function is not disabled (INSTABLINK_DIS = 0).
- the 5 dedicated software commands don't work as described in Command Description.
- the OUT0 stops running the blinking pattern if STAT is pulled low (STAT = L) or instant blinking function is disabled (INSTABLINK_DIS = 1).

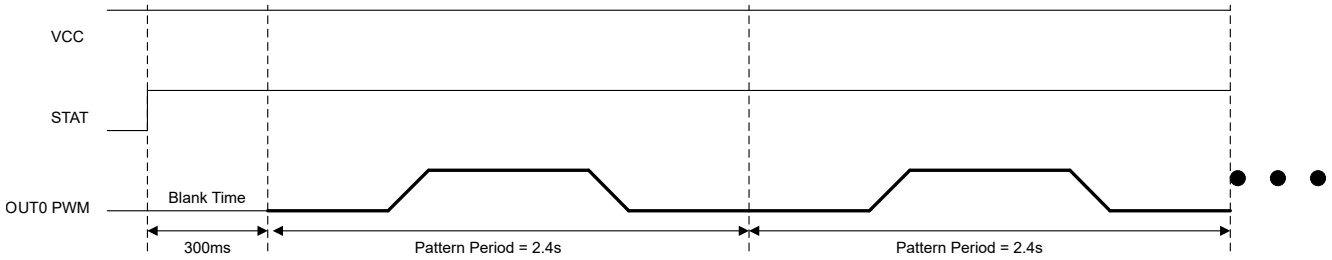

Figure 7-9. Instant Blinking Timing

Figure 7-10 shows the parameters of 1 cycle blinking pattern.

At the beginning, there is 500ms pause time before PWM starts ramping up. After the pause time, the PWM ramps up from 0 to 50% in 200ms, then keeps 50% for 1s. Next, it starts ramping down from 50% to 0 in 200ms. At last, the PWM keeps off for another 500ms pause time before the next cycle starts.

The maximum current setting for the instant blinking is 25.5mA with OUT0_DC = 0xFF, MAX_CURRENT = 0.

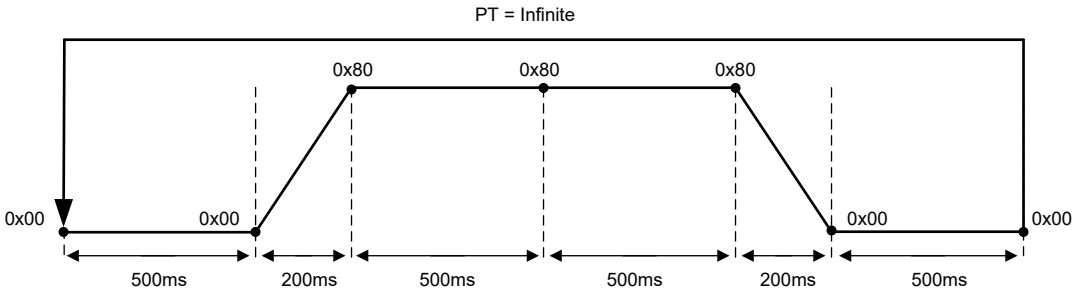

Figure 7-10. Instant Blinking Pattern

Figure 7-11 shows a typical application circuit that provides the instant blinking function. The STAT pin is pulled up by an external resistor to the battery voltage or bus voltage of the charger. And there is a LED connected to OUT0.

When the battery voltage drops below the charging threshold, the charger starts to work and can turn off the STAT pulling down switch. Then the LED connected to OUT0 starts blinking as long as the VCC voltage of the LP5815 is higher than the V_{CC_UVLO} threshold, which indicates the charging status. When the battery charging is completed, the charger can turn on the STAT pulling down switch to pull down the STAT to make the LP5815 exit the instant blinking state. Then the LED stops blinking to indicate the charging is completed.

