

## UCCx808-x Low Power Current Mode Push-Pull PWM

## 1 Features

- Dual output drive stages in push-pull configuration
- 130 $\mu$ A typical starting current
- 1mA typical run current
- Operation to 1MHz
- Internal soft-start
- On-chip error amplifier with 2MHz gain bandwidth product
- On-chip VDD clamping
- Output drive stages capable of 500mA peak source current, 1A peak sink current

## 2 Applications

- Server and desktop power supplies
- Telecom power supplies
- DC-DC converters
- Switched-mode power supplies

### 3 Description

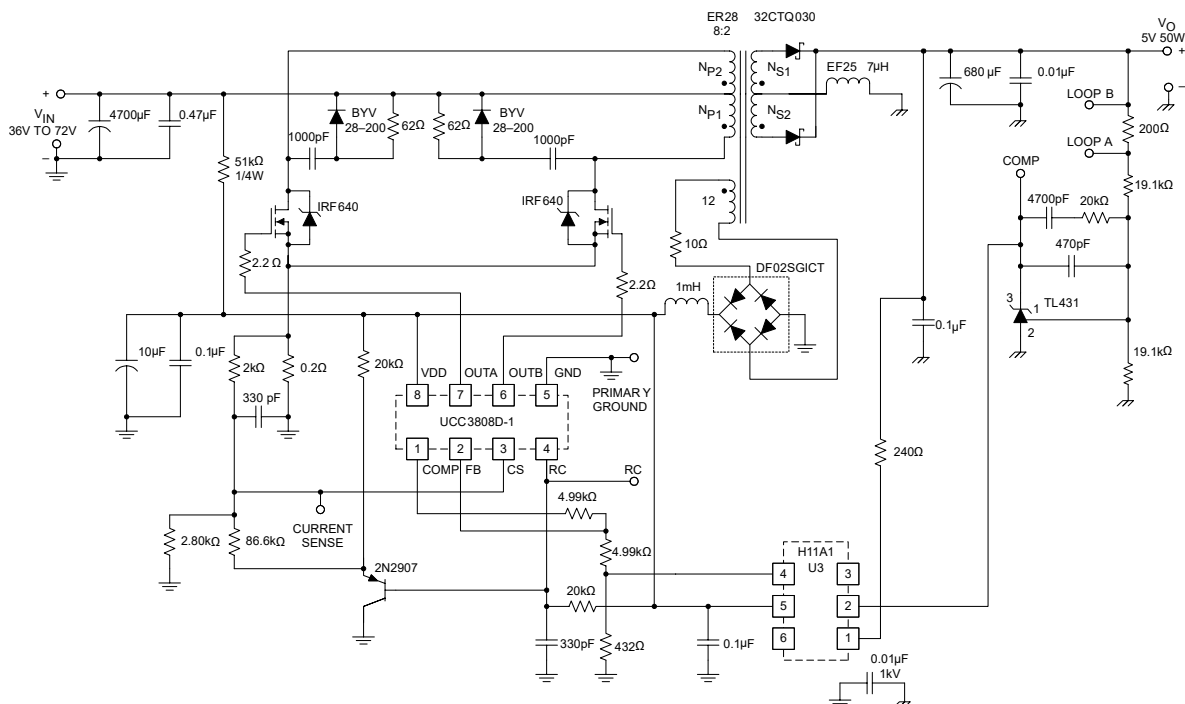

The UCCx808-x is a family of BiCMOS push-pull pulse-width modulators that are high-speed and low-power. The UCCx808 contains all of the control and drive circuitry required for offline or DC-to-DC fixed frequency current-mode switching power supplies with a minimal external parts count.

The UCCx808-x dual output drive stages are arranged in a push-pull configuration. Both outputs switch at half the oscillator frequency using a toggle flip-flop. The dead time between the two outputs is typically 60ns to 200ns, depending on the values of the timing capacitor and resistors, thus limiting each output stage duty cycle to less than 50%.

