TID Report	
TI Part Number	UC1845A-SP
SMD Number	5962P8670411VYC
Device Function	Current-Mode PWM Controllers
Die Name	SMEXARC1845VS / SMEXARC1845VSRH
Package	10-Pin HKU
Technology	JI1 PWR
Die Lot Number	4200380SHE
A/T Lot Number / Date Code	4011729MMT / 1437A
Biased Quantity Tested	37
Unbiased Quantity Tested	37
Radiation Facility	Aeroflex RAD
Total Dose	3 kRAD, 10 kRAD, 30 kRAD, & 45 kRAD
Dose Rate	0.01 RAD/s Si
Radiation Source	Co-60 Gamma
Irradiation Temperature	25°C

TI may provide technical, applications or design advice, quality characterization, and reliability data or service providing these items shall not expand or otherwise affect TI's warranties as set forth in the Texas Instruments Incorporated Standard Terms and Conditions of Sale for Semiconductor Products and no obligation or liability shall arise from Semiconductor Products and no obligation or liability shall arise from TI's provision of such items.

Overview and Background

It is well known that ionizing radiation can cause parametric degradation and ultimately functional failures in electronic devices. There are two dominant mechanisms associated with these effects, the generation of hole traps and interface states. Both of these mechanisms contribute to the overall MOS transistor V_t shifts. First order effects are typically seen in the thick field isolation region and second order effects in the gate region, under Total Irradiated Dose (TID) exposure. These mechanisms occur due to electron-hole pair production from ionization radiation and their transport and trapping in the dielectric and silicon interface regions. These mechanisms, known as hole traps, "V_{ot}" and interface traps "V_{it}" have been studied for many years and are well documented. It is also well known that annealing of these mechanisms can occur over time and may be accelerated by temperature. Figure 1 is a general summary of these effects. The effects are greatly affected by the particular technology and are greatly dependent on dielectric thickness and component construction.

