

TLIN1029-Q1 LIN Transceiver with Dominant State Timeout

1 Features

- AEC-Q100 Qualified for automotive applications
 - Temperature grade 1: -40°C to 125°C T_A
 - Device HBM certification level: ± 8 kV
 - Device CDM certification level: ± 1.5 kV
- Compatible with LIN 2.0, LIN 2.1, LIN 2.2, LIN 2.2 A and ISO/DIS 17987–4.2 (See [SLLA490](#))
- Conforms to SAE J2602 recommended practice for LIN (See [SLLA490](#))
- Supports ISO 9141 (K-Line)
- Supports 12 V applications
- LIN transmit data rate up to 20-kbps
- Wide operating ranges
 - 4-V to 36-V Supply voltage
 - ± 45 -V LIN bus fault protection
- Sleep mode: ultra-low current consumption allows wake-up event from:
 - LIN bus
 - Local wake up through EN
- Power up and down glitch free operation
- Protection features:
 - Under voltage protection on V_{SUP}
 - TXD Dominant time out protection (DTO)
 - Thermal shutdown protection
 - Unpowered node or ground disconnection failsafe at system level.
- Available in SOIC (8) and leadless VSON (8) packages for improved automated optical inspection (AOI) capability

2 Applications

- [Body electronics and lighting](#)
- [Infotainment and cluster](#)
- [Hybrid electric vehicles and power train systems](#)
- [Passive safety](#)
- [Appliances](#)

3 Description

The TLIN1029-Q1 is a local interconnect network (LIN) physical layer transceiver with integrated wake-up and protection features, compatible with LIN 2.0, LIN 2.1, LIN 2.2, LIN 2.2 A and ISO/DIS 17987–4.2 standards. LIN is a single-wire bidirectional bus typically used for in-vehicle networks using data rates up to 20 kbps. The TLIN1029-Q1 is designed to support 12-V applications with wider operating voltage and additional bus-fault protection.

The LIN receiver supports data rates up to 100 kbps for faster in-line programming. The TLIN1029-Q1 converts the data stream on the TXD input into a LIN bus signal using a current-limited wave-shaping driver which reduces electromagnetic emissions (EME). The receiver converts the data stream to logic level signals that are sent to the microprocessor through the open-drain RXD pin. Ultra-low current consumption is possible using the sleep mode which allows wake-up via LIN bus or EN pin.

Device Information

PART NUMBER	PACKAGE ⁽¹⁾	BODY SIZE (NOM)
TLIN1029-Q1	SOIC (D) (8)	4.90 mm x 3.91 mm
	VSON (DRB) (8)	3.00 mm x 3.00 mm

- (1) For all available packages, see the orderable addendum at the end of the data sheet.

4 Revision History

NOTE: Page numbers for previous revisions may differ from page numbers in the current version.

Changes from Revision E (May 2020) to Revision F (May 2022)	Page
• Changed all instances of legacy terminology to commander and responder where mentioned.....	1
Changes from Revision D (March 2020) to Revision E (May 2020)	Page
• Added: (See SLLA490) to the <i>Features</i> list.....	1
• Added : See errata TLIN1029-Q1 and TLIN2029-Q1 Duty Cycle Over V_{SUP}	8
Changes from Revision C (July 2019) to Revision D (March 2020)	Page
• Changed the 200 pF capacitor To: 220 pF in the <i>Simplified Schematics, Commander Mode</i>	1
• Changed the 200 pF capacitor To: 220 pF in the <i>Simplified Schematics, Responder Mode</i>	1
• Changed V_{LIN} from MIN = -58, MAX = 58 To: MIN = -60, MAX = 60 in the Absolute Maximum Ratings.....	5
• Changed C_{LINPIN} from MAX = 45 pF To: MAX = 25 pF and added V_{SUP} = 14 V for Test Condition in Electrical Characteristics	6
• Changed text From: "... a 200 pF capacitor" To: "... a 220 pF capacitor" For Pin 6 (LIN) in the <i>Layout Guidelines</i>	29
Changes from Revision B (February 2018) to Revision C (July 2019)	Page
• Changed the SOIC package Body Size From: 4.90 mm x 6.00 mm To: 4.90 mm x 3.91 mm in the <i>Device Information</i>	1
• Changed the 220 pF capacitor To: 200 pF in the <i>Simplified Schematics, Commander Mode</i>	1
• Changed the 220 pF capacitor To: 200 pF in the <i>Simplified Schematics, Responder Mode</i>	1
• Changed V_{LOGIC} absolute maximum rating MAX from 5.5 V to 6 V.....	5
• Changed the title of Figure 10-2 To: Recessive to Dominant Propagation.....	28
• Changed the title of Figure 10-3 To: Dominant to Recessive Propagation.....	28
• Changed text From: "... a 220 pF capacitor" To: "... a 200 pF capacitor" For Pin 6 (LIN) in the <i>Layout Guidelines</i>	29
Changes from Revision A (December 2017) to Revision B (February 2018)	Page
• Changed From: "Complaint to LIN 2.0..." To: "Compliant to LIN 2.0..." in the Features and Description.....	1

- Changed From: "complaint to LIN 2.0..." To: "compliant to LIN 2.0..." in the *Overview* section.....21

Changes from Revision * (October 2017) to Revision A (December 2017) Page

- Changed the device status from *Advance Information* to *Production Data* 1
-

5 Description (continued)

The integrated resistor, electrostatic discharge (ESD) and fault protection allows designers to save board space in their applications.

6 Pin Configuration and Functions

**Figure 6-1. D Package, 8-Pin (SOIC)
(Top View)**

**Figure 6-2. DRB Package, 8-Pin (VSON)
Top View**

Table 6-1. Pin Functions

PIN		Type	DESCRIPTION
Name	No.		
RXD	1	DO	RXD output (open-drain) interface reporting state of LIN bus voltage
EN	2	DI	Enable input - High puts the device in normal operation mode and low puts the device in sleep mode
NC	3	–	Not connected
TXD	4	DI	TXD input interface to control state of LIN output - Internally pulled to ground
GND	5	GND	Ground
LIN	6	HV I/O	LIN bus single-wire transmitter and receiver
V _{SUP}	7	HV Supply	Device supply voltage (connected to battery in series with external reverse blocking diode)
NC	8	–	Not connected
Thermal Pad		-	No electrical connection. Can be connected to the PCB to improve thermal coupling (DRB package only)

7 Specifications

7.1 Absolute Maximum Ratings

parameters valid across $-40^{\circ}\text{C} \leq T_A \leq 125^{\circ}\text{C}$ (unless otherwise noted)⁽¹⁾

Symbol	Parameter	MIN	MAX	UNIT
V_{SUP}	Supply voltage range (ISO/DIS 17987 Param 10)	−0.3	45	V
V_{LIN}	LIN bus input voltage (ISO/DIS 17987 Param 82)	−45	45	V
V_{LOGIC}	Logic pin voltage (RXD, TXD, EN)	−0.3	6	V
T_A	Ambient temperature range	−40	125	$^{\circ}\text{C}$
T_J	Junction temperature range	−55	150	$^{\circ}\text{C}$

- (1) Stresses beyond those listed under Absolute Maximum Ratings may cause permanent damage to the device. These are stress ratings only, which do not imply functional operation of the device at these or any other conditions beyond those indicated under Recommended Operating Conditions. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.