## Package Information

| PART NUMBER | PACKAGE <sup>(1)</sup> | PACKAGE SIZE <sup>(2)</sup> |
|-------------|------------------------|-----------------------------|
| UCC2808-1   | D (SOIC, 8)            | 4.90mm × 6.00mm             |
| UCC2808-2   |                        |                             |
| UCC3808-1   |                        |                             |
| UCC3808-2   |                        |                             |

- (1) For more information, see [Section 10](#).
- (2) The package size (length × width) is a nominal value and includes pins, where applicable.

### Simplified Schematic

## 4 Pin Configuration and Functions

**Figure 4-1. D Package, 8-Pin SOIC (Top View)**

**Table 4-1. Pin Functions**

| PIN  |     | Type <sup>(1)</sup> | DESCRIPTION  |
|------|-----|---------------------|--|
| NAME | NO. |                     |  |
| COMP | 1   | I/O                 | Output of the error amplifier and the input of the PWM comparator. |
| CS   | 3   | I                   | Input to the PWM, peak current, and overcurrent comparators.       |
| FB   | 2   | I                   | Inverting input to the error amplifier.                            |
| GND  | 5   | —                   | Reference ground and power ground for all functions.               |
| OUTA | 7   | O                   | Alternating high current output stage.                             |
| OUTB | 6   | O                   | Alternating high current output stage.                             |
| RC   | 4   | I                   | Oscillator programming pin.  |
| VDD  | 8   | —                   | Power input connection for this device.                            |

(1) I=Input; O=Output; I/O= Input or Output

## 5 Specifications

### 5.1 Absolute Maximum Ratings

over operating free-air temperature range (unless otherwise noted)<sup>(1)</sup>

|  | MIN  | MAX | UNIT |
|--|------|-----|------|
| Supply voltage ( $I_{DD} \leq 10\text{mA}$ )           |      | 15  | V    |
| Supply current   |      | 20  | mA   |
| OUTA/OUTB source current (peak) <sup>(2)</sup>         | –0.5 |     | A    |
| OUTA/OUTB sink current (peak) <sup>(2)</sup>           |      | 1   | A    |
| Analog inputs (FB, CS) – 0.3V to VDD + 0.3V            |      | 6   | V    |
| Power dissipation at T <sub>A</sub> = 25°C (D Package) |      | 650 | mW   |
| T <sub>J</sub> Junction temperature                    | –55  | 150 | °C   |
| Lead temperature (soldering, 10 seconds)               |      | 300 | °C   |
| T <sub>stg</sub> Storage temperature                   | –65  | 150 | °C   |

- (1) Operation outside the *Absolute Maximum Ratings* may cause permanent device damage. *Absolute Maximum Ratings* do not imply functional operation of the device at these or any other conditions beyond those listed under *Recommended Operating Conditions*. If used outside the *Recommended Operating Conditions* but within the *Absolute Maximum Ratings*, the device may not be fully functional, and this may affect device reliability, functionality, performance, and shorten the device lifetime.
- (2) Currents are positive into, negative out of the specified terminal. Consult the Packaging Section of the [Power Supply Control Data Book](#) for thermal limitations and considerations of packages.

### 5.2 ESD Ratings

|  | VALUE  | UNIT  |
|--|--|-------|
| V <sub>(ESD)</sub> Electrostatic discharge | Human body model (HBM), per ANSI/ESDA/JEDEC JS-001 <sup>(1)</sup>              | ±2500 |
|  | Charged-device model (CDM), per JEDEC specification JESD22-C101 <sup>(2)</sup> | ±1500 |

(1) JEDEC document JEP155 states that 500V HBM allows safe manufacturing with a standard ESD control process.

(2) JEDEC document JEP157 states that 250V CDM allows safe manufacturing with a standard ESD control process.