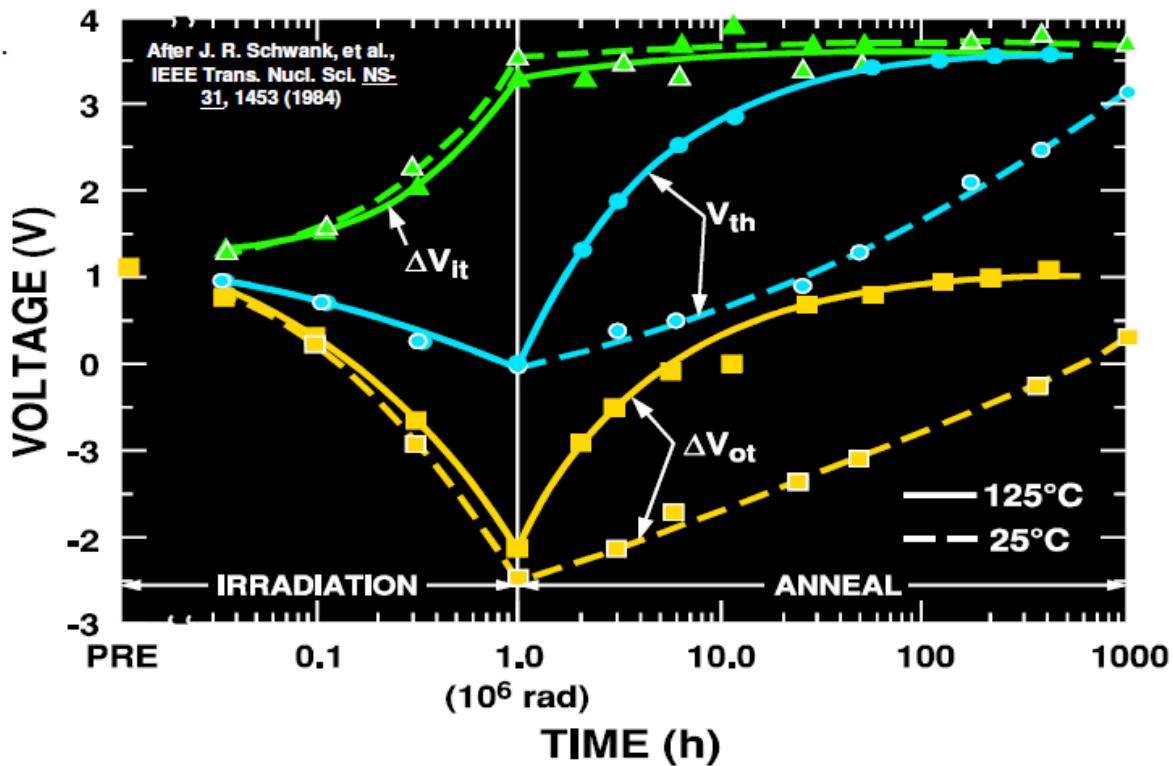

Figure 1. V_{ot} / V_{it} Generation and Time/ Temperature Annealing

Accumulation of hole traps is typically the primary mechanism for increased leakage and failures in MOS semiconductor devices. MOS Semiconductor devices are typically less dependent on the generation of interface traps, but the ratio of these two mechanisms do play a role in overall time dependent device behavior, and are typically very process and structure dependent. The anneal rate of hole traps (either deep or shallow) of a particular device is also process and structure dependent. Some semiconductor

processes exhibit quick anneal rates, while others may anneal at a low rates. Activation energy plays an important role in these recombination rates, i.e. annealing of hole traps, as shown by elevated temperatures in figure 1. On the other hand, interface (electron) traps do not anneal easily and can accumulate over time. Bipolar structures on the other hand are affected primarily by interface states and secondary by hole traps in the base oxide. Both of these mechanisms play a role in device behavior. Both again are very process and structure dependent. Because of accelerated testing, both hole traps and interface generation rates may not correlate to the actual intended radiation mission environment. In a space environment, the TID rates can be less than 0.01mRAD/sec, giving way to unexpected results compared to accelerated exposure. US MIL-STD-883, method 1019.9 covers both annealing , and rebound effects with a 168 hour 100°C bake and retest. Under accelerated exposure or testing annealing of devices are often checked, and is allowed under US MIL-STD-883H section 3.11.2. This can determine the dose rate and radiation level the parts can be expected to work over during it's intended application. However, to use this method the parts must remain functional after full TID exposure.

Since some devices include Bipolar components, a concern is the product behavior under Low Dose Rate radiation exposure to determine if these devices exhibit Enhanced Low Dose Rate Sensitivity (ELDRS). As mentioned previously, bipolar devices are often sensitive to interface and hole traps occurring in the base oxide and base emitter junction interface region as shown in figure 2.

