

200mA Dual Output AMOLED Display Power

Check for Samples: [TPS65137](#)

FEATURES

- 2.3 V to 5.5 V Input Voltage Range
- 1% Output Voltage Accuracy V_{POS}
- Excellent Line Transient Regulation
- Low Noise Operation
- 200 mA Output Current
- Fixed 4.63 V Positive Output Voltage
- Digitally Programmable Negative Output Voltage Down to $-5.23V$
- $-4.93V$ Default Value for V_{NEG}
- Advanced Power Save Mode
- Short Circuit Protection
- Thermal Shutdown
- TPS65137A High impedance output in shutdown
- 3x3 mm 10 Pin QFN Package

DESCRIPTION

The TPS65137 is designed to provide best in class picture quality for AMOLED displays (Active Matrix Organic Light Emitting Diode) requiring positive and negative voltage supply rails. With its wide input voltage range the device is ideally suited for AMOLED displays, which are used in mobile phones and smart phones. With this device the input voltage can be higher than the positive output voltage and still maintains accurate regulation of V_{POS} . Using the digital control pin (CTRL) allows adjusting the negative output voltage in digital steps. The TPS65137 uses a novel technology enabling excellent line and load regulation with minimum output voltage ripple by using a LDO post regulator for V_{POS} . This is required avoiding disturbance of the AMOLED display due to input voltage transients occurring during transmit periods in mobile phones.

APPLICATIONS

- Active Matrix OLED Power Supply

TYPICAL APPLICATION

Please be aware that an important notice concerning availability, standard warranty, and use in critical applications of Texas Instruments semiconductor products and disclaimers thereto appears at the end of this data sheet.

This integrated circuit can be damaged by ESD. Texas Instruments recommends that all integrated circuits be handled with appropriate precautions. Failure to observe proper handling and installation procedures can cause damage.

ESD damage can range from subtle performance degradation to complete device failure. Precision integrated circuits may be more susceptible to damage because very small parametric changes could cause the device not to meet its published specifications.

ORDERING INFORMATION⁽¹⁾ ⁽²⁾

FUNCTIONAL BLOCK DIAGRAM

DETAILED DESCRIPTION

The TPS65137 consists of a boost converter using a LDO as post regulator. The output voltage of the boost converter is regulated to operate the internal LDO above its dropout voltage maintaining best line and load regulation of OUP. The internal LDO disconnects OUP during shutdown and allows regulation of the output when the input voltage is higher than OUP. The LDO minimizes the output voltage ripple of OUP. The negative output uses a buck boost converter topology operating in DCM (Discontinuous Conduction Mode) providing superior line regulation. In order to adjust the output voltage of the negative converter a digital interface can be used to program the output voltage. To achieve high efficiency over the entire load current range the device reduces the switching frequency with the load current using its internal voltage controlled oscillator (VCO). Since the boost converter output CB is post regulated by the integrated LDO (Low Dropout Regulator) the output voltage ripple is minimized and the line transient response is at its best. Because of this topology the operation mode of the boost converter has minimum effect on the output voltage ripple observed on OUP. The boost converter, as well as the negative converter operate in peak current mode using the VCO (Voltage Controlled Oscillator) while operating in DCM (Discontinuous Conduction Mode). When entering CCM (Continuous Conduction Mode) the converter operates in peak current control using fixed off time control.

POWER SAVE MODE OPERATION

In order to maintain high efficiency over the entire load current range the converter reduces its switching frequency as the load current decreases. To maintain a controlled switching frequency a voltage controlled oscillator (VCO) is used.

SOFT START AND SHORT CIRCUIT PROTECTION

The device has a soft-start implemented limiting inrush current during turn on. The device is also protected against short circuits of the outputs to ground or when the outputs shorted together. This is implemented with two output voltage thresholds determining the device switch current limit and LDO operation shown in Figure 14.

Figure 14. Soft Start and Short Circuit Thresholds

When the device is enabled pulling CTRL pin high then the boost converter and buck converter starts with reduced switch current limit. During this period of time the LDO is turned off. As V_{NEG} reaches -0.4 V then the LDO is turned on having a 100 mA current limit. The switch current limit of both outputs is increased to 220 mA and 120 mA . When V_{POS} reaches 3 V and V_{NEG} reaches -1 V , then both outputs operate with full current limit. This architecture limits the inrush current during start-up and protects the device during short circuits events. When the positive output is shorted to the negative output then the device cycles between the first and second section of the start-up sequence. By that, the output current cycles between zero and 100 mA . This protects the device and avoids excessive power dissipation during short circuit conditions. With this architecture the device is able to start-into full load current once V_{POS} exceeds 3 V and V_{NEG} is lower than -1 V .

