SN74AHC1G09-Q1 Automotive Single 2–Input Positive-AND Gate With Open-Drain Output

1 Features

- AEC-Q100 Qualified for automotive applications:
  - Device temperature grade 1: –40°C to +125°C, T_A
  - Device HBM ESD Classification Level 2
  - Device CDM ESD Classification Level C6
- Operating range from 2 V to 5.5 V
- Low power consumption, 10-µA maximum I_{CC}
- Maximum t_{pd} of 6 ns at 5 V
- ±8-mA output drive at 5 V
- Latch-up performance exceeds 250 mA per JESD 17

2 Applications

- Combining power good signals
- Enable digital signals

3 Description

The SN74AHC1G09-Q1 is a single 2-input positive-AND gate with an open drain output configuration. The device performs the Boolean logic Y = A × B in positive logic.

Package Information

(1) Operation outside the *Absolute Maximum Rating* may cause permanent device damage. *Absolute Maximum Rating* do not imply functional operation of the device at these or any other conditions beyond those listed under *Recommended Operating Condition*. If used outside the *Recommended Operating Condition* but within the *Absolute Maximum Rating*, the device may not be fully functional, and this may affect device reliability, functionality, performance, and shorten the device lifetime.
(2) The input and output voltage ratings may be exceeded if the input and output current ratings are observed.

6.2 ESD Ratings

			VALUE	UNIT
$V_{(ESD)}$	Electrostatic discharge	Human body model (HBM), per AEC Q100-002 HBM ESD Classification Level 2(1)	±2000	V

B. Waveform 1 is for an output with internal conditions such that the output is low except when disabled by the output control. Waveform 2 is for an output with internal conditions such that the output is high except when disabled by the output control.
C. All input pulses are supplied by generators having the following characteristics: PRR ≤ 1 MHz, Z_O = 50 Ω, t_r ≤ 3 ns, t_f ≤ 3 ns.
D. The outputs are measured one at a time with one input transition per measurement.
E. All parameters and waveforms are not applicable to all devices.
F. Since this device has open-drain outputs, t_{PLZ} and t_{PZL} are the same as t_{PD}.
G. t_{PZL} is measured at $V_{CC}/2$.
H. t_{PLZ} is measured at V_{OL} + 0.3 V.

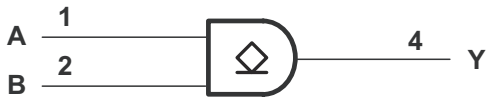
8 Detailed Description

8.1 Overview

The SN74AHC1G09-Q1 device contains one open-drain positive-AND gate with a maximum sink current of 8 mA. A wide operating range of 2 V to 5.5 V enables this device to be used in many different systems, and a low t_{pd} qualifies this device to be used in high-speed applications.

8.2 Functional Block Diagram



8.3 Feature Description

The wide operating voltage range of 2 V to 5 V allows the SN74AHC1G09-Q1 to be used in systems with many different voltage rails. In addition, the voltage tolerance on the output allows the device to be used for inverting up-translation or down-translation. The device is also equipped with Schmitt-trigger inputs, which increase the ability of the device to reject noise.

8.4 Device Functional Modes

Table 8-1 lists the functional modes of the SN74AHC1G09-Q1.

9 Application and Implementation

Note

Information in the following applications sections is not part of the TI component specification, and TI does not warrant its accuracy or completeness. TI's customers are responsible for determining suitability of components for their purposes, as well as validating and testing their design implementation to confirm system functionality.

9.1 Application Information

The SN74AHC1G09-Q1 is used in the following example in a basic power sequencing configuration. Power sequencing is often used in applications that require a processor or other delicate device with specific voltage timing requirements to protect the device from malfunctioning.

9.2 Typical Application

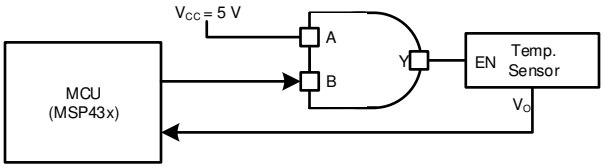

Figure 9-1. Typical Application Diagram

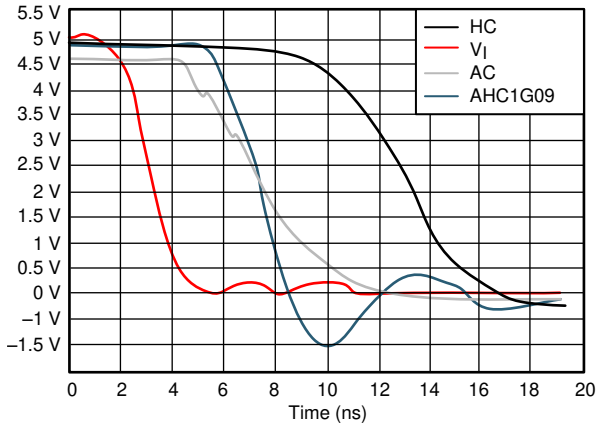
9.2.1 Design Requirements

This device uses CMOS technology. Take care to avoid bus contention because it can drive currents that would exceed maximum limits. The high drive will also create fast edges into light loads, so routing and load conditions should be considered to prevent ringing.