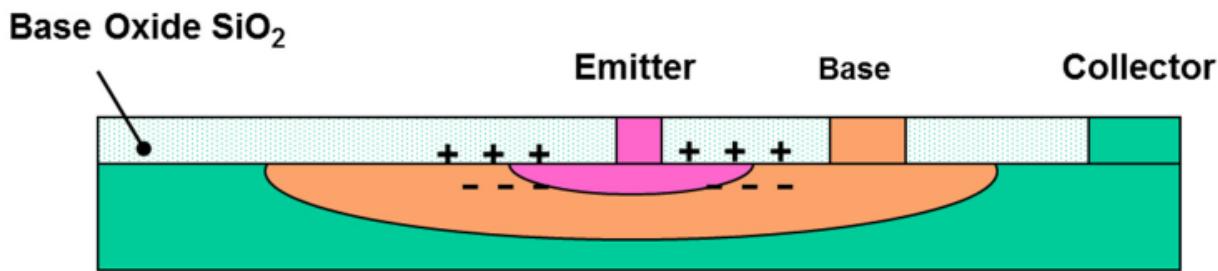

Figure 2. Bipolar structure and TID effects

The generation rates of these two mechanisms both result in effective Hfe or transistor gain drop in bipolar transistors. As previously mentioned interface generation can occur under TID exposure in devices. Interface state generation is primarily caused by proton transport mechanism or loose hydrogen in the device from processing or hydrogen in ambient surroundings. This condition can produce a large number of interface states when devices are exposed at low dose rates. The generation of these interface states are greatly enhanced at low dose rates due to a low concentration of hole traps at the interface that repel hydrogen under high dose rates. The test for ELDRS is currently preformed at 10mRAD(si)/sec. A rate that is still much higher than actual space dose rates, but it's much closer than accelerated rates of 50-300Rad/sec called out in Condition A of MIL-STD-883, Method 1019.9.

RHA Process

Radiation Hardness Assurance (RHA) "consists of all activities undertaken to ensure that the electronics and materials of a space system perform to their design specifications after exposure to the space environment." While the Texas Instruments RHA program is necessarily restricted to TI components, it is important to remember that to ensure RHA performance of the final system, the scope "goes beyond the piece-part level" holistically comprehending mission, system, and subsystem requirements, as well as the details of the operational environment (orbit, shielding effects, etc.) in the final development of a radiation tolerant system that meets its performance targets.

Texas Instruments has developed a robust test process for releasing RHA devices. Radiation testing is performed per wafer lot to insure that the devices meet electrical parameters post radiation exposure. All RHA releases adhere to guidelines set forth in the latest version of MIL-STD 883, Test Method 1019.

An individual test plan is developed for each RHA device release. The test plan is developed from the requirement set forth in MIL-STD 883 and a thorough review of the process technology details of the device being released. There are two key aspects of the release procedure, a radiation characterization portion and a wafer lot radiation acceptance test (Group E) portion. The radiation characterization portion determines what maximum TID level the device can operate in, while the wafer lot acceptance test portion guarantees that the device material meets that level once DLA accepts the product for release as a RHA device.

TID Characterization

TID Low Dose Rate (LDR) Characterization

TI submits samples for LDR evaluation built from randomly selected die across one wafer, as shown in Table 2. .

Table 2: LDR Characterization Plan

LDR Characterization	Each wafer (across 1 wafer)	Test Condition	Total Units Tested
	Any sections per wafer.	3 kRAD (Biased)	5
		10 kRAD (Biased)	5
		30 kRAD (Biased)	5
		45 kRAD (Biased)	22
		3 kRAD (UnBiased)	5
		10 kRAD (UnBiased)	5
		30 kRAD (UnBiased)	5
		45 kRAD (UnBiased)	22