ENABLE (CTRL pin)

The CTRL pin serves two functions. One is the enable and disable of the device, the other is the output voltage programming of the device. If the digital interface is not required the CTRL pin can be used as a standard enable pin for the device. Pulling CTRL high starts the converter operating with its default output voltage on OUTN of -4.93V .

DIGITAL INTERFACE (CTRL)

The digital interface allows programming the negative output voltage OUTN in digital steps. If the digital output voltage setting is not required then the CTRL pin can also be used as a standard enable pin. In such a case the device will come up with its default output voltage of OUTN of -4.93V .

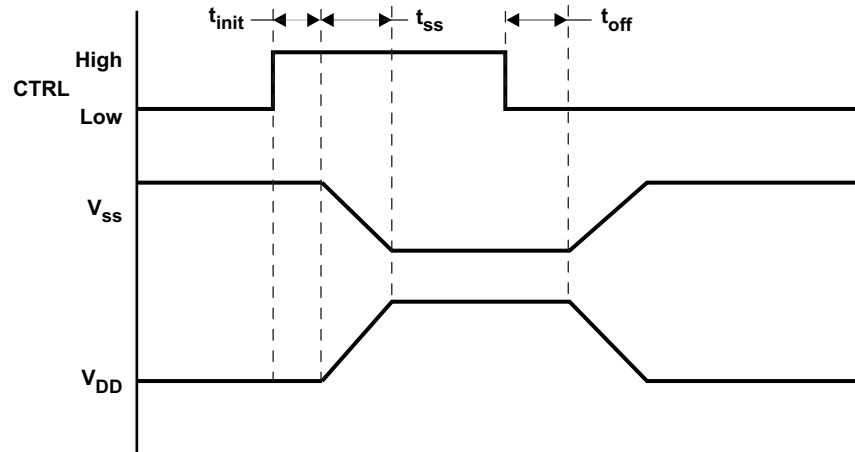

Figure 15. CTRL Used as a Standard Device Enable

The digital output voltage programming of OUTN is implemented by a simple digital interface with the timing shown in [Figure 16](#).

Figure 16. Digital Interface Using CTRL

Once CTRL is pulled high the device will come up with its default voltage of -4.93V . The TPS65137 has a 5 bit DAC implemented with the correspondent output voltage as given in [Table 1](#). The interface counts the rising edges applied to CTRL pin once the device is enable. For example with the timing diagram shown in [Figure 16](#), OUTN is programmed to -4.93V since 4 rising edges are applied. Other output voltages are programmed according to [Table 1](#).

Table 1. Programming Table for OUTN

BIT/RISING EDGES	OUTN (V _{ss})	DAC VALUE	BIT/RISING EDGES	OUTN(V _{ss})	DAC VALUE
Default	–4.93 V	00000	16	–3.7 V	10000
1	–5.23 V	00001	17	–3.62 V	10001
2	–5.13 V	00010	18	–3.52 V	10010

14	–3.93 V	01110	30	–2.31 V	11110
15	–3.82 V	01111	31	–2.21 V	11111

V_{neg} Programming Transition Time t_{set} for OUTN (C_T)

The TPS65137 allows setting the transition time t_{set} using an external capacitor connected to pin CT. The transition time is the time period required to move OUTN from one voltage level to the next programmed voltage level. When the CT pin is left open then the shortest possible transition time is programmed. When connecting a capacitor to the CT pin then the transition time is given by the R-C time constant. This is given by the output impedance of the CT pin of typically 250kΩ and the external capacitance. Within one τ the output voltage OUTN has reached 70% of its programmed value. An example is given when using 100nF for C_T.

$$\tau \approx t_{\text{set}70\%} = 250 \text{ k}\Omega \times C_T = 250 \text{ k}\Omega \times 100 \text{ nF} = 25 \text{ mS}$$

INPUT CAPACITOR SELECTION

The device typically requires a 4.7μF ceramic input capacitor. Larger values can be used to lower the input voltage ripple.

Table 2. Input Capacitor Selection

CAPACITOR	COMPONENT SUPPLIER	SIZE
4.7 μF/10 V	Taiyo Yuden LMK107BJ475	0603
10 μF/10 V	Taiyo Yuden LMK212BJ106	0805
10 μF/6.3 V	Taiyo Yuden JMK107BJ106	0603

BOOST CONVERTER DESIGN CONSIDERATION, V_{pos}

The positive output consists of a boost converter using a LDO as post regulator. The maximum output current is limited by the minimum current limit of the LDO, of 200mA. The component values and output current are calculated at maximum load current in continuous conduction operation. The typical switching frequency during this operation mode is 1.4MHz.