7.2 ESD Ratings

ESD Ratings				VALUE	UNIT
$V_{\text{(ESD)}}$	Electrostatic discharge	Human body model (HBM) TXD, RXD, EN Pins, per AEC Q100-002 ⁽¹⁾		±4000	V
		Human body model (HBM) LIN and V_{SUP} Pin, per AEC Q100-002 ⁽²⁾		±8000	
		Charged device model (CDM), per AEC Q100-011	All terminals	±1500	

- (1) JEDEC document JEP155 states that 500-V HBM allows safe manufacturing with a standard ESD control process.
(2) LIN bus is stressed with respect to GND.

7.3 ESD Ratings - IEC

ESD and Surge Protection Ratings			VALUE	UNIT
V _(ESD)	Electrostatic discharge	ISO 10605 per IEC 62228-3 Contact discharge	±8000	V
V _(ESD)	Powered ESD Performance, per SAEJ2962-1 ⁽¹⁾	contact discharge	±8000	V
		air-gap discharge	±25000	
ISO 7637-2 and IEC 62215-3 transients according to IBEE LIN EMC test specifications ⁽²⁾ (LIN and V _{SUP})		Pulse 1	−100	V
		Pulse 2	75	V
		Pulse 3a	−150	V
		Pulse 3b	100	V

- (1) SAEJ2962-1 Testing performed at 3rd party EMC test facility, test report available upon request.
(2) ISO 7637 is a system level transient test. Different system level configurations may lead to different results.

7.4 Thermal Information

THERMAL METRIC ⁽¹⁾		TLIN1029D	TLIN1029DRB	UNIT
		D (SOIC)	DRB (VSON)	
		8-PINS	8-PINS	
$R_{\theta\text{JA}}$	Junction-to-ambient thermal resistance	115.5	48.5	$^{\circ}\text{C/W}$
$R_{\theta\text{JC(top)}}$	Junction-to-case (top) thermal resistance	58.7	55.5	$^{\circ}\text{C/W}$
$R_{\theta\text{JB}}$	Junction-to-board thermal resistance	58.9	22.2	$^{\circ}\text{C/W}$
Ψ_{JT}	Junction-to-top characterization parameter	14.1	1.2	$^{\circ}\text{C/W}$
Ψ_{JB}	Junction-to-board characterization parameter	58.2	22.2	$^{\circ}\text{C/W}$
$R_{\theta\text{JC(bot)}}$	Junction-to-case (bottom) thermal resistance	-	4.8	$^{\circ}\text{C/W}$

- (1) For more information about traditional and new thermal metrics, see the Semiconductor and IC Package Thermal Metrics application report, SPRA953.

7.5 Recommended Operating Conditions

parameters valid across $-40^{\circ}\text{C} \leq T_A \leq 125^{\circ}\text{C}$ (unless otherwise noted)

PARAMETER - DEFINITION		MIN	NOM	MAX	UNIT
V_{SUP}	Supply voltage	4		36	V
V_{LIN}	LIN Bus input voltage	0		36	V
V_{LOGIC}	Logic Pin Voltage (RXD, TXD, EN)	0		5.25	V
TSD	Thermal shutdown temperature	165			$^{\circ}\text{C}$
TSD _(HYS)	Thermal shutdown hysteresis		15		$^{\circ}\text{C}$

7.6 Electrical Characteristics

parameters valid across $-40^{\circ}\text{C} \leq T_A \leq 125^{\circ}\text{C}$ (unless otherwise noted)

PARAMETER		TEST CONDITIONS	MIN	TYP	MAX	UNIT
Power Supply						
V_{SUP}	Operational supply voltage (ISO/DIS 17987 Param 10)	Device is operational beyond the LIN defined nominal supply voltage range. See Figure 8-1 and Figure 8-2	4		36	V
V_{SUP}	Nominal supply voltage (ISO/DIS 17987 Param 10)	Normal and Standby Modes: ramp V_{SUP} while LIN signal is a 10 kHz square wave with 50 % duty cycle and 18V swing. See Figure 8-1 and Figure 8-2	4		36	V
		Sleep Mode	4		36	V
UV_{SUP}	Under voltage V_{SUP} threshold	Min is falling edge and Max is rising edge	2.9		3.85	V
UV_{HYS}	Delta hysteresis voltage for V_{SUP} under voltage threshold			0.2		V
I_{SUP}	Supply current	Normal Mode: EN = high, bus dominant: total bus load where $R_{\text{LIN}} > 500 \Omega$ and $C_{\text{LIN}} < 10 \text{ nF}$ (See Figure 8-7)		1	5	mA
		Standby Mode: EN = low, bus dominant: total bus load where $R_{\text{LIN}} > 500 \Omega$ and $C_{\text{LIN}} < 10 \text{ nF}$ (See Figure 8-7)		1	2.1	mA
I_{SUP}	Supply current	Normal Mode: EN = high, bus recessive (LIN = V_{SUP})		300	650	μA
		Standby Mode: EN = low, bus recessive (LIN = V_{SUP})		10	30	μA
		Sleep Mode: $4.0 \text{ V} < V_{\text{SUP}} \leq 14 \text{ V}$, LIN = V_{SUP} , EN = 0 V, TXD and RXD floating		8	12	μA
		Sleep Mode: $14 \text{ V} < V_{\text{SUP}} \leq 36 \text{ V}$, LIN = V_{SUP} , EN = 0 V, TXD and RXD floating			20	μA
TSD	Thermal shutdown		165			$^{\circ}\text{C}$
TSD _(HYS)	Thermal shutdown hysteresis			15		$^{\circ}\text{C}$
RXD OUTPUT PIN (OPEN DRAIN)						
V_{OL}	Output low voltage	$R_{\text{PU}} = 2.4 \text{ k}\Omega$			0.6	V
I_{OL}	Low level output current, open drain	LIN = 0 V, RXD = 0.4 V	1.5			mA
I_{ILG}	Leakage current, high-level	LIN = V_{SUP} , RXD = 5 V	-5	0	5	μA
TXD INPUT PIN						
V_{IL}	Low level input voltage		-0.3		0.8	V
V_{IH}	High level input voltage		2		5.5	V
I_{ILG}	Low level input leakage current	TXD = low	-5	0	5	μA
R_{TXD}	Internal pull-down resistor value		125	350	800	$\text{k}\Omega$
LIN PIN						

7.6 Electrical Characteristics (continued)

parameters valid across $-40^{\circ}\text{C} \leq T_A \leq 125^{\circ}\text{C}$ (unless otherwise noted)

