TEXAS INSTRUMENTS

TPS22968-Q1

SLVSCP7B – NOVEMBER 2014 – REVISED MARCH 2016

TPS22968x-Q1 5.5-V, 4-A, 27-mΩ On-Resistance Load Switch

1 Features

- Integrated Dual Channel Load Switch
- Qualified for Automotive Applications:
  - Device Temperature Grade 1 : –40°C to +125°C Ambient Operating Temperature Range
- Input Voltage Range: 0.8 to 5.5 V
- VBIAS Voltage Range: 2.5 to 5.5 V
- On-Resistance
  - R_{ON} = 29 mΩ at V_{IN} = 5 V (V_{BIAS} = 5 V)
  - R_{ON} = 27 mΩ at V_{IN} = 3.3 V (V_{BIAS} = 5 V)
  - R_{ON} = 26 mΩ at V_{IN} = 1.8 V (V_{BIAS} = 5 V)
- 4-A Maximum Continuous Switch Current per Channel
- Low Quiescent Current
  - 58-µA at V_{BIAS} = 5 V (Both Channels)
- Low-Control Input-Threshold Enables Use of 1.2-, 1.8-, 2.5-, 3.3- V Logic
- Configurable Rise Time With CT Pin[1]
- Quick-Output Discharge (QOD)[2] (TPS22968-Q1 Only)
- 10-Pin WSON Package With Wettable Flanks
- ESD Performance Tested per JEDEC STD
  - ±2-kV HBM and ±1-kV CDM
- Latch-Up Performance meets 100-mA per JESD 78, Class II
- GPIO Enable – Active High

[1] See *Adjustable Rise Time* for CT value versus rise time

[2] This feature discharges output of the switch to GND through a 270-Ω resistor, preventing the output from floating.

2 Applications

- Automotive Electronics
- Infotainment
- Cluster
- ADAS

3 Description

The TPS22968x-Q1 is a small, dual-channel load switch with configurable rise time. The device contains two N-channel MOSFETs that can operate over an input voltage range of 0.8 V to 5.5 V and can support a maximum continuous current of 4-A per channel. Each switch is independently controlled by an on/off input (ON1 and ON2), which is capable of interfacing directly with low-voltage control signals. The TPS22968-Q1 includes a 270 Ω on-chip resistor for quick output discharge when the switch is turned off.
The TPS22968x-Q1 is available in a small, space-saving package (DMG) with wettable flanks and an integrated thermal pad. The wettable flanks allow for visual solder inspection. The device is characterized for operation over the free-air temperature range of –40 to +125°C.

Device Information [1]

PART NUMBER	PACKAGE	BODY SIZE (NOM)
TPS22968-Q1 TPS22968N-Q1	WSON (10)	2.00 mm x 3.00 mm

[1] For all available packages, see the orderable addendum at the end of the data sheet.

Typical Application Schematic

4 Revision History

NOTE: Page numbers for previous revisions may differ from page numbers in the current version.

| **Changes from Revision A (February 2015) to Revision B**	**Page**
• Added new Device TPS22968N-Q1	1

Changes from Original (November 2014) to Revision A	**Page**
• Changed device status from *Product Preview* to *Production Data*	1

5 Device Comparison Table

DEVICE	Ron (typ) at VIN = 3.3 V, VBIAS = 5.0 V	QUICK OUTPUT DISCHARGE	MAXIMUM OUTPUT CURRENT	ENABLE
TPS22968-Q1	27 mΩ	Yes	4 A	Active High
TPS22968N-Q1	27 mΩ	No	4 A	Active High

Pin Functions

PIN NO.	PIN NAME	I/O	DESCRIPTION
1	VIN1	I	Switch 1 input. Bypass this input with a ceramic capacitor to GND.
2	ON1	I	Active-high switch 1 control input. Do not leave floating.
3	VBIAS	I	Bias voltage. Power supply to the device. Recommended voltage range for this pin is 2.5 to 5.5 V. See V_{IN} and V_{BIAS} Voltage Range section.
4	ON2	I	Active-high switch 2 control input. Do not leave floating.
5	VIN2	I	Switch 2 input. Bypass this input with a ceramic capacitor to GND.
6	VOUT2	O	Switch 2 output
7	CT2	O	Switch 2 slew rate control. Can be left floating.
8	GND	—	Ground
9	CT1	O	Switch 1 slew rate control. Can be left floating.
10	VOUT1	O	Switch 1 output
—	Thermal Pad	—	Thermal pad (exposed center pad) to alleviate thermal stress. Tie to GND. See Layout Guidelines section.