The boost converter duty cycle is:

$$D = 1 - \frac{V_{\text{IN}} \times \eta}{V_{\text{POS}}} \quad (1)$$

To calculate the duty cycle, a good estimation for the efficiency, η, is 75% or it can be taken out of the typical curve in **Figure 1**. In order to calculate the maximum output current of the boost converter for a certain input voltage, the following formula is used:

$$I_{out} = (1 - D) \left(I_{sw} - \frac{V_{IN} \times D}{2 \times f_s \times L} \right) \quad (2)$$

The maximum output current is given at the highest switching frequency of typically 1.4MHz and minimum switch current limit of 0.9A. Equation 3 is used to calculate the switch peak current.

$$I_{swpeak} = \frac{V_{IN} \times D}{2 \times f_s \times L} + \frac{I_{out}}{1 - D} \quad (3)$$

The inductor needs to be rated for this switch peak current to avoid inductor saturation.

The boost converter output capacitor is connected to pin CB and a 4.7μF capacitor is sufficient. A 2.2μF capacitor is used on the output V_{POS}, which is the output of the internal low dropout regulator (LDO).

Table 3. Output Capacitor Selection

CAPACITOR	COMPONENT SUPPLIER	SIZE
4.7 μF/10 V	Taiyo Yuden LMK107BJ475	0603
2.2 μF/10 V	Taiyo Yuden LMK107BJ225	0603

NEGATIVE BUCK BOOST CONVERTER DESIGN CONSIDERATION, V_{neg}

The negative output is generated with a buck boost converter. The component values and output current are calculated at maximum load current in continuous conduction operation. The typical switching frequency during this operation mode is 1.4MHz.

The buck boost converter duty cycle is:

$$D = \frac{|V_{NEG}|}{V_{IN} \times \eta + |V_{NEG}|} \quad (4)$$

To calculate the duty cycle a good estimation for the efficiency, η, is 75% or it can be taken out of the typical curve in Figure 1. In order to calculate the maximum output current of the buck boost converter for a certain input voltage, the following formula is used:

$$I_{out} = (1 - D) \left(I_{sw} - \frac{V_{IN} \times D}{2 \times f_s \times L} \right) \quad (5)$$

The maximum output current is given at the highest switching frequency of typically 1.4MHz and minimum switch current limit of 1.1A. Equation 6 is used to calculate the switch peak current.

$$I_{swpeak} = \frac{V_{IN} \times D}{2 \times f_s \times L} + \frac{I_{out}}{1 - D} \quad (6)$$

The inductor needs to be rated for this switch peak current to avoid inductor saturation. Refer to Table 4 for possible inductors for this application. A 4.7μF output capacitor is used on the output V_{NEG}. Larger capacitor values can be used to minimize the output voltage ripple. Refer to Table 3 for output capacitor selection.

INDUCTOR SELECTION

The device is optimized to operate with 4.7uH inductors. Different inductor values will change the converter efficiency and output voltage ripple. A 2.2uH inductor is also a possible solution. Any other inductor values will degrade device performance and stability which is not recommended for this device.

Table 4. Inductor Selection

INDUCTOR VALUE	COMPONENT SUPPLIER	DIMENSIONS in mm	Isat/DCR
4.7 μH	TDK VLF4012	3.7 × 3.5 × 1.2	1.1A/140mΩ

APPLICATION INFORMATION

PCB LAYOUT

The layout for this device is important to keep the output voltage ripple and output voltage accuracy as low and accurate as possible. The following layout guidelines apply for this device:

- Keep the switch node pad for the boost converter and inverter switch as small as possible to avoid coupling into the output.
- The ground connection for the inductor of the negative converter needs to be as wide as possible to avoid noise generated by inductor ground currents.
- The ground connection of the timing capacitor on pin CT needs to be isolated and directly routed to the GND pin of the device. This is important to avoid noise being coupled into the error amplifier which is internally connected to the CT pin.
- Having the ground connection of the boost converter output capacitor and LDO output capacitor in a close connection to the device ground and power pad connection achieves best load regulation.