PARAMETER		TEST CONDITIONS	MIN	TYP	MAX	UNIT
V_{OH}	HIGH level output voltage	LIN recessive, TXD = high, $I_O = 0$ mA, $V_{SUP} = 7$ V to 36 V ⁽¹⁾	0.85			V_{SUP}
		LIN recessive, TXD = high, $I_O = 0$ mA, $V_{SUP} = 4$ V $\leq V_{SUP} < 7$ V ⁽¹⁾	3			V
V_{OL}	LOW level output voltage	LIN dominant, TXD = low, $V_{SUP} = 7$ V to 36 V ⁽¹⁾			0.2	V_{SUP}
		LIN dominant, TXD = low, $V_{SUP} = 4$ V $\leq V_{SUP} < 7$ V ⁽¹⁾			1.2	V
$V_{SUP_NON_OP}$	VSUP where impact of recessive LIN bus < 5% (ISO/DIS 17987 Param 11)	TXD & RXD open LIN = 4 V to 45 V	−0.3		45	V
I_{BUS_LIM}	Limiting current (ISO/DIS 17987 Param 12)	TXD = 0 V, $V_{LIN} = 18$ V, $R_{MEAS} = 440$ Ω , $V_{SUP} = 18$ V, $V_{BUSdom} < 4.518$ V See Figure 8-6	40	90	200	mA
$I_{BUS_PAS_dom}$	Receiver leakage current, dominant (ISO/DIS 17987 Param 13)	LIN = 0 V, $V_{SUP} = 12$ V Driver off/ recessive Figure 8-7	−1			mA
$I_{BUS_PAS_rec1}$	Receiver leakage current, recessive (ISO/DIS 17987 Param 14)	LIN > V_{SUP} , 4 V $\leq V_{SUP} \leq 36$ V Driver off; Figure 8-8			20	μ A
$I_{BUS_PAS_rec2}$	Receiver leakage current, recessive (ISO/DIS 17987 Param 14)	LIN = V_{SUP} , Driver off; Figure 8-8	−5		5	μ A
$I_{BUS_NO_GND}$	Leakage current, loss of ground (ISO/DIS 17987 Param 15)	GND = V_{SUP} , $V_{SUP} = 18$ V, LIN = 0 V; Figure 8-9	−1		1	mA
$I_{BUS_NO_BAT}$	Leakage current, loss of supply (ISO/DIS 17987 Param 16)	LIN = 18 V, $V_{SUP} = \text{GND}$; Figure 8-10			5	μ A
V_{BUSdom}	Low level input voltage (ISO/DIS 17987 Param 17)	LIN dominant (including LIN dominant for wake up) See Figure 8-4 , Figure 8-3			0.4	V_{SUP}
V_{BUSrec}	High level input voltage (ISO/DIS 17987 Param 18)	LIN recessive See Figure 8-4 , Figure 8-3	0.6			V_{SUP}
V_{BUS_CNT}	Receiver center threshold (ISO/DIS 17987 Param 19)	$V_{BUS_CNT} = (V_{IL} + V_{IH})/2$ See Figure 8-4 , Figure 8-3	0.475	0.5	0.525	V_{SUP}
V_{HYS}	Hysteresis voltage (ISO/DIS 17987 Param 20)	$V_{HYS} = (V_{IL} - V_{IH})$ See Figure 8-4 , Figure 8-3			0.175	V_{SUP}
V_{SERIAL_DIODE}	Serial diode LIN term pull-up path	By design and characterization	0.4	0.7	1	V
R_{PU_LIN}	Internal pull-up resistor to V_{SUP}	Normal and standby modes	20	45	60	k Ω
I_{RSLEEP}	Pull-up current source to V_{SUP}	Sleep mode, $V_{SUP} = 14$ V, LIN = GND	−2		−20	μ A
C_{LINPIN}	Capacitance of the LIN pin	$V_{SUP} = 14$ V			25	pF
EN INPUT PIN						
V_{IL}	Low level input voltage		−0.3		0.8	V
V_{IH}	High level input voltage		2		5.5	V
V_{IT}	Hysteresis voltage	By design and characterization		50	500	mV
I_{ILG}	Low level input current	EN = low	−5	0	5	μ A
R_{EN}	Internal pull-down resistor		125	350	800	k Ω

(1) LIN driver bus load conditions (C_{LIN} , R_{LIN}): No external load

7.7 Switching Characteristics

parameters valid across $-40^{\circ}\text{C} \leq T_A \leq 125^{\circ}\text{C}$ (unless otherwise noted)

