

TPS6244x 2.75-V to 6-V, Dual-Channel Step-Down Converter with Adjustable Frequency and 1% Accuracy in QFN package

1 Features

- [Functional Safety-Capable](#)
 - [Documentation available to aid functional safety system design](#)
- 0.6-V to 5.5-V dual-channel, output voltage
- 1-A/1-A, 2-A/2-A, 3-A/1-A output currents
- 2.75-V to 6-V input voltage range
- 1% feedback voltage accuracy (PWM operation)
- $T_J = -40^{\circ}\text{C}$ to $+150^{\circ}\text{C}$
- Two precise ENABLE inputs allow:
 - User-defined undervoltage lockout
 - Exact sequencing
- Two power-good outputs with window comparator
- 1.8-MHz to 4-MHz adjustable switching frequency
- Optional synchronization to external clock
- Optional spread spectrum clocking
- Forced PWM or PWM/PFM operation
- Selectable compensation network up to 200 μF
- 22- μA quiescent current
- 180° phase shifted operation
- 100% duty cycle mode
- Active output discharge
- Thermal shutdown protection
- 2.3-mm \times 2.7-mm QFN package

2 Applications

- [Motor drives/drone controller](#)
- [Robotics HMI](#)
- [Test and measurement](#)
- [Machine vision](#)
- [String inverter](#)

Schematic

3 Description

The TPS6244x is a family of pin-to-pin dual 1-A, dual 2-A, and 3-A/1-A high-efficiency and easy-to-use synchronous step-down DC/DC converters. The device family is based on a peak current mode control topology. The devices are designed for industrial applications such as motor drives and robotics. Low resistive switches allow up to 3-A continuous output current and total maximum output current up to 4-A at high ambient temperature. The switching frequency is externally adjustable from 1.8 MHz to 4 MHz and can also be synchronized to an external clock in the same frequency range. In PWM/PFM mode, the TPS6244x automatically enters power save mode at light loads to maintain high efficiency across the whole load range. The TPS6244x provides a 1% output voltage accuracy in PWM mode, which helps design a power supply with high output voltage accuracy.

The TPS6244x is available as an adjustable voltage version, packaged in a VQFN package.

Package Information

PART NUMBER	PACKAGE ⁽¹⁾	BODY SIZE (NOM)
TPS62441	RQR (VQFN, 14)	2.30 mm \times 2.70 mm
TPS62442		

- (1) For all available packages, see the orderable addendum at the end of the data sheet.

Efficiency Versus Output Current; $V_{\text{OUT}} = 3.3\text{ V}$, PWM/PFM, $f_{\text{sw}} = 2.25\text{ MHz}$

5 Device Comparison Table

DEVICE NUMBER	FEATURES	OUTPUT VOLTAGE
TPS62441RQRR	2 × 1-A output current V _{OUT} discharge	adjustable
TPS62442RQRR	2 × 2-A or 3-A and 1-A output current V _{OUT} discharge	adjustable

6 Pin Configuration and Functions

Figure 6-1. 14-Pin QFN RQR Package Top View

Table 6-1. Pin Functions

PIN		I/O	DESCRIPTION
NAME	NO.		
EN1	8	I	This pin is the enable pin of converter 1. Connect to logic low to disable the device. Pull high to enable the device. Do not leave this pin unconnected.
EN2	10	I	This pin is the enable pin of converter 2. Connect to logic low to disable the device. Pull high to enable the device. Do not leave this pin unconnected.
FB1	3	I	Voltage feedback input for converter 1. Connect the resistive output voltage divider to this pin.
FB2	1	I	Voltage feedback input for converter 2. Connect the resistive output voltage divider to this pin.
PG1	4	O	Open-drain power-good output of converter 1
PG2	13	O	Open-drain power-good output of converter 2
SW1	6		This pin is the switch pin of converter 1 and is connected to the internal power MOSFETs.
SW2	12		This pin is the switch pin of converter 2 and is connected to the internal power MOSFETs.
MODE/SYNC	5	I	The device runs in PFM/PWM mode when this pin is pulled low. When the pin is pulled high, the device runs in forced PWM mode. Do not leave this pin unconnected. The mode pin can also be used to synchronize the device to an external frequency. See the electrical characteristics for the detailed specification for the digital signal applied to this pin for external synchronization.
COMP/FSET	14	I	Device compensation and frequency set input. A resistor from this pin to GND defines the compensation of the control loop as well as the switching frequency if not externally synchronized. Do not leave this pin floating.
VIN1	7	—	Power supply input. Make sure the input capacitor is connected as close as possible between pin VIN1 and GND. Connect VIN1 to VIN2.
VIN2	11	—	Power supply input. Make sure the input capacitor is connected as close as possible between pin VIN2 and GND. Connect VIN2 to VIN1.
GND	2, 9	—	Ground pins. The GND pins are internally connected.

