

TLV5628C, TLV5628I OCTAL 8-BIT DIGITAL-TO-ANALOG CONVERTERS

SLAS108A – JANUARY 1995 – REVISED NOVEMBER 1995

- Eight 8-Bit Voltage Output DACs
- 3-V Single Supply Operation
- Serial Interface
- High-Impedance Reference Inputs
- Programmable for 1 or 2 Times Output Range
- Simultaneous Update Facility
- Internal Power-On Reset
- Low Power Consumption
- Half-Buffered Output

DW OR N PACKAGE
(TOP VIEW)

applications

- Programmable Voltage Sources
- Digitally Controlled Amplifiers/Attenuators
- Mobile Communications
- Automatic Test Equipment
- Process Monitoring and Control
- Signal Synthesis

description

The TLV5628C and TLV5628I are octal 8-bit voltage output digital-to-analog converters (DACs) with buffered reference inputs (high impedance). The DACs produce an output voltage that varies between one or two times the reference voltages and GND, and the DACs are monotonic. The device is simple to use, running from a single supply of 3 to 3.6 V. A power-on reset function is incorporated to ensure repeatable start-up conditions.

Digital control of the TLV5628C and TLV5628I is over a simple 3-wire serial bus that is CMOS compatible and easily interfaced to all popular microprocessor and microcontroller devices. The 12-bit command word comprises 8 bits of data, 3 DAC select bits and a range bit, the latter allowing selection between the times 1 or times 2 output range. The DAC registers are double buffered, allowing a complete set of new values to be written to the device, then all DAC outputs are updated simultaneously through control of the LDAC terminal. The digital inputs feature Schmitt triggers for high noise immunity.

The 16-terminal small-outline D package allows digital control of analog functions in space-critical applications. The TLV5628C is characterized for operation from 0°C to 70°C. The TLV5628I is characterized for operation from –40°C to 85°C. The TLV5628C and TLV5628I do not require external trimming.

AVAILABLE OPTIONS

PACKAGE		
T _A	SMALL OUTLINE (DW)	PLASTIC DIP (N)
0°C to 70°C	TLV5628CDW	TLV5628CN
–40°C to 85°C	TLV5628IDW	TLV5628IN

Please be aware that an important notice concerning availability, standard warranty, and use in critical applications of Texas Instruments semiconductor products and disclaimers thereto appears at the end of this data sheet.

PRODUCTION DATA information is current as of publication date. Products conform to specifications per the terms of Texas Instruments standard warranty. Production processing does not necessarily include testing of all parameters.

OCTAL 8-BIT DIGITAL-TO-ANALOG CONVERTERS

SLAS108A – JANUARY 1995 – REVISED NOVEMBER 1995

functional block diagram

Terminal Functions

TERMINAL NAME	NO.	I/O	DESCRIPTION
CLK	5	I	Serial-interface clock, data enters on the negative edge
DACA	2	O	DACA analog output
DACB	1	O	DACB analog output
DACC	16	O	DACC analog output
DACD	15	O	DACD analog output
DACE	7	O	DACE analog output
DACF	8	O	DACF analog output
DACG	9	O	DACG analog output
DACH	10	O	DACH analog output
DATA	4	I	Serial-interface digital data input
GND	3	I	Ground return and reference terminal
LDAC	13	I	DAC-update latch control
LOAD	12	I	Serial-interface load control
REF1	14	I	Reference voltage input to DACA
REF2	11	I	Reference voltage input to DACB
V _{DD}	6	I	Positive supply voltage

The TLV5628 is implemented using eight resistor-string DACs. The core of each DAC is a single resistor with 256 taps, corresponding to the 256 possible codes listed in Table 1. One end of each resistor string is connected to the GND terminal and the other end is fed from the output of the reference input buffer. Monotonicity is maintained by use of the resistor strings. Linearity depends upon the matching of the resistor elements and upon the performance of the output buffer. Because the inputs are buffered, the DACs always present a high-impedance load to the reference sources. There are two input reference terminals; REF1 is used for DACA through DACD and REF2 is used by DACE through DACH.