PARAMETER		TEST CONDITIONS	MIN	TYP	MAX	UNIT
D1 _{12V}	Duty Cycle 1 (ISO/DIS 17987 Param 27) ⁽¹⁾	$TH_{REC(MAX)} = 0.744 \times V_{SUP}$, $TH_{DOM(MAX)} = 0.581 \times V_{SUP}$, $V_{SUP} = 4\text{ V to }7.4\text{ V}$, $t_{BIT} = 50\text{ }\mu\text{s}$ (20 kbps), $D1 = t_{BUS_rec(min)}/(2 \times t_{BIT})$ (See Figure 8-11, Figure 8-12)	0.396			
D1 _{12V}	Duty Cycle 1 ⁽²⁾	$TH_{REC(MAX)} = 0.625 \times V_{SUP}$, $TH_{DOM(MAX)} = 0.581 \times V_{SUP}$, $V_{SUP} = 7.4\text{ V to }9.4\text{ V}$, $t_{BIT} = 50\text{ }\mu\text{s}$ (20 kbps), $D1 = t_{BUS_rec(min)}/(2 \times t_{BIT})$ (See Figure 8-11, Figure 8-12)	0.368			
D1 _{12V}	Duty Cycle 1 (ISO/DIS 17987 Param 27)	$TH_{REC(MAX)} = 0.744 \times V_{SUP}$, $TH_{DOM(MAX)} = 0.581 \times V_{SUP}$, $V_{SUP} = 9.4\text{ V to }18\text{ V}$, $t_{BIT} = 50\text{ }\mu\text{s}$ (20 kbps), $D1 = t_{BUS_rec(min)}/(2 \times t_{BIT})$ (See Figure 8-11, Figure 8-12)	0.396			
D2 _{12V}	Duty Cycle 2 (ISO/DIS 17987 Param 28)	$TH_{REC(MIN)} = 0.422 \times V_{SUP}$, $TH_{DOM(MIN)} = 0.284 \times V_{SUP}$, $V_{SUP} = 4\text{ V to }7.4\text{ V}$, $t_{BIT} = 50\text{ }\mu\text{s}$ (20 kbps), $D2 = t_{BUS_rec(MAX)}/(2 \times t_{BIT})$ (See Figure 8-11, Figure 8-12)			0.581	
D2 _{12V}	Duty Cycle 2 ⁽²⁾	$TH_{REC(MIN)} = 0.422 \times V_{SUP}$, $TH_{DOM(MIN)} = 0.284 \times V_{SUP}$, $V_{SUP} = 7.4\text{ V to }9.4\text{ V}$, $t_{BIT} = 50\text{ }\mu\text{s}$ (20 kbps), $D2 = t_{BUS_rec(MAX)}/(2 \times t_{BIT})$ (See Figure 8-11, Figure 8-12)			0.67	
D2 _{12V}	Duty Cycle 2 (ISO/DIS 17987 Param 28)	$TH_{REC(MIN)} = 0.422 \times V_{SUP}$, $TH_{DOM(MIN)} = 0.284 \times V_{SUP}$, $V_{SUP} = 9.4\text{ V to }18\text{ V}$, $t_{BIT} = 50\text{ }\mu\text{s}$ (20 kbps), $D2 = t_{BUS_rec(MAX)}/(2 \times t_{BIT})$ (See Figure 8-11, Figure 8-12)			0.581	
D3 _{12V}	Duty Cycle 3 (ISO/DIS 17987 Param 29)	$TH_{REC(MAX)} = 0.778 \times V_{SUP}$, $TH_{DOM(MAX)} = 0.616 \times V_{SUP}$, $V_{SUP} = 7\text{ V to }18\text{ V}$, $t_{BIT} = 96\text{ }\mu\text{s}$ (10.4 kbps), $D3 = t_{BUS_rec(min)}/(2 \times t_{BIT})$ (See Figure 8-11, Figure 8-12)	0.417			
D3 _{12V}	Duty Cycle 3	$TH_{REC(MAX)} = 0.645 \times V_{SUP}$, $TH_{DOM(MAX)} = 0.616 \times V_{SUP}$, $V_{SUP} = 4\text{ V to }7\text{ V}$, $t_{BIT} = 96\text{ }\mu\text{s}$ (10.4 kbps), $D3 = t_{BUS_rec(min)}/(2 \times t_{BIT})$ (See Figure 8-11, Figure 8-12)	0.417			
D4 _{12V}	Duty Cycle 4 (ISO/DIS 17987 Param 30)	$TH_{REC(MIN)} = 0.389 \times V_{SUP}$, $TH_{DOM(MIN)} = 0.251 \times V_{SUP}$, $V_{SUP} = 4.6\text{ V to }7.4\text{ V}$, $t_{BIT} = 96\text{ }\mu\text{s}$ (10.4 kbps), $D4 = t_{BUS_rec(MAX)}/(2 \times t_{BIT})$ (See Figure 8-11, Figure 8-12)			0.59	
D4 _{12V}	Duty Cycle 4 ⁽²⁾	$TH_{REC(MIN)} = 0.389 \times V_{SUP}$, $TH_{DOM(MIN)} = 0.251 \times V_{SUP}$, $V_{SUP} = 7.4\text{ V to }9.4\text{ V}$, $t_{BIT} = 96\text{ }\mu\text{s}$ (10.4 kbps), $D4 = t_{BUS_rec(MAX)}/(2 \times t_{BIT})$ (See Figure 8-11, Figure 8-12)			0.6	
D4 _{12V}	Duty Cycle 4 (ISO/DIS 17987 Param 30)	$TH_{REC(MIN)} = 0.389 \times V_{SUP}$, $TH_{DOM(MIN)} = 0.251 \times V_{SUP}$, $V_{SUP} = 7.4\text{ V to }18\text{ V}$, $t_{BIT} = 96\text{ }\mu\text{s}$ (10.4 kbps), $D4 = t_{BUS_rec(MAX)}/(2 \times t_{BIT})$ (See Figure 8-11, Figure 8-12)			0.59	

- (1) Duty cycles: LIN driver bus load conditions (C_{LIN} , R_{LIN}): Load1 = 1 nF, 1 k Ω ; Load2 = 10 nF, 500 Ω , Load3 = 6.8 nF, 660 Ω . Duty cycles 3 and 4 are defined for 10.4-kbps operation. The TLIN1029 also meets these lower data rate requirements, while it is capable of the higher speed 20-kbps operation as specified by duty cycles 1 and 2. SAEJ2602 derives propagation delay equations from the LIN 2.0 duty cycle definitions, for details see the SAEJ2602 specification

- (2) See errata [TLIN1029-Q1](#) and [TLIN2029-Q1 Duty Cycle Over VSUP](#)

7.8 Timing Requirements

SYMBOL	DESCRIPTION	TEST CONDITIONS	MIN	NOM	MAX	UNIT
t_{rx_pdr}, t_{rx_pdf}	Receiver rising and falling propagation delay time (ISO/DIS 17987 Param 31)	$R_{RXD} = 2.4\text{ k}\Omega$, $C_{RXD} = 20\text{ pF}$ (See Figure 8-13 and Figure 8-14)			6	μs
t_{rx_sym}	Symmetry of receiver propagation delay time	Rising edge with respect to falling edge, ($tr_{x_sym} = t_{rx_pdf} - t_{rx_pdr}$), $R_{RXD} = 2.4\text{ k}\Omega$, $C_{RXD} = 20\text{ pF}$ (See Figure 8-13 and Figure 8-14)	-2		2	μs
t_{LINBUS}	LIN wakeup time (Minimum dominant time on LIN bus for wakeup)	See Figure 8-17 , Figure 9-2 , and Figure 9-3	25	65	150	μs
t_{CLEAR}	Time to clear false wakeup prevention logic if LIN bus had a bus stuck dominant fault (recessive time on LIN bus to clear bus stuck dominant fault)	See Figure 9-3	8	25	50	μs
t_{DST}	Dominant state time out		20	45	80	ms
t_{MODE_CHANGE}	Mode change delay time	Time to change from standby mode to normal mode or normal mode to sleep mode through EN pin (See Figure 8-15 and Figure 9-4)	2		15	μs
t_{NOMINT}	Normal mode initialization time	Time for normal mode to initialize and data on RXD pin to be valid (See Figure 8-15)			35	μs

Figure 8-18. Test Circuit for AC Characteristics

the transmitter is disabled to protect the device. There is an internal pull-up resistor with a serial diode structure to V_{SUP} , so no external pull-up components are required for the LIN responder mode applications. An external pull-up resistor and series diode to V_{SUP} must be added when the device is used for a commander mode node application.

9.3.1.2 LIN Receiver Characteristics

The receiver's characteristic thresholds are proportional to the device supply pin in accordance to the LIN specification.

The receiver is capable of receiving higher data rates (> 100 kbps) than supported by LIN or SAEJ2602 specifications. This allows the TLIN1029-Q1 to be used for high speed downloads at the end-of-line production or other applications. The actual data rate achievable depends on system time constants (bus capacitance and pull-up resistance) and driver characteristics used in the system.

9.3.1.2.1 Termination

There is an internal pull-up resistor with a serial diode structure to V_{SUP} , so no external pull-up components are required for the LIN responder mode applications. An external pull-up resistor ($1\text{ k}\Omega$) and a series diode to V_{SUP} must be added when the device is used for com mode applications as per the LIN specification.

