# **BQ41xxx Production Calibration Guide**

Wyatt Keller

### **ABSTRACT**

This application note details manufacture testing, cell voltage calibration, BAT voltage calibration, PACK voltage calibration, current calibration (CC), and temperature calibration for the bq41xxx devices.

# 1 Manufacture Testing

To improve the manufacture testing flow, the gas gauge device allows certain features to be toggled on or off through *ManufacturerAccess()* commands. For example, the PRE-CHG FET(), CHG FET(), DS FET(), Lifetime Data Collection(), Calibration() features. Enabling only the feature under test can simplify the test flow in production by avoiding any feature interference. These toggling commands only set the RAM data, meaning the conditions set by the these commands are cleared if a reset or seal is issued to the gauge. The *ManufacturingStatus()* keeps track of the status (enabled or disabled) of each feature.

The data flash *ManufacturingStatus* provides the option to enable or disable individual features for normal operation. Upon a reset or a seal command, the *ManufacturingStatus()* is re-loaded from data flash *ManufacturingStatus()*. This also means if an update is made to *ManufacturingStatus()* to enable or disable a feature, the gauge only takes the new setting if a reset or seal command is sent.

www.ti.com Calibration

### 2 Calibration

The device has integrated routines that support calibration of current, voltage, and temperature readings, accessible after writing 0xF081 or 0xF082 to *ManufacturerAccess()* when the *ManufacturingStatus()*[CAL] bit is ON. While the calibration is active, the raw ADC data is available on *ManufacturerData()*. The device stops reporting calibration data on *ManufacturerData()* if any other MAC commands are sent or the device is reset or sealed.

#### Note

The *ManufacturingStatus()*)[CAL] bit must be turned OFF after calibration is completed. This bit is cleared at reset or after sealing.

ManufacturerAccess()	Description
0x002D	Enables/Disables ManufacturingStatus() [CAL]
0xF080	Disables raw ADC data output on ManufacturerData()
0xF081	Outputs raw ADC data of voltage, current, and temperature on ManufacturerData()
0xF082	Outputs raw ADC data of voltage, current, and temperature on <i>ManufacturerData()</i> . This mode enables an internal short on the coulomb counter inputs (SRP, SRN).

The *ManufacturerData()* output format is: ZZYYaaAAbbBBccCCddDDeeEEffFFggGGhhHHiilljjJJkkKK, where:

Value	Format	Description
ZZ	byte	8-bit counter, increments when raw ADC values are refreshed (every 250ms)
YY	byte	Output status  ManufacturerAccess() = 0xF081: 1  ManufacturerAccess() = 0xF082: 2
AAaa	2's comp	Current (coulomb counter)
BBbb	2's comp	Cell voltage 1
CCcc	2's comp	Cell voltage 2
DDdd	2's comp	Cell voltage 3
EEee	2's comp	Cell voltage 4
FFff	2's comp	PACK voltage
Value	Format	Description
GGgg	2's comp	BAT Voltage
HHhh	2's comp	Cell current 1
Ilii	2's comp	Cell current 2
JJjj	2's comp	Cell current 3
KKkk	2's comp	Cell current 4

Calibration www.ti.com

# 2.1 Cell Voltage Calibration

Figure 2-1 illustrates cell voltage calibration.

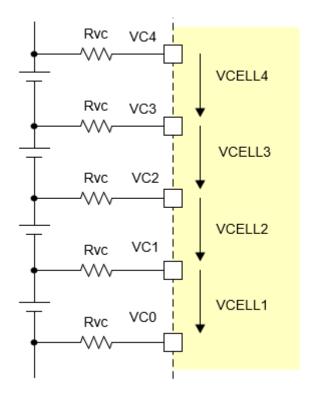

Figure 2-1. Cell Voltage Calibration

- 1. Apply known voltages in mV to the cell voltage inputs:
  - V<sub>CELL1</sub> between VC1 pin and VSS pin
  - V<sub>CELL2</sub> between VC2 pin and VC1 pin
  - V<sub>CELL3</sub> between VC3 pin and VC2 pin
  - V<sub>CELL4</sub> between VC4 pin and VC3 pin
- 2. If ManufacturerStatus()[CAL] = 0, send 0x002D to ManufacturerAccess() to enable the [CAL] flag.
- 3. Send 0xF081 or 0xF082 to ManufacturerAccess() to enable raw cell voltage output on ManufacturerData().
- 4. Poll ManufacturerData() until the 8-bit counter value increments by 2 before reading data.
- 5. Read the ADC conversion readings of cell voltages from *ManufacturerData()*:

