ABSTRACT

This report presents the effect of neutron displacement damage (NDD) on the TPS7H4102-SP, a 7V, 3A channel, dual channel, peak-current mode synchronous buck converter optimized for use in area sensitive, space environment applications. The TPS7H4102-SP showed a strong degree of hardness to neutron irradiation up to fluence level 1×10^{13} n/cm². The neutron irradiation test is a destructive test. Test procedure follows MIL-STD-883 Method 1017 as guidance. The purpose of this test is to determine the device susceptibility to non-ionizing energy loss (NIEL) degradation. Objectives of the test are, to detect and measure the degradation of critical device parameters as a function of neutron fluence and to determine if these parameters are within specified limits after exposure to a specified level of neutron fluence.

1 Device Information

1.1 Product Description

The TPS7H4102-SEP is an integrated, 7V, 3A per channel, dual-channel, peak current mode, synchronous buck converter designed for use in area sensitive, space environment applications. The device incorporates two identical channels that can be used to step down the power input voltage (PVIN) into two independent voltages up to 3A per phase or interleaved to increment the output current as needed, up to 6A.

Each channel incorporates the high and low side power MOSFETs with programmable soft-start and slope compensation. In addition, per channel powergood flag, and enable signals are provided.

Per Phase cycle-by-cycle current limiting on the high-side FET protects the device in overload situations and is enhanced by a low-side sourcing-sinking current protection which prevents current runaway. Thermal shutdown disables the device when the die temperature exceeds thermal limit.

The TPS7H4102-SEP is packaged in a 64-pin HTQFP plastic package. A standard microcircuit drawing (SMD) is available for the QML variant, 5962R2320802PYE.

2 Total Dose Test Setup

2.1 Test Overview

The TPS7H4102-SEP was tested according to MIL-STD-883, Method 1017 as a guide for neutron irradiation. The TPS7H4102-SP was electrically tested using the production automated test equipment (ATE) program at an ambient room temperature of 25°C before and after neutron irradiation. All devices remained functional passing all parametric test limits.

2.2 Test Description and Facilities

The utilized test facility is the Fast Neutron Irradiation (FNI) Facility of University of Massachusetts Lowell Research Reactor. The neutron fluence for this irradiation was measured utilizing ASTM E-265 “Measuring Reaction Rates and Fast Neutron Fluence by Radioactivation of Sulfur-32” and correlated to the measured reactor power level. All irradiation conditions required under ASTM 722 were met, this includes: neutron fluence, distribution and uncertainty. The Average Integrated Neutron Fluence, 1-MeV(Si) equivalent, reflects these factors. Detailed information of the radiation facility is available at the following link: [UNIVERSITY OF MASSACHUSETTS LOWELL RESEARCH REACTOR](#)

2.3 Test Setup Details

Devices were irradiated at three fluence levels in unbiased conditions: 1.0×10^{12} n/cm², 5.0×10^{12} n/cm² and 1.0×10^{13} n/cm². See the details in the following table.

3 NDD Characterization Test Results

3.1 NDD Characterization Summary

The results show that all devices were fully functional and within specification limits. A sample size of twelve units was exposed for neutron irradiation and an additional unirradiated control units were used as correlation.

Overall, the TPS7H4102-SP showed a strong degree of hardness to Neutron irradiation up to fluence level $1 \times 10^{13} \text{n/cm}^2$. The measurements taken post-irradiation for each sample set showed a marginal shift for most parameters at each fluence level. The parameters that showed a greater degree of change between pre- and post- irradiation were still within the Electrical Performance Characteristics specified in the Data Sheet Electrical Parameters table. See Table 3-1 for the Data Sheet Electrical Parameters and Associated Tests. Electrical testing is done for pre- and post- neutron irradiation by ATE. ATE electrical test is done at an ambient room temperature of 25°C. See Appendix A for NDD report up to $1.0 \times 10^{13} \text{n/cm}^2$.

The parameters post-irradiation were still within the electrical performance characteristics specified in the data sheet electrical parameters. See [TPS7H410x-SP Radiation-Hardeness-Assured, 3V to 7V Input, 3A/Channel, Multichannel Synchronous Buck Converter](#) for the data sheet electrical parameters and associated tests.

See Appendix A for NDD report up to $1 \times 10^{13} \text{n/cm}^2$.