Figure 9-1 shows a commander node configuration and how the voltage levels are defined

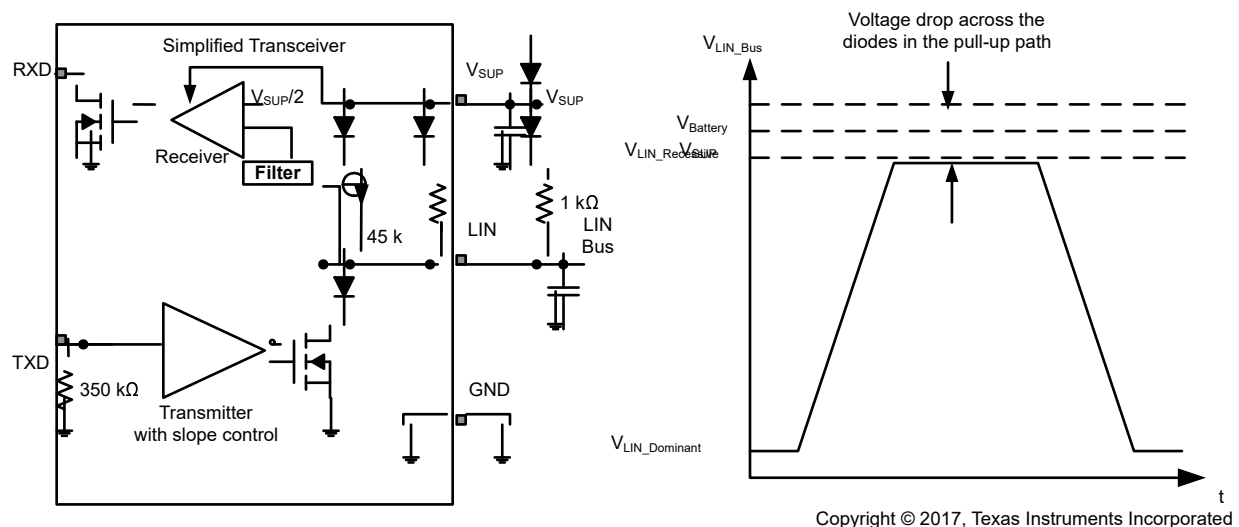

Figure 9-1. Commander Node Configuration with Voltage Levels

9.3.2 TXD (Transmit Input and Output)

TXD is the interface to the MCU's LIN protocol controller or SCI and UART that is used to control the state of the LIN output. When TXD is low the LIN output is dominant (near ground). When TXD is high the LIN output is recessive (near $V_{Battery}$). See Figure 9-1. The TXD input structure is compatible with microcontrollers with 3.3 V and 5 V I/O. TXD has an internal pull-down resistor. The LIN bus is protected from being stuck dominant through a system failure driving TXD low through the dominant state timer-out timer.

9.3.3 RXD (Receive Output)

RXD is the interface to the MCU's LIN protocol controller or SCI and UART, which reports the state of the LIN bus voltage. LIN recessive (near $V_{Battery}$) is represented by a high level on the RXD and LIN dominant (near ground) is represented by a low level on the RXD pin. The RXD output structure is an open-drain output stage. This allows the device to be used with 3.3 V and 5 V I/O microcontrollers. If the microcontroller's RXD pin does not have an integrated pull-up, an external pull-up resistor to the microcontroller I/O supply voltage is required. In standby mode the RXD pin is driven low to indicate a wake-up request from the LIN bus.

9.3.4 V_{SUP} (Supply Voltage)

V_{SUP} is the power supply pin. V_{SUP} is connected to the battery through an external reverse-blocking diode (Figure 9-1). If there is a loss of power at the ECU level, the device has extremely low leakage from the LIN pin, which does not load the bus down. This is optimal for LIN systems in which some of the nodes are unpowered (ignition supplied) while the rest of the network remains powered (battery supplied).

9.3.5 GND (Ground)

GND is the device ground connection. The device can operate with a ground shift as long as the ground shift does not reduce the V_{SUP} below the minimum operating voltage, as well as ensuring the input and output voltages are within their appropriate thresholds. If there is a loss of ground at the ECU level, the device has extremely low leakage from the LIN pin, which does not load the bus down. This is optimal for LIN systems in which some of the nodes are unpowered (ignition supplied) while the rest of the network remains powered (battery supplied).

9.3.6 EN (Enable Input)

EN controls the operational modes of the device. When EN is high the device is in normal operating mode allowing a transmission path from TXD to LIN and from LIN to RXD. When EN is low the device is put into sleep mode and there are no transmission paths available. The device can enter normal mode only after wake-up. EN has an internal pull-down resistor to ensure the device remains in low-power mode even if EN floats.

9.3.7 Protection Features

The TLIN1029-Q1 has several protection features, described below.

9.3.8 TXD Dominant Time Out (DTO)

During normal mode, if TXD is inadvertently driven permanently low by a hardware or software application failure, the LIN bus is protected by the dominant state timeout timer. This timer is triggered by a falling edge on the TXD pin. If the low signal remains on TXD for longer than t_{DST}, the transmitter is disabled, thus allowing the LIN bus to return to recessive state and communication to resume on the bus. The protection is cleared and the t_{DST} timer is reset by a rising edge on TXD. The TXD pin has an internal pull-down to ensure the device fails to a known state if TXD is disconnected. During this fault, the transceiver remains in normal mode (assuming no change of stated request on EN), the transmitter is disabled, the RXD pin reflects the LIN bus and the LIN bus pull-up termination remains on.

9.3.9 Bus Stuck Dominant System Fault: False Wake-Up Lockout

The TLIN1029-Q1 contains logic to detect bus stuck dominant system faults and prevents the device from waking up falsely during the system fault. Upon entering sleep mode, the device detects the state of the LIN bus. If the bus is dominant, the wake-up logic is locked out until a valid recessive on the bus “clears” the bus stuck dominant, preventing excessive current consumption. Figure 9-2 and Figure 9-3 show the behavior of this protection.