REVISION HISTORY

Changes from Original (May 2010) to Revision A	Page
• Changed Features 6, 7 and 8 from 4.6V to 4.63V, -5.2V to -5.23V and -4.9V to -4.93V	1
• Changed TYPICAL APPLICATION V_{POS} from 4.6V/200mA to 4.63V/200mA	1
• Changed ELECTRICAL CHARACTERISTICS conditions from OUTP=4.6V to OUTP=4.63V and OUTN= -4.9V to -4.93V	4
• Changed ELECTRICAL CHARACTERISTICS OUTPUT OUTP V_{POS} , TYP column from 4.6 to 4.63	4
• Changed V_{POS} from 4.6V to 4.63V and V_{NEG} from -4.9V -4.93V in graphs	6
• Changed Figure 9 waveform	7
• Changed Figure 10 waveform	7
• Changed -4.9V. to -4.93V in Digital Interface (CTRL) section	11
• Changed values in Table 1	12

PACKAGING INFORMATION

Orderable part number	Status (1)	Material type (2)	Package Pins	Package qty Carrier	RoHS (3)	Lead finish/ Ball material (4)	MSL rating/ Peak reflow (5)	Op temp (°C)	Part marking (6)
TPS65137ADSCR	Active	Production	WSON (DSC) 10	3000 LARGE T&R	Yes	NIPDAU NIPDAU	Level-2-260C-1 YEAR	-40 to 85	PTTI
TPS65137ADSCR.B	Active	Production	WSON (DSC) 10	3000 LARGE T&R	Yes	NIPDAU	Level-2-260C-1 YEAR	-40 to 85	PTTI

⁽¹⁾ **Status:** For more details on status, see our [product life cycle](#).

⁽²⁾ **Material type:** When designated, preproduction parts are prototypes/experimental devices, and are not yet approved or released for full production. Testing and final process, including without limitation quality assurance, reliability performance testing, and/or process qualification, may not yet be complete, and this item is subject to further changes or possible discontinuation. If available for ordering, purchases will be subject to an additional waiver at checkout, and are intended for early internal evaluation purposes only. These items are sold without warranties of any kind.

⁽³⁾ **RoHS values:** Yes, No, RoHS Exempt. See the [TI RoHS Statement](#) for additional information and value definition.

⁽⁴⁾ **Lead finish/Ball material:** Parts may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead finish/Ball material values may wrap to two lines if the finish value exceeds the maximum column width.

⁽⁵⁾ **MSL rating/Peak reflow:** The moisture sensitivity level ratings and peak solder (reflow) temperatures. In the event that a part has multiple moisture sensitivity ratings, only the lowest level per JEDEC standards is shown. Refer to the shipping label for the actual reflow temperature that will be used to mount the part to the printed circuit board.

⁽⁶⁾ **Part marking:** There may be an additional marking, which relates to the logo, the lot trace code information, or the environmental category of the part.

Multiple part markings will be inside parentheses. Only one part marking contained in parentheses and separated by a "~" will appear on a part. If a line is indented then it is a continuation of the previous line and the two combined represent the entire part marking for that device.

NOTES: (continued)

6. Laser cutting apertures with trapezoidal walls and rounded corners may offer better paste release. IPC-7525 may have alternate design recommendations.

IMPORTANT NOTICE AND DISCLAIMER

TI PROVIDES TECHNICAL AND RELIABILITY DATA (INCLUDING DATA SHEETS), DESIGN RESOURCES (INCLUDING REFERENCE DESIGNS), APPLICATION OR OTHER DESIGN ADVICE, WEB TOOLS, SAFETY INFORMATION, AND OTHER RESOURCES "AS IS" AND WITH ALL FAULTS, AND DISCLAIMS ALL WARRANTIES, EXPRESS AND IMPLIED, INCLUDING WITHOUT LIMITATION ANY IMPLIED WARRANTIES OF MERCHANTABILITY, FITNESS FOR A PARTICULAR PURPOSE OR NON-INFRINGEMENT OF THIRD PARTY INTELLECTUAL PROPERTY RIGHTS.

These resources are intended for skilled developers designing with TI products. You are solely responsible for (1) selecting the appropriate TI products for your application, (2) designing, validating and testing your application, and (3) ensuring your application meets applicable standards, and any other safety, security, regulatory or other requirements.

These resources are subject to change without notice. TI grants you permission to use these resources only for development of an application that uses the TI products described in the resource. Other reproduction and display of these resources is prohibited. No license is granted to any other TI intellectual property right or to any third party intellectual property right. TI disclaims responsibility for, and you will fully indemnify TI and its representatives against, any claims, damages, costs, losses, and liabilities arising out of your use of these resources.

TI's products are provided subject to [TI's Terms of Sale](#) or other applicable terms available either on [ti.com](#) or provided in conjunction with such TI products. TI's provision of these resources does not expand or otherwise alter TI's applicable warranties or warranty disclaimers for TI products.

TI objects to and rejects any additional or different terms you may have proposed.