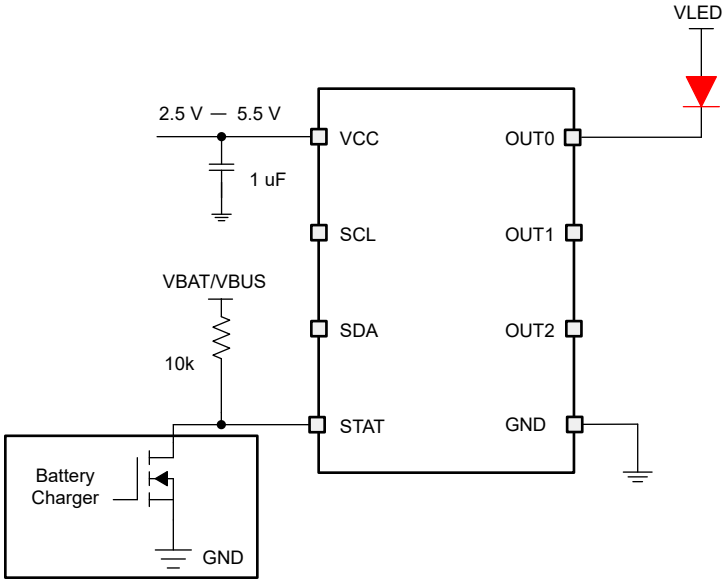

Figure 7-11. Instant Blinking Application Circuit

7.3.6 Protections

7.3.6.1 UVLO

The LP5815 has an internal comparator that monitors the voltage at VCC. When V_{CC} is below V_{CC_UVLO}, the device resets and keeps in Power On Reset (POR) state. When V_{CC} ramps above V_{CC_UVLO}, the device enters INITIALIZATION mode and the POR flag is set. The POR flag needs manual clear by setting POR_CLR bit when CHIP_EN = 1.

7.3.6.2 Thermal Shutdown

The LP5815 implements a thermal shutdown mechanism to protect the device from damage due to overheating. When the junction temperature of the device rises to 155°C (typical), the device turns off all output channels. The TSD flag is set to indicate thermal shutdown is triggered. The LP5815 releases thermal shutdown when the junction temperature reduces to 140°C (typical). The TSD flag needs manual clear by setting TSD_CLR bit when CHIP_EN = 1.

7.4 Device Functional Modes

The Figure 7-12 shows the function modes of the LED driver.

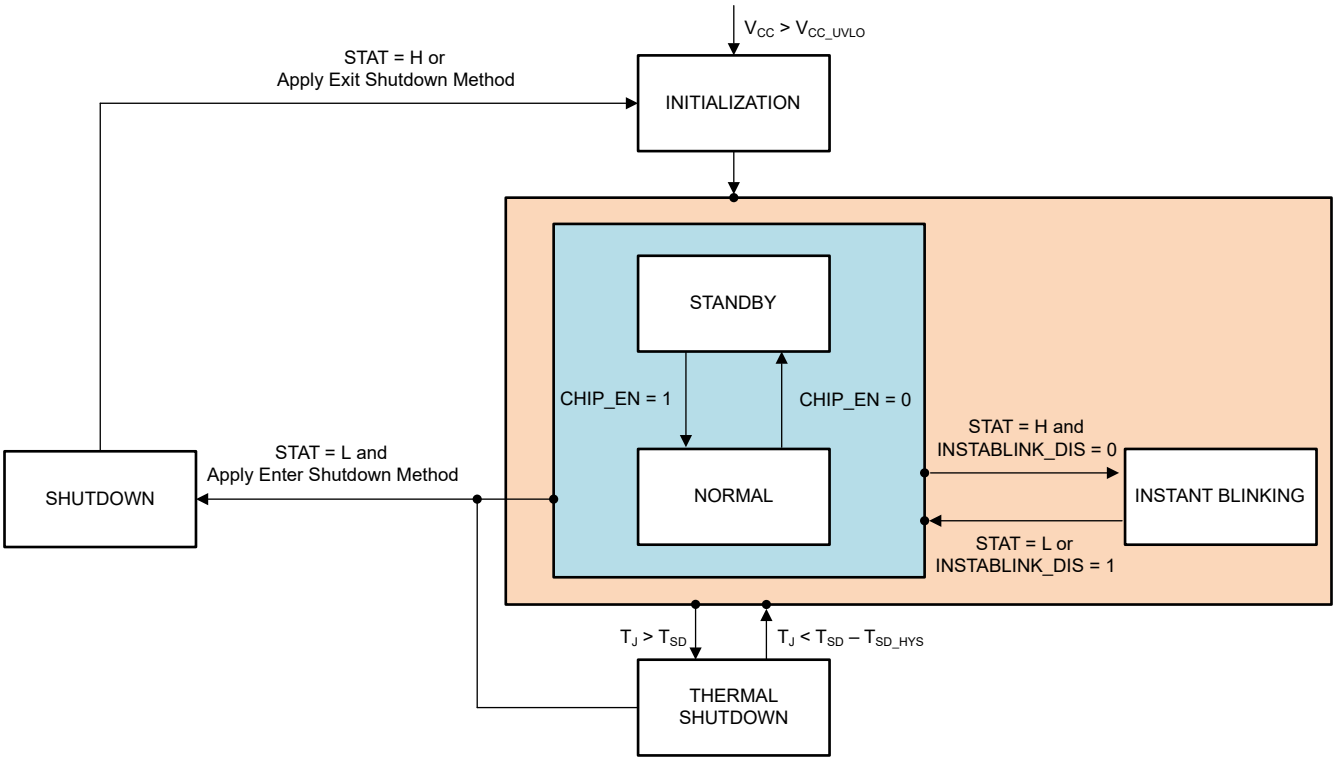

Figure 7-12. Functional Modes

7.4.1 Initialization Mode

The LP5815 enters INITIALIZATION mode when VCC voltage ramps above the V_{CC_UVLO} or exits from SHUTDOWN mode. The LP5815 reset all registers to default value in INITIALIZATION mode. The POR flag is set to 1 after exiting from INITIALIZATION mode to indicate the reset history.