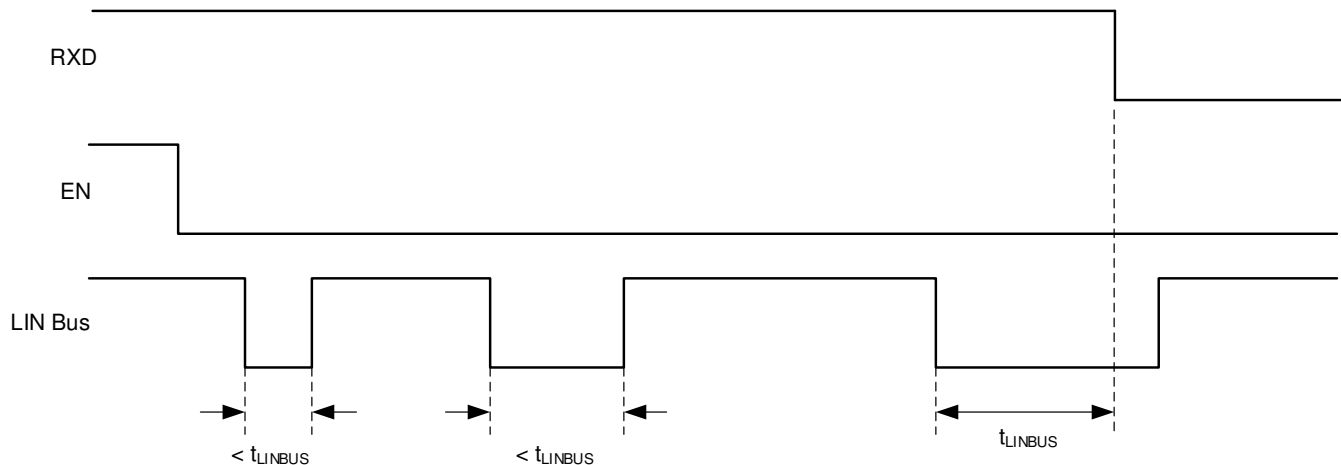

Figure 9-2. No Bus Fault: Entering Sleep Mode with Bus Recessive Condition and Wake-Up

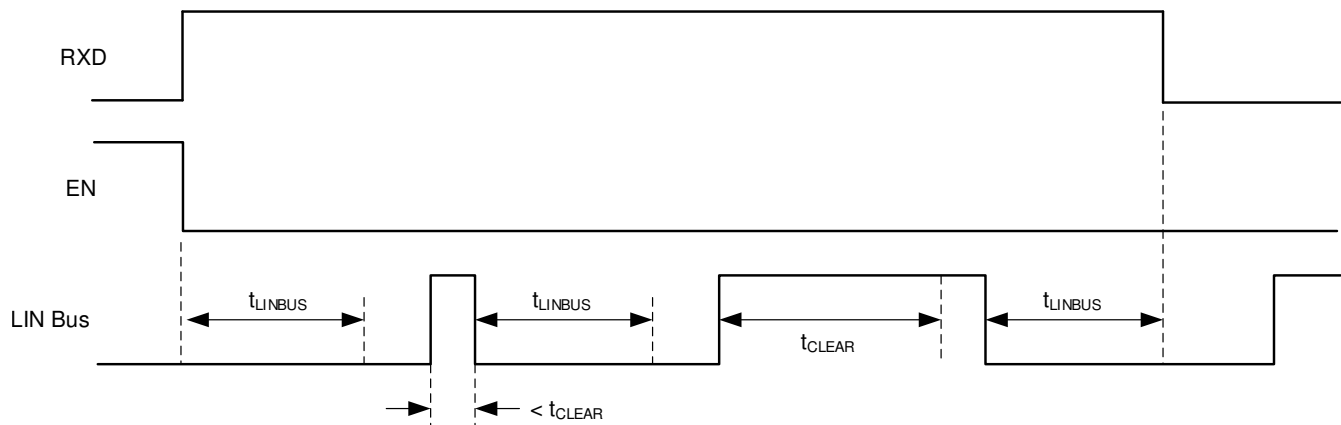

Figure 9-3. Bus Fault: Entering Sleep Mode with Bus Stuck Dominant Fault, Clearing, and Wake-Up

9.3.10 Thermal Shutdown

The LIN transmitter is protected by current limiting circuitry; however, if the junction temperature of the device exceeds the thermal shutdown threshold, the device puts the LIN transmitter into the recessive state. Once the over-temperature fault condition has been removed and the junction temperature has cooled beyond the hysteresis temperature, the transmitter is re-enabled, assuming the device remained in the normal operation mode. During this fault, the transceiver remains in normal mode (assuming no change of state request on EN), the transmitter is in recessive state, the RXD pin reflects the LIN bus and LIN bus pull-up termination remains on.

9.3.11 Under Voltage on V_{SUP}

The TLIN1029-Q1 contains a power-on reset circuit to avoid false bus messages during under voltage conditions when V_{SUP} is less than UV_{SUP} .

9.3.12 Unpowered Device and LIN Bus

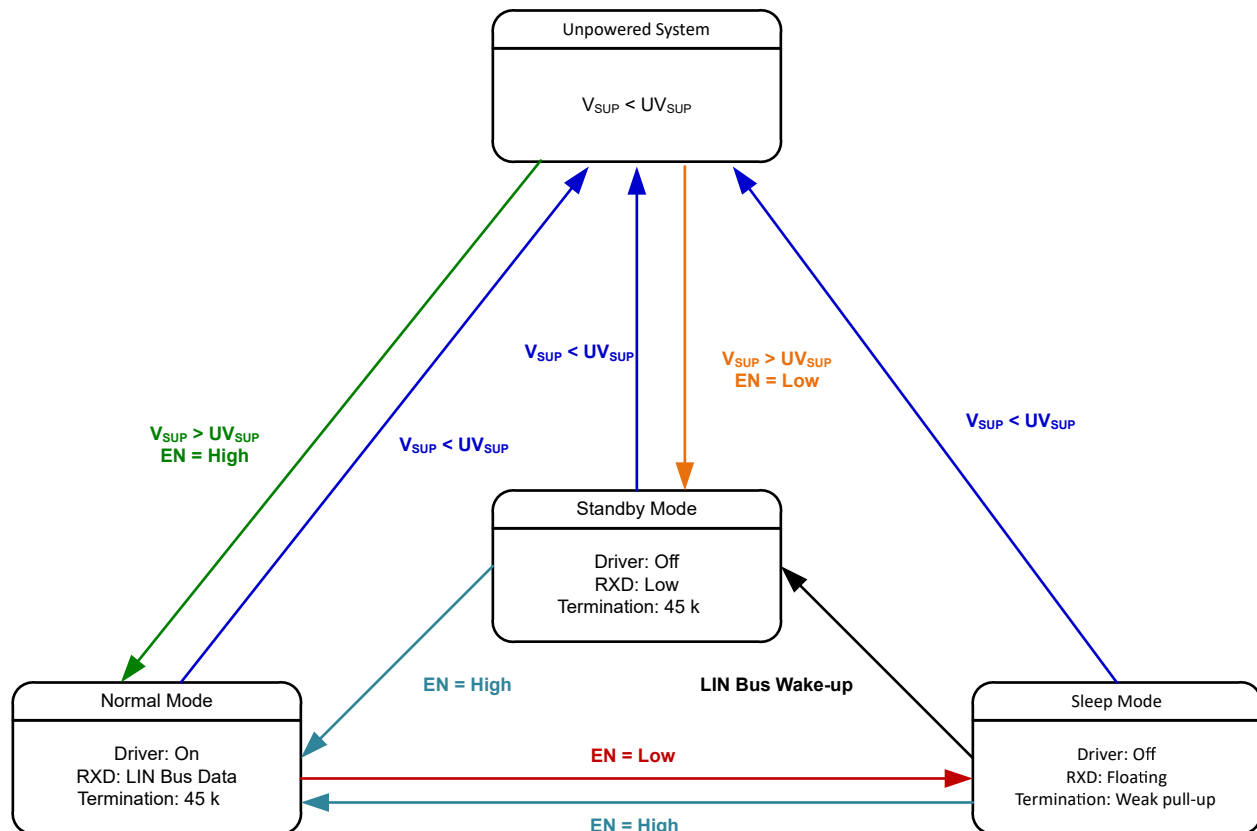

In automotive applications some LIN nodes in a system can be unpowered (ignition supplied) while others in the network remain powered by the battery. The TLIN1029-Q1 has extremely low unpowered leakage current from the bus so an unpowered node does not affect the network or load it down.