7 Specifications

7.1 Absolute Maximum Ratings

Over operating free-air temperature (unless otherwise noted) [1] [2]

		MIN	MAX	UNIT
$V_{IN1,2}$	Input voltage	−0.3	6	V
V_{BIAS}	Bias voltage	−0.3	6	V
$V_{OUT1,2}$	Output voltage	−0.3	6	V
$V_{ON1,2}$	ON voltage	−0.3	6	V
I_{MAX}	Maximum continuous switch current per channel, T_A = 50 °C		4	A
I_{PLS}	Maximum pulsed switch current, pulse <300 µs, 2% duty cycle		6	A
T_J	Maximum junction temperature		150	°C
T_{LEAD}	Maximum lead temperature (10-s soldering time)		300	°C
T_{stg}	Storage temperature	−65	150	°C

(1) Stresses beyond those listed under *Absolute Maximum Ratings* may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated under *Recommended Operating Conditions* is not implied. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.
(2) All voltage values are with respect to network ground terminal.

7.2 ESD Ratings

			VALUE	UNIT
$V_{(ESD)}$	Electrostatic discharge	Human-body model (HBM), per AEC Q100-002[1]	±2000	V
		Charged-device model (CDM), per AEC Q100-011	±1000	

(1) AEC Q100-002 indicates that HBM stressing shall be in accordance with the ANSI/ESDA/JEDEC JS-001 specification.

7.3 Recommended Operating Conditions

			MIN	MAX	UNIT
$V_{IN1,2}$	Input voltage range		0.8	V_{BIAS}	V
V_{BIAS}	Bias voltage range		2.5	5.5	V
$V_{ON1,2}$	ON voltage range		0	5.5	V
$V_{OUT1,2}$	Output voltage range			V_{IN}	V
$V_{IH, ON1,2}$	High-level input voltage, ON1,2	V_{BIAS} = 2.5 to 5.5 V	1.2	5.5	V
$V_{IL, ON1,2}$	Low-level input voltage, ON1,2	V_{BIAS} = 2.5 to 5.5 V	0	0.5	V
$C_{IN1,2}$	Input capacitor		1 [1]		µF
T_A	Operating free-air temperature [2]		−40	125	°C

(1) Refer to *Application Information*.
(2) In applications where high power dissipation and/or poor package thermal resistance is present, the maximum ambient temperature may have to be derated. Maximum ambient temperature [$T_{A(max)}$] is dependent on the maximum operating junction temperature [$T_{J(max)}$], the maximum power dissipation of the device in the application [$P_{D(max)}$], and the junction-to-ambient thermal resistance of the part/package in the application ($R_{\theta JA}$), as given by the following equation: $T_{A(max)} = T_{J(max)} − (R_{\theta JA} \times P_{D(max)})$.

7.4 Thermal Information

THERMAL METRIC [1] [2]		TPS22968x-Q1	UNIT
		DMG (WSON)	
		10 PINS	
$R_{\theta JA}$	Junction-to-ambient thermal resistance	55.6	°C/W
$R_{\theta JC(top)}$	Junction-to-case (top) thermal resistance	71	°C/W
$R_{\theta JB}$	Junction-to-board thermal resistance	21.7	°C/W
ψ_{JT}	Junction-to-top characterization parameter	1.9	°C/W

(1) For more information about traditional and new thermal metrics, see the *Semiconductor and IC Package Thermal Metrics* application report, SPRA953.
(2) For thermal estimates of this device based on PCB copper area, see the TI PCB Thermal Calculator.

9 Detailed Description

9.1 Overview

The device is a 5.5 V, 4-A, dual-channel ultra-low R_{ON} load switch with controlled turn on. The device contains two N-channel MOSFETs. Each channel can support a maximum continuous current of 4-A. Each channel is controlled by an on/off GPIO-compatible input. The ON pin must be connected and cannot be left floating. The device is designed to control the turn-on rate and therefore the inrush current. By controlling the inrush current, power supply sag can be reduced during turn-on. The slew rate for each channel is set by connecting a capacitor to GND on the CT pins.

The slew rate is proportional to the capacitor on the CT pin. Refer to *Adjustable Rise Time* to determine the correct CT value for a desired rise time.

