

OPA3S2859 Dual-Channel, 900-MHz, 2.2-nV/√Hz, Programmable Gain Transimpedance Amplifier

1 Features

- Gain bandwidth product: 900 MHz
- Internal switches for programmable gain
- High impedance FET inputs
- Input voltage noise: 2.2 nV/√Hz
- Slew rate: 350 V/μs
- Supply voltage range: 3.3 V to 5.25 V
- Quiescent current: 22 mA/channel
- Power down mode I_Q : 75 μA
- Temperature range: -40 °C to 125 °C

2 Applications

- Switchable transimpedance amplifier
- Smart munitions
- [Laser distance measurement](#)
- [Optical time domain reflectometry \(OTDR\)](#)
- Silicon photomultiplier (SiPM) buffer
- Photomultiplier tube post amplifier
- High speed programmable gain amplifier

3 Description

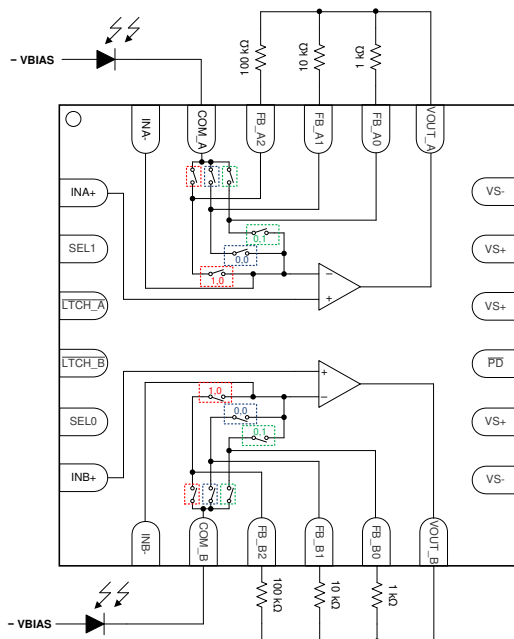

The OPA3S2859 is a wideband, low-noise programmable gain amplifier with CMOS inputs for wideband transimpedance and voltage amplifier applications. When the device is configured as a transimpedance amplifier (TIA), the 0.9-GHz gain bandwidth product (GBWP) enables high closed-loop bandwidths in low-capacitance photodiode (PD) applications.

The three internal switched feedback paths along with an optional parallel non-switched feedback path allows for up to four selectable gain configurations. The internal switches minimize parasitic contributions to increase performance compared to systems that use discrete external switches. Each switch is optimized for feedback resistor values ranging from < 1 kΩ to > 100 kΩ for wide dynamic range applications. The selected switch path is controlled for both channels using a 2-wire parallel interface. For each channel selected, the gain path can also be held constant by exerting the latch pin, which subsequently disables switch control for the selected channel and prevents the channel from changing gain.

Package Information⁽¹⁾

PART NUMBER	PACKAGE	BODY SIZE (NOM)
OPA3S2859	WQFN (24)	4.00 mm × 4.00 mm

- (1) See the package option addendum at the end of the data sheet for all available packages.

24-Pin WQFN With Exposed Thermal Pad
(Top View)**

Table 5-1. Pin Functions

PIN		TYPE ⁽¹⁾	DESCRIPTION
NAME	NO.		
COM_A	23	I	Photodiode input – Channel A
COM_B	8	I	Photodiode input – Channel B
FB_A0	20	I	Feedback connection to Channel A – TIA Gain Resistor (Low gain, optimized for gain in < 10 kΩ range)
FB_A1	21	I	Feedback connection to Channel A – TIA Gain Resistor (Mid gain, optimized for gain in 10 kΩ – 100 kΩ range)
FB_A2	22	I	Feedback connection to Channel A – TIA Gain Resistor (High gain, optimized for gain in > 100 kΩ range)
FB_B0	11	I	Feedback connection to Channel B – TIA Gain Resistor (Low gain, optimized for gain in < 10 kΩ range)
FB_B1	10	I	Feedback connection to Channel B – TIA Gain Resistor (Mid gain, optimized for gain in 10 kΩ – 100 kΩ range)
FB_B2	9	I	Feedback connection to Channel B – TIA Gain Resistor (High gain, optimized for gain in > 100 kΩ range)
INA-	24	I	Negative (inverting) input for amplifier A
INA+	1	I	Positive (noninverting) input for amplifier A
INB-	7	I	Negative (inverting) input for amplifier B
INB+	6	I	Positive (noninverting) input for amplifier B

Table 5-1. Pin Functions (continued)

PIN		TYPE ⁽¹⁾	DESCRIPTION
NAME	NO.		
LTCH_A	3	I	Latch control input for Channel A. LTCH_A = logic high (default) = transparent mode, gain setting changes based on SEL0 and SEL1 pins are reflected at the output. LTCH_A = logic low = latch mode = changing SEL0 and SEL1 pins does not affect the gain configuration of amplifier.
LTCH_B	4	I	Latch control input for Channel B. LTCH_B = logic high (default) = transparent mode, gain setting changes based on SEL0 and SEL1 pins are reflected at the output. LTCH_B = logic low = latch mode = changing SEL0 and SEL1 pins does not affect the gain configuration of amplifier.
PD	15	I	Power down pin. PD = logic high (default) = normal operation, PD = logic low = power down mode.
SEL0	5	I	TIA gain selection. SEL0 = logic high (default). See Table 5-2 for details.
SEL1	2	I	TIA gain selection. SEL1 = logic high (default). See Table 5-2 for details.
VOUT_A	19	O	Output of amplifier A
VOUT_B	12	O	Output of amplifier B
VS-	13, 18	I	Negative (lowest) power supply
VS+	14, 16, 17	I	Positive (highest) power supply
Thermal pad		—	Connect the thermal pad to the most negative power supply (pin 13 and 18) of the device under test (DUT).