9.4 Device Functional Modes

The TLIN1029-Q1 has three functional modes of operation: normal, sleep, and standby. The next sections will describe these modes as well as how the device moves between the different modes. Figure 9-4 graphically shows the relationship while Table 9-1 shows the state of pins.

Table 9-1. Operating Modes

MODE	EN	RXD	LIN BUS TERMINATION	TRANSMITTER	COMMENT
Sleep	Low	Floating	Weak current pull-up	Off	
Standby	Low	Low	45 kΩ (typical)	Off	Wake-up event detected, waiting on MCU to set EN
Normal	High	LIN bus data	45 kΩ (typical)	On	LIN transmission up to 20 kbps

Copyright © 2017, Texas Instruments Incorporated

Figure 9-4. Operating State Diagram

9.4.1 Normal Mode

If the EN pin is high at power up the device will power up in normal mode. If the EN pin is low, it will power up in standby mode. The EN pin controls the mode of the device. In normal operational mode the receiver and transmitter are active and the LIN transmission up to the LIN specified maximum of 20 kbps is supported. The receiver detects the data stream on the LIN bus and outputs it on RXD for the LIN controller. A recessive signal on the LIN bus is a logic high and a dominant signal on the LIN bus is a logic low. The driver transmits input data from TXD to the LIN bus. Normal mode is entered as EN transitions high while the TLIN1029-Q1 is in sleep or standby mode for $> t_{\text{MODE_CHANGE}}$ plus t_{NOMINT} .

9.4.2 Sleep Mode

Sleep mode is the power saving mode for the TLIN1029-Q1. Sleep mode is only entered when the EN pin is low and from normal mode. Even with extremely low current consumption in this mode, the TLIN1029-Q1 can still wake up from LIN bus through a wake-up signal or if EN is set high for $\geq t_{\text{MODE_CHANGE}}$. The LIN bus is filtered to prevent false wake-up events. The wake-up events must be active for the respective time periods (t_{LINBUS}).

The sleep mode is entered by setting EN low for longer than $t_{\text{MODE_CHANGE}}$.

While the device is in sleep mode, the following conditions exist:

- The LIN bus driver is disabled and the internal LIN bus termination is switched off (to minimize power loss if LIN is short circuited to ground). However, the weak current pull-up is active to prevent false wake-up events in case an external connection to the LIN bus is lost.
- The normal receiver is disabled.
- EN input and LIN wake-up receiver are active.

9.4.3 Standby Mode

This mode is entered whenever a wake-up event occurs through LIN bus while the device is in sleep mode. The LIN bus responder mode termination circuit is turned on when standby mode is entered. Standby mode is signaled through a low level on RXD. See [Section 10.2.2.2](#) for more application information.

When EN is set high for longer than $t_{\text{MODE_CHANGE}}$ while the device is in standby mode, the device returns to normal mode. The normal transmission paths from TXD to LIN bus and LIN bus to RXD are enabled.

9.4.4 Wake-Up Events

There are two ways to wake up from sleep mode:

- Remote wake-up initiated by the falling edge of a recessive (high) to dominant (low) state transition on LIN bus where the dominant state is held for t_{LINBUS} filter time. After this t_{LINBUS} filter time has been met and a rising edge on the LIN bus going from dominant state to recessive state initiates a remote wake-up event, eliminating false wake-ups from disturbances on the LIN bus or if the bus is shorted to ground.
- Local wake-up through EN being set high for longer than $t_{\text{MODE_CHANGE}}$.

9.4.4.1 Wake-Up Request (RXD)

When the TLIN1029-Q1 encounters a wake-up event from the LIN bus, RXD goes low and the device transitions to standby mode until EN is reasserted high and the device enters normal mode. Once the device enters normal mode, the RXD pin releases the wake-up request signal and the RXD pin then reflects the receiver output from the LIN bus.

9.4.4.2 Mode Transitions

When the TLIN1029-Q1 is transitioning from normal to sleep or standby modes the device needs the time $t_{\text{MODE_CHANGE}}$ to allow the change to fully propagate from the EN pin through the device into the new state. When transitioning from sleep or standby to normal mode the device needs $t_{\text{MODE_CHANGE}}$ plus t_{NOMINT} .

10.2.1 Design Requirements

The RXD output structure is an open-drain output stage. This allows the TLIN1029-Q1 to be used with 3.3-V and 5-V I/O processor. If the RXD pin of the processor does not have an integrated pull-up, an external pull-up resistor to the processor I/O supply voltage is required. The select external pull-up resistor value should be between 1 k Ω to 10 k Ω , depending on supply used (See I_{OL} in electrical characteristics). The V_{SUP} pin of the device should be decoupled with a 100-nF capacitor as close to the supply pin of the device as possible.

10.2.2 Detailed Design Procedures

10.2.2.1 Normal Mode Application Note

When using the TLIN1029-Q1 in systems which are monitoring the RXD pin for a wake-up request, special care should be taken during the mode transitions. The output of the RXD pin is indeterminate for the transition period between states as the receivers are switched. The application software should not look for an edge on the RXD pin indicating a wake-up request until t_{MODE_CHANGE} . This is shown in [Figure 8-15](#)

10.2.2.2 Standby Mode Application Note

If the TLIN1029-Q1 detects an under voltage on V_{SUP} the RXD pin transitions low and would signal to the software that the TLIN1029-Q1 is in standby mode and should be returned to sleep mode for the lowest power state.

10.2.2.2.1 TXD Dominant State Timeout Application Note

The maximum dominant TXD time allowed by the TXD dominant state time out limits the minimum possible data rate of the device. The LIN protocol has different constraints for a commander node and responder node applications thus there are different maximum consecutive dominant bits for each application case and thus different minimum data rates.

10.2.3 Application Curves

The below figures show the propagation delay from the TXD pin to the LIN pin for both dominant to recessive and recessive to dominant stated under lightly loaded conditions.

Figure 10-2. Recessive to Dominant Propagation

Figure 10-3. Dominant to Recessive Propagation

11 Power Supply Recommendations

The TLIN1029-Q1 was designed to operate directly off a car battery, or any other DC supply ranging from 4 V to 36 V. A 100 nF decoupling capacitor should be placed as close to the V_{SUP} pin of the device as possible. It is good practice for some applications with noisier supplies to include 1 μ F and 10 μ F decoupling capacitor, as well.