The internal circuitry is powered by the VBIAS pin, which supports voltages from 2.5 to 5.5 V. This circuitry includes the charge pump, QOD (TPS22968-Q1 only), and control logic. For these internal blocks to function correctly, a voltage between 2.5 and 5.5 V must be supplied to VBIAS.

When a voltage is supplied to VBIAS and the ON1, 2 pin goes low, the QOD turns on. This connects VOUT1, 2 to GND through an on-chip resistor. The typical pulldown resistance (R_{PD}) is 270 Ω. Note that QOD is not applicable to TPS22968N-Q1.

9.2 Functional Block Diagram
9.3 Feature Description

9.3.1 ON and OFF Control

The ON pins control the state of the switch. Asserting ON high enables the switch. ON is active high and has a low threshold, making it capable of interfacing with low-voltage signals. The ON pin is compatible with standard GPIO logic threshold. It can be used with any microcontroller with 1.2 V or higher GPIO voltage. This pin cannot be left floating and must be tied either high or low for proper functionality.

9.3.2 Quick Output Discharge (QOD) (TPS22968-Q1 Only)

The TPS22968-Q1 includes a QOD feature. When the switch is disabled, a discharge resistor is connected between VOUT and GND. This resistor has a typical value of 270 Ω and prevents the output from floating while the switch is disabled.

9.3.3 Adjustable Rise Time

A capacitor to GND on the CT pins sets the slew rate for each channel. The capacitor to GND on the CT pins should be rated for 25 V and above. An approximate formula for the relationship between CT and slew rate with V_{BIAS} = 5 V is shown in Equation 1:

$$SR = 0.35 \times CT + 25$$

where

- SR = slew rate (in µs/V)
- CT = the capacitance value on the CT pin (in pF)
- The units for the constant 25 is in µs/V. (1)

Rise time can be calculated by multiplying the input voltage by the slew rate. Table 1 contains rise time values measured on a typical device.

Table 1. Rise Time Table

CTx (pF)	Rise Time (µs) [1] [2]					
	V_{IN} = 5 V	V_{IN} = 3.3 V	V_{IN} = 2.5 V	V_{IN} = 1.8 V	V_{IN} = 1.2 V	V_{IN} = 0.8 V
0	84	63	52	43	35	27
220	418	285	223	168	122	88

10 Application and Implementation

> **NOTE**
>
> Information in the following applications sections is not part of the TI component specification, and TI does not warrant its accuracy or completeness. TI's customers are responsible for determining suitability of components for their purposes. Customers should validate and test their design implementation to confirm system functionality.

10.1 Application Information

This section highlights some of the design considerations for implementing this device in various applications. A PSPICE model for this device is also available on the product page on www.ti.com for further aid. (See the *Device Support* section for more information)

10.1.1 Input Capacitor (Optional)

To limit the voltage drop on the input supply caused by transient inrush currents when the switch turns on into a discharged load capacitor, a capacitor must be placed between VIN and GND. A 1-μF ceramic capacitor, C_{IN}, placed close to the pins, is usually sufficient. Higher values of C_{IN} can be used to further reduce the voltage drop during high-current applications. When switching heavy loads, TI recommends to have an input capacitor about 10× higher than the output capacitor to avoid excessive voltage drop.

10.1.2 Output Capacitor (Optional)

Due to the integrated body diode in the NMOS switch, TI highly recommends a C_{IN} greater than C_L. A C_L greater than C_{IN} can cause the voltage on VOUT to exceed VIN when the system supply is removed. This could result in current flow through the body diode from VOUT to VIN. TI recommends a C_{IN} to C_L ratio of 10 to 1 for minimizing V_{IN} dip caused by inrush currents during startup.

10.1.3 V_{IN} and V_{BIAS} Voltage Range

For optimal R_{ON} performance, make sure $V_{IN} \leq V_{BIAS}$. The device is still functional if $V_{IN} > V_{BIAS}$, but it will exhibit R_{ON} greater than what is listed in the *Electrical Characteristics (V_{BIAS} = 5 V)* and *Electrical Characteristics (V_{BIAS} = 2.5 V)*. See Figure 35 for an example of a typical device. Notice the increasing R_{ON} as V_{IN} exceeds V_{BIAS} voltage. Be sure to never exceed the maximum voltage rating for V_{IN} and V_{BIAS}.
$T_A = 25°C$ $I_{OUT} = -200$ mA

Figure 35. R_{ON} vs V_{IN}

Product Folder Links: *TPS22968-Q1*

Application Information (continued)