### 5.3 Recommended Operating Conditions

over operating free-air temperature range (unless otherwise noted)

|                                     | MIN       | MAX | UNIT |
|-------------------------------------|-----------|-----|------|
| V <sub>DD</sub> Supply Voltage      | UCCx808-1 | 13  | 14   |
|                                     | UCCx808-2 | 5   | 14   |
| T <sub>J</sub> Junction Temperature | UCC2808-x | –40 | 85   |
|                                     | UCC3808-x | 0   | 70   |

### 5.4 Thermal Information

| THERMAL METRIC <sup>(1)</sup> |  | UCCx808  | UNIT |
|-------------------------------|--|----------|------|
|                               |  | D (SOIC) |      |
|                               |  | 8 PINS   |      |
| R <sub>θJA</sub>              | Junction-to-ambient thermal resistance       | 118.7    | °C/W |
| R <sub>θJC(top)</sub>         | Junction-to-case (top) thermal resistance    | 66       | °C/W |
| R <sub>θJB</sub>              | Junction-to-board thermal resistance         | 63.5     | °C/W |
| Ψ <sub>JT</sub>               | Junction-to-top characterization parameter   | 14.7     | °C/W |
| Ψ <sub>JB</sub>               | Junction-to-board characterization parameter | 62.5     | °C/W |
| R <sub>θJC(bot)</sub>         | Junction-to-case (bottom) thermal resistance | —        | °C/W |

- (1) For more information about traditional and new thermal metrics, see the [Semiconductor and IC Package Thermal Metrics application note](#).

## 5.5 Electrical Characteristics

$T_A = 0^\circ\text{C}$  to  $70^\circ\text{C}$  for the UCC3808-x,  $-40^\circ\text{C}$  to  $85^\circ\text{C}$  for the UCC2808-x and  $-55^\circ\text{C}$  to  $125^\circ\text{C}$  for the UCC1808-x,  $V_{DD} = 10\text{V}^{(1)}$ ,  $1\mu\text{F}$  capacitor from  $V_{DD}$  to  $\text{GND}$ ,  $R = 22\text{k}\Omega$ ,  $C = 330\text{pF}$ ,  $T_A = T_J$ , (unless otherwise specified)

| VDD zener shunt voltage                 | IDD = 10mA <sup>(6)</sup>           | 13    | 14   | 15   | V    |

(1) Does not include current in the external oscillator network.

(2) Measured at RC. Signal amplitude tracks  $V_{DD}$ .

(3) Gain is defined by: [Equation 1](#)

(4) Parameter measured at trip point of latch with FB at 0V.

(5) For UCCx808 – 1, set  $V_{DD}$  above the start threshold before setting at 10V

(6) Start threshold and Zener shunt threshold track one another.

$$A = \frac{\Delta V_{COMP}}{\Delta V_{CS}}, 0 \leq V_{CS} \leq 0.4V \quad (1)$$

## 6 Detailed Description

### 6.1 Overview

The UCCx808-x device is a highly-integrated push-pull PWM controller that is low power and has a current mode. The controller employs low starting current and an internal control algorithm that offers accurate static output voltage regulation against line and load. The UCCx808-x family offers a variety of package temperature range options, and choice of undervoltage lockout levels. The family has UVLO thresholds and hysteresis options for offline and battery-powered system.