7.4.2 Standby and Normal Mode

The LP5815 enters STANDBY mode when CHIP_EN = 0 or NORMAL mode when CHIP_EN = 1 after exiting from INITIALIZATION mode, INSTANT BLINKING mode or THERMAL SHUTDOWN mode.

While staying in STANDBY or NORMAL mode,

- when STAT is pulled high (STAT = H) and instant blinking function is not disabled (INSTABLINK_DIS = 0), the LP5815 enters INSTANT BLINKING mode after the 300ms blank time as described in Instant Blinking.
- when STAT is pulled low (STAT = L) and Enter Shutdown Method is applied, the LP5815 enters SHUTDOWN mode. The Enter Shutdown Method is described in Shutdown Mode.
- when instant blinking function is disabled (INSTABLINK_DIS = 1) and STAT is pulled high (STAT = H), the LP5815 doesn't enter SHUTDOWN mode even though Enter Shutdown Method is applied. But the internal trigger of entering shutdown mode is recorded and the LP5815 enters SHUTDOWN mode immediately as long as the STAT is pulled low.
- when the junction temperature of the LP5815 rises above the thermal shutdown threshold T_{SD}, the LP5815 turns off all output channels and enters THERMAL SHUTDOWN mode.

7.4.3 Instant Blinking Mode

The OUT0 of the LP5815 keeps running the blinking pattern as shown in Instant Blinking Pattern while the LP5815 staying in INSTANT BLINKING mode.

The LP5815 exits INSTANT BLINKING mode when STAT is pulled down (STAT = L) or instant blinking function is disabled through setting the INSTABLINK_DIS bit as 1.

In INSTANT BLINKING mode, the LP5815 doesn't respond to the 5 dedicated software commands, Shutdown_command, Reset_command, Update_command, Start_command and Stop_command.

7.4.4 Shutdown Mode

The LP5815 supports shutdown mode to minimize the power consumption from VCC. The quscient current from VCC decreases to 0.1 uA (typical) in SHUTDOWN mode. The LP5815 provides two pairs of methods to control the device enter and exit SHUTDOWN mode.

- Figure 7-13 shows the method 1
  - **Enter shutdown**, send Shutdown_command by writing 0x33 to register 0xD though I^2C communication when STAT is pulled down.
  - **Exit shutdown**,
    - Toggle SDA 8 times to generate 8 falling edges while keeping SCL as high. The supported maximum toggle frequency for SDA is 100kHz.
    - Or pull up STAT regardless of the SCL and SDA state.
- Figure 7-14 shows the method 2
  - **Enter shutdown**, pull down SCL for 100ms while keeping SDA as high when STAT is pulled down.
  - **Exit shutdown**,
    - Pull up SCL to generate one rising edge regardless of SDA state.
    - Or pull up STAT regardless of the SCL and SDA state.