9.2.2 Detailed Design Procedure

1. Recommended Input Conditions:
   - Rise time and fall time specifications. See ($\Delta t/\Delta V$) in *Recommended Operating Conditions*.
   - Specified high and low levels. See (V_{IH} and V_{IL}) in *Recommended Operating Conditions*.
   - Inputs are overvoltage-tolerant, allowing them to go as high as (V_I maximum) in *Recommended Operating Conditions* at any valid V_{CC}.
2. Absolute Maximum Conditions:
   - Load currents should not exceed (I_O maximum) per output and should not exceed (continuous current through V_{CC} or GND) total current for the part. These limits are located in *Absolute Maximum Ratings*.
   - Outputs should not be pulled above V_{CC}.

9.2.3 Application Curves



V_{CC} = 5 V, Load = 50 Ω / 50 pF

Figure 9-2. I_{CC} vs Input Voltage

9.3 Power Supply Recommendations

The power supply can be any voltage between the minimum and maximum supply voltage rating located in *Recommended Operating Conditions*.

Each V_{CC} pin should have a good bypass capacitor to prevent power disturbance. For devices with a single supply, a 0.1-µF capacitor is recommended; if there are multiple V_{CC} pins, then a 0.01-µF or 0.022-µF capacitor is recommended for each power pin. It is acceptable to parallel multiple bypass capacitors to reject different frequencies of noise. 0.1-µF and 1-µF capacitors are commonly used in parallel. The bypass capacitor should be installed as close to the power pin as possible for best results.

9.4 Layout

9.4.1 Layout Guidelines

When using multiple bit logic devices, inputs must never float. In many cases, functions or parts of functions of digital logic devices are unused (for example, when only two inputs of a triple-input AND gate are used, or only 3 of the 4 buffer gates are used). Such input pins must not be left unconnected because the undefined voltages at the outside connections result in undefined operational states.

The following are the rules that must be observed under all circumstances:

- All unused inputs of digital logic devices must be connected to a high or low bias to prevent them from floating.
- The logic level that should be applied to any particular unused input depends on the function of the device. Generally the unused inputs will be tied to GND or V_{CC}, whichever makes more sense or is more convenient.

10.5 Electrostatic Discharge Caution

This integrated circuit can be damaged by ESD. Texas Instruments recommends that all integrated circuits be handled with appropriate precautions. Failure to observe proper handling and installation procedures can cause damage.

ESD damage can range from subtle performance degradation to complete device failure. Precision integrated circuits may be more susceptible to damage because very small parametric changes could cause the device not to meet its published specifications.

(1) **Status:** For more details on status, see our product life cycle.

(2) **Material type:** When designated, preproduction parts are prototypes/experimental devices, and are not yet approved or released for full production. Testing and final process, including without limitation quality assurance, reliability performance testing, and/or process qualification, may not yet be complete, and this item is subject to further changes or possible discontinuation. If available for ordering, purchases will be subject to an additional waiver at checkout, and are intended for early internal evaluation purposes only. These items are sold without warranties of any kind.

(3) **RoHS values:** Yes, No, RoHS Exempt. See the TI RoHS Statement for additional information and value definition.

(4) **Lead finish/Ball material:** Parts may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead finish/Ball material values may wrap to two lines if the finish value exceeds the maximum column width.

(5) **MSL rating/Peak reflow:** The moisture sensitivity level ratings and peak solder (reflow) temperatures. In the event that a part has multiple moisture sensitivity ratings, only the lowest level per JEDEC standards is shown. Refer to the shipping label for the actual reflow temperature that will be used to mount the part to the printed circuit board.

(6) **Part marking:** There may be an additional marking, which relates to the logo, the lot trace code information, or the environmental category of the part.

Multiple part markings will be inside parentheses. Only one part marking contained in parentheses and separated by a "~" will appear on a part. If a line is indented then it is a continuation of the previous line and the two combined represent the entire part marking for that device.