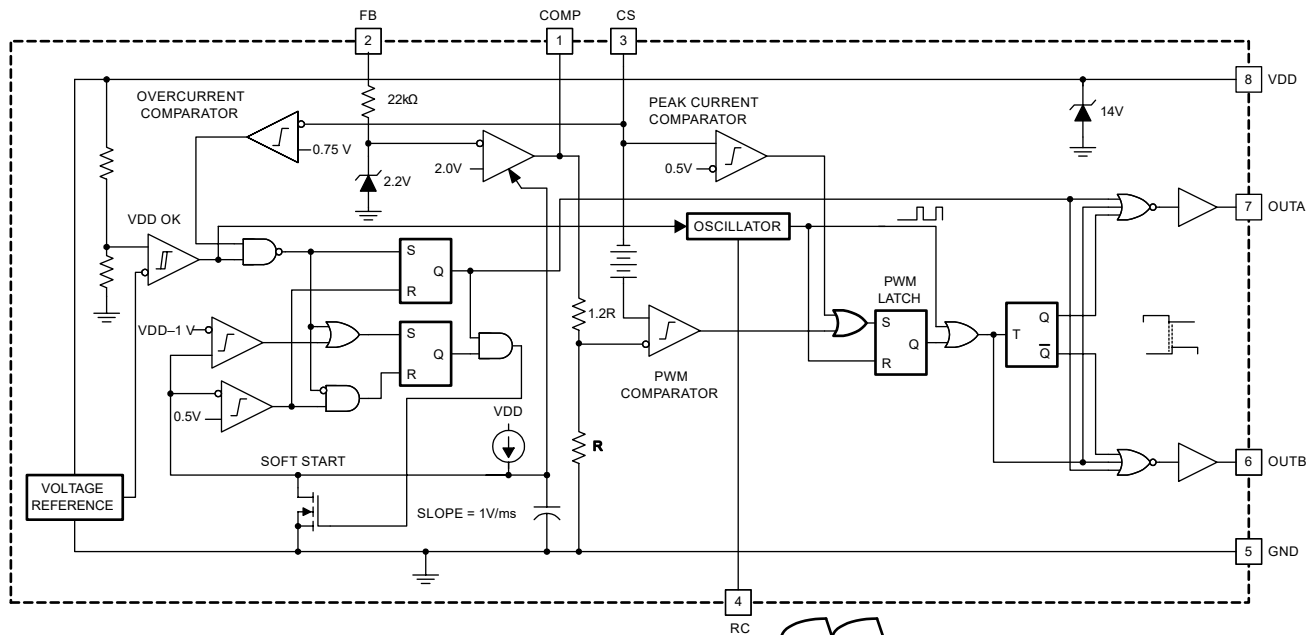

**Table 6-1. Undervoltage Lockout Levels**

| PART NUMBER | TURN ON THRESHOLD | TURN OFF THRESHOLD |
|-------------|-------------------|--------------------|
| UCCx808-1   | 12.5V             | 8.3V               |
| UCCx808-2   | 4.3V              | 4.1V               |

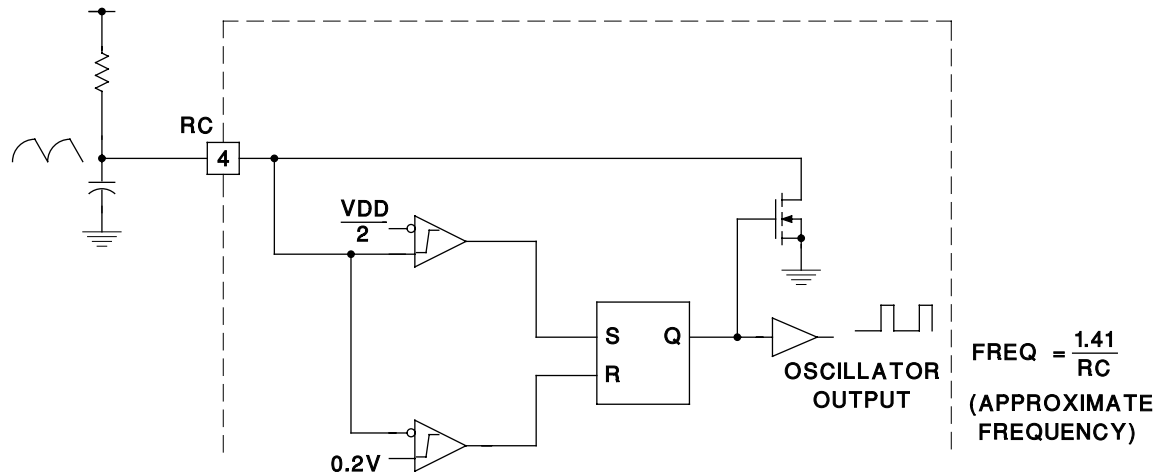

**Table 6-2. Undervoltage Lockout Options**

| $T_A = T_J$   | PACKAGED DEVICES |            |
|---------------|------------------|------------|
|               | UVLO OPTION      | SOIC (D)   |
| -40°C to 85°C | 12.5V / 8.3V     | UCC2808D-1 |
|               | 4.3V / 4.1V      | UCC2808D-2 |
| 0°C to 70°C   | 12.5V / 8.3V     | UCC3808D-1 |
|               | 4.3V / 4.1V      | UCC3808D-2 |

### 6.2 Functional Block Diagram

**Figure 6-1. Functional Block Diagram**

The oscillator generates a sawtooth waveform on RC. During the RC rise time, the output stages alternate on time, but both stages are off during the RC fall time. The output stages switch at ½ the oscillator frequency, with duty cycle of <50% for both outputs.