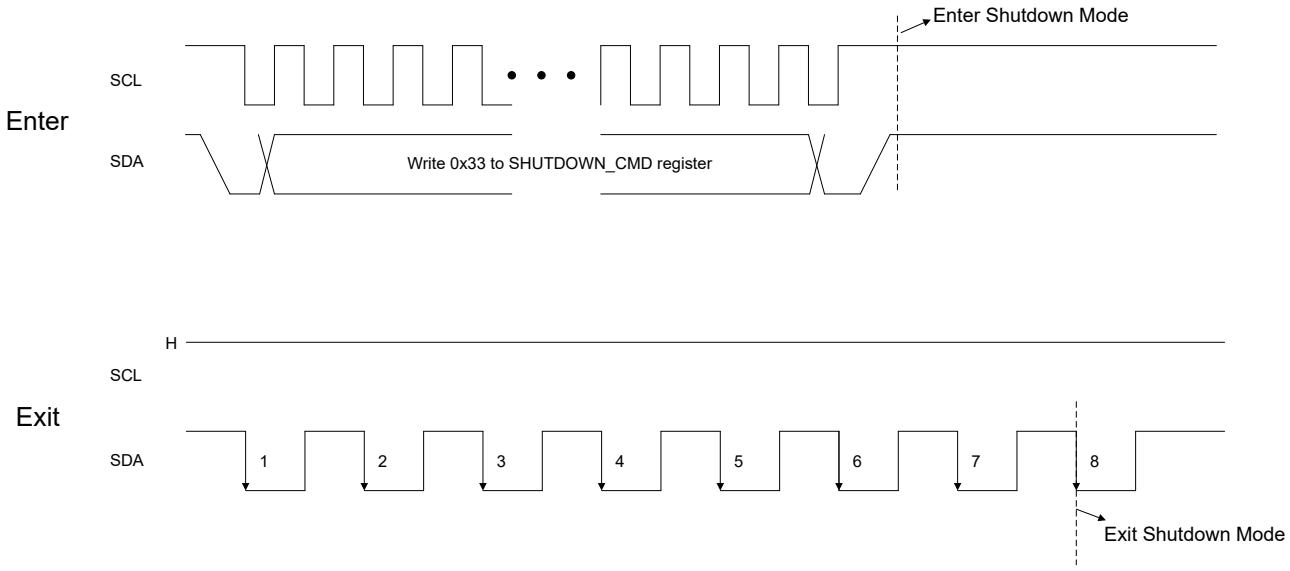

Figure 7-13. Enter and Exit Shutdown Mode Method Pair 1

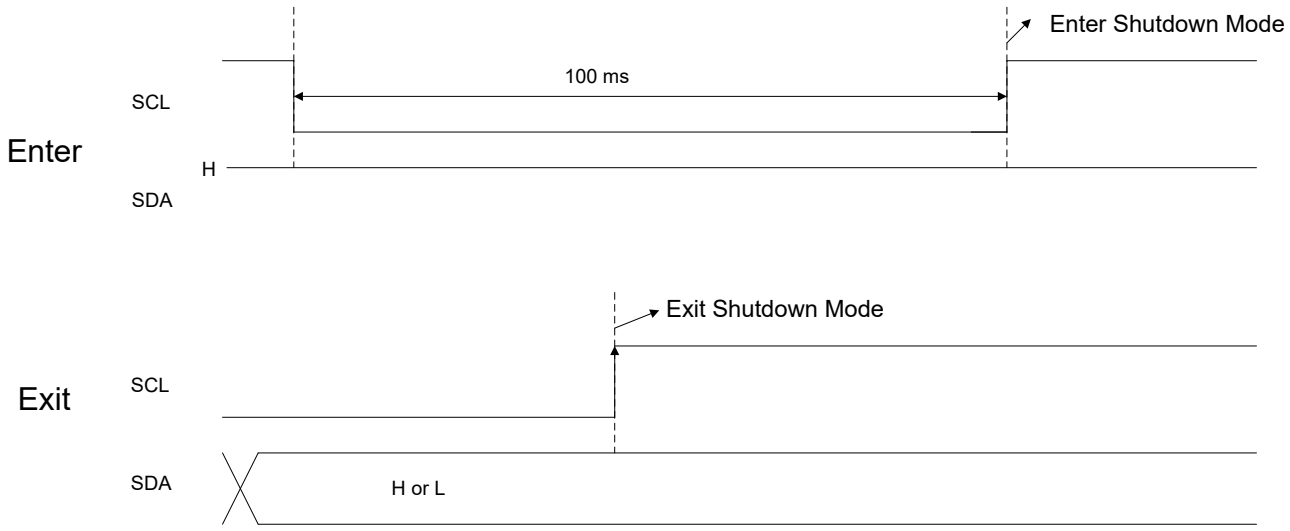

Figure 7-14. Enter and Exit Shutdown Mode Method Pair 2

7.4.5 Thermal Shutdown Mode

All output channels are turned off while the LP5815 staying in THERMAL SHUTDOWN mode. The I2C interface is still active and the LP5815 enters SHUTDOWN mode when STAT is pulled low (STAT = L) and Enter Shutdown Method is applied.

When the junction temperature of LP5815 falles blow the thermal shutdown threshold, the LP5815 enters STANDBY mode when CHIP_EN = 0 or NORMAL mode when CHIP_EN = 1 after exiting from THERMAL SHUTDOWN mode. The TSD flag needs manual clear through setting TSD_CLR bit when CHIP_EN = 1.

7.5 Programming

The LP5815 is compatible with I²C standard specification. The device supports standard mode (100kHz maximum), fast mode (400kHz maximum) and fast plus mode (1MHz maximum). The device chip address is 0x2D.

7.5.1 I²C Data Tansactions

The data on SDA line must be stable during the HIGH period of the clock signal (SCL). In other words, state of the data line can only be changed when clock signal is LOW. START and STOP conditions classify the beginning and the end of the data transfer session. A START condition is defined as the SDA signal transitioning from and the end of the data transfer session. A START condition is defined as the SDA signal transitioning from HIGH to LOW while SCL line is HIGH. A STOP condition is defined as the SDA transitioning from LOW to HIGH while SCL is HIGH. The bus leader always generates START and STOP conditions. The bus is considered to be busy after a START condition and free after a STOP condition. During data transmission, the bus leader can generate repeated START conditions. First START and repeated START conditions are functionally equivalent.

Each byte of data has to be followed by an acknowledge bit. The acknowledge related clock pulse is generated by the leader. The leader releases the SDA line (HIGH) during the acknowledge clock pulse. The device pulls down the SDA line during the 9th clock pulse, signifying an acknowledge. The device generates an acknowledge after each byte has been received.