On power-up, the DACs are reset to CODE 0.

$$V_{O(DACA|B|C|D|E|F|G|H)} = \text{REF} \times \frac{\text{CODE}}{256} \times (1 + \text{RNG bit value})$$

data interface

With LOAD high, data is clocked into the DATA terminal on each falling edge of CLK. Once all data bits have been clocked in, LOAD is pulsed low to transfer the data from the serial-input register to the selected DAC as shown in Figure 1. When LDAC is low, the selected DAC output voltage is updated and LOAD goes low. When LDAC is high during serial programming, the new value is stored within the device and can be transferred to the DAC output at a later time by pulsing LDAC low as shown in Figure 2. Data is entered MSB first. Data transfers using two 8 clock cycle periods are shown in Figures 3 and 4.

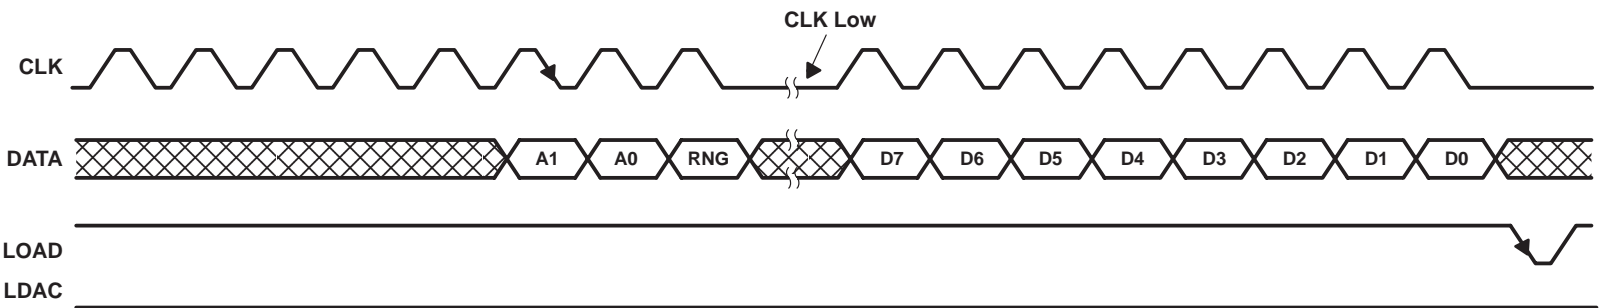

Figure 3. Load Controlled Update Using 8-Bit Serial Word (LDAC = Low)

Figure 4. LDAC Controlled Update Using 8-Bit Serial Word

data interface (continued)

Table 2 lists the A2, A1, and A0 bits and the selection of the updated DACs. The RNG bit controls the DAC output range. When RNG = low, the output range is between the applied reference voltage and GND, and when RNG = high, the range is between twice the applied reference voltage and GND.

OCTAL 8-BIT DIGITAL-TO-ANALOG CONVERTERS

SLAS108A – JANUARY 1995 – REVISED NOVEMBER 1995

linearity, offset, and gain error

When an amplifier is operated from a single supply, the voltage offset can still be either positive or negative. With a positive offset, the output voltage changes on the first code change. With a negative offset the output voltage may not change with the first code depending on the magnitude of the offset voltage.

The output amplifier, with a negative voltage offset, attempts to drive the output to a negative voltage. However, since the most negative supply rail is ground, the output cannot drive to a negative voltage.

So when the output offset voltage is negative, the output voltage remains at 0 volts until the input code value produces a sufficient output voltage to overcome the inherent negative offset voltage resulting in the transfer function shown in Figure 5.