7 Specifications

7.1 Absolute Maximum Ratings

over operating temperature range (unless otherwise noted)⁽¹⁾

		MIN	MAX	UNIT
Pin voltage ⁽²⁾	VIN1, VIN2	-0.3	6.5	V
	SW1, SW2 (DC)	-0.3	V _{IN} + 0.3	V
	SW1, SW2 (AC, less than 10ns) ⁽³⁾	-3	10	V
	FB1, FB2	-0.3	4	V
	PG1, PG2, COMP/FSET	-0.3	V _{IN} + 0.3	V
	EN1, EN2, MODE/SYNC	-0.3	6.5	V
T _{stg}	Storage temperature	-65	150	°C

- (1) Operation outside the *Absolute Maximum Ratings* may cause permanent device damage. *Absolute Maximum Ratings* do not imply functional operation of the device at these or any other conditions beyond those listed under *Recommended Operating Conditions*. If used outside the *Recommended Operating Conditions* but within the *Absolute Maximum Ratings*, the device may not be fully functional, and this may affect device reliability, functionality, performance, and shorten the device lifetime.
- (2) All voltage values are with respect to the network ground terminal
- (3) While switching

7.2 ESD Ratings

			VALUE	UNIT
V _(ESD)	Electrostatic discharge	Human body model (HBM), per ANSI/ESDA/JEDEC JS-001, all pins ⁽¹⁾	±2000	V
		Charged device model (CDM), per ANSI/ESDA/JEDEC JS-002, all pins ⁽²⁾	±750	

- (1) JEDEC document JEP155 states that 500-V HBM allows safe manufacturing with a standard ESD control process.
- (2) JEDEC document JEP157 states that 250-V CDM allows safe manufacturing with a standard ESD control process.

7.3 Recommended Operating Conditions

Over operating temperature range (unless otherwise noted)

		MIN	NOM	MAX	UNIT
V _{IN1} , V _{IN2}	Input voltage range	2.75		6	V
V _{OUT1} , V _{OUT2}	Output voltage range	0.6		5.5	V
L ₁ , L ₂	Effective inductance	0.32	0.47	0.9	μH
C _{OUT1} , C _{OUT2}	Effective output capacitance ⁽¹⁾	8	10	200	μF
C _{IN1} , C _{IN2}	Effective input capacitance on each pin ⁽¹⁾		10		μF
R _{CF}		4.5		100	kΩ
I _{SINK_PG}	Sink current at PG pin	0		2	mA
T _J	Junction temperature	-40		150	°C

- (1) The values given for all the capacitors in the table are effective capacitance, which includes the DC bias effect. Due to the DC bias effect of ceramic capacitors, the effective capacitance is lower than the nominal value when a voltage is applied. Please check the manufacturer's DC bias curves for the effective capacitance vs DC voltage applied. Further restrictions may apply. Please see the feature description for COMP/FSET about the output capacitance vs compensation setting and output voltage.

9 Detailed Description

9.1 Overview

The TPS6244x synchronous dual switch mode power converters are based on a peak current mode control topology. The control loop is internally compensated. To optimize the bandwidth of the control loop to the wide range of output capacitance that can be used with TPS6244x, the internal compensation has two settings. See [COMP/FSET](#). One of the two compensation settings is chosen either by a resistor from COMP/FSET to GND, or by the logic state of this pin. The regulation network achieves fast and stable operation with small external components and low-ESR ceramic output capacitors. The devices can be operated without a feedforward capacitor on the output voltage divider, however, using a typically 10-pF feed forward capacitor improves transient response.

The devices support forced fixed-frequency PWM operation with the MODE pin tied to a logic high level. The frequency is defined as either 2.25 MHz internally fixed when COMP/FSET is tied to GND or VIN or in a range of 1.8 MHz to 4 MHz defined by a resistor from COMP/FSET to GND. Alternatively, the devices can be synchronized to an external clock signal in a range from 1.8 MHz to 4 MHz, applied to the MODE pin with no need for additional passive components. External synchronization can only be used when there is a resistor from COMP/FSET to GND. When COMP/FSET is directly tied to GND or VIN, the TPS6244x cannot be synchronized externally. The TPS6244x allows for a change from internal clock to external clock during operation. When the MODE pin is set to a logic low level, the device operates in power save mode (PFM) at low output current and automatically transfers to fixed frequency PWM mode at higher output current. In PFM mode, the switching frequency decreases linearly based on the load to sustain high efficiency down to very low output current. When a converter switches from PFM to PWM operation, there can be a maximum delay of one clock cycle because in this case, the converter has to synchronize to the other converter to achieve 180 degrees phase shift.