12 Layout

In order for your PCB design to be successful, start with design of the protection and filtering circuitry. Because ESD transients have a wide frequency bandwidth from approximately 3 MHz to 3 GHz, high frequency layout techniques must be applied during PCB design. Placement at the connector also prevents these noisy events from propagating further into the PCB and system.

12.1 Layout Guidelines

- **Pin 1 (RXD):** The pin is an open-drain output and requires an external pull-up resistor in the range of 1 k Ω to 10 k Ω to function properly. Note that the minimum value will depend on the VIO supply used. See I_{OL} in electrical specifications. If the microprocessor paired with the transceiver does not have an integrated pull-up, an external resistor should be placed between RXD and the regulated voltage supply for the microprocessor.
- **Pin 2 (EN):** EN is an input pin that is used to place the device in a low-power sleep mode. If this feature is not used the pin should be pulled high to the regulated voltage supply of the microprocessor through a series resistor between 1 k Ω and 10 k Ω . Additionally, a series resistor may be placed on the pin to limit current on the digital lines in the case of an over voltage fault.
- **Pin 3 (NC):** Not Connected.
- **Pin 4 (TXD):** The TXD pin is used to transmit the input signal from the microcontroller. A series resistor can be placed to limit the input current to the device in the case of an over-voltage on this pin. A capacitor to ground can be placed close to the input pin of the device to filter noise.
- **Pin 5 (GND):** This is the ground connection for the device. This pin should be tied to the ground plane through a short trace with the use of two vias to limit total return inductance.
- **Pin 6 (LIN):** This pin connects to the LIN bus. For responder mode applications, a 220 pF capacitor to ground is implemented. For commander mode applications, an additional series resistor and blocking diode should be placed between the LIN pin and the V_{SUP} pin. See [Figure 10-1](#).
- **Pin 7 (VSUP):** This is the supply pin for the device. A 100 nF decoupling capacitor should be placed as close to the device as possible.
- **Pin 8 (NC):** Not Connected.

Note

All ground and power connections should be made as short as possible and use at least two vias to minimize the total loop inductance.

13.5 Electrostatic Discharge Caution

This integrated circuit can be damaged by ESD. Texas Instruments recommends that all integrated circuits be handled with appropriate precautions. Failure to observe proper handling and installation procedures can cause damage.

ESD damage can range from subtle performance degradation to complete device failure. Precision integrated circuits may be more susceptible to damage because very small parametric changes could cause the device not to meet its published specifications.

13.6 Glossary

[TI Glossary](#) This glossary lists and explains terms, acronyms, and definitions.

14 Mechanical, Packaging, and Orderable Information

The following pages include mechanical, packaging, and orderable information. This information is the most current data available for the designated devices. This data is subject to change without notice and revision of this document. For browser-based versions of this data sheet, refer to the left-hand navigation.

⁽¹⁾ **Status:** For more details on status, see our [product life cycle](#).

⁽²⁾ **Material type:** When designated, preproduction parts are prototypes/experimental devices, and are not yet approved or released for full production. Testing and final process, including without limitation quality assurance, reliability performance testing, and/or process qualification, may not yet be complete, and this item is subject to further changes or possible discontinuation. If available for ordering, purchases will be subject to an additional waiver at checkout, and are intended for early internal evaluation purposes only. These items are sold without warranties of any kind.

⁽³⁾ **RoHS values:** Yes, No, RoHS Exempt. See the [TI RoHS Statement](#) for additional information and value definition.

⁽⁴⁾ **Lead finish/Ball material:** Parts may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead finish/Ball material values may wrap to two lines if the finish value exceeds the maximum column width.

⁽⁵⁾ **MSL rating/Peak reflow:** The moisture sensitivity level ratings and peak solder (reflow) temperatures. In the event that a part has multiple moisture sensitivity ratings, only the lowest level per JEDEC standards is shown. Refer to the shipping label for the actual reflow temperature that will be used to mount the part to the printed circuit board.

⁽⁶⁾ **Part marking:** There may be an additional marking, which relates to the logo, the lot trace code information, or the environmental category of the part.

Multiple part markings will be inside parentheses. Only one part marking contained in parentheses and separated by a "~" will appear on a part. If a line is indented then it is a continuation of the previous line and the two combined represent the entire part marking for that device.

PLASTIC SMALL OUTLINE - NO LEAD

4222121/C 10/2016

1. All linear dimensions are in millimeters. Any dimensions in parenthesis are for reference only. Dimensioning and tolerancing per ASME Y14.5M.
2. This drawing is subject to change without notice.
3. The package thermal pad must be soldered to the printed circuit board for thermal and mechanical performance.

DRB0008F

VSON - 1 mm max height

PLASTIC SMALL OUTLINE - NO LEAD

LAND PATTERN EXAMPLE
SCALE:20X

SOLDER MASK DETAILS

4222121/C 10/2016

NOTES: (continued)

4. This package is designed to be soldered to a thermal pad on the board. For more information, see Texas Instruments literature number SLUA271 (www.ti.com/lit/sluea271).
5. Vias are optional depending on application, refer to device data sheet. If any vias are implemented, refer to their locations shown on this view. It is recommended that vias under paste be filled, plugged or tented.

EXAMPLE STENCIL DESIGN

DRB0008F

VSON - 1 mm max height

PLASTIC SMALL OUTLINE - NO LEAD

SOLDER PASTE EXAMPLE
BASED ON 0.125 mm THICK STENCIL

EXPOSED PAD
82% PRINTED SOLDER COVERAGE BY AREA
SCALE:25X

4222121/C 10/2016

NOTES: (continued)

6. Laser cutting apertures with trapezoidal walls and rounded corners may offer better paste release. IPC-7525 may have alternate design recommendations.

4227074/D 08/2022

NOTES:

1. All linear dimensions are in millimeters. Any dimensions in parenthesis are for reference only. Dimensioning and tolerancing per ASME Y14.5M.
2. This drawing is subject to change without notice.
3. The package thermal pad must be soldered to the printed circuit board for optimal thermal and mechanical performance.

EXPOSED PAD 9:
80% PRINTED SOLDER COVERAGE BY AREA
SCALE:25X

4227074/D 08/2022

NOTES: (continued)

6. Laser cutting apertures with trapezoidal walls and rounded corners may offer better paste release. IPC-7525 may have alternate design recommendations.

PACKAGE OUTLINE

SOIC - 1.75 mm max height

SMALL OUTLINE INTEGRATED CIRCUIT

1. Linear dimensions are in inches [millimeters]. Dimensions in parenthesis are for reference only. Controlling dimensions are in inches. Dimensioning and tolerancing per ASME Y14.5M.
2. This drawing is subject to change without notice.
3. This dimension does not include mold flash, protrusions, or gate burrs. Mold flash, protrusions, or gate burrs shall not exceed .006 [0.15] per side.
4. This dimension does not include interlead flash.
5. Reference JEDEC registration MS-012, variation AA.