There is one exception to the acknowledge after every byte rule. When the leader is the receiver, the receiver must indicate to the transmitter an end of data by not acknowledging (negative acknowledge) the last byte clocked out of the follower. This negative acknowledge still includes the acknowledge clock pulse (generated by the leader), but the SDA line is not pulled down.

7.5.2 I²C Data Format

The address and data bits are transmitted MSB first with 8-bits length format in each cycle. Each transmission is started with Address Byte 1, which are divided into 7 bits of the chip address and 1 read/write bit. The 8 bits of register address are put in Address Byte 2. The device supports both independent mode and broadcast mode. The auto-increment feature allows writing / reading several consecutive registers within one transmission. If not consecutive, a new transmission must be started.

Table 7-5. I²C Data Format

Address Byte1	Chip Address							R/W
	Bit 7	Bit 6	Bit 5	Bit 4	Bit 3	Bit 2	Bit 1	Bit 0
Independent	0	1	0	1	1	0	1	R: 1 W: 0
Broadcast	0	1	1	0	1	0	0	
Address Byte2	Register Address							
	Bit 7	Bit 6	Bit 5	Bit 4	Bit 3	Bit 2	Bit 1	Bit 0
	7th bit	6th bit	5th bit	4th bit	3rd bit	2nd bit	1st bit	0 bit

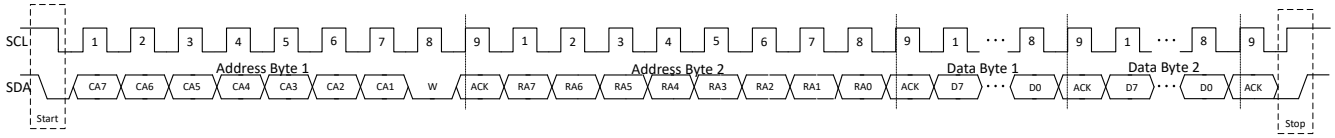

Figure 7-15. I²C Write Timming

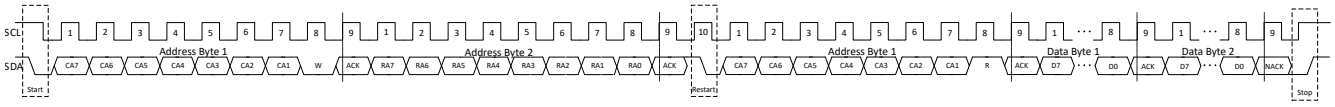

Figure 7-16. I²C Read Timming

7.5.3 Command Description

The LP5815 has 5 dedicated software commands, Shutdown_command, Reset_command, Update_command, Start_command and Stop_command. Besides the 5 software commands, there is another PAUSE_CONTINUE bit used to control the execution of the autonomous animation.

- Send **Shutdown_command** is one of the 2 methods to make the device enter SHUTDOWN mode as described in Shutdown Mode . In INSTANT BLINKING mode, the LP5815 doesn't respond to the Shutdown_command.
- Send **Reset_command** to reset all registers to default value. In INSTANT BLINKING mode, the LP5815 doesn't respond to the Reset_command.
- Send **Update_command** to make the modified value in the device configuration registers as shown in Table 7-6 to take effect. The LP5815 responds to the Update_command only when CHIP_EN = 1 and not in INSTANT BLINKING mode.
- Send **Start_command** to start running the configured autonomous animation patterns on the outputs. The LP5815 responds to the Start_command only when CHIP_EN = 1 and not in INSTANT BLINKING mode.
- Send **Stop_command** to stop running the configured autonomous animation patterns on the outputs. The LP5815 responds to the Stop_command only when CHIP_EN = 1 and not in INSTANT BLINKING mode.
- Set **PAUSE_CONTINUE** bit as 1 to pause the running of the configured autonomous animation patterns on the outputs. Clear **PAUSE_CONTINUE** bit as 0 to continue the running of the previous paused autonomous animation patterns on the outputs. When the PAUSE_CONTINUE = 1, the configured autonomous animation pattern is not started after Start_command is sent.

0	POR	R	0h	POR flag. 0x0 = POR is not triggered 0x1 = POR is triggered

8 Application and Implementation

Note

Information in the following applications sections is not part of the TI component specification, and TI does not warrant its accuracy or completeness. TI's customers are responsible for determining suitability of components for their purposes, as well as validating and testing their design implementation to confirm system functionality.

8.1 Application Information

The LP5815 is a 3 channel RGB LED driver with instant blinking and autonomous animation control. The device has ultra-low operation current at active mode and only consumes 0.25mA when LED current is set at 25mA. In battery powered applications like e-tag, ear bud, e-cigarettes, VR headset, RGB mouse, smart speaker, and other hand-held devices, LP5815 can provide premium LED lighting effects with low power consumption and small package.