9.2 Functional Block Diagram

9.3 Feature Description

9.3.1 Precise Enable (EN)

The voltage applied at EN1 and EN2 is compared to a fixed threshold of 1.1 V for a rising voltage. This comparison allows the user to drive the pin by a slowly changing voltage and enables the use of an external RC network to achieve a power-up delay.

The precise enable input provides a user-programmable undervoltage lockout by adding a resistor divider to the input of EN1 and EN2.

The enable input threshold for a falling edge is typically 100 mV lower than the rising edge threshold. The TPS6244x starts operation when the rising threshold is exceeded. For proper operation, the enable (EN) pin must be terminated and must not be left floating. Pulling the enable pin low forces the device into shutdown, with a shutdown current of typically 1.5 μ A. In this mode, the internal high-side and low-side MOSFETs are turned off and the entire internal control circuitry is switched off.

The enable delay time is defined from EN1 or EN2 going high to when the converter starts switching. The converter is enabled first, the internal bandgap is started, and bias currents and configuration bits are read, so its start-up delay time is longer than for the converter being enabled when this is already done.

9.3.2 COMP/FSET

This pin allows to set three different parameters:

- Internal compensation settings for the control loop (two settings available)
- The switching frequency in PWM mode from 1.8 MHz to 4 MHz
- Enable/ disable spread spectrum clocking (SSC)

A resistor from COMP/FSET to GND changes the compensation as well as the switching frequency. The change in compensation allows the user to adopt the device to different values of output capacitance. The resistor must be placed close to the pin to keep the parasitic capacitance on the pin to a minimum. The compensation setting is sampled at start-up of the converter, so a change in the resistor during operation only has an effect on the switching frequency but not on the compensation.

To save external components, the pin can also be directly tied to VIN or GND to set a pre-defined setting. Do not leave the pin floating.

The switching frequency has to be selected based on the input voltage and the output voltage to meet the specifications for the minimum on time and minimum off time.

Example:

$$V_{IN} = 5.5V; V_{OUT} = 1 \Rightarrow \text{Duty Cycle} = \frac{1V}{5.5V} = 0.2$$

$$t_{on,min} = \frac{1}{f_s} \times 0.2$$

$$f_{sw,max} = \frac{1}{t_{on,min}} \times 0.2 = \frac{1}{0.075\mu s} \times 0.2 = 2.67MHz$$

The compensation range has to be chosen based on the minimum capacitance used. The capacitance can be increased from the minimum value as given in [Table 9-1](#), up to the maximum of 200- μ F effective capacitance in both compensation ranges. If the capacitance of an output changes during operation, for example, when load switches are used to connect or disconnect parts of the circuitry, the compensation has to be chosen for the minimum capacitance on the output. With large output capacitance, the compensation must be done based on that large capacitance to get the best load transient response. Compensating for large output capacitance but placing less capacitance on the output can lead to instability.

The switching frequency for the different compensation setting is determined by the following equations.

For compensation (comp) setting 1 with spread spectrum clocking (SSC) disabled:

$$R_{CF}(k\Omega) = \frac{18 MHz \times k\Omega}{f_s(MHz)} - 0.18k \quad (1)$$

For compensation (comp) setting 1 with spread spectrum clocking (SSC) enabled:

$$R_{CF}(k\Omega) = \frac{60 MHz \times k\Omega}{f_s(MHz)} - 0.6k \quad (2)$$

For compensation (comp) setting 2 with spread spectrum clocking (SSC) disabled:

$$R_{CF}(k\Omega) = \frac{180 MHz \times k\Omega}{f_s(MHz)} - 1.8k \quad (3)$$

Table 9-1. Switching Frequency, Compensation, and Spread Spectrum Clocking

R_{CF}	COMPENSATION	SWITCHING FREQUENCY	MINIMUM OUTPUT CAPACITANCE FOR $V_{OUT} < 1\text{ V}$	MINIMUM OUTPUT CAPACITANCE FOR $1\text{ V} \leq V_{OUT} < 3.3\text{ V}$	MINIMUM OUTPUT CAPACITANCE FOR $V_{OUT} \geq 3.3\text{ V}$
10 k Ω .. 4.5 k Ω	for smallest output capacitance (comp setting 1) SSC disabled	1.8 MHz (10 k Ω) .. 4 MHz (4.5 k Ω) according to Equation 1	11 μF	7 μF	5 μF
33 k Ω .. 18 k Ω	for smallest output capacitance (comp setting 1) SSC enabled	1.8 MHz (33 k Ω) .. 4 MHz (18 k Ω) according to Equation 2	11 μF	7 μF	5 μF
100 k Ω .. 45 k Ω	for best transient response (larger output capacitance) (comp setting 2) SSC disabled	1.8 MHz (100 k Ω) .. 4 MHz (45 k Ω) according to Equation 3	30 μF	18 μF	15 μF
tied to GND	for smallest output capacitance (comp setting 1) SSC disabled	internally fixed 2.25 MHz	11 μF	7 μF	5 μF
tied to V_{IN}	for best transient response (larger output capacitance) (comp setting 2) SSC enabled	internally fixed 2.25 MHz	30 μF	18 μF	15 μF