10.1.3.1 Parallel Configuration

To increase the current capabilities and lower the R_{ON} by approximately 50%, both channels can be placed in parallel as shown in Figure 36 (parallel configuration). With this configuration, the CT1 and CT2 pins can be tied together to use one capacitor, CT, as shown in Figure 36. With a single CT capacitor, the rise time will be half of the typical rise-time value. Refer to the Table 1 for typical timing values.
Figure 36. Parallel Configuration Schematic

10.1.3.2 Standby Power Reduction

TPS22968x-Q1 can help to reduce the standby power consumption of a module. Some loads will consume a non-trivial amount of power when turned off. If the power to the load is removed by the load switch, the standby power consumption can be significantly reduced. Figure 37 below shows the Standby Power Reduction Schematic.
Figure 37. Standby Power Reduction Schematic

Product Folder Links: *TPS22968-Q1*

Application Information (continued)

10.1.3.3 Power Supply Sequencing Without a GPIO Input

In many end equipments, there is a need to power up various modules in a predetermined manner. TPS22968x-Q1 can solve the problem of power sequencing without adding any complexity to the overall system. See Figure 38.
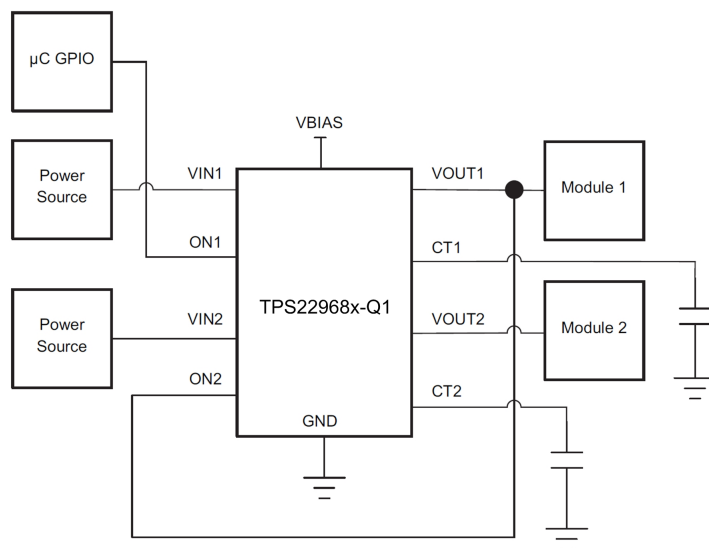

VIN1 must be greater V_{IH}.

Figure 38. Power Sequencing Without a GPIO Input Schematic

10.1.3.4 Reverse Current Blocking

In certain applications, it may be desirable to have reverse current blocking. Reverse current blocking prevents current from flowing from the output to the input of the load switch when the device is disabled. With the following configuration, the TPS22968x-Q1 can be converted into a single-channel switch with reverse current blocking. In this configuration, VIN1 or VIN2 can be used as the input and VIN2 or VIN1 is the output. See Figure 39.
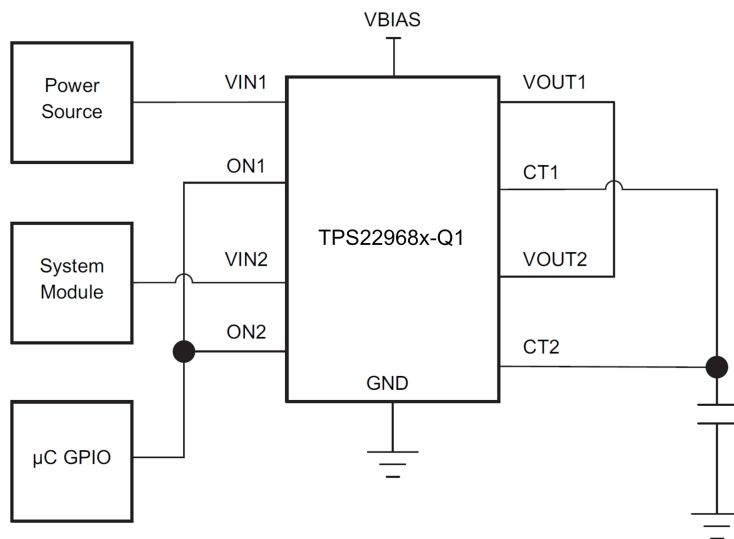

Figure 39. Reverse Current Blocking Schematic

10.2 Typical Application

This application demonstrates how the TPS22968x-Q1 can be used to power a downstream load with a large capacitance. The example in Figure 40 is powering a 22-µF capacitive output load.
Figure 40. Typical Application Schematic for Powering a Downstream Module

10.2.1 Design Requirements

For this design example, use the values listed in Table 3 as the input parameters.