(1) I = input, O = output

Table 5-2. Select Pin Decoder

SEL1	SEL0	Gain
LOW	HIGH	Low Gain, optimized for gain in < 10 kΩ range
LOW	LOW	Mid Gain, optimized for gain in 10 kΩ – 100 kΩ range
HIGH	LOW	High Gain, optimized for gain in > 100 kΩ range
HIGH (Default)	HIGH (Default)	External Gain. All internal switches open

6 Specifications

6.1 Absolute Maximum Ratings

over operating free-air temperature range (unless otherwise noted)⁽¹⁾

		MIN	MAX	UNIT
V _S	Total supply voltage (V _{S+} - V _{S-})		5.5	V
V _{IN+} , V _{IN-}	Input voltage	(V _{S-}) - 0.5	(V _{S+}) + 0.5	V
V _{ID}	Differential input voltage		1	V
V _{OUT}	Output voltage	(V _{S-}) - 0.5	(V _{S+}) + 0.5	V
I _{IN}	Continuous input current		±4	mA
I _{OUT}	Continuous output current ⁽²⁾		25	mA
T _J	Junction temperature		150	°C
T _A	Operating free-air temperature	-40	125	°C
T _{stg}	Storage temperature	-65	150	°C

- (1) Operation outside the *Absolute Maximum Ratings* may cause permanent device damage. Absolute maximum ratings do not imply functional operation of the device at these or any other conditions beyond those listed under *Recommended Operating Conditions*. If briefly operating outside the *Recommended Operating Conditions* but within the *Absolute Maximum Ratings*, the device may not sustain damage, but it may not be fully functional. Operating the device in this manner may affect device reliability, functionality, performance, and shorten the device lifetime.
- (2) Long-term continuous output current for electromigration limits

6.2 ESD Ratings

			VALUE	UNIT
V _(ESD)	Electrostatic discharge	Human body model (HBM), per ANSI/ESDA/JEDEC JS-001, all pins ⁽¹⁾	±1500	V
		Charged device model (CDM), per JEDEC specification JEDEC JS-002, all pins ⁽²⁾	±1000	

- (1) JEDEC document JEP155 states that 500-V HBM allows safe manufacturing with a standard ESD control process.
- (2) JEDEC document JEP157 states that 250-V CDM allows safe manufacturing with a standard ESD control process.

6.3 Recommended Operating Conditions

over operating free-air temperature range (unless otherwise noted)

		MIN	NOM	MAX	UNIT
V _S	Total supply voltage (V _{S+} - V _{S-})	3.3	5	5.25	V
T _A	Ambient temperature	-40		125	°C

6.4 Thermal Information

THERMAL METRIC ⁽¹⁾		OPA3S2859	UNIT
		RTW	
		24 PINS	
R _{θJA}	Junction-to-ambient thermal resistance	52	°C/W
R _{θJC(top)}	Junction-to-case (top) thermal resistance	39.6	°C/W
R _{θJB}	Junction-to-board thermal resistance	28.2	°C/W
Ψ _{JT}	Junction-to-top characterization parameter	1.8	°C/W
Ψ _{JB}	Junction-to-board characterization parameter	28.2	°C/W
R _{θJC(bot)}	Junction-to-case (bottom) thermal resistance	13.3	°C/W

- (1) For more information about traditional and new thermal metrics, see the [Semiconductor and IC Package Thermal Metrics](#) application report.

6.5 Electrical Characteristics

$V_{S+} = 5\text{ V}$, $V_{S-} = 0\text{ V}$, $R_L = 200\ \Omega$, output load is referenced to midsupply, input common-mode biased at midsupply, and $T_A \approx +25^\circ\text{C}$ (unless otherwise noted)