**Figure 6-2. Block Diagram for Oscillator**

## 6.3 Feature Description

### 6.3.1 Pin Descriptions

**COMP:** COMP is the output of the error amplifier and the input of the PWM comparator. The error amplifier in the UCC3808 is a true low-output impedance, 2MHz operational amplifier. As such, the COMP pin sources and sinks current. However, the error amplifier is internally current limited, so that zero duty cycle can be externally forced by pulling COMP to GND.

The UCC3808 family features built-in full cycle soft-start. Soft-start is implemented as a clamp on the maximum COMP voltage.

**CS:** The input to the PWM, peak current, and overcurrent comparators. The overcurrent comparator is only intended for fault sensing. Exceeding the overcurrent threshold causes a soft-start cycle.

**FB:** The inverting input to the error amplifier. For best stability, keep FB lead length as short as possible and FB stray capacitance as small as possible.

**GND:** Reference ground and power ground for all functions. Due to high currents, and high frequency operation of the UCC3808, a low-impedance printed-circuit-board ground plane is highly recommended.

**OUTA and OUTB:** Alternating high current output stages. Both stages are capable of driving the gate of a power MOSFET. Each stage is capable of 500mA peak source current, and 1A peak sink current.

The output stages switch at half the oscillator frequency, in a push-pull configuration. When the voltage on the RC pin is rising, one of the two outputs is high, but during fall time, both outputs are off. This dead time between the two outputs, along with a slower output rise time than fall time, insures that the two outputs can not be on at the same time. Dead time is typically 60ns to 200ns and depends upon the values of the timing capacitor and resistor.

The high-current output drivers consist of MOSFET output devices, which switch from VDD to GND. Each output stage also provides a very low impedance to overshoot and undershoot. In many cases, external Schottky clamp diodes are not required.

**RC:** The oscillator programming pin. The oscillator of the UCC3808-x tracks VDD and GND internally, so that variations in power supply rails minimally affect frequency stability. [Figure 6-2](#) shows the oscillator block diagram.

Only two components are required to program the oscillator: a resistor (tied to the VDD and RC), and a capacitor (tied to the RC and GND). The approximate oscillator frequency is determined by the simple formula:

$$f_{\text{OSCILLATOR}} = \frac{1.41}{RC} \quad (2)$$

where

- Frequency is in hertz (Hz)
- Resistance is in  $\Omega$
- Capacitance is in farads (F)

The recommended range of timing resistors is between 10k $\Omega$  and 200k $\Omega$  and range of timing capacitors is between 100pF and 1000pF. Avoid timing resistors less than 10k $\Omega$ .

For best performance, keep the timing capacitor lead to GND, timing resistor lead from VDD, and leads between timing components and RC as short as possible. Separate ground and VDD traces to the external timing network are encouraged.

**VDD:** The power input connection for this device. Although quiescent VDD current is very low, total supply current is higher, depending on OUTA and OUTB current, and the programmed oscillator frequency. Total VDD current is the sum of quiescent VDD current and the average OUT current. Knowing the operating frequency and the MOSFET gate charge ( $Q_g$ ), average OUT current can be calculated from:

$$f_{\text{OSCILLATOR}} = \frac{1.41}{RC} \quad (3)$$

where

- F is frequency

To prevent noise problems, bypass VDD to GND with a ceramic capacitor as close to the chip as possible along with an electrolytic capacitor.

A 1 $\mu$ F decoupling capacitor is recommended.

## 6.4 Device Functional Modes

### 6.4.1 VCC

When VCC becomes above 12.5V (for UCCx808-1) or 4.3V (for UCCx808-2), the device is enable, and after all fault conditions are cleared, the gate driver starts with soft-start. When VCC drops below 8.3V (for UCCx808-1) or 4.1V (for UCCx808-2), the device enters the UVLO protection mode and both gate drivers are actively pulled low.