ADC<sub>CELL1</sub> = BBbb of *ManufacturerData()* 

Is ADC<sub>CELL1</sub> < 0x8000? If yes, use ADC<sub>CELL1</sub>; otherwise, ADC<sub>CELL1</sub> = -(0xFFFF - BBbb + 0x0001).

6. Average several readings for higher accuracy. Poll ManufacturerData() until ZZ increments, to indicate that updated values are available:

 $ADC_{CELL1} = [ADC_{CELL1}(reading n) + ... + ADC_{CELL1}(reading 1)]/n$ 

7. Average all of the cells to create a single cell gain with the average all voltages:

$$Cell \ Gain = \frac{V_{cell1} + V_{cell2} + V_{cell3} + V_{cell4}}{ADC_{cell1} + ADC_{cell2} + ADC_{cell3} + ADC_{cell4}} \times 2^{16}$$
(1)

- 8. Write the new Cell Gain value to data flash.
- 9. Re-check voltage readings and if these are not accurate, repeat steps 4 − 8.
- 10. Send 0x002D to ManufacturerAccess() to clear the [CAL] flag if all calibration is complete.

### 2.2 BAT Voltage Calibration

BAT Voltage Calibration is shown in Figure 2-2.

www.ti.com Calibration

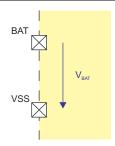

Figure 2-2. BAT Voltage Calibration

- 1. Apply known voltages in mV to the voltage input:
  - VBAT between VC4 pin and VSS pin
- 2. If ManufacturerStatus()[CAL] = 0, send 0x002D to ManufacturerAccess() to enable the [CAL] flag.
- 3. Send 0xF081 or 0xF082 to ManufacturerAccess() to enable raw cell voltage output on ManufacturerData().
- 4. Poll ManufacturerData() until the 8-bit counter value increments by 2 before reading data.
- 5. Read ADC conversion readings of cell stack voltage from ManufacturerData():
  - ADCBAT = GGgg of ManufacturerData(),
- 6. Average several readings for higher accuracy. Poll *ManufacturerData()* until ZZ increments to indicate that updated values are available:
  - ADCBAT = [ADCBAT(reading n) + ... + ADCBAT(reading 1)]/n
- 7. Calculate gain value:

$$BAT \ Gain = \frac{V_{BAT}}{ADC_{BAT}} \times 2^{16}$$
 (2)

- 8. Write the new BAT Gain value to data flash.
- 9. Re-check voltage readings and if these are not accurate, repeat steps 4 6.
- 10. Send 0x002D to ManufacturerAccess() to clear the [CAL] flag if all calibration is complete.

# 2.3 PACK Voltage Calibration

PACK voltage calibration is illustrated in Figure 2-3.

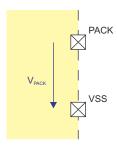

Figure 2-3. PACK Voltage Calibration

- 1. Apply known voltages in mV to the voltage input:
  - V<sub>PACK</sub> between PACK pin and VSS pin
- 2. If ManufacturerStatus()[CAL] = 0, send 0x002D to ManufacturerAccess() to enable the [CAL] flag.
- 3. Send 0xF081 or 0xF082 to ManufacturerAccess() to enable raw cell voltage output on ManufacturerData().
- 4. Poll ManufacturerData() until the 8-bit counter value increments by 2 before reading data.
- 5. Read ADC conversion readings of pack voltage from ManufacturerData():
  - ADC<sub>PACK</sub> = FFff of ManufacturerData()
- 6. Average several readings for higher accuracy. Poll *ManufacturerData()* until ZZ increments to indicate that updated values are available:
  - ADC<sub>PACK</sub> = [ADC<sub>PACK</sub>(reading n) + ... + ADC<sub>PACK</sub>(reading 1)]/n
- 7. Calculate gain value:

$$PACK Gain = \frac{V_{PACK}}{ADC_{PACK}} \times 2^{16}$$
 (3)