8.2 Typical Application

8.2.1 Application

Figure 8-1 shows an example of typical application, which uses one LP5815 to drive RGB LEDs through I^2C communication. The STAT terminal is pulled up with an external resistor to VBAT or VBUS and can be pulled down through the N-Channel MOSFET.

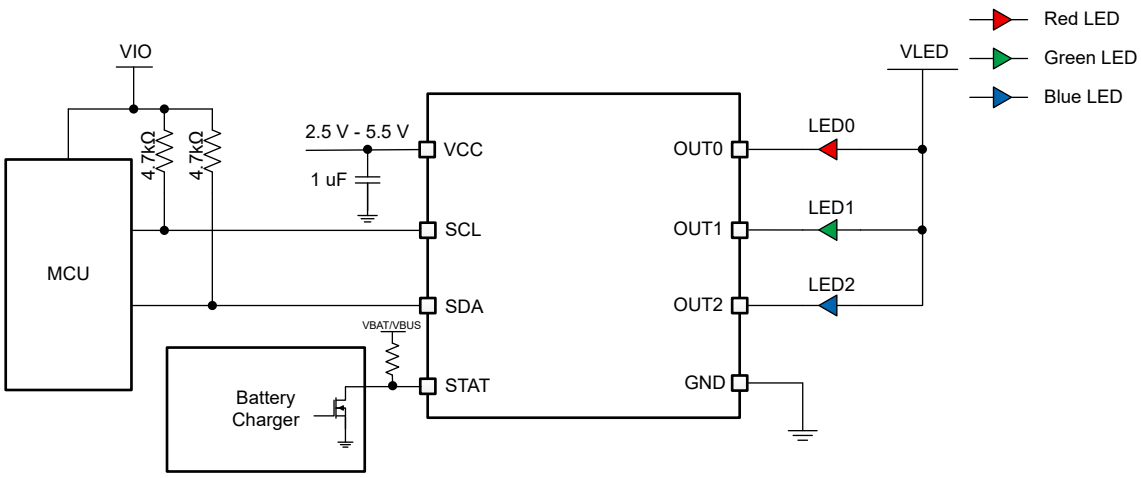

Figure 8-1. Typical Application - LP5815 Driving RGB LEDs

8.2.2 Design Parameters

Design Parameters shows the typical design parameters of Application.

Table 8-1. Design Parameters

PARAMETER	VALUE
Input voltage	3.6V to 4.2V by one Li-on battery cell
RGB LED count	1
LED maximum average current (red, green, blue)	51mA, 40.8mA, 40.8mA
LED PWM frequency	23kHz
Red LED Mode	Manual Mode, Contsant ON with 50% PWM Duty Cycle
Green LED Mode	Animation Mode, Blinking with 5Hz Frequency
Blue LED Mode	Animation Mode, Breathing with 1s Exponential Ramping Up and 1s Exponential Ramping Down

8.2.3 Detailed Design Procedure

This section will showcase the detailed design procedures for LP5815 including components selection, program procedure and examples.

8.2.3.1 Program Procedure

After VCC powering up, the instant blinking is disabled by pulling down the STAT or setting INSTABLINK_DIS = 1 through I^2C command, then enable the device by setting CHIP_EN = 1. Set the maximum current for each output. Then set the device configuration registers to enbale the output, select the dimming control mode for each output, and select the animation engine for the output in autonomous animation mode. Finally, Send UPDATE_CMD to make the prior configuration settings take effect.

For the output channel that is configured in manual mode, the output PWM changes immediately when the corresponding manual PWM register value is set.

For the output channel that is configured in autonomous animation mode, firstly, select animation engine for output. Secondly, construct the animation engine by setting the engine configure registers to select the animation pattern to map to the engine order and enable or disable the engine order. Then, build the animation patterns as required by setting pattern unit paramters. Finally, send START_CMD to initiate the autonomous animation.

The detailed program procedure is illustrated in Figure 8-2.