Enhanced Low Dose Rate (ELDRS) Characterization

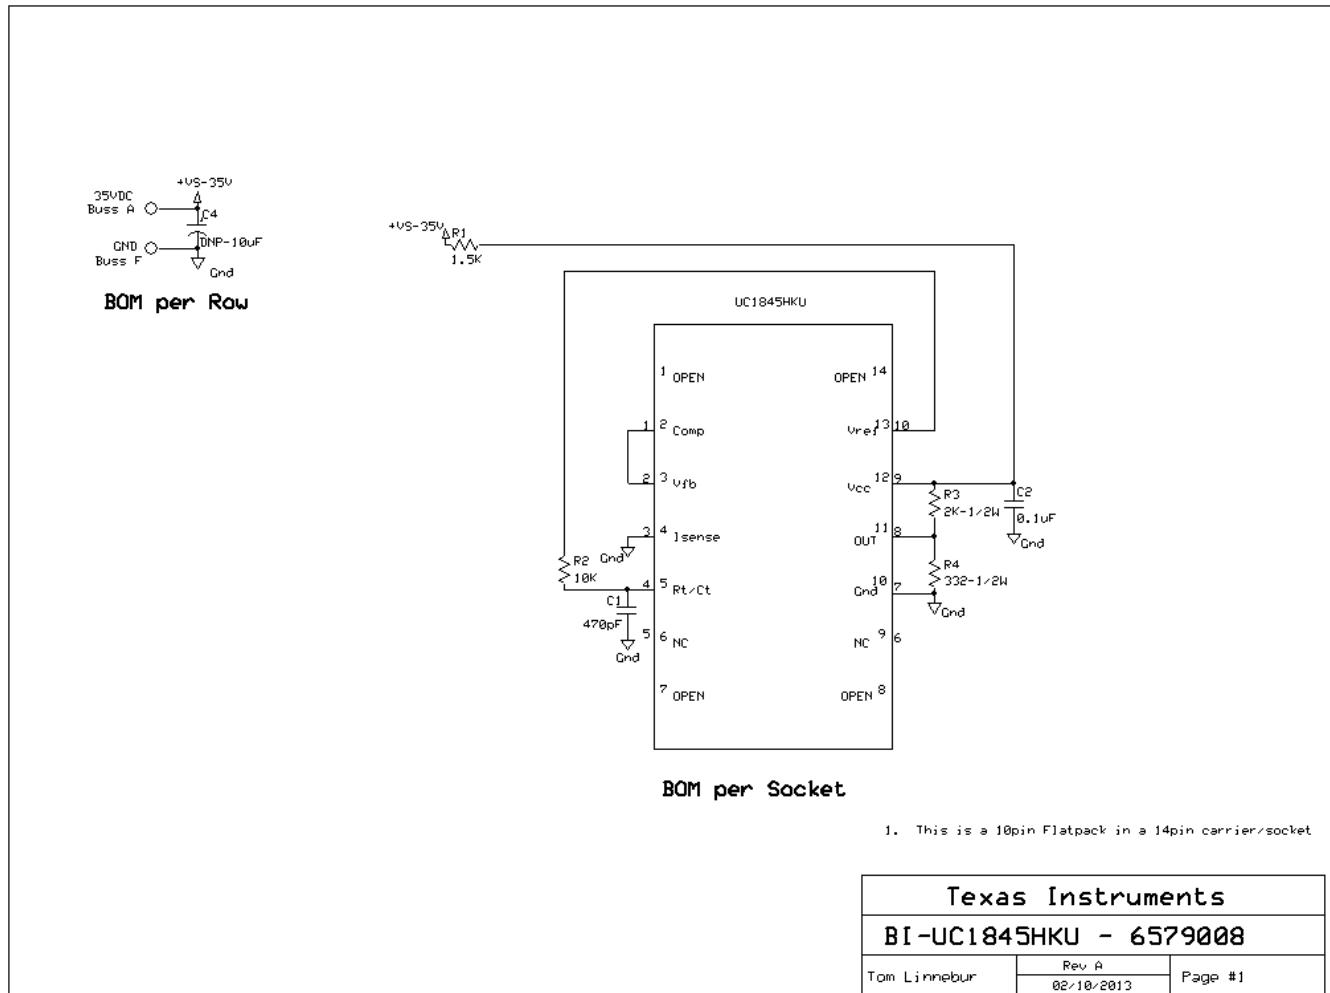

TI JI1 PWR process is low dose rate sensitive from history of data from the Unitrode family, hence Characterization and RLAT is done using LDR for this device.

Exposure and Testing Process

All electrical testing is performed at a different site than the exposure facility. All devices are pre-tested and datalogged for traceability. The devices are then shipped to the exposure facility. Devices are monitored for current changes during exposure if they are biased. Unbiased exposures have the devices mounted in conductive foam or have the leads shorted together. Once exposure is complete, the devices are immediately shipped back to TI test facilities on dry ice per MIL-STD-883 Test Method 1019, 3.10 and tested within 72 hours. Full parametric testing must complete within the 72 hours of the devices being stored in dry ice. This insures that there is no annealing of the TID-induced damage that might lead to underestimation of the TID sensitivity. The tests are datalogged and compared with the pre-test data for parametric shift and functional verification.