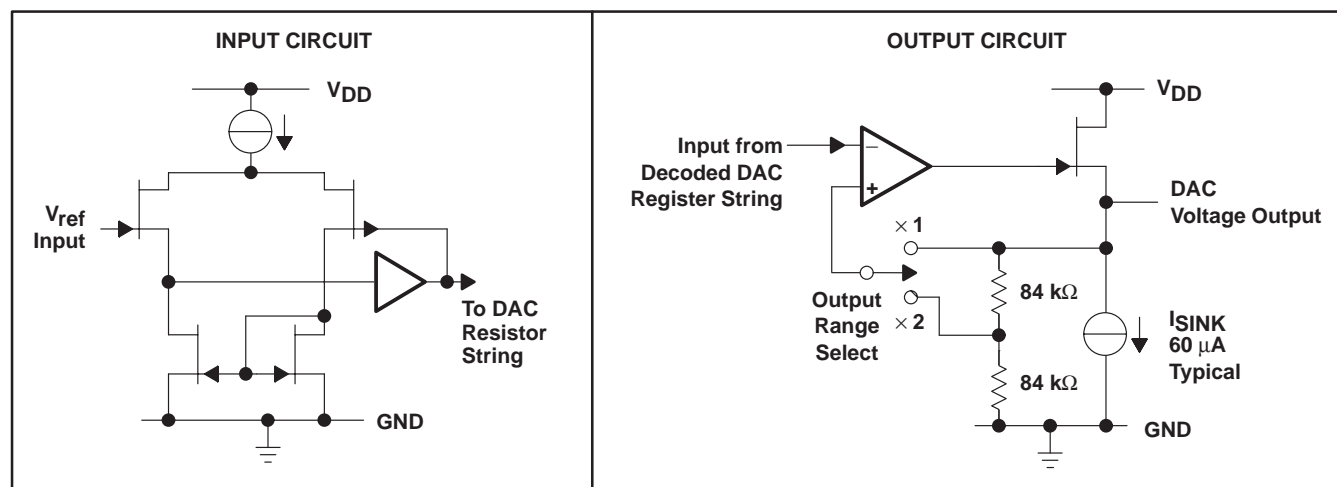

Figure 5. Effect of Negative Offset (Single Supply)

The negative offset error produces a breakpoint, not a linearity error. The transfer function would follow the dotted line if the output buffer could drive to a negative voltage.

For a DAC, linearity is measured between zero input code (all inputs 0) and full scale code (all inputs 1) after offset and full scale is adjusted out or accounted for in some way. However, single supply operation does not allow for adjustment when the offset is negative due to the breakpoint in the transfer function. The linearity in the unipolar mode is measured between full scale code and the lowest code which produces a positive output voltage.

The code is calculated from the maximum specification for the negative offset.

	Reference input capacitance			15		
I _{DD}	Supply current	V _{DD} = 3.3 V			4	mA
I _{ref}	Reference input current	V _{DD} = 3.3 V, V _{ref} = 1.5 V			±10	μA
E _L	Linearity error (end point corrected)	V _{ref} = 1.25 V, × 2 gain (see Note 1)			±1	LSB
E _D	Differential linearity error	V _{ref} = 1.25 V, × 2 gain (see Note 2)			±0.9	LSB
E _{ZS}	Zero-scale error	V _{ref} = 1.25 V, × 2 gain (see Note 3)	0		30	mV
	Zero-scale error temperature coefficient	V _{ref} = 1.25 V, × 2 gain (see Note 4)		10		μV/°C
E _{FS}	Full-scale error	V _{ref} = 1.25 V, × 2 gain (see Note 5)			±60	mV
	Full-scale error temperature coefficient	V _{ref} = 1.25 V, × 2 gain (see Note 6)		±25		μV/°C
PSRR	Power supply sensitivity	See Notes 7 and 8		0.5		mV/V