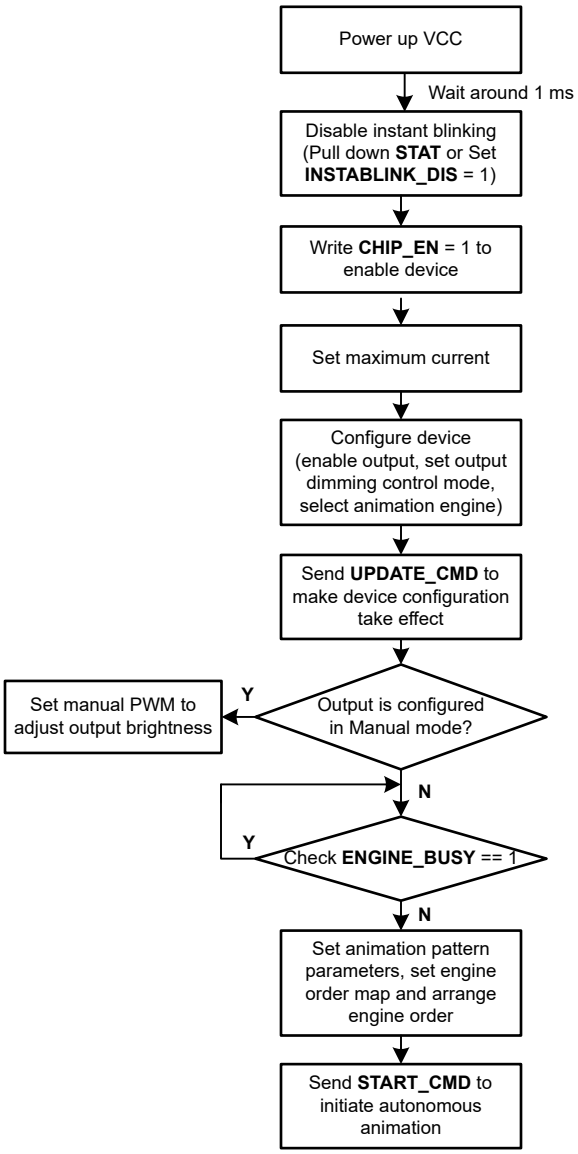

Figure 8-2. Program Procedure

8.2.3.2 Programming Example

To get the design parameters in Section 8.2.2, the following program steps can be referred.

After VCC powering up and wait around 1ms,

1. Set INSTABLINK_DIS = 1 to disable instant blinking, set CHIP_EN = 1 to enable the device (**Write 03h to register 00h**)
2. Set MAX_CURRENT = 1h to set 51mA maximum output LED current (**Write 01h to register 01h**)
3. Set 51mA maximum current for red LEDs, 40.8mA maximum current for green and blue LEDs (**Write FFh to registers 14h, write CCh to registers 15h and 16h**)
4. Enable all 3 LEDs (**Write 07h to register 02h**)
5. Set red LED in manual mode, set green and blue LEDs in autonomous animation mode, and enable blue LED exponential PWM dimming (**Write 46h to register 04h**)
6. Select ENGINE0 for green LED and ENGINE1 for blue LED (**Write 10h to register 05h**)
7. Send **UPDATE_CMD** to make above step2, step4, step5 and step6 configurations take effect (**Write 55h to register 0Fh**)
8. Set red LED PWM duty cycle as 50% (**Write 80h to register 18h**)

   After this step, the read LED is turned on.
9. Check **ENGINE_BUSY** flag by reading the FLAG register (**Read register 40h**)
   - If **ENGINE_BUSY = 1**, send **STOP_CMD** to clear ENGINE_BUSY flag as showed in Figure 7-7 (**Write AAh to register 11h**), then move to next step.
   - If **ENGINE_BUSY = 0**, move to next step directly.
10. Select PATTERN0 for ENGINE0_ORDER0 and PATTERN1 for ENGINE1_ORDER0 (**Write 00h to register 06h, write 01h to register 07h**)
11. Enable ENGINE0_ORDER0 and ENGINE1_ORDER0 (**Write 11h to register 0Ah**)
12. Set PATTERN0 parameters as showed in Table 8-2 to realize 5Hz blinking effect on green LED, set PATTERN1 parameters as showed in Table 8-3 to realize breathing effect on blue LED.
13. Send **START_CMD** to intiate the animation (**Write FFh to register 10h**)

After this step, the red LED keeps constant ON, the green LED keeps blinking with 5Hz frequency.

Table 8-2. PATTERN0 5Hz Blinking Register Setting

Address	Register	Set Value	Description
1Ch	PATTERN0_PAUSE_TIME	00h	No pause time
1Dh	PATTERN0_REPEAT_TIME	0Fh	Infinite repeat times

OUT1	Animation Mode, Blinking with 5Hz Frequency
OUT2	Animation Mode, Breathing with 1s Exponential Ramping Up and 1s Ramping Down

Figure 8-6. Current Sinks Waveforms of OUT0, OUT1, OUT2

8.3 Power Supply Recommendations

The LP5815 is designed to operate from an input voltage supply range from 2.5V to 5.5V. This input supply must be well regulated. If the input supply is located more than a few inches from the converter, additional bulk capacitance is required close to the ceramic bypass capacitors. A typical choice is a tantalum or aluminum electrolytic capacitor with a value of 100µF.

8.4 Layout

8.4.1 Layout Guidelines

The input capacitor needs not only to be close to the VCC pin, but also to the GND pin to reduce input supply ripple. For OUTx (x = 0, 1, 2), low inductive and resistive path of switch load loop can help to provide a high slew rate. Therefore, path of adjecent outputs must be short and wide and avoid parallel wiring and narrow trace. For better thermal performance, TI suggest to make copper polygon connected with each pin bigger.