Sample Device Information		
Serial Number	Bias conditions	Total Dose
056, 057, 058, 059, 060	Biased	3 kRAD
062, 063, 064, 065, 066	Unbiased	3 kRAD

UC1845A-SP / 5962P8670411VYC

Bias Board

Summary

US1845A-SP is low dose sensitive device from the Unitrode family, for Condition D, the device was irradiated at 10 mrad (Si)/s. We followed MIL-STD-883 test method 1019.9 para 3.13.3.b an over test for lot acceptance testing. The device is target for release at 30 kRad and hence we performed irradiation at 1.5X times the target at 45 kRad. This device passed functionally and parametrically after LDR exposure at 45 kRad and is RHA rated for 30 kRad.

IMPORTANT NOTICE

Texas Instruments Incorporated and its subsidiaries (TI) reserve the right to make corrections, enhancements, improvements and other changes to its semiconductor products and services per JESD46, latest issue, and to discontinue any product or service per JESD48, latest issue. Buyers should obtain the latest relevant information before placing orders and should verify that such information is current and complete. All semiconductor products (also referred to herein as "components") are sold subject to TI's terms and conditions of sale supplied at the time of order acknowledgment.

TI warrants performance of its components to the specifications applicable at the time of sale, in accordance with the warranty in TI's terms and conditions of sale of semiconductor products. Testing and other quality control techniques are used to the extent TI deems necessary to support this warranty. Except where mandated by applicable law, testing of all parameters of each component is not necessarily performed.

TI assumes no liability for applications assistance or the design of Buyers' products. Buyers are responsible for their products and applications using TI components. To minimize the risks associated with Buyers' products and applications, Buyers should provide adequate design and operating safeguards.

TI does not warrant or represent that any license, either express or implied, is granted under any patent right, copyright, mask work right, or other intellectual property right relating to any combination, machine, or process in which TI components or services are used. Information published by TI regarding third-party products or services does not constitute a license to use such products or services or a warranty or endorsement thereof. Use of such information may require a license from a third party under the patents or other intellectual property of the third party, or a license from TI under the patents or other intellectual property of TI.

Reproduction of significant portions of TI information in TI data books or data sheets is permissible only if reproduction is without alteration and is accompanied by all associated warranties, conditions, limitations, and notices. TI is not responsible or liable for such altered documentation. Information of third parties may be subject to additional restrictions.

Resale of TI components or services with statements different from or beyond the parameters stated by TI for that component or service voids all express and any implied warranties for the associated TI component or service and is an unfair and deceptive business practice. TI is not responsible or liable for any such statements.

Buyer acknowledges and agrees that it is solely responsible for compliance with all legal, regulatory and safety-related requirements concerning its products, and any use of TI components in its applications, notwithstanding any applications-related information or support that may be provided by TI. Buyer represents and agrees that it has all the necessary expertise to create and implement safeguards which anticipate dangerous consequences of failures, monitor failures and their consequences, lessen the likelihood of failures that might cause harm and take appropriate remedial actions. Buyer will fully indemnify TI and its representatives against any damages arising out of the use of any TI components in safety-critical applications.

In some cases, TI components may be promoted specifically to facilitate safety-related applications. With such components, TI's goal is to help enable customers to design and create their own end-product solutions that meet applicable functional safety standards and requirements. Nonetheless, such components are subject to these terms.

No TI components are authorized for use in FDA Class III (or similar life-critical medical equipment) unless authorized officers of the parties have executed a special agreement specifically governing such use.

Only those TI components which TI has specifically designated as military grade or "enhanced plastic" are designed and intended for use in military/aerospace applications or environments. Buyer acknowledges and agrees that any military or aerospace use of TI components which have **not** been so designated is solely at the Buyer's risk, and that Buyer is solely responsible for compliance with all legal and regulatory requirements in connection with such use.

TI has specifically designated certain components as meeting ISO/TS16949 requirements, mainly for automotive use. In any case of use of non-designated products, TI will not be responsible for any failure to meet ISO/TS16949.