Calibration Www.ti.com

- 8. Write the new PACK Gain value to data flash.
- 9. Re-check voltage readings and if these are not accurate, repeat steps 4-6.
- 10. Send 0x002D to ManufacturerAccess() to clear the [CAL] flag if all calibration is complete.

### 2.4 Current Calibration

A diagram of current calibration is shown in Figure 2-4.

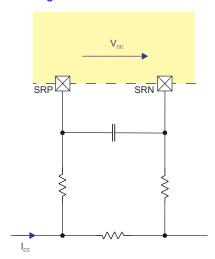

Figure 2-4. Current Calibration

#### 2.4.1 CC Offset Calibration

#### Note

Due to hardware improvements in this device, CC Offset calibration is not necessary. Only run the CC Offset Calibration procedure if current is observed when no current is present.

- 1. Apply a known current of 0 mA, and verify no current is flowing through the sense resistor connected between the SRP and SRN pins.
- 2. Externally short the SRN and SRP pins together for best results during CC offset calibration.
- 3. If ManufacturerStatus()[CAL] = 0, send 0x002D to ManufacturerAccess() to enable the [CAL] flag.
- 4. Send 0xF081 to ManufacturerAccess() to enable raw current output on ManufacturerData().
- 5. Poll *ManufacturerData()* until ZZ increments by 2 before reading data.
- 6. Obtain the ADC conversion readings of current from *ManufacturerData()*:
  - ADC<sub>CC</sub> = AAaa of ManufacturerData()

Is ADC<sub>CC</sub> < 0x8000? If yes, use ADC<sub>CC</sub>; otherwise, ADC<sub>CC</sub> = -(0xFFFF - AAaa + 0x0001).

- 7. Average several readings for higher accuracy. Poll *ManufacturerData()* until ZZ increments to indicate that updated values are available:
  - ADC<sub>CC</sub> = [ADC<sub>CC</sub>(reading n) + ... + ADC<sub>CC</sub>(reading 1)]/n
- 8. Read Coulomb Counter Offset Samples from data flash.
- 9. Calculate offset value:
  - CC offset = ADC<sub>CC</sub> × (Coulomb Counter Offset Samples)
- 10. Write the new CC Offset value to data flash.
- 11. Re-check the current reading and if not accurate, repeat steps 1 10.
- 12. Send 0x002D to ManufacturerAccess() to clear the [CAL] flag if all calibration is complete.

#### 2.4.2 Board Offset Calibration

#### Note

Due to hardware improvements in this device, Board Offset calibration is not necessary. Only run the Board Offset Calibration procedure if board offset current is observed.

www.ti.com Calibration

- 1. Verify that Offset Calibration was performed first.
- 2. Apply a known current of 0mA, and verify no current is flowing through the sense resistor connected between the SRP and SRN pins.
- 3. If ManufacturerStatus()[CAL] = 0, send 0x002D to ManufacturerAccess() to enable the [CAL] flag.
- 4. Send 0xF081 to ManufacturerAccess() to enable raw current output on ManufacturerData().
- 5. Poll ManufacturerData() until ZZ increments by 2 before reading data.
- 6. Obtain the ADC conversion readings of current from ManufacturerData():
  - ADC<sub>CC</sub> = AAaa of ManufacturerData()

Is ADC<sub>CC</sub> < 0x8000? If yes, use ADC<sub>CC</sub>; otherwise, ADC<sub>CC</sub> = -(0xFFFF - AAaa + 0x0001).