8.4.2 Layout Example

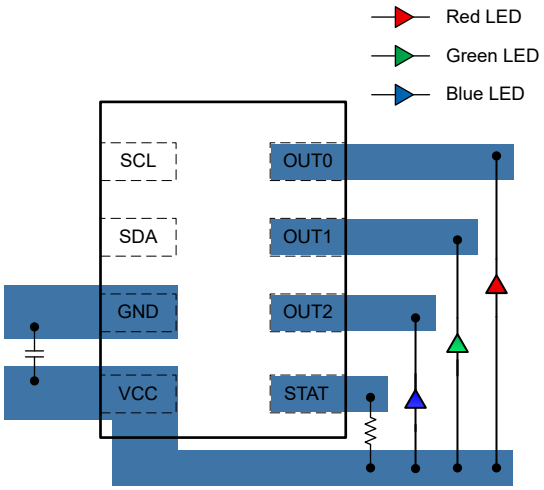

Figure 8-7. LP5815 DRL Package Layout Example

9 Device and Documentation Support

TI offers an extensive line of development tools. Tools and software to evaluate the performance of the device, generate code, and develop solutions are listed below.

9.1 Documentation Support

9.2 Receiving Notification of Documentation Updates

To receive notification of documentation updates, navigate to the device product folder on ti.com. Click on *Notifications* to register and receive a weekly digest of any product information that has changed. For change details, review the revision history included in any revised document.

9.3 Support Resources

TI E2E™ support forums are an engineer's go-to source for fast, verified answers and design help — straight from the experts. Search existing answers or ask your own question to get the quick design help you need.

Linked content is provided "AS IS" by the respective contributors. They do not constitute TI specifications and do not necessarily reflect TI's views; see TI's Terms of Use.

9.4 Trademarks

TI E2E™ is a trademark of Texas Instruments.
All trademarks are the property of their respective owners.

9.5 Electrostatic Discharge Caution

This integrated circuit can be damaged by ESD. Texas Instruments recommends that all integrated circuits be handled with appropriate precautions. Failure to observe proper handling and installation procedures can cause damage.

ESD damage can range from subtle performance degradation to complete device failure. Precision integrated circuits may be more susceptible to damage because very small parametric changes could cause the device not to meet its published specifications.

9.6 Glossary

TI Glossary — This glossary lists and explains terms, acronyms, and definitions.

10 Revision History

NOTE: Page numbers for previous revisions may differ from page numbers in the current version.

DATE	REVISION	NOTES
March 2025	*	Initial Release

11 Mechanical, Packaging, and Orderable Information

The following pages include mechanical, packaging, and orderable information. This information is the most current data available for the designated devices. This data is subject to change without notice and revision of this document. For browser-based versions of this data sheet, refer to the left-hand navigation.

PACKAGING INFORMATION

Orderable part number	Status (1)	Material type (2)	Package | Pins	Package qty | Carrier	RoHS (3)	Lead finish/ Ball material (4)	MSL rating/ Peak reflow (5)	Op temp (°C)	Part marking (6)
LP5815DRLR	Active	Production	SOT-5X3 (DRL) | 8	4000 | LARGE T&R	Yes	SN	Level-1-260C-UNLIM	-40 to 125	5815
LP5815DRLR.A	Active	Production	SOT-5X3 (DRL) | 8	4000 | LARGE T&R	Yes	SN	Level-1-260C-UNLIM	-40 to 125	5815
LP5815DRLR.B	Active	Production	SOT-5X3 (DRL) | 8	4000 | LARGE T&R	-	SN	Level-1-260C-UNLIM	-40 to 125	5815

(1) **Status:** For more details on status, see our product life cycle.

(2) **Material type:** When designated, preproduction parts are prototypes/experimental devices, and are not yet approved or released for full production. Testing and final process, including without limitation quality assurance, reliability performance testing, and/or process qualification, may not yet be complete, and this item is subject to further changes or possible discontinuation. If available for ordering, purchases will be subject to an additional waiver at checkout, and are intended for early internal evaluation purposes only. These items are sold without warranties of any kind.

(3) **RoHS values:** Yes, No, RoHS Exempt. See the TI RoHS Statement for additional information and value definition.

(4) **Lead finish/Ball material:** Parts may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead finish/Ball material values may wrap to two lines if the finish value exceeds the maximum column width.

(5) **MSL rating/Peak reflow:** The moisture sensitivity level ratings and peak solder (reflow) temperatures. In the event that a part has multiple moisture sensitivity ratings, only the lowest level per JEDEC standards is shown. Refer to the shipping label for the actual reflow temperature that will be used to mount the part to the printed circuit board.

(6) **Part marking:** There may be an additional marking, which relates to the logo, the lot trace code information, or the environmental category of the part.

Multiple part markings will be inside parentheses. Only one part marking contained in parentheses and separated by a "~" will appear on a part. If a line is indented then it is a continuation of the previous line and the two combined represent the entire part marking for that device.

TAPE AND REEL INFORMATION