Table 3. Design Parameters

DESIGN PARAMETER	EXAMPLE VALUE
V_{IN}	3.3 V
V_{BIAS}	5 V
Output capacitance (C_L)	22 µF
Allowable inrush current on VOUT	0.4 A

10.2.2 Detailed Design Procedure

To begin the design process, the designer must know the following:

- V_{IN} voltage
- V_{BIAS} voltage
- Output capacitance (C_L)
- Allowable inrush current on VOUT due to C_L capacitor

10.2.2.1 Inrush Current

To determine how much inrush current will be caused by the C_L capacitor, use Equation 2.

$$I_{INRUSH} = C_L \times \frac{dV_{OUT}}{dt}$$

where

- I_{INRUSH} = amount of inrush current caused by C_L
- C_L = capacitance on VOUT
- dt = V_{OUT} rise time
- dV_{OUT} = increase in V_{OUT} during the rise time   (2)

Inrush current is proportional to rise time. The rise time is adjustable by use of the CT capacitor. The appropriate rise time can be calculated using the design requirements and the inrush current equation (Equation 2).

400 mA = 22 µF × 3.3 V / dt   (3)

dt = 182 µs   (4)

To ensure an inrush current of less than 400 mA, choose a CT capacitor value that will yield a rise time of more than 182 µs. See the oscilloscope captures in the *Application Curves* for an example of how the CT capacitor can be used to reduce inrush current. See Table 1 for correlation between rise times and CT values.

An appropriate C_L value should be placed on VOUT such that the I_{MAX} and I_{PLS} specifications of the device are not violated.

10.2.3 Application Curves

The two scope captures in Figure 41 and Figure 42 show how the CT capacitor can be used to reduce inrush current.

Figure 41. Inrush Current Without CT Capacitor

Figure 42. Inrush Current With CT = 220 pF
11 Power Supply Recommendations

The device is designed to operate from a V_{BIAS} range of 2.5 V to 5.5 V and V_{IN} range of 0.8 V to 5.5 V. This supply must be well regulated and placed as close to the device pin as possible with the recommended 1-µF bypass capacitor. If the supply is located more than a few inches from the device pins, additional bulk capacitance may be required in addition to the ceramic bypass capacitors. If additional bulk capacitance is required, an electrolytic, tantalum, or ceramic capacitor of 10 µF may be sufficient.

12 Layout

12.1 Layout Guidelines

- VIN and VOUT traces should be as short and wide as possible to accommodate for high current.
- Use vias under the exposed thermal pad for thermal relief for high current operation.
- VINx pins should be bypassed to ground with low-ESR ceramic bypass capacitors. The typical recommended bypass capacitance is 1-µF ceramic with X5R or X7R dielectric. This capacitor should be placed as close to the device pins as possible.
- VOUTx pins should be bypassed to ground with low-ESR ceramic bypass capacitors. The typical recommended bypass capacitance is one-tenth of the VINx bypass capacitor of X5R or X7R dielectric rating. This capacitor should be placed as close to the device pins as possible.
- The VBIAS pin should be bypassed to ground with low-ESR ceramic bypass capacitors. The typical recommended bypass capacitance is 0.1-µF ceramic with X5R or X7R dielectric.
- The CTx capacitors should be placed as close to the device pins as possible. The typical recommended CTx capacitance is a capacitor of X5R or X7R dielectric rating with a rating of 25 V or higher.

Product Folder Links: *TPS22968-Q1*

12.2 Layout Example
Figure 43. Layout Schematic

12.3 Thermal Considerations

The maximum IC junction temperature should be restricted to 150°C under normal operating conditions. To calculate the maximum allowable dissipation, $P_{D(max)}$ for a given ambient temperature, use Equation 5.

$$P_{D(MAX)} = \frac{T_{J(MAX)} - T_A}{R_{\theta JA}}$$

where

- $P_{D(max)}$ = maximum allowable power dissipation
- $T_{J(max)}$ = maximum allowable junction temperature (150°C for the TPS22968x-Q1)
- T_A = ambient temperature of the device
- $R_{\theta JA}$ = junction to air thermal impedance. See *Thermal Information*. This parameter is highly dependent upon board layout. (5)

Following are two examples demonstrating how to use the above information: For V_{BIAS} = 5 V, V_{IN} = 5 V, the maximum allowable ambient temperature with a 3-A load through each channel can be determined by using the following calculations.