PARAMETER		TEST CONDITIONS	MIN	TYP	MAX	UNIT
AC PERFORMANCE						
SSBW	Small-signal transimpedance bandwidth ⁽¹⁾	$V_{OUT} = 100\text{ mV}_{PP}$, Gain = 1 k Ω , $C_{IN} = 4\text{ pF}$		130		MHz
		$V_{OUT} = 100\text{ mV}_{PP}$, Gain = 10 k Ω , $C_{IN} = 4\text{ pF}$		40		MHz
		$V_{OUT} = 100\text{ mV}_{PP}$, Gain = 100k Ω , $C_{IN} = 4\text{ pF}$		14		MHz
GBWP	Gain-bandwidth product			900		MHz
	Slew rate (10% - 90%)	$V_{OUT} = 2\text{-V step}$		350		V/ μs
e_n	Input-referred voltage noise	$f = 1\text{ MHz}$		2.2		nV/ $\sqrt{\text{Hz}}$
Z_{OUT}	Closed-loop output impedance	$f = 1\text{ MHz}$		0.02		Ω
DC PERFORMANCE						
A_{OL}	Open-loop voltage gain	$f = \text{DC}$	70	76		dB
V_{OS}	Input offset voltage	$T_A = 25^\circ\text{C}$	-8	± 0.9	8	mV
$\Delta V_{OS}/\Delta T$	Input offset voltage drift	$T_A = -40^\circ\text{C to } +125^\circ\text{C}$		-2		$\mu\text{V}/^\circ\text{C}$
I_{BN}, I_{BI}	Input bias current ⁽²⁾		-50		50	pA
I_{BOS}	Input offset current ⁽²⁾		-50		50	pA
CMRR	Common-mode rejection ratio	$V_{CM} = \pm 0.5\text{ V (from midsupply)}$	67	78		dB
INPUTS						
C_{IN+}	Non-inverting input capacitance			1.4		pF
C_{IN-}	Inverting input capacitance ⁽³⁾			3		pF
V_{IH}	Common-mode input range (high)	CMRR > 64 dB	3.4	3.6		V
V_{IH}	Common-mode input range (high)	CMRR > 64 dB, $V_{S+} = 3.3\text{ V}$	1.7	1.9		V
V_{IL}	Common-mode input range (low)	CMRR > 64 dB		0	0.4	V
V_{IL}	Common-mode input range (low)	CMRR > 64 dB, $V_{S+} = 3.3\text{ V}$		0	0.4	V
OUTPUTS						
V_{OH}	Output voltage (high)	$T_A = 25^\circ\text{C}$	3.95	4.1		V
V_{OH}	Output voltage (high)	$V_{S+} = 3.3\text{ V}$, $T_A = 25^\circ\text{C}$	2.3	2.4		V
V_{OL}	Output voltage (low)	$T_A = 25^\circ\text{C}$		1.1	1.2	V
V_{OL}	Output voltage (low)	$V_{S+} = 3.3\text{ V}$, $T_A = 25^\circ\text{C}$		1.05	1.15	V
I_{O_LIN}	Linear output drive (source and sink)	$R_L = 10\ \Omega$, $A_{OL} > 52\text{ dB}$	65	74		mA
CHANNEL-TO-CHANNEL MATCHING						
	Crosstalk (output-referred)	$f = 1\text{ MHz}$, Gain = 100 k Ω , $V_{OUT} = 100\text{ mV}_{PP}$		-70		dB
	Offset voltage mismatch			± 1		mV
	Offset current mismatch		-20		20	pA

6.5 Electrical Characteristics (continued)

$V_{S+} = 5\text{ V}$, $V_{S-} = 0\text{ V}$, $R_L = 200\ \Omega$, output load is referenced to midsupply, input common-mode biased at midsupply, and $T_A \approx +25^\circ\text{C}$ (unless otherwise noted)

PARAMETER		TEST CONDITIONS	MIN	TYP	MAX	UNIT
POWER SUPPLY						
I_Q	Quiescent current (both channels)	$V_{S+} = 5\text{ V}$		44	53	mA
		$V_{S+} = 5\text{ V}$, $T_A = +125^\circ\text{C}$		51		mA
		$V_{S+} = 5\text{ V}$, $T_A = -40^\circ\text{C}$		39		mA
PSRR+	Power Supply Rejection Ratio	$f = \text{DC}$	74	85		dB
PSRR-	Power Supply Rejection Ratio	$f = \text{DC}$	68	72		dB
POWER DOWN						
	Disable voltage threshold	Voltage referenced to V_{S+} , amplifier OFF below this voltage	$V_{S+} - 1.5$	$V_{S+} - 1.3$		V
	Enable voltage threshold	Voltage referenced to V_{S+} , amplifier ON above this voltage		$V_{S+} - 1.2$	$V_{S+} - 0.8$	V
	Power-down quiescent current			75	140	μA
	$\overline{\text{PD}}$ bias current	$V_{\overline{\text{PD}}} = V_{S-}$ or V_{S+}		6		μA
	$\overline{\text{PD}}$ bias current	$V_{\overline{\text{PD}}}$ at switching threshold		160		μA
	Turnon time delay	Time to $V_{\text{OUT}} = 90\%$ of final value		90		ns
	Turnoff time delay	Time to $V_{\text{OUT}} = 10\%$ of final value		330		ns

- (1) C_{IN} = Photodiode capacitance + PCB capacitance. Photodiode capacitance is 3.3 pF and estimated PCB capacitance is 0.7 pF.
- (2) Leakage currents from switches are not included in this measurement.
- (3) $C_{\text{IN-}}$ refers to the capacitance at the inverting input of the amplifier. $C_{\text{IN-}} = C_{\text{IN-(CM)}} + C_{\text{DIFF}} + \text{Switch capacitance on the amplifier inverting pin (ON capacitance of the closed switch + OFF capacitance for open switches)}$.