Refer to [Section 10.1.2.2.2](#) for further details on the output capacitance required depending on the output voltage.

A too-high resistor value for R_{CF} is decoded as "tied to V_{IN} ", a value below the lowest range as "tied to GND". The minimum output capacitance in [Table 9-1](#) is for capacitors close to the output of the device. If the capacitance is distributed, a lower compensation setting can be required.

9.3.3 MODE/SYNC

When MODE/SYNC is set low, the device operates in PWM or PFM mode, depending on the output current. The MODE/SYNC pin allows the user to force PWM mode when set high. The pin also allows the user to apply an external clock in a frequency range from 1.8 MHz to 4 MHz for external synchronization. Similar to COMP/FSET, the specifications for the minimum on time and minimum off time have to be observed when setting the external frequency. For use with external synchronization on the MODE/SYNC pin, the internal switching frequency must be set by R_{CF} to a similar value of the externally applied clock. This makes sure that, if the external clock fails, the switching frequency stays in the same range and the compensation settings are still valid. When there is no resistor from COMP/FSET to GND but the pin is pulled high or low, external synchronization is not possible. If the device is externally synchronized, both converters are forced to run on that clock frequency preserving 180° phase relation. The internally generated spread spectrum clocking is turned off while running on an external clock.

9.3.4 Undervoltage Lockout (UVLO)

If the input voltage drops, the undervoltage lockout prevents mis-operation of the device by switching off both the power FETs. The device is fully operational for voltages above the rising UVLO threshold and turns off if the input voltage trips below the threshold for a falling supply voltage.

9.3.5 Power-Good Output (PG)

Power good is an open-drain output driven by a window comparator. PG is held low when the device is:

- Disabled
- In undervoltage lockout
- In thermal shutdown
- Not in soft start

When the output voltage is in regulation hence, within the window defined in the electrical characteristics, the output is high impedance.

Table 9-2. PG Status

EN	DEVICE STATUS	PG STATE
X	$V_{IN} < 2\text{ V}$	undefined
low	$V_{IN} \geq 2\text{ V}$	low
high	$2\text{ V} \leq V_{IN} \leq \text{UVLO}$ OR in thermal shutdown OR V_{OUT} not in regulation OR device in soft start	low
high	V_{OUT} in regulation	high impedance

9.3.6 Thermal Shutdown

The junction temperature (T_J) of the device is monitored by an internal temperature sensor. If T_J exceeds 170°C (typical), the device goes into thermal shutdown. Both the high-side and low-side power FETs of both converters are turned off and PG goes low. When T_J decreases below the hysteresis amount of typically 20°C, the converters resume normal operation, beginning with soft start. When both converters are in a PFM pause, the thermal shutdown is not active. After the PFM pause, the device needs up to 9 μs to detect a too high junction temperature. If the PFM burst is shorter than this delay, the device does not detect a too high junction temperature. As long as one converter is in PWM, thermal shutdown is always active.

9.4 Device Functional Modes

9.4.1 Pulse Width Modulation (PWM) Operation

The TPS6244x has two operating modes. Forced PWM mode is discussed in this section and PWM/PFM as discussed in [Section 9.4.2](#).

With the MODE/SYNC pin set to high, the TPS6244x operates with pulse width modulation in continuous conduction mode (CCM). The switching frequency is either defined by a resistor from the COMP pin to GND or by an external clock signal applied to the MODE/SYNC pin. With an external clock applied to MODE/SYNC, the TPS6244x follows the frequency applied to the pin. The frequency must be in a range the device can operate at, taking the minimum on time into account.

9.4.2 Power Save Mode Operation (PWM/PFM)

When the MODE/SYNC pin is low, power save mode is allowed. The device operates in PWM mode as long as the peak inductor current is above the PFM threshold of approximately 0.8 A. When the peak inductor current drops below the PFM threshold, the device starts to skip switching pulses. In power save mode, the switching frequency decreases with the load current maintaining high efficiency.