## 7 Application and Implementation

### Note

Information in the following applications sections is not part of the TI component specification, and TI does not warrant its accuracy or completeness. TI's customers are responsible for determining suitability of components for their purposes, as well as validating and testing their design implementation to confirm system functionality.

### 7.1 Application Information

The UCCx808-x PWM controller contains all of the features needed to implement push-pull topology, using current-mode control in a small 8-pin package. The UCCx808-x is designed for current-mode control push-pull topology. UCCx808-x employs advantages of current-mode control, peak current sense, overcurrent protection.

### 7.2 Typical Application

A 200kHz push-pull application circuit with a full wave rectifier is shown in [Figure 7-1](#).

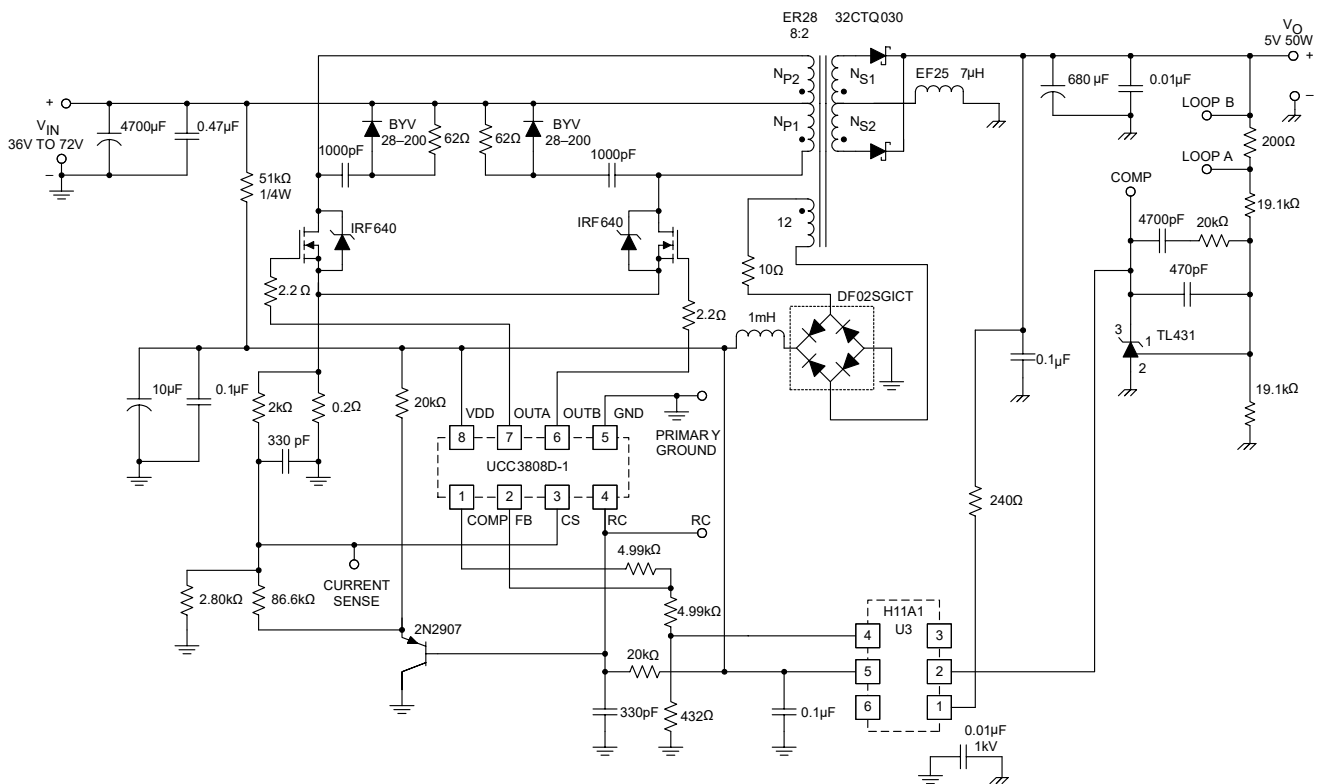

Figure 7-1. Typical Application Diagram: 48V In, 5V, 50W Output

#### 7.2.1 Design Requirements

[Table 7-1](#) lists the design parameters of the UCC3808-x.