6.6 Switching Characteristics

$V_{S+} = 5\text{ V}$, $V_{S-} = 0\text{ V}$, input common-mode biased at midsupply, $R_{F0} = 1\text{ k}\Omega$, $R_{F1} = 10\text{ k}\Omega$, $R_{F2} = 100\text{ k}\Omega$, $R_L = 200\text{ }\Omega$, output load is referenced to midsupply, and $T_A \approx +25^\circ\text{C}$ (unless otherwise noted), see [figure 7-1](#) for schematic configuration. ⁽¹⁾ ⁽²⁾

PARAMETER		TEST CONDITIONS	MIN	TYP	MAX	UNIT
GAIN SWITCHES						
	Switch transition-time ⁽⁵⁾	SW_0 OFF to SW_1 ON		160		ns
		SW_0 OFF to SW_2 ON		230

	On resistance channel-to-channel matching ⁽³⁾ ⁽⁴⁾	SW_{COM0} for Channel A and B		0.15		Ω
		SW_{FB0} for Channel A and B		0.4		
		SW_{COM1} for Channel A and B		0.45		
		SW_{FB1} for Channel A and B		0.07		
		SW_{COM2} for Channel A and B		3		
		SW_{FB2} for Channel A and B		0.12		

6.6 Switching Characteristics (continued)

$V_{S+} = 5\text{ V}$, $V_{S-} = 0\text{ V}$, input common-mode biased at midsupply, $R_{F0} = 1\text{ k}\Omega$, $R_{F1} = 10\text{ k}\Omega$, $R_{F2} = 100\text{ k}\Omega$, $R_L = 200\text{ }\Omega$, output load is referenced to midsupply, and $T_A \approx +25^\circ\text{C}$ (unless otherwise noted), see [figure 7-1](#) for schematic configuration. ⁽¹⁾ ⁽²⁾

PARAMETER	TEST CONDITIONS	MIN	TYP	MAX	UNIT
LOGIC PIN FUNCTION (LATCH, SEL)					
Logic low threshold	Logic low below the threshold voltage	$V_{S+} - 1.5$	$V_{S+} - 1.3$		V
Logic high threshold	Logic high above the threshold voltage		$V_{S+} - 1.2$	$V_{S+} - 0.8$	V
Bias current	$V_{PIN} = V_{S-}$ or V_{S+}		6		μA
Bias current	V_{PIN} at switching threshold		160		μA
Setup time		100			ns
Hold time		100			ns

- (1) All the specifications apply for both Channels A and B, unless otherwise noted.
- (2) When switching from one gain condition to another, the new gain switches are closed before opening the previous gain switches (make-before-break).
- (3) SW_{COM0} , SW_{COM1} , SW_{COM2} refer to switch on the common-mode side (COM) for the different gain options.
- (4) SW_{FB0} , SW_{FB1} , SW_{FB2} refer to switch on the feedback side (FB) for the different gain options.
- (5) SW_0 , SW_1 , SW_2 refers to the two switches needed for a given gain condition. For example, SW_0 refers to SW_{COM0} and SW_{FB0} .
- (6) C_{COM0} , C_{COM1} , C_{COM2} is the capacitance at the COM pin for different gain options. It is equal to ON capacitance of closed switch + OFF capacitance of open switches.
- (7) C_{FB0} , C_{FB1} , C_{FB2} is the capacitance at the FB_X pin. It is equal to ON capacitance of the gain option selected ($SW_{COM0} + SW_{FB0}$ capacitance).
- (8) R_{ON_COM0} , R_{ON_COM1} , R_{ON_COM2} , refer to ON resistance for the COM side switch.
- (9) R_{ON_FB0} , R_{ON_FB1} , R_{ON_FB2} , refer to ON resistance for the FB side switch.

6.7 Typical Characteristics

$V_{S+} = +2.5\text{ V}$, $V_{S-} = -2.5\text{ V}$, $R_L = 200\ \Omega$, $C_{IN} = 4\text{ pF}$, output load is referenced to mid-supply, input common-mode biased at mid-supply, and $T_A \cong +25^\circ\text{C}$ (unless otherwise noted)

7 Parameter Measurement Information

The following figure shows the test setup configuration for OPA3S2859.

Figure 7-1. Switching Characteristics Configuration

8 Detailed Description

8.1 Overview

The OPA3S2859 features dual channel, high-speed, low noise, wide gain bandwidth amplifier with programmable gain switches to offer a compact, easy-to-use device for wideband transimpedance applications, high-speed data acquisition systems, and applications with weak signal inputs that require low-noise and high-gain front ends. Integrated switches allow for multiple gain settings on a single amplifier stage without the need for an additional multiplexer, therefore minimizing board parasitics.

The OPA3S2859 is offered in a 4-mm × 4-mm, 24-pin WQFN package that features multiple feedback (FB) pins for different gain options to make simple feedback network connection between the amplifier output and inverting input. The three internally switched feedback paths along with an additional parallel non-switched feedback path allows for up to four selectable gain configurations.

8.2 Functional Block Diagram

8.3 Feature Description

8.3.1 Programmable Gain

The OPA3S2859 features integrated switches that can be used for implementing different gain configurations. The closed-loop bandwidth and noise of a TIA are affected by the transimpedance gain and photodiode capacitance. The OPA3S2859 has a higher bandwidth in its low-gain configuration for a given value of photodiode capacitance compared to the high-gain configuration. Increasing the gain of the TIA stage by a factor of X increases the output signal by a factor X , but the noise contribution from the resistor only increases by \sqrt{X} . The input-referred noise density of the low-gain configuration is therefore higher than the input-referred noise density of the high-gain configuration.