9.4.3 100% Duty-Cycle Operation

The duty cycle of a buck converter operated in PWM mode is given as $D = V_{OUT} / V_{IN}$. The duty cycle increases as the input voltage comes close to the output voltage and the off time gets smaller. When the minimum off time of typically 30 ns is reached, the TPS6244x skips switching cycles while it approaches 100% mode. In 100% mode, the device keeps the high-side switch on continuously. The high-side switch stays turned on as long as the output voltage is below the target. In 100% mode, the low side switch is turned off. The maximum dropout voltage in 100% mode is the product of the on-resistance of the high-side switch plus the series resistance of the inductor and the load current.

9.4.4 Current Limit and Short-Circuit Protection

The TPS6244x is protected against overload and short circuit events. The converter is not switching with the fixed frequency when in current limit. The converter resumes the fixed frequency operation when the converter leaves current limit condition. If the inductor current exceeds the current limit, I_{LIMH} , the high-side switch is turned off and the low-side switch is turned on to ramp down the inductor current. The high-side switch turns on again only if the current in the low-side switch has decreased below the low-side current limit. This can cause bursts or single pulses between the high-side and low-side current limit. Due to internal propagation delay, the actual current can exceed the static current limit. The dynamic current limit is given as:

$$I_{peak(typ)} = I_{LIMH} + \frac{V_L}{L} \times t_{PD} \quad (4)$$

where

- I_{LIMH} is the static current limit as specified in the electrical characteristics.
- L is the effective inductance at the peak current.
- V_L is the voltage across the inductor ($V_{IN} - V_{OUT}$).
- t_{PD} is the internal propagation delay of typically 50 ns.

The current limit can exceed static values, especially if the input voltage is high and very small inductances are used. The dynamic high-side switch peak current can be calculated as follows:

$$I_{peak(typ)} = I_{LIMH} + \frac{V_{IN} - V_{OUT}}{L} \times 50ns \quad (5)$$

9.4.5 Output Discharge

The purpose of the discharge function is to ensure a defined down-ramp of the output voltage when the device is being disabled but also to keep the output voltage close to 0 V when the device is off. The output discharge feature is only active after the TPS6244x has been enabled at least once since the supply voltage was applied. The discharge function is enabled as soon as the device is disabled, in thermal shutdown, or in undervoltage lockout. The minimum supply voltage required for the discharge function to remain active typically is 2 V. Output discharge is not activated during a current limit or foldback current limit event.

9.4.6 Soft Start

The internal soft-start circuitry controls the output voltage slope during start-up. This action avoids excessive inrush current and ensures a controlled output voltage rise time. This action also prevents unwanted voltage drops from high impedance power sources or batteries. When EN1 and EN2 are set high, the device starts switching after t_{Delay} . The output voltage is ramped with a slope defined by t_{Ramp} .

10 Application and Implementation

Note

Information in the following applications sections is not part of the TI component specification, and TI does not warrant its accuracy or completeness. TI's customers are responsible for determining suitability of components for their purposes, as well as validating and testing their design implementation to confirm system functionality.

10.1 Application Information

10.1.1 Programming the Output Voltage

The output voltage of the TPS6244x is adjustable. The output voltage can be programmed for output voltages from 0.6 V to 5.5 V, using a resistor divider from V_{OUT} to GND. The voltage at the FB pin is regulated to 600 mV. The value of the output voltage is set by the selection of the resistor divider from Equation 6. TI recommends to choose resistor values, which allows a current of at least 6 μA, meaning the value of R₂ must not exceed 100 kΩ. TI recommends lower resistor values for highest accuracy and most robust design.

$$R_1 = R_2 \times \left(\frac{V_{OUT}}{V_{FB}} - 1 \right) \quad (6)$$

10.1.2 External Component Selection

10.1.2.1 Inductor Selection

The TPS6244x is designed for a nominal 0.47-μH inductor with a switching frequency of typically 2.25 MHz. Larger values can be used to achieve a lower inductor current ripple but they can have a negative impact on efficiency and transient response. Smaller values than 0.47 μH cause a larger inductor current ripple, which causes larger negative inductor current in forced PWM mode at low or no output current. For a higher or lower nominal switching frequency, the inductance must be changed accordingly.

The inductor selection is affected by several effects like the following:

- Inductor ripple current
- Output ripple voltage
- PWM-to-PFM transition point
- Efficiency

In addition, the inductor selected has to be rated for appropriate saturation current and DC resistance (DCR). The following equation calculates the maximum inductor current.

$$I_{L(max)} = I_{OUT(max)} + \frac{\Delta I_{L(max)}}{2} \quad (7)$$

$$\Delta I_{L(max)} = \frac{V_{OUT} \times \left(1 - \frac{V_{OUT}}{V_{IN}} \right)}{L_{min}} \times \frac{1}{f_{sw}} \quad (8)$$

where

- I_{L(max)} is the maximum inductor current.
- ΔI_{L(max)} is the peak-to-peak inductor ripple current.
- L_{min} is the minimum inductance at the operating point.

