

TPS7H3301-SP Neutron Displacement Damage Characterization

ABSTRACT

This report presents the effect of neutron displacement damage (NDD) on the TPS7H3301-SP device. The results show that all devices were fully functional and within production test limits after having been irradiated up to a neutron fluence of 1×10^{13} n/cm² (1-MeV equivalent). A sample size of nine units was exposed to radiation testing per (MIL-STD-883, Method 1017 for Neutron Irradiation) and an additional unirradiated sample device was used for correlation. All devices used in the experiment were from lot date code 1729A and assembly lot 7003811. Electrical testing was performed at Texas Instruments before and after neutron irradiation using the production test program for TPS7H3301-SP.

1 Overview

The TPS7H3301-SP is a radiation-hardened double data rate (DDR) 3-A termination regulator with built-in VTTREF buffer. The regulator is specifically designed to provide a complete, compact, low-noise solution for space DDR termination applications such as single board computers, solid state recorders, and payload processing.

General device information and testing conditions are listed in [Table 1](#).

Table 1. Overview Information

TI Part Number	TPS7H3301-SP
SMD Number	5962R1422801VXC
Device Function	DDR 3-A Termination Regulator
Die Name	RTPS7H3301A1VM
Technology	LBC7
A/T Lot Number / Date Code	7003811 /1729A
Unbiased Quantity Tested	9
Exposure Facility	VPT Rad
Neutron Fluence (1-MeV equivalent)	1.0×10^{12} , 5.0×10^{12} , 1.0×10^{13} n/cm ²
Irradiation Temperature	25°C

TI may provide technical, applications or design advice, quality characterization, and reliability data or service providing these items shall not expand or otherwise affect TI's warranties as set forth in the Texas Instruments Incorporated Standard Terms and Conditions of Sale for Semiconductor Products and no obligation or liability shall arise from Semiconductor Products and no obligation or liability shall arise from TI's provision of such items.

2 Test Procedures

The TPS7H3301-SP was electrically pre-tested using the production automated test equipment program. General test procedures were MIL-STD-883, Method 1017 for Neutron Irradiation of TPS7H3301-SP.

Table 2. Neutron Irradiation Conditions

Group	Sample Qty	Neutron Fluence (n/cm ²)	Bias
A	3	1.0×10^{12}	Unbiased
B	3	5.0×10^{12}	Unbiased
C	3	1.0×10^{13}	Unbiased

Figure 1. TPS7H3301-SP Device

3 Facility

The University of Massachusetts's Fast Neutron Irradiation (FNI) facility is an experimental facility that replaced the three beam ports that originally existed on the left side of the research reactor. It is designed to give a fast flux level $\geq 10^{11}$ n/cm²–s, with relatively low thermal fluence and gamma dose rates.

Samples with a cross-sectional area as large as 30 cm (12 in) \times 30 cm (12 in) and up to 15 cm (6 in) thick can be irradiated. The fast neutron flux is designed to be nearly uniform over the 30-cm (12-in) \times 30-cm (12-in) area facing the core, and the fast fluence variation through the sample thickness is minimized via a single 180° rotation of the sample canister at the midpoint of the irradiation period. The FNI facility offers a significantly larger sample volume than previously available within the University of Massachusetts Lowell Research Reactor (UMLRR).

The fluences are calculated based on 1-MeV equivalences.

Detailed information of the radiation facility is available at the following link:

www.uml.edu/docs/FNI%20Brochure_tcm18-90375.pdf

4 Results

There were no functional failures at any irradiation level. All parametric measurements remained well within all data sheet ([SLVSCJ5](#)) limits for all exposure levels. All parametric measurements remained well within the production test limits which are guard-banded from the data sheet limits. The full parameter list and graphs are found in [Appendix A](#)

[Table 3](#) lists the TPS7H3301-SP specification compliance matrix.