Table 7-1. Design Parameters

| DESIGN PARAMETER       | TARGET VALUE |
|------------------------|--------------|
| Output voltage         | 5V           |
| Rated output power     | 50W          |
| Input DC voltage range | 36V to 72V   |
| Switching frequency    | 210kHz       |

## 7.2.2 Detailed Design Procedure

The output, VO, provides 5V at 75W maximum and is electrically isolated from the input. Because the UCC3808 is a peak current mode controller, the 2N2222A emitter following amplifier (buffers the CT waveform) provides slope compensation which is necessary for duty ratios greater than 50%. Capacitor decoupling is very important with a single ground IC controller, and a 1 $\mu$ F is suggested for placement as close to the IC as possible. The controller supply is a series RC for start-up, paralleled with a bias winding on the output inductor used in steady-state operation.

Isolation is provided by an optocoupler with regulation done on the secondary side using the UC3965 Precision Reference with Low Offset Error Amplifier. Small signal compensation with tight voltage regulation is achieved using the UC3965 device part on the secondary side. Many choices exist for the output inductor depending on cost, volume, and mechanical strength. Several design options are iron powder, molypermalloy (MPP), or a ferrite core with an air gap as shown in [Figure 7-1](#). The main power transformer is a low profile design, EFD size 25, using Magnetics® Inc. P material which is a good choice at the frequency and temperature in [Design Parameters](#). The input voltage ranges from 36V DC to 72V DC.

## 7.2.3 Application Curves

**Figure 7-2. Error Amplifier Gain and Phase Response vs Frequency**

**Figure 7-3. Dead Time vs Timing Resistor**

## 7.3 Power Supply Recommendations

The VDD power terminal for the device requires the placement of electrolytic capacitor as energy storage capacitor, because UCCx808-x is a controller with a 1A driver capability. The UCCx808-x device requires the placement of low-ESR noise-decoupling capacitance as directly as possible from the VDD terminal to the GND terminal, ceramic capacitors with stable dielectric characteristics over temperature are recommended, such as X7R or better. The recommended electrolytic capacitor is a 10 $\mu$ F or 25V capacitor.

The recommended decoupling capacitors are a 0.1 $\mu$ F 0603-sized 25V X7R capacitor.

## 7.4 Layout

### 7.4.1 Layout Guidelines

- Place the VDD capacitor as close as possible between the VDD terminal and GND of the UCCx808-x, tracked directly to both terminals.
- A small, external filter capacitor is recommended on the CS terminal. Track the filter capacitor as directly as possible from the CS to GND terminal.
- The tracking and layout of the FB terminal and connecting components is critical to minimize noise pick-up and interference in the magnetic sensing block. Minimize the total surface area of trances on the FB net.
- The OUTA/OUTB terminal has high internal sink or source current capability. An external gate resistor is recommended. The value depends on the choice of power MOSFET, efficiency and EMI considerations. A

pull-down resistor on the gate of the external MOSFET is recommended to prevent the MOSFET gate from floating on if there is an open-circuit error in the gate drive path.

### 8.3 Receiving Notification of Documentation Updates

To receive notification of documentation updates, navigate to the device product folder on [ti.com](#). Click on *Notifications* to register and receive a weekly digest of any product information that has changed. For change details, review the revision history included in any revised document.

### 8.4 Support Resources

[TI E2E™ support forums](#) are an engineer's go-to source for fast, verified answers and design help — straight from the experts. Search existing answers or ask your own question to get the quick design help you need.

Linked content is provided "AS IS" by the respective contributors. They do not constitute TI specifications and do not necessarily reflect TI's views; see TI's [Terms of Use](#).

### 8.5 Trademarks

TI E2E™ is a trademark of Texas Instruments.

Magnetics® is a registered trademark of Magnetics Inc.

All trademarks are the property of their respective owners.

### 8.6 Electrostatic Discharge Caution

This integrated circuit can be damaged by ESD. Texas Instruments recommends that all integrated circuits be handled with appropriate precautions. Failure to observe proper handling and installation procedures can cause damage.