Table 10-1. Typical Inductors

TYPE	INDUCTANCE [μH]	CURRENT [A] ⁽¹⁾	FOR DEVICE	NOMINAL SWITCHING FREQUENCY	DIMENSIONS [L × B × H] mm	MANUFACTURER ⁽²⁾
DFE201210U-R47M	0.47 μH, ±20%	see data sheet	TPS62442	2.25 MHz	2.0 × 1.2 × 1.0	Murata
DFE201210U-R68M	0.68 μH, ±20%	see data sheet	TPS62441	2.25 MHz	2.0 × 1.2 × 1.0	Murata

Table 10-1. Typical Inductors (continued)

TYPE	INDUCTANCE [μH]	CURRENT [A] ⁽¹⁾	FOR DEVICE	NOMINAL SWITCHING FREQUENCY	DIMENSIONS [L × B × H] mm	MANUFACTURER ⁽²⁾
DFE201610E-R47M#	0.47 μH , $\pm 20\%$	see data sheet	TPS62442	2.25 MHz	2.0 × 1.6 × 1.0	Murata
XEL3515-561ME	0.56 μH , $\pm 20\%$	4.5	TPS62442	2.25 MHz	3.5 × 3.2 × 1.5	Coilcraft
XFL4015-701ME	0.70 μH , $\pm 20\%$	5.3	TPS62442	2.25 MHz	4.0 × 4.0 × 1.6	Coilcraft
XFL4015-471ME	0.47 μH , $\pm 20\%$	5.4	TPS62442	2.25 MHz	4.0 × 4.0 × 1.6	Coilcraft
TFM201610ALM-R47MTAA	0.47 μH , $\pm 20\%$	5.8	TPS62442	2.25 MHz	2.0 × 1.6 × 1.0	TDK

(1) Lower of I_{RMS} at 20°C rise or I_{SAT} at 20% drop.

(2) See the [Third-Party Products Disclaimer](#).

Calculating the maximum inductor current using the actual operating conditions gives the minimum saturation current of the inductor needed. TI recommends to add a margin of about 20%. A larger inductor value is also useful to get lower ripple current, but increases the transient response time and size as well.

10.1.2.2 Capacitor Selection

10.1.2.2.1 Input Capacitor

For most applications, 10- μF nominal is sufficient and recommended. The input capacitor buffers the input voltage for transient events and also decouples the converter from the supply. A low-ESR multilayer ceramic capacitor (MLCC) is recommended for best filtering and must be placed between VIN and GND as close as possible to those pins.

10.1.2.2.2 Output Capacitor

The architecture of the TPS6244x allows the use of tiny ceramic output capacitors with low-equivalent series resistance (ESR). These capacitors provide low output voltage ripple and are recommended. To keep its low resistance up to high frequencies and to get narrow capacitance variation with temperature, use X7R or X5R dielectric. Using a higher value has advantages like smaller voltage ripple and a tighter DC output accuracy in power save mode. By changing the device compensation with a resistor from COMP/FSET to GND, the device can be compensated in three steps based on the minimum capacitance used on the output. The maximum capacitance is 200 μF in any of the compensation settings.

10.2 Typical Application

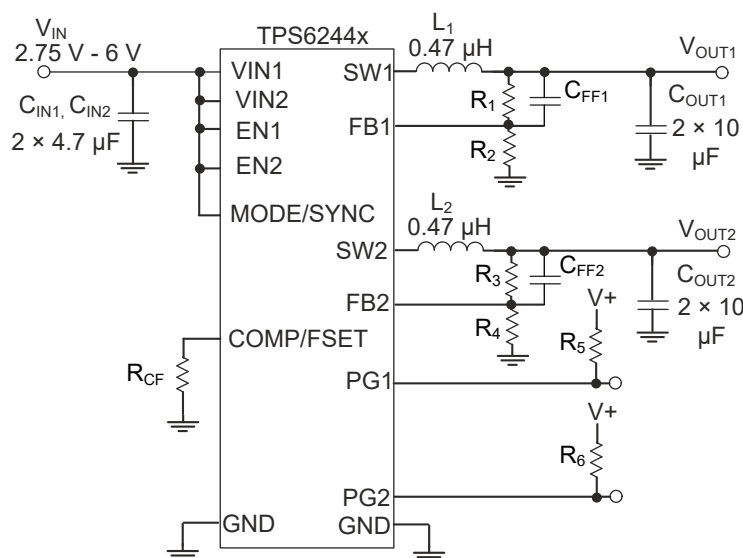

Figure 10-1. Typical Application Schematic

10.2.1 Design Requirements

The design guidelines provide a component selection to operate the device within the recommended operating conditions.