- NOTES: 1. Integral nonlinearity (INL) is the maximum deviation of the output from the line between zero-scale and full scale (excluding the effects of zero code and full-scale errors).
2. Differential nonlinearity (DNL) is the difference between the measured and ideal 1 LSB amplitude change of any two adjacent codes. Monotonic means the output voltage changes in the same direction (or remains constant) as a change in the digital input code.
3. Zero-scale error is the deviation from zero voltage output when the digital input code is zero.
4. Zero-scale error temperature coefficient is given by: ZSETC = [ZSE(T_{max}) – ZSE(T_{min})]/V_{ref} × 10⁶/(T_{max} – T_{min}).
5. Full-scale error is the deviation from the ideal full-scale output (V_{ref} – 1 LSB) with an output load of 10 kΩ.
6. Full-scale temperature coefficient is given by: FSETC = [FSE(T_{max}) – FSE(T_{min})]/V_{ref} × 10⁶/(T_{max} – T_{min}).
7. Zero-scale error rejection ratio (ZSE-RR) is measured by varying the V_{DD} voltage from 4.5 V to 5.5 V dc and measuring the effect of this signal on the zero-code output voltage.
8. Full-scale error rejection ratio (FSE-RR) is measured by varying the V_{DD} voltage from 3 V to 3.6 V dc and measuring the effect of this signal on the full-scale output voltage.

**operating characteristics over recommended operating free-air temperature range,
V_{DD} = 3 V to 3.6 V, V_{ref} = 2 V, × 1 gain output range (unless otherwise noted)**

	TEST CONDITIONS	MIN	TYP	MAX	UNIT
Output slew rate	C _L = 100 pF, R _L = 10 kΩ		1		V/μs
Output settling time	To 0.5 LSB, C _L = 100 pF, R _L = 10 kΩ, See Note 9		10		μs
Large-signal bandwidth	Measured at –3 dB point		100		kHz
Digital crosstalk	CLK = 1-MHz square wave measured at DACA-DACH		–50		dB
Reference feedthrough	See Note 10		–60		dB
Channel-to-channel isolation	See Note 11		–60		dB
Reference input bandwidth	See Note 12		100		kHz

- NOTES: 9. Settling time is the time for the output signal to remain within ±0.5 LSB of the final measured value for a digital input code change of 00 hex to FF hex or FF hex to 00 hex. For TLC5628C V_{DD} = 5 V, V_{ref} = 2 V and range = ×2. For TLC5628I V_{DD} = 3 V, V_{ref} = 1.25 V and range ×2.
10. Reference feedthrough is measured at any DAC output with an input code = 00 hex with a V_{ref} input = 1 V dc + 1 V_{pp} at 10 kHz.
11. Channel-to-channel isolation is measured by setting the input code of one DAC to FF hex and the code of all other DACs to 00 hex with V_{ref} input = 1 V dc + 1 V_{pp} at 10 kHz.
12. Reference bandwidth is a –3 dB bandwidth with an input at V_{ref} = 1.25 V dc + 2 V_{pp} and with a full-scale digital input code.

⁽¹⁾ **Status:** For more details on status, see our [product life cycle](#).

⁽²⁾ **Material type:** When designated, preproduction parts are prototypes/experimental devices, and are not yet approved or released for full production. Testing and final process, including without limitation quality assurance, reliability performance testing, and/or process qualification, may not yet be complete, and this item is subject to further changes or possible discontinuation. If available for ordering, purchases will be subject to an additional waiver at checkout, and are intended for early internal evaluation purposes only. These items are sold without warranties of any kind.

⁽³⁾ **RoHS values:** Yes, No, RoHS Exempt. See the [TI RoHS Statement](#) for additional information and value definition.

⁽⁴⁾ **Lead finish/Ball material:** Parts may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead finish/Ball material values may wrap to two lines if the finish value exceeds the maximum column width.

⁽⁵⁾ **MSL rating/Peak reflow:** The moisture sensitivity level ratings and peak solder (reflow) temperatures. In the event that a part has multiple moisture sensitivity ratings, only the lowest level per JEDEC standards is shown. Refer to the shipping label for the actual reflow temperature that will be used to mount the part to the printed circuit board.

⁽⁶⁾ **Part marking:** There may be an additional marking, which relates to the logo, the lot trace code information, or the environmental category of the part.

Multiple part markings will be inside parentheses. Only one part marking contained in parentheses and separated by a "~" will appear on a part. If a line is indented then it is a continuation of the previous line and the two combined represent the entire part marking for that device.