OPA3S2859 provides control for switching among three independently-configured external feedback networks using FB_x0, FB_x1, FB_x2 pins, and allows for up to four selectable gain configurations with an additional parallel non-switched feedback path. The internal switches minimize parasitic contributions to increase performance compared to external methods. Each switch is optimized for increasing feedback resistor values ranging from $< 1\text{ k}\Omega$ to $> 100\text{ k}\Omega$ for wide dynamic range applications. The selected switch path is controlled for both channels using a 2-wire parallel interface (SEL0 and SEL1).

In many systems it is typical that gain will switch sequentially (also known as adjacent gain switching). For example, the gain will switch low to medium to high or high to medium to low. When switching between adjacent gains, the switches feature make-before-break switching. When programmed to a different connection, the previous switch does not change to high impedance state until the new switch is closed (with a typical 80 ns to 230 ns delay when both switches are closed). This feature helps the amplifier from not operating in an open-loop state when the switches are used in a switched-gain transimpedance configuration.

8.3.2 Slew Rate

The OPA3S2859 features a high slew rate of $350\text{ V}/\mu\text{s}$. The slew rate is a critical parameter in high-speed pulse applications such as optical time-domain reflectometry (OTDR). As [Figure 6-11](#) shows, the high slew rate implies that the device accurately reproduces a 2-V, sub 100-ns pulse edge. The wide bandwidth and slew rate of the device make it an excellent amplifier for high-speed signal-chain front ends.

8.3.3 Input and ESD Protection

The OPA3S2859 is fabricated on a low-voltage, high-speed, BiCMOS process. The internal, junction breakdown voltages are low for these small geometry devices, and as a result, all device pins are protected with internal ESD protection diodes to the power supplies. There are two antiparallel diodes between the inputs of the amplifier that clamp the inputs during an overrange or fault condition.

8.4 Device Functional Modes

8.4.1 Split-Supply and Single-Supply Operation

The OPA3S2859 can be configured with single-sided supplies or split-supplies without degrading performance. In either case, the thermal pad should be tied to the same voltage as V_{S-} .

8.4.2 Power-Down Mode

The OPA3S2859 features a power-down mode to conserve power. Connecting the $\overline{\text{PD}}$ pin low disables the amplifier thereby reducing the quiescent current and places the output in a high-impedance state.

$\overline{\text{PD}}$ pin has an internal pull up resistor. If the pin is left floating, then the device defaults to an ON state. The $\overline{\text{PD}}$ disable and enable threshold voltages are referenced to the positive supply (for more information refer to the *Electrical Characteristics* section). If the amplifier is configured with the positive supply at 5 V and the negative supply at ground, then the disable and enable threshold voltages are 3.5 V and 4.2 V, respectively. If the amplifier is configured with $\pm 2.5\text{ V}$ supplies, then the threshold voltages are at 1 V and 1.7 V.

8.4.3 Gain Select Mode (SEL)

The OPA3S2859 features two pins SEL0 and SEL1 to choose between three different internal switch networks and an external option. The SELx disable and enable threshold voltages are with reference to the positive supply as shown in the *Switching Characteristics* table. Note: while the SELx logic will select the same switch configuration for channel A and B, the external components (feedback network) of channels A and B do not have to be exactly the same.

When switching between different gain settings (feedback networks), the device has a transition time of only 80 ns to 230 ns (typical) as shown in the *Switching Characteristics* table. In many systems, it is typical that gain will be stepped sequentially (for example, low to medium to high or high to medium to low). As provided in [Table 5-2](#), the SELx logic assignment ensures that switching gains up or down involve only one input-pin transition, reducing the probability of unintended false codes during logic settling.

8.4.4 Latch Mode

OPA3S2859 features $\overline{\text{LTCH_A}}$ and $\overline{\text{LTCH_B}}$ pins which independently latch the gain configuration for Channel A and Channel B, respectively. If the latch control inputs are connected to logic high or floating, then the chosen feedback selection (through the SEL0 and SEL1 pins) applies to A and B analog channels immediately, this is also called transparent mode. If the latch control inputs are logic low, then changing the feedback selection (through the SEL0 and SEL1 pins) does not affect the gain configuration of the respective amplifier channel. [Figure 8-1](#) shows the minimum timing requirements that should be met when using $\overline{\text{LTCH_x}}$ pins to latch gain configuration.

As shown in [Figure 8-1](#), use the latch control input for each channel to separately control the feedback selection from the common SEL1 and SEL0 pins. The latch control inputs can also provide benefits in some cases where channel A and B need to have the same configuration. For example, any timing skew from SEL1 and SEL0 may result in unintended switch logic configurations for a short-duration resulting in transient output glitch when switching between different settings in transparent mode. Holding the $\overline{\text{LTCH_x}}$ pin low until the new selection value at the SEL pins have settled can minimize these intermediate glitch states.

This feature is also useful in larger systems with multiple OPA3S2859 devices. The gain path can be set using common SEL0 and SEL1 signals for all the devices, and latch pins can be used to control the gain independently for each amplifier channel.