10.2.2 Detailed Design Procedure

$$R_1 = R_2 \times \left(\frac{V_{OUT}}{V_{FB}} - 1 \right) \quad (9)$$

With $V_{FB} = 0.6 \text{ V}$:

Table 10-2. Setting the Output Voltage

NOMINAL OUTPUT VOLTAGE V_{OUT}	R_1, R_3	R_2, R_4	C_{FF1}, C_{FF2}	EXACT OUTPUT VOLTAGE
0.8 V	16.9 k Ω	51 k Ω	10 pF	0.7988 V
1.0 V	20 k Ω	30 k Ω	10 pF	1.0 V
1.1 V	39.2 k Ω	47 k Ω	10 pF	1.101 V
1.2 V	68 k Ω	68 k Ω	10 pF	1.2 V
1.5 V	76.8 k Ω	51 k Ω	10 pF	1.5 V
1.8 V	80.6 k Ω	40.2 k Ω	10 pF	1.803 V
2.5 V	47.5 k Ω	15 k Ω	10 pF	2.5 V
3.3 V	88.7 k Ω	19.6 k Ω	10 pF	3.315 V

10.2.3 Application Curves

All plots have been taken with a nominal switching frequency of 2.25 MHz when set to PWM mode, unless otherwise noted. The BOM is according to [Table 8-1](#).

10.3 Power Supply Recommendations

The TPS6244x device family has no special requirements for its input power supply. The output current of the input power supply must be rated according to the supply voltage, output voltage, and output current of the TPS6244x.

10.4 Layout

10.4.1 Layout Guidelines

A proper layout is critical for the operation of a switched mode power supply, even more at high switching frequencies. Therefore, the PCB layout of the TPS6244x demands careful attention to ensure operation and to get the performance specified. A poor layout can lead to issues like the following:

- Poor regulation (both line and load)
- Stability and accuracy weaknesses
- Increased EMI radiation
- Noise sensitivity

See [Figure 10-51](#) for the recommended layout of the TPS6244x, which is designed for common external ground connections. The input capacitor must be placed as close as possible between the VIN and GND pin.

Provide low inductive and resistive paths for loops with high di/dt . Therefore, paths conducting the switched load current must be as short and wide as possible. Provide low capacitive paths (with respect to all other nodes) for wires with high dv/dt . Therefore, the input and output capacitance must be placed as close as possible to the IC pins and parallel wiring over long distances as well as narrow traces must be avoided. Loops which conduct an alternating current must outline an area as small as possible, as this area is proportional to the energy radiated.

Sensitive nodes like FB must be connected with short wires and not nearby high dv/dt signals (for example SW). As they carry information about the output voltage, they must be connected as close as possible to the actual output voltage (at the output capacitor). The FB resistors, R_1 , R_2 as well as R_3 , R_4 must be kept close to the IC and connect directly to those pins and the system ground plane.

The package uses the pins for power dissipation. Thermal vias on the VIN, GND, and SW pins help to spread the heat into the PCB.

The recommended layout is implemented on the EVM and shown in the [TPS62442EVM-122 User's Guide](#).

10.4.2 Layout Example

Click on *Subscribe to updates* to register and receive a weekly digest of any product information that has changed. For change details, review the revision history included in any revised document.

11.4 Support Resources

[TI E2E™ support forums](#) are an engineer's go-to source for fast, verified answers and design help — straight from the experts. Search existing answers or ask your own question to get the quick design help you need.

Linked content is provided "AS IS" by the respective contributors. They do not constitute TI specifications and do not necessarily reflect TI's views; see TI's [Terms of Use](#).

11.5 Trademarks

TI E2E™ is a trademark of Texas Instruments.

All trademarks are the property of their respective owners.

11.6 Electrostatic Discharge Caution

This integrated circuit can be damaged by ESD. Texas Instruments recommends that all integrated circuits be handled with appropriate precautions. Failure to observe proper handling and installation procedures can cause damage.

ESD damage can range from subtle performance degradation to complete device failure. Precision integrated circuits may be more susceptible to damage because very small parametric changes could cause the device not to meet its published specifications.

11.7 Glossary

[TI Glossary](#) This glossary lists and explains terms, acronyms, and definitions.