NOTE

When calculating power dissipation in the switch, it is important to use the correct R_{ON} value. R_{ON} is dependent on the junction temperature of the device.

$P_D = I^2 \times R \times 2$ (multiplied by 2 because there are two channels) (6)

$$2 \times I^2 \times R = \frac{T_{J(MAX)} - T_A}{R_{\theta JA}}$$

(7)

$T_A = T_{J(MAX)} - R_{\theta JA} \times 2 \times I^2 \times R$ (8)

$T_A = 150°C - 55.6°C/W \times 2 \times (3\ A)^2 \times 45\ m\Omega = 105°C$ (9)

For V_{BIAS} = 5 V, V_{IN} = 5 V, the maximum continuous current for an ambient temperature of 85°C with the same current flowing through each channel can be determined by using the following calculation:

$$2 \times I^2 \times R = \frac{T_{J(MAX)} - T_A}{R_{\theta JA}}$$

(10)

$$I = \sqrt{\frac{T_{J(MAX)} - T_A}{2 \times R \times R_{\theta JA}}}$$

(11)

$$I = \sqrt{\frac{150°C - 85°C}{2 \times 45\ m\Omega \times 55.6°C/W}} = 3.6\ A$$

(1) Status: For more details on status, see our product life cycle.

(2) Material type: When designated, preproduction parts are prototypes/experimental devices, and are not yet approved or released for full production. Testing and final process, including without limitation quality assurance, reliability performance testing, and/or process qualification, may not yet be complete, and this item is subject to further changes or possible discontinuation. If available for ordering, purchases will be subject to an additional waiver at checkout, and are intended for early internal evaluation purposes only. These items are sold without warranties of any kind.

(3) RoHS values: Yes, No, RoHS Exempt. See the TI RoHS Statement for additional information and value definition.

(4) Lead finish/Ball material: Parts may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead finish/Ball material values may wrap to two lines if the finish value exceeds the maximum column width.

(5) MSL rating/Peak reflow: The moisture sensitivity level ratings and peak solder (reflow) temperatures. In the event that a part has multiple moisture sensitivity ratings, only the lowest level per JEDEC standards is shown. Refer to the shipping label for the actual reflow temperature that will be used to mount the part to the printed circuit board.

(6) Part marking: There may be an additional marking, which relates to the logo, the lot trace code information, or the environmental category of the part.

Multiple part markings will be inside parentheses. Only one part marking contained in parentheses and separated by a "~" will appear on a part. If a line is indented then it is a continuation of the previous line and the two combined represent the entire part marking for that device.

design recommendations.

IMPORTANT NOTICE AND DISCLAIMER

TI PROVIDES TECHNICAL AND RELIABILITY DATA (INCLUDING DATA SHEETS), DESIGN RESOURCES (INCLUDING REFERENCE DESIGNS), APPLICATION OR OTHER DESIGN ADVICE, WEB TOOLS, SAFETY INFORMATION, AND OTHER RESOURCES "AS IS" AND WITH ALL FAULTS, AND DISCLAIMS ALL WARRANTIES, EXPRESS AND IMPLIED, INCLUDING WITHOUT LIMITATION ANY IMPLIED WARRANTIES OF MERCHANTABILITY, FITNESS FOR A PARTICULAR PURPOSE OR NON-INFRINGEMENT OF THIRD PARTY INTELLECTUAL PROPERTY RIGHTS.

These resources are intended for skilled developers designing with TI products. You are solely responsible for (1) selecting the appropriate TI products for your application, (2) designing, validating and testing your application, and (3) ensuring your application meets applicable standards, and any other safety, security, regulatory or other requirements.

These resources are subject to change without notice. TI grants you permission to use these resources only for development of an application that uses the TI products described in the resource. Other reproduction and display of these resources is prohibited. No license is granted to any other TI intellectual property right or to any third party intellectual property right. TI disclaims responsibility for, and you will fully indemnify TI and its representatives against, any claims, damages, costs, losses, and liabilities arising out of your use of these resources.

TI's products are provided subject to TI's Terms of Sale or other applicable terms available either on ti.com or provided in conjunction with such TI products. TI's provision of these resources does not expand or otherwise alter TI's applicable warranties or warranty disclaimers for TI products.

TI objects to and rejects any additional or different terms you may have proposed.