The steps to update the gain settings in the following example configuration for Channel A only, are as follows:

1. Set $\overline{\text{LTCH_B}}$ to logic low (latch mode), this way changes made on Channel A do not affect Channel B gain configuration.
2. If $\overline{\text{LTCH_A}}$ is high (transparent mode), then use SEL0 and SEL1 pins to select the feedback network of interest. If $\overline{\text{LTCH_A}}$ is low, then toggle it to logic high and use SEL0 and SEL1 pins to select the feedback network of interest.
3. To hold the selected gain, set $\overline{\text{LTCH_A}}$ to logic low. Ensure minimum setup time requirements (100 ns) are met between SELx selection to $\overline{\text{LTCH_A}}$ going low. Also, ensure that during the hold time (100 ns), no changes should be made on SELx pins. The minimum timing is based on internal device configuration. If needed, additional time must be added due to board layout parasitics and signal delays.
4. Gain setting for channel A is now latched and any changes on the SELx pins will not change the gain configuration for channel A.

Figure 8-1. Timing Diagram

9 Application and Implementation

Note

Information in the following applications sections is not part of the TI component specification, and TI does not warrant its accuracy or completeness. TI's customers are responsible for determining suitability of components for their purposes, as well as validating and testing their design implementation to confirm system functionality.

9.1 Application Information

The OPA3S2859 offers a unique combination of dual channel, wide bandwidth low noise amplifiers with integrated programmable gain switches. This combination makes this amplifier an excellent choice for photodiode transimpedance amplifier applications with variable gain needs.

9.2 Typical Application

Figure 9-1 shows the circuit used to measure transimpedance bandwidth of the OPA3S2859 with different feedback network setting options. This configuration imitates the impedance of the photodiode on the input of the TIA.

Figure 9-1. OPA3S2859 Test Circuit

9.2.1 Design Requirements

The objective is to design a variable gain, low noise, wideband optical front-end transimpedance amplifier. The design requirements are as follows:

- Amplifier supply voltage: ± 2.5 V
- Transimpedance gain: 1 k Ω , 10 k Ω , or 100 k Ω
- Photodiode capacitance: $C_{APD} = 3.3$ pF (additional estimated PCB capacitance = 0.7 pF)
- Target bandwidth: 130 MHz, 40 MHz, or 14 MHz

9.2.2 Detailed Design Procedure

The OPA3S2859 meets the growing demand for wideband, low-noise photodiode amplifiers. The closed-loop bandwidth of a transimpedance amplifier is a function of the following:

1. The total input capacitance (C_{IN}). This total includes the photodiode capacitance, the input capacitance of the amplifier (common-mode and differential capacitance) and any stray capacitance from the PCB.
2. The op amp gain bandwidth product (GBWP).
3. The transimpedance gain (R_F).

Figure 9-1 shows the OPA3S2859 configured as programmable gain TIA using different feedback paths through the switch network. The feedback resistance (R_F) and the input capacitance (C_{IN}) form a zero in the noise gain that results in instability if left unchecked. To counteract the effect of the zero, a pole is inserted into the noise gain transfer function by adding the feedback capacitor (C_F). The [Transimpedance Considerations for High-Speed Amplifiers Application Report](#) application report discusses theories and equations that show how to compensate a transimpedance amplifier for a particular transimpedance gain and input capacitance. The bandwidth and compensation equations from the application report are available in an Excel® calculator. [What You Need To Know About Transimpedance Amplifiers – Part 1](#) provides a link to the calculator.

The equations and calculators in the referenced application report and blog posts are used to model the bandwidth (f_{-3dB}) and noise performance of the OPA3S2859 configured as a TIA. For this setup, to emulate an ideal current source, choose an R_{IN} value that is 1 to 10x greater than R_F so that the resulting low frequency noise gain is closer to 1 V/V than to 2 V/V ($R_F = 1\text{ k}\Omega$, $10\text{ k}\Omega$, or $100\text{ k}\Omega$, $R_{IN} = 10\text{ k}\Omega$, $100\text{ k}\Omega$, or $100\text{ k}\Omega$; respectively). Figure 9-2 shows the resultant performance. To maximize bandwidth, make sure to reduce any stray parasitic capacitance from the PCB. Increasing R_F results in lower bandwidth. To maximize the signal-to-noise ratio (SNR) in an optical front-end system, maximize the gain in the TIA stage.

9.2.3 Application Curves

Figure 9-2. Bandwidth vs Frequency

10 Power Supply Recommendations

The OPA3S2859 operates on supplies from 3.3 V to 5.25 V. The device operates on single-sided supplies, split and balanced bipolar supplies, and unbalanced bipolar supplies. Because the OPA3S2859 does not feature rail-to-rail inputs or outputs, the input common-mode and output swing ranges are limited at 3.3-V supplies.