12 Mechanical, Packaging, and Orderable Information

The following pages include mechanical, packaging, and orderable information. This information is the most current data available for the designated devices. This data is subject to change without notice and revision of this document. For browser-based versions of this data sheet, refer to the left-hand navigation.

PACKAGING INFORMATION

Orderable part number	Status (1)	Material type (2)	Package Pins	Package qty Carrier	RoHS (3)	Lead finish/ Ball material (4)	MSL rating/ Peak reflow (5)	Op temp (°C)	Part marking (6)
TPS62441RQRR	Active	Production	VQFN-HR (RQR) 14	3000 LARGE T&R	Yes	SN	Level-2-260C-1 YEAR	-40 to 150	62441

TPS62442RQRR.A	Active	Production	VQFN-HR (RQR) 14	3000 LARGE T&R	Yes	SN	Level-2-260C-1 YEAR	-40 to 150	441

(1) **Status:** For more details on status, see our [product life cycle](#).

(2) **Material type:** When designated, preproduction parts are prototypes/experimental devices, and are not yet approved or released for full production. Testing and final process, including without limitation quality assurance, reliability performance testing, and/or process qualification, may not yet be complete, and this item is subject to further changes or possible discontinuation. If available for ordering, purchases will be subject to an additional waiver at checkout, and are intended for early internal evaluation purposes only. These items are sold without warranties of any kind.

(3) **RoHS values:** Yes, No, RoHS Exempt. See the [TI RoHS Statement](#) for additional information and value definition.

(4) **Lead finish/Ball material:** Parts may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead finish/Ball material values may wrap to two lines if the finish value exceeds the maximum column width.

(5) **MSL rating/Peak reflow:** The moisture sensitivity level ratings and peak solder (reflow) temperatures. In the event that a part has multiple moisture sensitivity ratings, only the lowest level per JEDEC standards is shown. Refer to the shipping label for the actual reflow temperature that will be used to mount the part to the printed circuit board.

(6) **Part marking:** There may be an additional marking, which relates to the logo, the lot trace code information, or the environmental category of the part.

Multiple part markings will be inside parentheses. Only one part marking contained in parentheses and separated by a "~" will appear on a part. If a line is indented then it is a continuation of the previous line and the two combined represent the entire part marking for that device.

NOTES: (continued)

- 3. For more information, see Texas Instruments literature number SLUA271 (www.ti.com/lit/sluea271).
- 4. Solder mask tolerances between and around signal pads can vary based on board fabrication site.

EXAMPLE STENCIL DESIGN

RQR0014B

VQFN-HR - 1 mm max height

PLASTIC QUAD FLATPACK- NO LEAD

SOLDER PASTE EXAMPLE
BASED ON 0.1 mm THICK STENCIL
SCALE: 18X

4229193/A 11/2022

NOTES: (continued)

5. Laser cutting apertures with trapezoidal walls and rounded corners may offer better paste release. IPC-7525 may have alternate design recommendations.

IMPORTANT NOTICE AND DISCLAIMER

TI PROVIDES TECHNICAL AND RELIABILITY DATA (INCLUDING DATA SHEETS), DESIGN RESOURCES (INCLUDING REFERENCE DESIGNS), APPLICATION OR OTHER DESIGN ADVICE, WEB TOOLS, SAFETY INFORMATION, AND OTHER RESOURCES "AS IS" AND WITH ALL FAULTS, AND DISCLAIMS ALL WARRANTIES, EXPRESS AND IMPLIED, INCLUDING WITHOUT LIMITATION ANY IMPLIED WARRANTIES OF MERCHANTABILITY, FITNESS FOR A PARTICULAR PURPOSE OR NON-INFRINGEMENT OF THIRD PARTY INTELLECTUAL PROPERTY RIGHTS.

These resources are intended for skilled developers designing with TI products. You are solely responsible for (1) selecting the appropriate TI products for your application, (2) designing, validating and testing your application, and (3) ensuring your application meets applicable standards, and any other safety, security, regulatory or other requirements.

These resources are subject to change without notice. TI grants you permission to use these resources only for development of an application that uses the TI products described in the resource. Other reproduction and display of these resources is prohibited. No license is granted to any other TI intellectual property right or to any third party intellectual property right. TI disclaims responsibility for, and you will fully indemnify TI and its representatives against, any claims, damages, costs, losses, and liabilities arising out of your use of these resources.

TI's products are provided subject to [TI's Terms of Sale](#) or other applicable terms available either on [ti.com](https://www.ti.com) or provided in conjunction with such TI products. TI's provision of these resources does not expand or otherwise alter TI's applicable warranties or warranty disclaimers for TI products.

TI objects to and rejects any additional or different terms you may have proposed.