ESD damage can range from subtle performance degradation to complete device failure. Precision integrated circuits may be more susceptible to damage because very small parametric changes could cause the device not to meet its published specifications.

<sup>(1)</sup> **Status:** For more details on status, see our [product life cycle](#).

<sup>(2)</sup> **Material type:** When designated, preproduction parts are prototypes/experimental devices, and are not yet approved or released for full production. Testing and final process, including without limitation quality assurance, reliability performance testing, and/or process qualification, may not yet be complete, and this item is subject to further changes or possible discontinuation. If available for ordering, purchases will be subject to an additional waiver at checkout, and are intended for early internal evaluation purposes only. These items are sold without warranties of any kind.

<sup>(3)</sup> **RoHS values:** Yes, No, RoHS Exempt. See the [TI RoHS Statement](#) for additional information and value definition.

<sup>(4)</sup> **Lead finish/Ball material:** Parts may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead finish/Ball material values may wrap to two lines if the finish value exceeds the maximum column width.

<sup>(5)</sup> **MSL rating/Peak reflow:** The moisture sensitivity level ratings and peak solder (reflow) temperatures. In the event that a part has multiple moisture sensitivity ratings, only the lowest level per JEDEC standards is shown. Refer to the shipping label for the actual reflow temperature that will be used to mount the part to the printed circuit board.

**(6) Part marking:** There may be an additional marking, which relates to the logo, the lot trace code information, or the environmental category of the part.

Multiple part markings will be inside parentheses. Only one part marking contained in parentheses and separated by a "~" will appear on a part. If a line is indented then it is a continuation of the previous line and the two combined represent the entire part marking for that device.

**Important Information and Disclaimer:** The information provided on this page represents TI's knowledge and belief as of the date that it is provided. TI bases its knowledge and belief on information provided by third parties, and makes no representation or warranty as to the accuracy of such information. Efforts are underway to better integrate information from third parties. TI has taken and continues to take reasonable steps to provide representative and accurate information but may not have conducted destructive testing or chemical analysis on incoming materials and chemicals. TI and TI suppliers consider certain information to be proprietary, and thus CAS numbers and other limited information may not be available for release.

In no event shall TI's liability arising out of such information exceed the total purchase price of the TI part(s) at issue in this document sold by TI to Customer on an annual basis.

**NOTES:**

1. Linear dimensions are in inches [millimeters]. Dimensions in parenthesis are for reference only. Controlling dimensions are in inches. Dimensioning and tolerancing per ASME Y14.5M.
2. This drawing is subject to change without notice.
3. This dimension does not include mold flash, protrusions, or gate burrs. Mold flash, protrusions, or gate burrs shall not exceed .006 [0.15] per side.
4. This dimension does not include interlead flash.
5. Reference JEDEC registration MS-012, variation AA.

**D0008A**

### SOIC - 1.75 mm max height

## SMALL OUTLINE INTEGRATED CIRCUIT

LAND PATTERN EXAMPLE  
EXPOSED METAL SHOWN  
SCALE:8X

## SOLDER MASK DETAILS

4214825/C 02/2019

NOTES: (continued)

6. Publication IPC-7351 may have alternate designs.

7. Solder mask tolerances between and around signal pads can vary based on board fabrication site.

**D0008A**

### SOIC - 1.75 mm max height

## SMALL OUTLINE INTEGRATED CIRCUIT

SOLDER PASTE EXAMPLE  
BASED ON .005 INCH [0.125 MM] THICK STENCIL  
SCALE:8X

4214825/C 02/2019

NOTES: (continued)

8. Laser cutting apertures with trapezoidal walls and rounded corners may offer better paste release. IPC-7525 may have alternate design recommendations.
9. Board assembly site may have different recommendations for stencil design.

P (R-PDIP-T8)

PLASTIC DUAL-IN-LINE PACKAGE

- NOTES:
- A. All linear dimensions are in inches (millimeters).
  - B. This drawing is subject to change without notice.
  - C. Falls within JEDEC MS-001 variation BA.