- 7. Average several readings for higher accuracy. Poll *ManufacturerData()* until ZZ increments to indicate that updated values are available:
  - ADC<sub>CC</sub> = [ADC<sub>CC</sub>(reading n) + ... + ADCCC(reading 1)]/n
- 8. Read Coulomb Counter Offset Samples from data flash.
- 9. Calculate offset value:
  - Board offset = (ADC<sub>CC</sub> CC Offset) × Coulomb Counter Offset Samples
- 10. Write the new Board Offset value to data flash.
- 11. Re-check the current reading. If the reading is not accurate, repeat steps 1 10.
- 12. Send 0x002D to ManufacturerAccess() to clear the [CAL] flag if all calibration is complete.

#### 2.4.3 CC Gain Calibration

- 1. Apply a known current (typically 1A to 2A), and verify ICC is flowing through the sense resistor connected between the SRP and SRN pins.
- 2. If ManufacturerStatus()[CAL] = 0, send 0x002D to ManufacturerAccess() to enable the [CAL] flag.
- 3. Send 0xF081 to ManufacturerAccess() to enable raw CC output on ManufacturerData().
- 4. Poll ManufacturerData() until ZZ increments by 2 before reading data.
- 5. Read the ADC conversion readings of current from ManufacturerData():
  - ADC<sub>CC</sub> = AAaa of ManufacturerData()

Is ADC<sub>CC</sub> < 0x8000? If yes, use ADC<sub>CC</sub>; otherwise, ADC<sub>CC</sub> = -(0xFFFF - AAaa + 0x0001).

- 6. Average several readings for higher accuracy. Poll *ManufacturerData()* until ZZ increments to indicate that updated values are available:
  - ADC<sub>CC</sub> = [ADC<sub>CC</sub>(reading n) + ... + ADC<sub>CC</sub>(reading 1)]/n
- 7. Read Coulomb Counter Offset Samples from data flash.
- 8. Calculate gain values:

$$CC \quad Gain = \frac{I_{cc}}{ADC_{cc} - \frac{Board \quad Offset \quad + \quad CC \quad Offset}{Coulomb \quad Counter \quad Offset \quad Samples}} \times 2^{16}$$
(4)

- 9. Write the new CC Gain and value to data flash.
- 10. Re-check the current reading. If the reading is not accurate, repeat steps 1-9.
- 11. Send 0x002D to ManufacturerAccess() to clear the [CAL] flag if all calibration is complete.

#### Note

Capacity Gain is no longer used in the BQ41xxx product family and must not be used or modified.

### 2.5 Temperature Calibration

Figure 2-5 illustrates temperature calibration.

Calibration

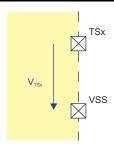

Figure 2-5. Temperature Calibration

### 2.5.1 Internal Temperature Sensor Calibration

- 1. Apply a known temperature in 0.1°C, and verify that temperature Temp<sub>TINT</sub> is applied to the device.
- 2. Read the TINT offset<sub>old</sub> from Internal Temp Offset.
- 3. Read the reported temperature from DAStatus2():
  - TINT = AAaa of DAStatus2()Is TINT > 0? If yes, TINT = AAaa 2732.
- 4. Calculate temperature offset:

$$TINT offset = TEMP_{TINT} - TINT + TINT offset_{old}$$
(5)

- 5. Write the new Internal Temp Offset value to data flash.
- 6. Re-check the *DAStatus2()* reading. If the reading is not accurate, repeat steps 1-5.

#### 2.5.2 TS1-TS2-TS3-TS4 Calibration

- Apply a known temperature in 0.1°C, and verify that temperature TEMP<sub>TSx</sub> is applied to the thermistor connected to the TSx pin. "TSx" refers to TS1, TS2, TS3, or TS4, whichever is applicable.
- 2. Read the TSx offset<sub>old</sub> from External x Temp Offset, where x is 1, 2, 3, or 4.
- Read the appropriate temperature from the DAStatus2() block as TSx.
- 4. Calculate the temperature offset:

$$TSx offset = TEMP_{TSX} - TSx + TSx offset_{old}$$
(6)

Where x is 1, 2, 3, or 4.

- 5. Write the new External x Temp Offset (where x is 1, 2, 3, or 4) value to data flash.
- 6. Re-check the DAStatus2() reading. If the reading is not accurate, repeat steps 1 − 5.