11 Layout

11.1 Layout Guidelines

Achieving optimum performance with a high-frequency amplifier, such as the OPA3S2859, requires careful attention to board layout parasitics and external component types. Recommendations that optimize performance include the following:

- **Reduce capacitive coupling between feedback traces.** Trace-to-trace capacitance between the three feedback connection traces can cause the traces to couple together at high frequency and effect the gain of the device. Particularly for high gain feedback configurations, capacitive coupling to feedback paths with lower gain can significantly reduce the bandwidth if not properly isolated. For example, in a circuit configuration with 100k, 10k, and 1k feedback elements, the 100k gain path can see over 66% reduction in bandwidth when using a non-optimized feedback layout. To properly isolate the feedback traces, it is important to space the traces out and pour ground plane between the traces to isolate their capacitance; additional trace length, however, does add further inductance and capacitance to the traces which can also effect performance. Therefore, it is important to balance the feedback area and trace length to best minimize the major parasitic effect. A good starting point is to use a design similar to the evaluation module with a feedback area of approximately 6 mm × 6 mm. This can then be adjusted depending on circuit limitations and needs.
- **Minimize parasitic capacitance from the signal I/O pins to ac ground.** Parasitic capacitance on the output pins can cause instability, where as parasitic capacitance on the input pin reduces the amplifier bandwidth. To reduce unwanted capacitance, cut out the power and ground traces under the signal input pins, output pins, and exterior feedback trace when possible. A small value isolation resistor between the DUT output and feedback network can also help reduce the parasitic loading caused by the feedback trace on the output. Otherwise, ground and power planes must be unbroken elsewhere on the board.
- **Minimize the distance from the power-supply pins to the high-frequency bypass capacitors.** Use high-quality, 100-pF to 0.1-μF, C0G and NPO-type decoupling capacitors with voltage ratings at least three times greater than the amplifiers maximum power supplies. Place the smallest value capacitors on the same side as the DUT. If space constraints force the larger value bypass capacitors to be placed on the opposite side of the PCB, use multiple vias on the supply and ground side of the capacitors. This configuration makes sure that there is a low-impedance path to the amplifiers power-supply pins across the amplifiers gain bandwidth specification. Avoid narrow power and ground traces to minimize inductance between the pins and the decoupling capacitors. Larger (2.2-μF to 6.8-μF) decoupling capacitors that are effective at lower frequency must be used on the supply pins. Place these decoupling capacitors further from the device. Share the decoupling capacitors among several devices in the same area of the printed circuit board (PCB).

11.2 Layout Examples

Figure 11-1 shows a typical layout around the OPA3S2859 based on the evaluation module. The smallest decoupling capacitors were placed as close as possible to the DUT with wide metal area to minimize inductance. Special attention was placed on the feedback network layout to optimize the design for a typical application using 1 kΩ, 10 kΩ, and 100 kΩ feedback resistors. Figure 11-2 shows more details. The black colored areas under the input and feedback traces show the voids cut in the ground plane underneath the traces to minimize capacitance to ground as much as possible.

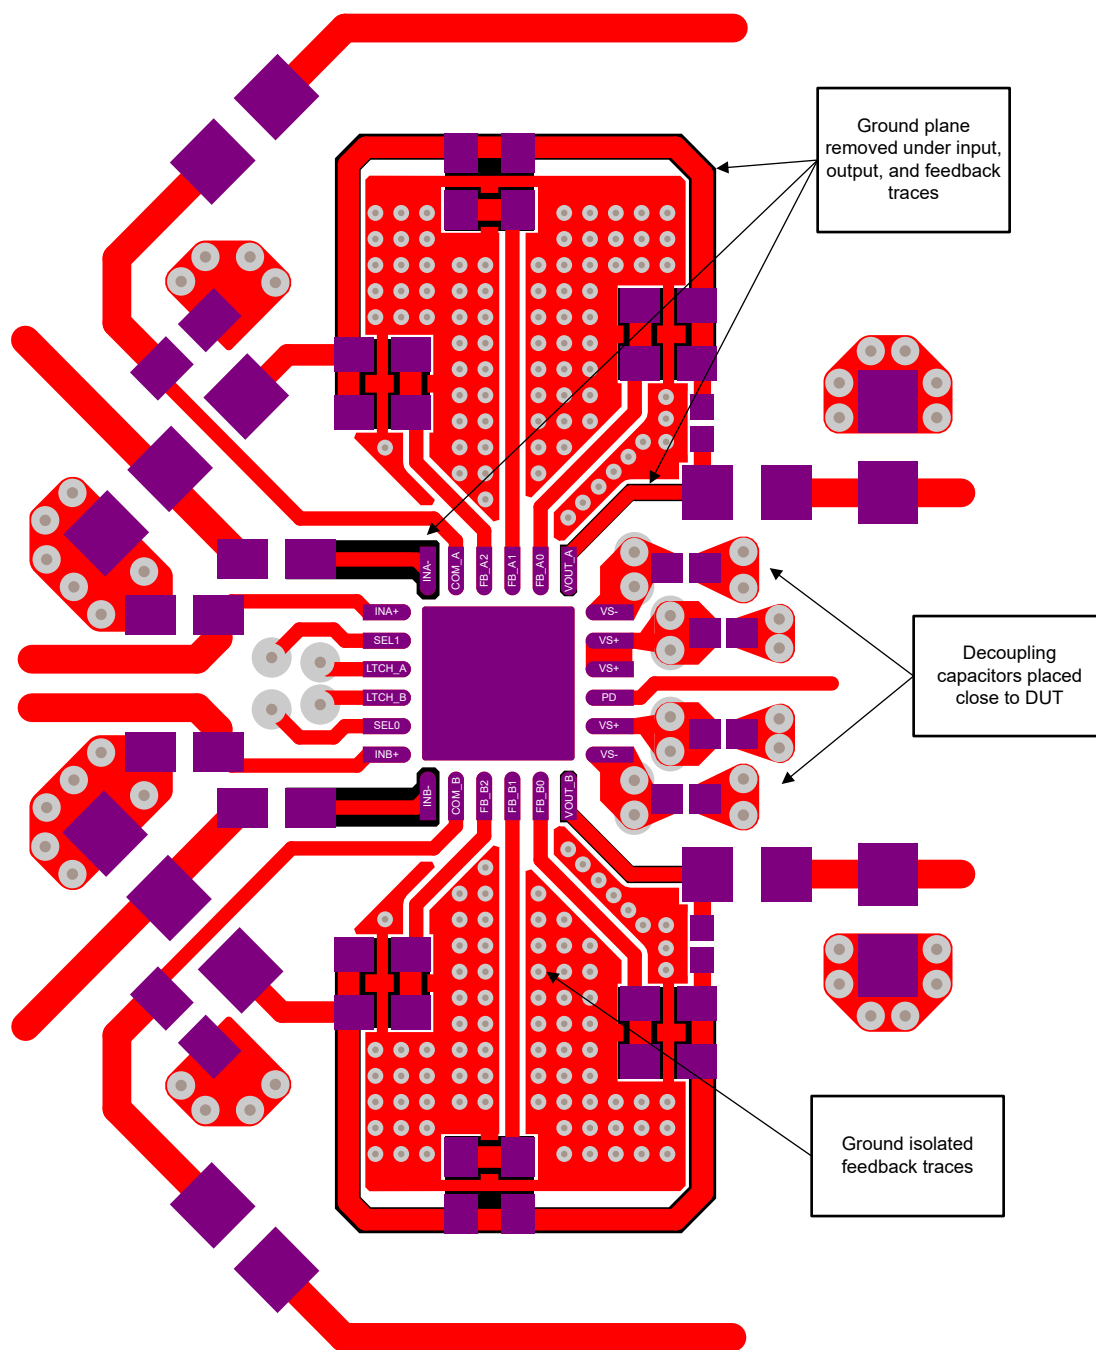

Figure 11-1. General Layout Example

Figure 11-2 shows an example of a feedback network from the evaluation module optimized to reduce the capacitive coupling between the feedback and output traces. Ground plane is poured between each of the feedback traces and component footprints as much as possible for the best isolation. A small isolation resistor (RISO) is connected between the output and feedback trace to help isolate the trace capacitance from being directly connected to the DUT output. Additionally, the ground plane is removed from under the feedback trace to further reduce the parasitic capacitance to ground created by the additional trace length required for the feedback network.

12.6 Electrostatic Discharge Caution

This integrated circuit can be damaged by ESD. Texas Instruments recommends that all integrated circuits be handled with appropriate precautions. Failure to observe proper handling and installation procedures can cause damage.

ESD damage can range from subtle performance degradation to complete device failure. Precision integrated circuits may be more susceptible to damage because very small parametric changes could cause the device not to meet its published specifications.

12.7 Glossary

[TI Glossary](#) This glossary lists and explains terms, acronyms, and definitions.

13 Mechanical, Packaging, and Orderable Information

The following pages include mechanical, packaging, and orderable information. This information is the most current data available for the designated devices. This data is subject to change without notice and revision of this document. For browser-based versions of this data sheet, refer to the left-hand navigation.

PACKAGING INFORMATION

Orderable part number	Status (1)	Material type (2)	Package Pins	Package qty Carrier	RoHS (3)	Lead finish/ Ball material (4)	MSL rating/ Peak reflow (5)	Op temp (°C)	Part marking (6)
OPA3S2859IRTW	Active	Production	WQFN (RTW) 24	3000 LARGE T&R	Yes	NIPDAU	Level-1-260C-UNLIM	-40 to 125	O3S2859
OPA3S2859IRTW.B	Active	Production	WQFN (RTW) 24	3000 LARGE T&R	Yes	NIPDAU	Level-1-260C-UNLIM	-40 to 125	O3S2859

⁽¹⁾ **Status:** For more details on status, see our [product life cycle](#).

⁽²⁾ **Material type:** When designated, preproduction parts are prototypes/experimental devices, and are not yet approved or released for full production. Testing and final process, including without limitation quality assurance, reliability performance testing, and/or process qualification, may not yet be complete, and this item is subject to further changes or possible discontinuation. If available for ordering, purchases will be subject to an additional waiver at checkout, and are intended for early internal evaluation purposes only. These items are sold without warranties of any kind.

⁽³⁾ **RoHS values:** Yes, No, RoHS Exempt. See the [TI RoHS Statement](#) for additional information and value definition.

⁽⁴⁾ **Lead finish/Ball material:** Parts may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead finish/Ball material values may wrap to two lines if the finish value exceeds the maximum column width.

⁽⁵⁾ **MSL rating/Peak reflow:** The moisture sensitivity level ratings and peak solder (reflow) temperatures. In the event that a part has multiple moisture sensitivity ratings, only the lowest level per JEDEC standards is shown. Refer to the shipping label for the actual reflow temperature that will be used to mount the part to the printed circuit board.

⁽⁶⁾ **Part marking:** There may be an additional marking, which relates to the logo, the lot trace code information, or the environmental category of the part.

Multiple part markings will be inside parentheses. Only one part marking contained in parentheses and separated by a "~" will appear on a part. If a line is indented then it is a continuation of the previous line and the two combined represent the entire part marking for that device.
